    zation stage.

    optimize [bool] If present, indicates that the encoder should make an
    extra pass over the image in order to select optimal encoder settings.

    progressive [bool] If present, indicates that this image should be stored
    as a progressive JPEG file.

    pil_kwvars [dict, optional] Additional keyword arguments that are
    passed to PIL.Image.save when saving the figure. These take prece-
    dence over quality, optimize and progressive.
print_jpg(self, filename_or_obj, *args, dryrun=False, pil_kwargs=None, **kwargs)
Write the figure to a JPEG file.

Parameters

filename_or_obj [str or PathLike or file-like object] The file to write to.

Other Parameters

quality [int] The image quality, on a scale from 1 (worst) to 100 (best).
The default is rcParams["savefig.jpeg_quality"] (default: 95). Values above 95 should be avoided; 100 completely disables the JPEG quantization stage.

optimize [bool] If present, indicates that the encoder should make an extra pass over the image in order to select optimal encoder settings.

progressive [bool] If present, indicates that this image should be stored as a progressive JPEG file.

pil_kwargs [dict, optional] Additional keyword arguments that are passed to PIL.Image.save when saving the figure. These take precedence over quality, optimize and progressive.

print_png(self, filename_or_obj, *args, metadata=None, pil_kwargs=None, **kwargs)
Write the figure to a PNG file.

Parameters

filename_or_obj [str or PathLike or file-like object] The file to write to.

metadata [dict, optional] Metadata in the PNG file as key-value pairs of bytes or latin-1 encodable strings. According to the PNG specification, keys must be shorter than 79 chars.

The PNG specification defines some common keywords that may be used as appropriate:

- Title: Short (one line) title or caption for image.
- Author: Name of image’s creator.
- Description: Description of image (possibly long).
- Copyright: Copyright notice.
- Creation Time: Time of original image creation (usually RFC 1123 format).
- Software: Software used to create the image.
- Disclaimer: Legal disclaimer.
- Warning: Warning of nature of content.
- Source: Device used to create the image.
- Comment: Miscellaneous comment; conversion from other image format.

Other keywords may be invented for other purposes.

If ‘Software’ is not given, an autogenerated value for matplotlib will be used.
For more details see the PNG specification.

**pil_kwargs** [dict, optional] If set to a non-None value, use Pillow to save the figure instead of Matplotlib’s builtin PNG support, and pass these keyword arguments to PIL.Image.save.

If the ‘pnginfo’ key is present, it completely overrides metadata, including the default ‘Software’ key.

```python
print_raw(self, filename_or_obj, *args, **kwargs)
print_rgba(self, filename_or_obj, *args, **kwargs)
print_tif(self, filename_or_obj, *args, dryrun=False, pil_kwargs=None, **kwargs)
print_tiff(self, filename_or_obj, *args, dryrun=False, pil_kwargs=None, **kwargs)
print_to_buffer(self)
restore_region(self, region, bbox=None, xy=None)
tostring_argb(self)
    Get the image as an ARGB byte string.
    draw must be called at least once before this function will work and to update the renderer for any subsequent changes to the Figure.

Returns
bytes
tostring_rgb(self)
    Get the image as an RGB byte string.
    draw must be called at least once before this function will work and to update the renderer for any subsequent changes to the Figure.

Returns
bytes
class matplotlib.backends.backend_agg.RendererAgg(width, height, dpi)
Bases: matplotlib.backend_bases.RendererBase
The renderer handles all the drawing primitives using a graphics context instance that controls the colors/styles
buffer_rgba(self)
clear(self)
draw_mathtext(self, gc, x, y, s, prop, angle)
    Draw the math text using matplotlib.mathtext
draw_path(self, gc, path, transform, rgbFace=None)
    Draws a Path instance using the given affine transform.
draw_tex(self, gc, x, y, s, prop, angle, ismath='\TeX!', mtext=None)
draw_text(self, gc, x, y, s, prop, angle, ismath=False, mtext=None)
    Draw the text instance.

Parameters
    x [scalar] The x location of the text in display coords.
y [scalar] The y location of the text baseline in display coords.

s [str] The text string.

angle [scalar] The rotation angle in degrees.

mtext [matplotlib.text.Text] The original text object to be rendered.

Notes

**backend implementers note**

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```python
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

get_canvas_width_height(self)
Return the canvas width and height in display coords.

get_text_width_height_descent(self, s, prop, ismath)
Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string s with FontProperties prop

lock = <unlocked _thread.RLock object owner=0 count=0>

option_image_nocomposite(self)
Return whether image composition by Matplotlib should be skipped.

Raster backends should usually return False (letting the C-level rasterizer take care of image composition); vector backends should usually return not rcParams["image.composite_image"].

option_scale_image(self)
Return whether arbitrary affine transformations in draw_image() are supported (True for most vector backends).

points_to_pixels(self, points)
Convert points to display units.

You need to override this function (unless your backend doesn’t have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```python
points to pixels = points * pixels_per_inch/72.0 * dpi/72.0
```

**Parameters**

points [scalar or array_like] a float or a numpy array of float

**Returns**

Points converted to pixels

restore_region(self, region, bbox=None, xy=None)
Restore the saved region. If bbox (instance of BboxBase, or its extents) is given, only the region specified by the bbox will be restored. xy (a pair of floats) optionally
specifies the new position (the LLC of the original region, not the LLC of the bbox) where the region will be restored.

```python
>>> region = renderer.copy_from_bbox()
>>> x1, y1, x2, y2 = region.get_extents()
>>> renderer.restore_region(region, bbox=(x1+dx, y1, x2, y2),
                          xy=(x1-dx, y1))
```

**start_filter**(self)
Start filtering. It simply create a new canvas (the old one is saved).

**stop_filter**(self, post_processing)
Save the plot in the current canvas as a image and apply the post_processing function.

```python
def post_processing(image, dpi):
    # ny, nx, depth = image.shape  # image (numpy array) has RGBA channels and has a depth of 4.
    ...  # create a new_image (numpy array of 4 channels, size can be different). The resulting image may have offsets from lower-left corner of the original image
    return new_image, offset_x, offset_y
```

The saved renderer is restored and the returned image from post_processing is plotted (using draw_image) on it.

**tostring_argb**(self)
**tostring_rgb**(self)
**tostring_rgba_minimized**(self)

---

17.10.3 matplolib.backends.backend_cairo

A Cairo backend for matplotlib

**Author** Steve Chaplin and others

This backend depends on cairocffi or pycairo.

```python
class matplolib.backends.backend_cairo.ArrayWrapper(**kwargs):
    Bases: object

    [Deprecated] Thin wrapper around numpy ndarray to expose the interface expected by cairocffi. Basically replicates the array.array interface.
```

**Notes**

Deprecate since version 3.0.

```python
buffer_info(self)
```

```python
matplolib.backends.backend_cairo.FigureCanvas
    alias of matplolib.backends.backend_cairo.FigureCanvasCairo

class matplolib.backends.backend_cairo.FigureCanvasCairo(figure):
    Bases: matplolib.backend_bases.FigureCanvasBase

    print_pdf(self, fobj, *args, **kwargs)
```
print_png(self, fobj, *args, **kwargs)
print_ps(self, fobj, *args, **kwargs)
print_raw(self, fobj, *args, **kwargs)
print_rgba(self, fobj, *args, **kwargs)
print_svg(self, fobj, *args, **kwargs)
print_svgz(self, fobj, *args, **kwargs)
supports_blit = False
class matplotlib.backends.backend_cairo.GraphicsContextCairo(renderer)
    Bases: matplotlib.backend_bases.GraphicsContextBase

    get_rgb(self)
        Return a tuple of three or four floats from 0-1.

    restore(self)
        Restore the graphics context from the stack - needed only for backends that save
        graphics contexts on a stack.

    set_alpha(self, alpha)
        Set the alpha value used for blending - not supported on all backends.
        If alpha=None (the default), the alpha components of the foreground and fill colors
        will be used to set their respective transparencies (where applicable); otherwise,
        alpha will override them.

    set_capstyle(self, cs)
        Set the capstyle to be one of (‘butt’, ‘round’, ‘projecting’).

    set_clip_path(self, path)
        Set the clip path and transformation. Path should be a TransformedPath instance.

    set_clip_rectangle(self, rectangle)
        Set the clip rectangle with sequence (left, bottom, width, height)

    set_dashes(self, offset, dashes)
        Set the dash style for the gc.

    Parameters

    dash_offset [float] is the offset (usually 0).

    dash_list [array_like] specifies the on-off sequence as points. (None, None)
    specifies a solid line

    set_foreground(self, fg, isRGBA=None)
        Set the foreground color.

    Parameters

    fg [color]

    isRGBA [bool] If fg is known to be an (r, g, b, a) tuple, isRGBA can be
    set to True to improve performance.

    set_joinstyle(self, js)
        Set the join style to be one of (‘miter’, ‘round’, ‘bevel’).

    set_linewidth(self, w)
        Set the linewidth in points.
class matplotlib.backends.backend_cairo.RendererCairo(dpi)
    Bases: matplotlib.backend_bases.RendererBase

static convert_path(ctx, path, transform, clip=None)
    [Deprecated]

Notes

Deprecated since version 3.0:

draw_image(self, gc, x, y, im)
    Draw an RGBA image.

Parameters

x [scalar] the distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.
y [scalar] the distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.
transform [matplotlib.transforms.Affine2DBase] If and only if the concrete backend is written such that option_scale_image() returns True, an affine transformation may be passed to draw_image(). It takes the form of a Affine2DBase instance. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override x and y, and has to be applied before translating the result by x and y (this can be accomplished by adding x and y to the translation vector defined by transform).

draw_markers(self, gc, marker_path, marker_trans, path, transform, rgbFace=None)
    Draws a marker at each of the vertices in path. This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of draw_markers that makes multiple calls to draw_path(). Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

Parameters

gc [GraphicsContextBase] The graphics context

trans [matplotlib.transforms.Transform] An affine transform applied to the path.

draw_path(self, gc, path, transform, rgbFace=None)
    Draws a Path instance using the given affine transform.

draw_text(self, gc, x, y, s, prop, angle, ismath=False, mtext=None)
    Draw the text instance.

Parameters
**Notes**

**backend implementers note**
When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```python
if 0: bbox_artist(self, renderer)
```

to 1, and then the actual bounding box will be plotted along with your text.

```python
fontangles = {'italic': <MyCairoCffi name='mock.FONT_SLANT_ITALIC' id='139704430343168'>, 'normal': <MyCairoCffi name='mock.FONT_SLANT_NORMAL' id='139704414136400'>, 'oblique': <MyCairoCffi name='mock.FONT_SLANT_OBLIQUE' id='139704348174128'>}
fontweights = {100: <MyCairoCffi name='mock.FONT_WEIGHT_NORMAL' id='139704432103136'>, 200: <MyCairoCffi name='mock.FONT_WEIGHT_BOLD' id='139704431153408'>}
```

```
def get_canvas_width_height(self):
    Return the canvas width and height in display coords.

def get_text_width_height_descent(self, s, prop, ismath):
    Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string s with FontProperties prop

def new_gc(self):
    Return an instance of a GraphicsContextBase.

def points_to_pixels(self, points):
    Convert points to display units.
```

You need to override this function (unless your backend doesn’t have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points to pixels = points * pixels_per_inch/72.0 * dpi/72.0
```

**Parameters**

- **points** [scalar or array_like] a float or a numpy array of float

**Returns**

- **Points converted to pixels**

```python
def set_ctx_from_surface(self, surface):
    set_width_height(self, width, height)
```
17.10.4 `matplotlib.backends.backend_gtk3agg`

**TODO** We’ll add this later, importing the gtk3 backends requires an active X-session, which is not compatible with cron jobs.

17.10.5 `matplotlib.backends.backend_gtk3cairo`

**TODO** We’ll add this later, importing the gtk3 backends requires an active X-session, which is not compatible with cron jobs.

17.10.6 `matplotlib.backends.backend_nbagg`

Interactive figures in the IPython notebook

```python
class matplotlib.backends.backend_nbagg.CommSocket(manager)
    Bases: object
    Manages the Comm connection between IPython and the browser (client).
    Comms are 2 way, with the CommSocket being able to publish a message via the send_json method, and handle a message with on_message. On the JS side figure.send_message and figure.ws.onmessage do the sending and receiving respectively.

    is_open(self)
    on_close(self)
    on_message(self, message)
    send_binary(self, blob)
    send_json(self, content)
```

`matplotlib.backends.backend_nbagg.FigureCanvas` alias of `matplotlib.backends.backend_nbagg.FigureCanvasNbAgg`

```python
class matplotlib.backends.backend_nbagg.FigureCanvasNbAgg(*args, **kwargs)
    Bases: matplotlib.backends.backend_webagg_core.FigureCanvasWebAggCore
    new_timer(self, *args, **kwargs)
    Creates a new backend-specific subclass of backend_bases.Timer. This is useful for getting periodic events through the backend’s native event loop. Implemented only for backends with GUIs.
```

**Other Parameters**

- **interval** [scalar] Timer interval in milliseconds
- **callbacks** [List[Tuple[callable, Tuple, Dict]]] Sequence of (func, args, kwargs) where func(*args, **kwargs) will be executed by the timer every interval.
  
  callbacks which return False or 0 will be removed from the timer.
Examples

```python
>>> timer = fig.canvas.new_timer(callbacks=[(f1, (1,), {'a': 3})])
```

```python
matplotlib.backends.backend_nbagg.FigureManager
    alias of matplotlib.backends.backend_nbagg.FigureManagerNbAgg
class matplotlib.backends.backend_nbagg.FigureManagerNbAgg(canvas, num)
    Bases: matplotlib.backends.backend_webagg_core.FigureManagerWebAgg
    ToolbarCls
        alias of NavigationIPy
clearup_closed(self)
    Clear up any closed Comms.
class connected
destroy(self)
display_js(self)
classmethod get_javascript(stream=None)
remove_comm(self, comm_id)
reshow(self)
    A special method to re-show the figure in the notebook.
show(self)
    For GUI backends, show the figure window and redraw. For non-GUI backends, raise an exception to be caught by show(), for an optional warning.
class matplotlib.backends.backend_nbagg.NavigationIPy(canvas)
    Bases: matplotlib.backends.backend_webagg_core.NavigationToolbar2WebAgg
toolitems = [('Home', 'Reset original view', 'fa fa-home icon-home', 'home'), ('Back', 'Back to previous view', 'fa fa-reply icon-reply', 'back'), (None, None, None, None), ('Download', 'Download plot', 'fa fa-floppy-o icon-save', 'download')]
class matplotlib.backends.backend_nbagg.connection_info()
    Return a string showing the figure and connection status for the backend.
    This is intended as a diagnostic tool, and not for general use.
class matplotlib.backends.backend_nbagg.new_figure_manager_given_figure(num, figure)
    Create a new figure manager instance for the given figure.
class matplotlib.backends.backend_nbagg.show(*args, block=None, **kwargs)
    Show all figures.
    `show` blocks by calling mainloop if block is True, or if it is None and we are neither in IPython's %pylab mode, nor in interactive mode.
```

17.10.7 matplotlib.backends.backend_pdf

A PDF matplotlib backend
Author: Jouni K Seppänen <jks@iki.fi>
class matplotlib.backends.backend_pdf.FigureCanvas
    alias of matplotlib.backends.backend_pdf.FigureCanvasPdf
class matplotlib.backends.backend_pdf.FigureCanvasPdf(figure)
    Bases: matplotlib.backend_bases.FigureCanvasBase
The canvas the figure renders into. Calls the draw and print fig methods, creates the renderers, etc...

**Attributes**

- **figure** [``matplotlib.figure.Figure``] A high-level Figure instance

```python
def draw(self)
    Render the Figure.
```

```python
filetypes = {'pdf': 'Portable Document Format'}
```

```python
fixed_dpi = 72
```

```python
def get_default_filetype(self)
    Get the default savefig file format as specified in rcParam savefig.format. Returned string excludes period. Overridden in backends that only support a single file type.
```

```python
def print_pdf(self, filename, *, dpi=72, bbox_inches_restore=None, metadata=None, **kwargs)
```

```python
class matplotlib.backends.backend_pdf.GraphicsContextPdf(file)
    Bases: matplotlib.backend_bases.GraphicsContextBase
```

```python
def alpha_cmd(self, alpha, forced, effective_alphas)
```

```python
def capstyle_cmd(self, style)
```

```python
capstyles = {'butt': 0, 'projecting': 2, 'round': 1}
```

```python
def clip_cmd(self, cliprect, clippath)
    Set clip rectangle. Calls self.pop() and self.push().
```

```python
commands = (('_cliprect', '_clippath'), <function GraphicsContextPdf.clip_cmd>), (('_alpha', '_forced_alpha', ...
```

```python
def copy_properties(self, other)
    Copy properties of other into self.
```

```python
def dash_cmd(self, dashes)
```

```python
def delta(self, other)
    Copy properties of other into self and return PDF commands needed to transform self into other.
```

```python
def fill(self, *args)
```

```python
fillcolor_cmd(self, rgb)
```

```python
def finalize(self)
    Make sure every pushed graphics state is popped.
```

```python
def hatch_cmd(self, hatch, hatch_color)
```

```python
def joinstyle_cmd(self, style)
```

```python
joinstyles = {'bevel': 2, 'miter': 0, 'round': 1}
```

```python
def linewidth_cmd(self, width)
```

```python
def paint(self)
    Return the appropriate pdf operator to cause the path to be stroked, filled, or both.
```

```python
def pop(self)
```

17.10. matplotlib.backends 1269
push(self)
rgb_cmd(self, rgb)
stroke(self)
    Predicate: does the path need to be stroked (its outline drawn)? This tests for the
    various conditions that disable stroking the path, in which case it would presumably
    be filled.
class matplotlib.backends.backend_pdf.Name(name)
    Bases: object
    PDF name object.
    static hexify(match)
    name
    pdfRepr(self)
class matplotlib.backends.backend_pdf.Operator(op)
    Bases: object
    PDF operator object.
    op
    pdfRepr(self)
class matplotlib.backends.backend_pdf.PdfFile(filename, metadata=None)
    Bases: object
    PDF file object.
    addGouraudTriangles(self, points, colors)
    alphaState(self, alpha)
        Return name of an ExtGState that sets alpha to the given value.
    beginStream(self, id, len, extra=None, png=None)
    close(self)
        Flush all buffers and free all resources.
    createType1Descriptor(self, t1font, fontfile)
    dviFontName(self, dvifont)
        Given a dvi font object, return a name suitable for Op.selectfont. This registers the
        font information in self.dviFontInfo if not yet registered.
    embedTTF(self, filename, characters)
        Embed the TTF font from the named file into the document.
    endStream(self)
    finalize(self)
        Write out the various deferred objects and the pdf end matter.
    fontName(self, fontprop)
        Select a font based on fontprop and return a name suitable for Op.selectfont. If
        fontprop is a string, it will be interpreted as the filename of the font.
    hatchPattern(self, hatch_style)
    imageObject(self, image)
        Return name of an image XObject representing the given image.
markerObject(self, path, trans, fill, stroke, lw, joinstyle, capstyle)
    Return name of a marker XObject representing the given path.

ewPage(self, width, height)

newTextnote(self, text, positionRect=[-100, -100, 0, 0])

output(self, *data)

pathCollectionObject(self, gc, path, trans, padding, filled, stroked)

static pathOperations(path, transform, clip=None, simplify=None, sketch=None)

recordXref(self, id)

reserveObject(self, name="")
    Reserve an ID for an indirect object. The name is used for debugging in case we
    forget to print out the object with writeObject.

texFontMap

write(self, data)

writeFonts(self)

writeGouraudTriangles(self)

writeHatches(self)

writeImages(self)

writeInfoDict(self)
    Write out the info dictionary, checking it for good form

writeMarkers(self)

writeObject(self, object, contents)

writePath(self, path, transform, clip=False, sketch=None)

writePathCollectionTemplates(self)

writeTrailer(self)
    Write out the PDF trailer.

writeXref(self)
    Write out the xref table.

class matplotlib.backends.backend_pdf.PdfPages(filename, keep_empty=True, metadata=None)

Bases: object

A multi-page PDF file.

Notes

In reality PdfPages is a thin wrapper around PdfFile, in order to avoid confusion when
using savefig() and forgetting the format argument.

Examples
Create a new PdfPages object.

**Parameters**

- `filename` [str] Plots using `PdfPages.savefig()` will be written to a file at this location. The file is opened at once and any older file with the same name is overwritten.
- `keep_empty` [bool, optional] If set to False, then empty pdf files will be deleted automatically when closed.
- `metadata` [dictionary, optional] Information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary'), e.g.: `{ 'Creator': 'My software', 'Author': 'Me', 'Title': 'Awesome fig' }`

The standard keys are 'Title', 'Author', 'Subject', 'Keywords', 'Creator', 'Producer', 'CreationDate', 'ModDate', and 'Trapped'. Values have been predefined for 'Creator', 'Producer' and 'CreationDate'. They can be removed by setting them to `None`.

- `attach_note(self, text, positionRect=[-100, -100, 0, 0])`
  Add a new text note to the page to be saved next. The optional positionRect specifies the position of the new note on the page. It is outside the page per default to make sure it is invisible on printouts.

- `close(self)`
  Finalize this object, making the underlying file a complete PDF file.

- `get_pagecount(self)`
  Returns the current number of pages in the multipage pdf file.

- `infodict(self)`
  Return a modifiable information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary').

- `keep_empty`

- `savefig(self, figure=None, **kwargs)`
  Saves a `Figure` to this file as a new page.

  Any other keyword arguments are passed to `savefig()`.

**Parameters**

- `figure` [Figure or int, optional] Specifies what figure is saved to file. If not specified, the active figure is saved. If a `Figure` instance is provided, this figure is saved. If an int is specified, the figure instance to save is looked up by number.

---

```python
>>> import matplotlib.pyplot as plt
>>> # Initialize:
>>> with PdfPages('foo.pdf') as pdf:
...     # As many times as you like, create a figure fig and save it:
...     fig = plt.figure()
...     pdf.savefig(fig)
...     # When no figure is specified the current figure is saved
...     pdf.savefig()
```

Bases: `object`
PDF reference object. Use PdfFile.reserveObject() to create References.

def pdfRepr(self)
    write(self, contents, file)

class matplotlib.backends.backend_pdf.RendererPdf(file, image_dpi, height, width)
    Bases: matplotlib.backends._backend_pdf_ps.RendererPDFPSBase

afm_font_cache
    [Deprecated]

Notes
    Deprecated since version 3.1:

def check_gc(self, gc, fillcolor=None)

def draw_gouraud_triangle(self, gc, points, colors, trans)
    Draw a Gouraud-shaded triangle.

    Parameters
        points [array_like, shape=(3, 2)] Array of (x, y) points for the triangle.
        colors [array_like, shape=(3, 4)] RGBA colors for each point of the triangle.
        transform [matplotlib.transforms.Transform] An affine transform to apply to the points.

def draw_gouraud_triangles(self, gc, points, colors, trans)
    Draws a series of Gouraud triangles.

    Parameters
        points [array_like, shape=(N, 3, 2)] Array of N (x, y) points for the triangles.
        colors [array_like, shape=(N, 3, 4)] Array of N RGBA colors for each point of the triangles.
        transform [matplotlib.transforms.Transform] An affine transform to apply to the points.

def draw_image(self, gc, x, y, im, transform=None)
    Draw an RGBA image.

    Parameters
        x [scalar] the distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.
        y [scalar] the distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.
        transform [matplotlib.transforms.Affine2DBase] If and only if the concrete backend is written such that option_scale_image() returns True, an affine transformation may be passed to draw_image(). It takes the
form of a `Affine2DBase` instance. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override \( x \) and \( y \), and has to be applied before translating the result by \( x \) and \( y \) (this can be accomplished by adding \( x \) and \( y \) to the translation vector defined by `transform`).

```python
draw_markers(self, gc, marker_path, marker_trans, path, trans, rgbFace=None)
```

Draws a marker at each of the vertices in path. This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of `draw_markers` that makes multiple calls to `draw_path()`. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

**Parameters**

- **gc** [GraphicsContextBase] The graphics context
- **marker_trans** [matplotlib.transforms.Transform] An affine transform applied to the marker.
- **trans** [matplotlib.transforms.Transform] An affine transform applied to the path.

```python
draw_mathtext(self, gc, x, y, s, prop, angle)
```

```python
draw_path(self, gc, path, transform, rgbFace=None)
```

Draws a `Path` instance using the given affine transform.

```python
draw_path_collection(self, gc, master_transform, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds, urls, offset_position)
```

Draws a collection of paths selecting drawing properties from the lists `facecolors`, `edgecolors`, `linewidths`, `linestyles` and `antialiaseds`. `offsets` is a list of offsets to apply to each of the paths. The offsets in `offsets` are first transformed by `offsetTrans` before being applied. `offset_position` may be either "screen" or "data" depending on the space that the offsets are in.

This provides a fallback implementation of `draw_path_collection()` that makes multiple calls to `draw_path()`. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths()` and `_iter_collection()` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of `draw_path_collection()` can be made globally.

```python
draw_tex(self, gc, x, y, s, prop, angle, ismath='TeX!', mtext=None)
```

```python
draw_text(self, gc, x, y, s, prop, angle, ismath=False, mtext=None)
```

Draw the text instance.

**Parameters**

- **x** [scalar] The \( x \) location of the text in display coords.
- **y** [scalar] The \( y \) location of the text baseline in display coords.
- **s** [str] The text string.

angle [scalar] The rotation angle in degrees.

mtext [matplotlib.text.Text] The original text object to be rendered.

Notes

backend implementers note
When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```python
if 0: bbox_artist(self, renderer)
```
to if 1, and then the actual bounding box will be plotted along with your text.

encode_string(self, s, fonttype)
finalise(self)
get_image_magnification(self)
Get the factor by which to magnify images passed to draw_image(). Allows a backend to have images at a different resolution to other artists.
merge_used_characters(self, other)
new_gc(self)
Return an instance of a GraphicsContextBase.
track_characters(self, font, s)
Keeps track of which characters are required from each font.

class matplotlib.backends.backend_pdf.Stream(id, len, file, extra=None, png=None)
Bases: object
PDF stream object.
This has no pdfRepr method. Instead, call begin(), then output the contents of the stream by calling write(), and finally call end().

id: object id of stream; len: an unused Reference object for the length of the stream, or None (to use a memory buffer); file: a PdfFile; extra: a dictionary of extra key-value pairs to include in the stream header; png: if the data is already png compressed, the decode parameters
compressobj
end(self)
Finalize stream.
extra
file
id
len
pdfFile
pos
write(self, data)
    Write some data on the stream.

class matplotlib.backends.backend_pdf.Verbatim(X)
    Bases: object
    Store verbatim PDF command content for later inclusion in the stream.

    pdfRepr(self)

matplotlib.backends.backend_pdf.fill(strings, linelen=75)
    Make one string from sequence of strings, with whitespace in between. The whitespace
    is form to lines of at most linelen characters, if possible.

matplotlib.backends.backend_pdf.pdfRepr(obj)
    Map Python objects to PDF syntax.

17.10.8 matplotlib.backends.backend_pdf

matplotlib.backends.backend_pdf.FigureCanvas
    alias of matplotlib.backends.backend_pdf.FigureCanvasPgf

class matplotlib.backends.backend_pdf.FigureCanvasPgf(figure)
    Bases: matplotlib.backend_bases.FigureCanvasBase

    filetypes = {'pdf': 'LaTeX compiled PGF picture', 'pgf': 'LaTeX PGF picture', 'png': 'Portable Network Graphics'}

    get_default_filetype(self)
        Get the default savefig file format as specified in rcParam savefig.format. Returned
        string excludes period. Overridden in backends that only support a single file type.

    get_renderer(self)

    print_pdf(self, fname_or_fh, *args, **kwargs)
        Use LaTeX to compile a Pgf generated figure to PDF.

    print_pgf(self, fname_or_fh, *args, **kwargs)
        Output pgf commands for drawing the figure so it can be included and rendered in
        latex documents.

    print_png(self, fname_or_fh, *args, **kwargs)
        Use LaTeX to compile a pgf figure to pdf and convert it to png.

matplotlib.backends.backend_pdf.FigureManager
    alias of matplotlib.backends.backend_pdf.FigureManagerPgf

class matplotlib.backends.backend_pdf.FigureManagerPgf(canvas, num)
    Bases: matplotlib.backend_bases.FigureManagerBase

class matplotlib.backends.backend_pdf.GraphicsContextPgf
    Bases: matplotlib.backend_bases.GraphicsContextBase

exception matplotlib.backends.backend_pdf.LatexError(message, latex_output="")
    Bases: Exception

class matplotlib.backends.backend_pdf.LatexManager
    Bases: object

    The LatexManager opens an instance of the LaTeX application for determining the met-
    rics of text elements. The LaTeX environment can be modified by setting fonts and/or a
    custom preamble in the rc parameters.
get_width_height_descent(self, text, prop)
    Get the width, total height and descent for a text typeset by the current LaTeX environment.

class matplotlib.backends.backend_pgf.LatexManagerFactory(**kwargs)
    Bases: object
    [Deprecated]

Notes

Deprecated since version 3.1:

static get_latex_manager()

previous_instance = None
class matplotlib.backends.backend_pgf.PdfPages(filename, *, keep_empty=True, metadata=None)
    Bases: object
    A multi-page PDF file using the pgf backend

Examples

>>> import matplotlib.pyplot as plt
>>> # Initialize:
>>> with PdfPages('foo.pdf') as pdf:
...    # As many times as you like, create a figure fig and save it:
...    fig = plt.figure()
...    pdf.savefig(fig)
...    # When no figure is specified the current figure is saved
...    pdf.savefig()

Create a new PdfPages object.

Parameters

filename [str] Plots using PdfPages.savefig() will be written to a file at this location. Any older file with the same name is overwritten.

keep_empty [bool, optional] If set to False, then empty pdf files will be deleted automatically when closed.

metadata [dictionary, optional] Information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary'), e.g.:
    {'Creator': 'My software', 'Author': 'Me', 'Title': 'Awesome fig'}
    The standard keys are 'Title', 'Author', 'Subject', 'Keywords', 'Producer', 'Creator' and 'Trapped'. Values have been predefined for 'Creator' and 'Producer'. They can be removed by setting them to the empty string.

close(self)
    Finalize this object, running LaTeX in a temporary directory and moving the final pdf file to filename.
get_pagecount(self)
    Returns the current number of pages in the multipage pdf file.

keep_empty

metadata

savefig(self, figure=None, **kwargs)
    Saves a Figure to this file as a new page.
    Any other keyword arguments are passed to savefig().

Parameters

    figure [Figure or int, optional] Specifies what figure is saved to file. If
    not specified, the active figure is saved. If a Figure instance is provided,
    this figure is saved. If an int is specified, the figure instance to save is
    looked up by number.

class matplotlib.backends.backend_pgf.RendererPgf(figure, fh, dummy=False)
Bases: matplotlib.backend_bases.RendererBase

    Creates a new PGF renderer that translates any drawing instruction into text commands
    to be interpreted in a latex pgfpicture environment.

Attributes

    figure [matplotlib.figure.Figure] Matplotlib figure to initialize height,
    width and dpi from.

    fh [file-like] File handle for the output of the drawing commands.

draw_image(self, gc, x, y, im, transform=None)
    Draw an RGBA image.

Parameters

    x [scalar] the distance in physical units (i.e., dots or pixels) from the left
    hand side of the canvas.

    y [scalar] the distance in physical units (i.e., dots or pixels) from the bottom
    side of the canvas.

    transform [matplotlib.transforms.Affine2DBase] If and only if the concrete
    backend is written such that option_scale_image() returns True, an affine
    transformation may be passed to draw_image(). It takes the form of a
    Affine2DBase instance. The translation vector of the transformation is given in
    physical units (i.e., dots or pixels). Note that the transformation does not
    override x and y, and has to be applied before translating the result by x and
    y (this can be accomplished by adding x and y to the translation vector
    defined by transform).

draw_markers(self, gc, marker_path, marker_trans, path, trans, rgbFace=None)
    Draws a marker at each of the vertices in path. This includes all vertices,
    including control points on curves. To avoid that behavior, those vertices
    should be removed before calling this function.
This provides a fallback implementation of draw_markers that makes multiple calls to draw_path(). Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

**Parameters**

- **gc** [GraphicsContextBase] The graphics context
- **marker_trans** [matplotlib.transforms.Transform] An affine transform applied to the marker.
- **trans** [matplotlib.transforms.Transform] An affine transform applied to the path.

**draw_path**

    draw_path(self, gc, path, transform, rgbFace=None)

    Draws a Path instance using the given affine transform.

**draw_tex**

    draw_tex(self, gc, x, y, s, prop, angle, ismath='TeX!', mtext=None)

    Draw the text instance.

**Parameters**

- **x** [scalar] The x location of the text in display coords.
- **y** [scalar] The y location of the text baseline in display coords.
- **s** [str] The text string.
- **prop** [matplotlib.font_manager.FontProperties] The font properties.
- **angle** [scalar] The rotation angle in degrees.
- **mtext** [matplotlib.text.Text] The original text object to be rendered.

**Notes**

**backend implementers note**

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```python
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

**flipy**

    flipy(self)

    Return whether y values increase from top to bottom.

    Note that this only affects drawing of texts and images.

**get_canvas_width_height**

    get_canvas_width_height(self)

    Return the canvas width and height in display coords.

**get_text_width_height_descent**

    get_text_width_height_descent(self, s, prop, ismath)

    Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string s with FontProperties prop

**new_gc**

    new_gc(self)

    Return an instance of a GraphicsContextBase.
option_image_nocomposite(self)
    Return whether image composition by Matplotlib should be skipped.

    Raster backends should usually return False (letting the C-level rasterizer take care
    of image composition); vector backends should usually return not rcParams["image.
    composite_image"].

option_scale_image(self)
    Return whether arbitrary affine transformations in draw_image() are supported (True
    for most vector backends).

points_to_pixels(self, points)
    Convert points to display units.

    You need to override this function (unless your backend doesn’t have a dpi, e.g.,
    postscript or svg). Some imaging systems assume some value for pixels per inch:

    \[
    \text{points to pixels} = \text{points} \times \text{pixels per inch}/72.0 \times \text{dpi}/72.0
    \]

Parameters

points [scalar or array_like] a float or a numpy array of float

Returns

Points converted to pixels

class matplotlib.backends.backend_pgf.TmpDirCleaner
    Bases: object
    static add(tmpdir)
    static cleanup_remaining_tmpdirs()
    remaining_tmpdirs = {}

matplotlib.backends.backend_pgf.common_texification(text)
    Do some necessary and/or useful substitutions for texts to be included in LaTeX docu-
    ments.

matplotlib.backends.backend_pgf.get_fontspec()
    Build fontspec preamble from rc.

matplotlib.backends.backend_pgf.get_preamble()
    Get LaTeX preamble from rc.

matplotlib.backends.backend_pgf.get_texcommand()
    [Deprecated] Get chosen TeX system from rc.

Notes

Deprecated since version 3.0.

matplotlib.backends.backend_pgf.make_pdf_to_png_converter()
    Returns a function that converts a pdf file to a png file.

matplotlib.backends.backend_pgf.repl_escapetext(m)
matplotlib.backends.backend_pgf.repl_mathdefault(m)
matplotlib.backends.backend_pgf.writeln(fh, line)
**17.10.9 matplotlib.backends.backend_ps**

A PostScript backend, which can produce both PostScript .ps and .eps.

```python
class matplotlib.backends.backend_ps.FigureCanvasPS(figure)
    Bases: matplotlib.backend_bases.FigureCanvasBase
draw(self)
    Render the Figure.
    filetypes = {'eps': 'Encapsulated Postscript', 'ps': 'Postscript'}
    fixed_dpi = 72
    get_default_filetype(self)
    Get the default savefig file format as specified in rcParam savefig.format. Returned
    string excludes period. Overridden in backends that only support a single file type.
    print_eps(self, outfile, *args, **kwargs)
    print_ps(self, outfile, *args, **kwargs)

class matplotlib.backends.backend_ps.GraphicsContextPS
    Bases: matplotlib.backend_bases.GraphicsContextBase
get_capstyle(self)
    Return the capstyle as a string in ('butt', 'round', 'projecting').
    get_joinstyle(self)
    Return the line join style as one of ('miter', 'round', 'bevel').
    shouldstroke(self)
    [Deprecated]

Notes

Deprecated since version 3.1:

```
Notes

Deprecated since version 3.1:

create_hatch(self, hatch)
draw_gouraud_triangle(self, gc, points, colors, trans)
   Draw a Gouraud-shaded triangle.

Parameters

- **points** [array_like, shape=(3, 2)] Array of (x, y) points for the triangle.
- **colors** [array_like, shape=(3, 4)] RGBA colors for each point of the triangle.
- **transform** [matplotlib.transforms.Transform] An affine transform to apply to the points.

draw_gouraud_triangles(self, gc, points, colors, trans)
   Draws a series of Gouraud triangles.

Parameters

- **points** [array_like, shape=(N, 3, 2)] Array of N (x, y) points for the triangles.
- **colors** [array_like, shape=(N, 3, 4)] Array of N RGBA colors for each point of the triangles.
- **transform** [matplotlib.transforms.Transform] An affine transform to apply to the points.

draw_image(self, gc, x, y, im, transform=None)
   Draw an RGBA image.

Parameters

- **gc** [GraphicsContextBase] a graphics context with clipping information.
- **x** [scalar] the distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.
- **y** [scalar] the distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.
- **im** [array_like, shape=(N, M, 4), dtype=np.uint8] An array of RGBA pixels.
- **transform** [matplotlib.transforms.Affine2DBase] If and only if the concrete backend is written such that option_scale_image() returns True, an affine transformation may be passed to draw_image(). It takes the form of a Affine2DBase instance. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override x and y, and has to be applied before translating the result by x and y (this can be accomplished by adding x and y to the translation vector defined by transform).

draw_markers(self, gc, marker_path, marker_trans, path, trans, rgbFace=None)
   Draws a marker at each of the vertices in path. This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.
This provides a fallback implementation of draw_markers that makes multiple calls to `draw_path()`. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

**Parameters**

```python
draw_mathtext(self, gc, x, y, s, prop, angle)
```
Draw the math text using matplotlib.mathtext.

```python
draw_path(self, gc, path, transform, rgbFace=None)
```
Draws a `Path` instance using the given affine transform.

```python
draw_path_collection(self, gc, master_transform, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds, urls, offset_position)
```
Draws a collection of paths selecting drawing properties from the lists `facecolors`, `edgecolors`, `linewidths`, `linestyles` and `antialiaseds`. `offsets` is a list of offsets to apply to each of the paths. The offsets in `offsets` are first transformed by `offsetTrans` before being applied. `offset_position` may be either “screen” or “data” depending on the space that the offsets are in.

This provides a fallback implementation of `draw_path_collection()` that makes multiple calls to `draw_path()`. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths()` and `_iter_collection()` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of `draw_path_collection()` can be made globally.

```python
draw_tex(self, gc, x, y, s, prop, angle, ismath='\TeX!', mtext=None)
```
Draw the text instance.

```python
draw_text(self, gc, x, y, s, prop, angle, ismath=False, mtext=None)
```
Draw the text instance.

**Parameters**

- `x` [scalar] The x location of the text in display coords.
- `y` [scalar] The y location of the text baseline in display coords.
- `s` [str] The text string.
- `angle` [scalar] The rotation angle in degrees.
- `mtext` [matplotlib.text.Text] The original text object to be rendered.

**Notes**

`backend implementers note`
When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```python
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

- `get_image_magnification()`
  Get the factor by which to magnify images passed to draw_image. Allows a backend to have images at a different resolution to other artists.

- `merge_used_characters(self, other)`

- `new_gc(self)`
  Return an instance of a GraphicsContextBase.

- `set_color(self, r, g, b, store=1)`

- `set_font(self, fontname, fontsize, store=1)`

- `set_linecap(self, linecap, store=1)`

- `set_linedash(self, offset, seq, store=1)`

- `set_linejoin(self, linejoin, store=1)`

- `set_linewidth(self, linewidth, store=1)`

- `track_characters(self, font, s)`
  Keeps track of which characters are required from each font.

- `matplotlib.backends.backend_ps.convert_psfrags(tmpfile, psfrags, font_preamble, custom_preamble, paperWidth, paperHeight, orientation)`
  When we want to use the LaTeX backend with postscript, we write PSFrag tags to a temporary postscript file, each one marking a position for LaTeX to render some text. `convert_psfrags` generates a LaTeX document containing the commands to convert those tags to text. LaTeX/dvips produces the postscript file that includes the actual text.

- `matplotlib.backends.backend_ps.get_bbox(tmpfile, bbox)`
  [Deprecated] Use ghostscript’s bbox device to find the center of the bounding box. Return an appropriately sized bbox centered around that point. A bit of a hack.

**Notes**

Deprecated since version 3.0.

- `matplotlib.backends.backend_ps.get_bbox_header(lbrt, rotated=False)`
  return a postscript header string for the given bbox lbrt=(l, b, r, t). Optionally, return rotate command.

- `matplotlib.backends.backend_ps.gs_distill(tmpfile, eps=False, ptype='letter', bbox=None, rotated=False)`
  Use ghostscript’s pswrite or epswrite device to distill a file. This yields smaller files without illegal encapsulated postscript operators. The output is low-level, converting text to outlines.

- `matplotlib.backends.backend_ps.pstoeps(tmpfile, bbox=None, rotated=False)`
  Convert the postscript to encapsulated postscript. The bbox of the eps file will be replaced with the given `bbox` argument. If None, original bbox will be used.
matplotlib.backends.backend_ps.quote_ps_string(s)
    Quote dangerous characters of S for use in a PostScript string constant.

matplotlib.backends.backend_ps.xpdf_distill(tmpfile, eps=False, ptype='letter',
    bbox=None, rotated=False)
    Use ghostscript’s ps2pdf and xpdf’s/poppler’s pdftops to distill a file. This yields smaller
    files without illegal encapsulated postscript operators. This distiller is preferred, generating
    high-level postscript output that treats text as text.

17.10.10 matplotlib.backends.backend_qt4agg

    NOTE Not included, to avoid adding a dependency to building the docs.

17.10.11 matplotlib.backends.backend_qt4cairo

    NOTE Not included, to avoid adding a dependency to building the docs.

17.10.12 matplotlib.backends.backend_qt5agg

    NOTE Not included, to avoid adding a dependency to building the docs.

17.10.13 matplotlib.backends.backend_qt5cairo

    NOTE Not included, to avoid adding a dependency to building the docs.

17.10.14 matplotlib.backends.backend_svg

    alias of matplotlib.backends.backend_svg.FigureCanvas

class matplotlib.backends.backend_svg.FigureCanvasSVG(figure)
    Bases: matplotlib.backend_bases.FigureCanvasBase

        filetypes = {'svg': 'Scalable Vector Graphics', 'svgz': 'Scalable Vector Graphics'}
        fixed_dpi = 72
        get_default_filetype(self)
            Get the default savefig file format as specified in rcParam savefig.format. Returned
            string excludes period. Overridden in backends that only support a single file type.

        print_svg(self, filename, *args, **kwargs)
        print_svgz(self, filename, *args, **kwargs)

class matplotlib.backends.backend_svg.RendererSVG(width, height, svgwriter, base-
    name=None, image_dpi=72)
    Bases: matplotlib.backend_bases.RendererBase

close_group(self, s)
    Close a grouping element with label s
    Only used by the SVG renderer.
**draw_gouraud_triangle**(*self, gc, points, colors, trans*)

Draw a Gouraud-shaded triangle.

**Parameters**

- **points** [array_like, shape=(3, 2)] Array of (x, y) points for the triangle.
- **colors** [array_like, shape=(3, 4)] RGBA colors for each point of the triangle.
- **transform** [matplotlib.transforms.Transform] An affine transform to apply to the points.

**draw_gouraud_triangles**(*self, gc, triangles_array, colors_array, transform*)

Draws a series of Gouraud triangles.

**Parameters**

- **points** [array_like, shape=(N, 3, 2)] Array of N (x, y) points for the triangles.
- **colors** [array_like, shape=(N, 3, 4)] Array of N RGBA colors for each point of the triangles.
- **transform** [matplotlib.transforms.Transform] An affine transform to apply to the points.

**draw_image**(*self, gc, x, y, im, transform=None*)

Draw an RGBA image.

**Parameters**

- **gc** [GraphicsContextBase] a graphics context with clipping information.
- **x** [scalar] the distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.
- **y** [scalar] the distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.
- **im** [array_like, shape=(N, M, 4), dtype=np.uint8] An array of RGBA pixels.
- **transform** [matplotlib.transforms.Affine2DBase] If and only if the concrete backend is written such that option_scale_image() returns True, an affine transformation may be passed to draw_image(). It takes the form of a Affine2DBase instance. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override x and y, and has to be applied before translating the result by x and y (this can be accomplished by adding x and y to the translation vector defined by transform).

**draw_markers**(*self, gc, marker_path, marker_trans, path, trans, rgbFace=None*)

Draws a marker at each of the vertices in path. This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of draw_markers that makes multiple calls to draw_path(). Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

**Parameters**

- **gc** [GraphicsContextBase] The graphics context
**marker_trans** [``matplotlib.transforms.Transform``] An affine transform applied to the marker.

**trans** [``matplotlib.transforms.Transform``] An affine transform applied to the path.

```python
def draw_path(self, gc, path, transform, rgbFace=None)
    Draws a Path instance using the given affine transform.
```

```python
def draw_path_collection(self, gc, master_transform, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds, urls, offset_position)
    Draws a collection of paths selecting drawing properties from the lists facecolors, edgecolors, linewidths, linestyles and antialiaseds. offsets is a list of offsets to apply to each of the paths. The offsets in offsets are first transformed by offsetTrans before being applied. offset_position may be either “screen” or “data” depending on the space that the offsets are in.
```

This provides a fallback implementation of draw_path_collection() that makes multiple calls to draw_path(). Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods _iter_collection_raw_paths() and _iter_collection() are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of draw_path_collection() can be made globally.

```python
def draw_tex(self, gc, x, y, s, prop, angle, ismath=True, mtext=None)
```

```python
def draw_text(self, gc, x, y, s, prop, angle, ismath=False, mtext=None)
    Draw the text instance.
```

**Parameters**

- **x** [scalar] The x location of the text in display coords.
- **y** [scalar] The y location of the text baseline in display coords.
- **s** [str] The text string.
- **prop** [``matplotlib.font_manager.FontProperties``] The font properties.
- **angle** [scalar] The rotation angle in degrees.
- **mtext** [``matplotlib.text.Text``] The original text object to be rendered.

**Notes**

**backend implementers note**

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```python
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

```python
finalize(self)
```
flipy(self)
    Return whether y values increase from top to bottom.
    Note that this only affects drawing of texts and images.

get_canvas_width_height(self)
    Return the canvas width and height in display coords.

get_image_magnification(self)
    Get the factor by which to magnify images passed to draw_image(). Allows a backend
    to have images at a different resolution to other artists.

get_text_width_height_descent(self, s, prop, ismath)
    Get the width, height, and descent (offset from the bottom to the baseline), in display
    coords, of the string s with FontProperties prop

open_group(self, s, gid=None)
    Open a grouping element with label s and gid (if set) as id.
    Only used by the SVG renderer.

option_image_nocomposite(self)
    Return whether image composition by Matplotlib should be skipped.
    Raster backends should usually return False (letting the C-level rasterizer take care
    of image composition); vector backends should usually return not rcParams["image.
    composite_image"].

option_scale_image(self)
    Return whether arbitrary affine transformations in draw_image() are supported (True
    for most vector backends).

class matplotlib.backends.backend_svg.XMLWriter(file)
    Bases: object

    Parameters

    file [writable text file-like object]

close(self, id)
    Closes open elements, up to (and including) the element identified by the given
    identifier.

    Parameters

    id Element identifier, as returned by the start() method.

comment(self, comment)
    Adds a comment to the output stream.

    Parameters

    comment [str] Comment text.

data(self, text)
    Adds character data to the output stream.

    Parameters

    text [str] Character data.

element(self, tag, text=None, attrib={}, **extra)
    Adds an entire element. This is the same as calling start(), data(), and end() in
    sequence. The text argument can be omitted.
end(self, tag=None, indent=True)
Closes the current element (opened by the most recent call to start()).

**Parameters**

- **tag**  Element tag. If given, the tag must match the start tag. If omitted, the current element is closed.

flush(self)
Flushes the output stream.

start(self, tag, attrib={}, **extra)
Opens a new element. Attributes can be given as keyword arguments, or as a string/string dictionary. The method returns an opaque identifier that can be passed to the close() method, to close all open elements up to and including this one.

**Parameters**

- **tag**  Element tag.
- **attrib**  Attribute dictionary. Alternatively, attributes can be given as keyword arguments.

**Returns**

An element identifier.

```
matplotlib.backends.backend_svg.escape_attrib(s)
```

```
matplotlib.backends.backend_svg.escape_cdata(s)
```

```
matplotlib.backends.backend_svg.escape_comment(s)
```

```
matplotlib.backends.backend_svg.generate_css(attrib={})
```

```
matplotlib.backends.backend_svg.generate_transform(transform_list=[])  
```

```
matplotlib.backends.backend_svg.short_float_fmt(x)
```

Create a short string representation of a float, which is %f formatting with trailing zeros and the decimal point removed.

### 17.10.15 matplotlib.backends.backend_tkagg

```
matplotlib.backends.backend_tkagg.FigureCanvas  
alias of matplotlib.backends.backend_tkagg.FigureCanvasTkAgg
```

```
class matplotlib.backends.backend_tkagg.FigureCanvasTkAgg(figure, master=None, resize_callback=None)  
Bases: matplotlib.backends.backend_agg.FigureCanvasAgg, matplotlib.backends._backend_tk.FigureCanvasTk
```

```
blit(self, bbox=None)  
Blit the canvas in bbox (default entire canvas).
```

```
draw(self)  
Draw the figure using the renderer.
```

### 17.10.16 matplotlib.backends.backend_webagg
**Note:** The WebAgg backend is not documented here, in order to avoid adding Tornado to the doc build requirements.

17.10.17 `matplotlib.backends.backend_wxagg`

**NOTE** Not included, to avoid adding a dependency to building the docs.

17.11 `matplotlib.blocking_input`

This provides several classes used for blocking interaction with figure windows:

- **BlockingInput** Creates a callable object to retrieve events in a blocking way for interactive sessions. Base class of the other classes listed here.
- **BlockingKeyMouseInput** Creates a callable object to retrieve key or mouse clicks in a blocking way for interactive sessions. Used by `waitforbuttonpress`.
- **BlockingMouseInput** Creates a callable object to retrieve mouse clicks in a blocking way for interactive sessions. Used by `ginput`.
- **BlockingContourLabeler** Creates a callable object to retrieve mouse clicks in a blocking way that will then be used to place labels on a `ContourSet`. Used by `clabel`.

```python
class matplotlib.blocking_input.BlockingContourLabeler(CS)
    Bases: matplotlib.blocking_input.BlockingMouseInput

    Callable for retrieving mouse clicks and key presses in a blocking way.
    Used to place contour labels.

    add_click(self, event)
        Add the coordinates of an event to the list of clicks.

    Parameters

        event [MouseEvent]

    button1(self, event)
        Process an button-1 event (add a label to a contour).

    Parameters

        event [MouseEvent]

    button3(self, event)
        Process an button-3 event (remove a label if not in inline mode).

        Unfortunately, if one is doing inline labels, then there is currently no way to fix the broken contour - once humpty-dumpty is broken, he can't be put back together. In inline mode, this does nothing.

    Parameters

        event [MouseEvent]

    pop_click(self, event, index=-1)
        Remove a click (by default, the last) from the list of clicks.
```
Parameters

**event** [MouseEvent]

```python
class matplotlib.blocking_input.BlockingInput(fig, eventslist=())
    Bases: object
    Callable for retrieving events in a blocking way.

    add_event(self, event)
        For base class, this just appends an event to events.

    cleanup(self)
        Disconnect all callbacks.

    on_event(self, event)
        Event handler; will be passed to the current figure to retrieve events.

    pop(self, index=-1)
        Remove an event from the event list - by default, the last.
        Note that this does not check that there are events, much like the normal pop
        method. If no events exist, this will throw an exception.

    pop_event(self, index=-1)
        Remove an event from the event list - by default, the last.
        Note that this does not check that there are events, much like the normal pop
        method. If no events exist, this will throw an exception.

    post_event(self)
        For baseclass, do nothing but collect events.
```

```python
class matplotlib.blocking_input.BlockingKeyMouseInput(fig)
    Bases: matplotlib.blocking_input.BlockingInput
    Callable for retrieving mouse clicks and key presses in a blocking way.

    post_event(self)
        Determine if it is a key event.
```

```python
class matplotlib.blocking_input.BlockingMouseInput(fig, mouse_add=1, mouse_pop=3, mouse_stop=2)
    Bases: matplotlib.blocking_input.BlockingInput
    Callable for retrieving mouse clicks in a blocking way.
    This class will also retrieve keypresses and map them to mouse clicks: delete and
    backspace are like mouse button 3, enter is like mouse button 2 and all others are like
    mouse button 1.

    add_click(self, event)
        Add the coordinates of an event to the list of clicks.
```

Parameters

**event** [MouseEvent]

```python
button_add = 1
button_pop = 3
button_stop = 2
cleanup(self, event=None)
```
Parameters

**event**  
[event, optional] Not used

**key_event**(self)
Process a key press event, mapping keys to appropriate mouse clicks.

**mouse_event**(self)
Process a mouse click event.

**mouse_event_add**(self, event)
Process an button-1 event (add a click if inside axes).

Parameters

**event**  
[event]

**mouse_event_pop**(self, event)
Process an button-3 event (remove the last click).

Parameters

**event**  
[event]

**mouse_event_stop**(self, event)
Process an button-2 event (end blocking input).

Parameters

**event**  
[event]

pop(self, event, index=-1)
Removes a click and the associated event from the list of clicks.
Defaults to the last click.

pop_click(self, event, index=-1)
Remove a click (by default, the last) from the list of clicks.

Parameters

**event**  
[event]

post_event**(self)
Process an event.

17.12 matplotlib.category

Module that allows plotting of string “category” data. i.e. `plot(['d', 'f', 'a'],[1, 2, 3])` will plot three points with x-axis values of ‘d’, ‘f’, ‘a’.

See /gallery/lines_bars_and_markers/categorical_variables for an example.

The module uses Matplotlib’s `matplotlib.units` mechanism to convert from strings to integers, provides a tick locator and formatter, and the class: `UnitData` that creates and stores the string-to-integer mapping.

```python
class matplotlib.category.StrCategoryConverter
    Bases: matplotlib.units.ConversionInterface

    static axisinfo(unit, axis)
    Sets the default axis ticks and labels
```
Parameters

unit [UnitData] object string unit information for value
axis [axis] axis for which information is being set

Returns

axisinfo [AxisInfo] Information to support default tick labeling

static convert(value, unit, axis)
Convert strings in value to floats using mapping information store in the unit object.

Parameters

value [string or iterable] Value or list of values to be converted.
unit [UnitData] An object mapping strings to integers.
axis [Axis] axis on which the converted value is plotted.

Note: axis is unused.

Returns

mapped_value [float or ndarray[float]]

static default_units(data, axis)
Sets and updates the axis units.

Parameters

data [string or iterable of strings]
axis [axis] axis on which the data is plotted

Returns

class [UnitData] object storing string to integer mapping

class matplotlib.category.StrCategoryFormatter(units_mapping)
   Bases: matplotlib.ticker.Formatter
   String representation of the data at every tick
   Parameters
      units_mapping [Dict[Str, int]] string:integer mapping

class matplotlib.category.StrCategoryLocator(units_mapping)
   Bases: matplotlib.ticker.Locator
   tick at every integer mapping of the string data
   Parameters
      units_mapping [Dict[str, int]] string:integer mapping

tick_values(self, vmin, vmax)
Return the values of the located ticks given vmin and vmax.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]

```python
class matplotlib.category.UnitData(data=None)
    Bases: object
    Create mapping between unique categorical values and integer ids.

    Parameters
    ----------
    data [iterable] sequence of string values

    update(self, data)
    Maps new values to integer identifiers.

    Parameters
    ----------
    data [iterable] sequence of string values

    Raises
    -----
    TypeError If the value in data is not a string, unicode, bytes type
```

## 17.13 matplotlib.cbook

A collection of utility functions and classes. Originally, many (but not all) were from the Python Cookbook – hence the name cbook.

This module is safe to import from anywhere within matplotlib; it imports matplotlib only at runtime.

```python
class matplotlib.cbook.Bunch(**kwargs)
    Bases: types.SimpleNamespace
    [Deprecated] Often we want to just collect a bunch of stuff together, naming each item of the bunch; a dictionary’s OK for that, but a small do-nothing class is even handier, and prettier to use. Whenever you want to group a few variables:

```python
>>> point = Bunch(datum=2, squared=4, coord=12)
>>> point.datum
```

**Notes**

Deprecated since version 3.0.

```python
class matplotlib.cbook.CallbackRegistry(exception_handler=<function _exception_printer>)
    Bases: object
    Handle registering and disconnecting for a set of signals and callbacks:
```
```python
>>> def oneat(x):
...     print('eat', x)
>>> def ondrink(x):
...     print('drink', x)

>>> from matplotlib.cbook import CallbackRegistry
>>> callbacks = CallbackRegistry()

>>> id_eat = callbacks.connect('eat', oneat)
>>> id_drink = callbacks.connect('drink', ondrink)

>>> callbacks.process('drink', 123)
drink 123
>>> callbacks.process('eat', 456)
et 456
>>> callbacks.process('be merry', 456)  # nothing will be called
>>> callbacks.disconnect(id_eat)
>>> callbacks.process('eat', 456)  # nothing will be called
```

In practice, one should always disconnect all callbacks when they are no longer needed to avoid dangling references (and thus memory leaks). However, real code in Matplotlib rarely does so, and due to its design, it is rather difficult to place this kind of code. To get around this, and prevent this class of memory leaks, we instead store weak references to bound methods only, so when the destination object needs to die, the CallbackRegistry won’t keep it alive.

**Parameters**

- **exception_handler** [callable, optional] If provided must have signature

  ```python
def handler(exc: Exception) -> None:
```

  If not None this function will be called with any `Exception` subclass raised by the callbacks in `CallbackRegistry.process`. The handler may either consume the exception or re-raise.

  The callable must be pickle-able.

  The default handler is

  ```python
def h(exc):
    traceback.print_exc()
```

- `connect(self, s, func)`
  
  Register `func` to be called when signal `s` is generated.

- `disconnect(self, cid)`
  
  Disconnect the callback registered with callback id `cid`.

- `process(self, s, *args, **kwargs)`
  
  Process signal `s`.

  All of the functions registered to receive callbacks on `s` will be called with `*args` and `**kwargs`.

- `class matplotlib.cbook.GetRealpathAndStat(**kwargs)`
  
  Bases: `object`

17.13. `matplotlib.cbook` 1295
[Deprecated]

Notes

Deprecated since version 3.0:

class matplotlib.cbook.Grouper(init=())
Bases: object

This class provides a lightweight way to group arbitrary objects together into disjoint sets when a full-blown graph data structure would be overkill.

Objects can be joined using \texttt{join()}, tested for connectedness using \texttt{joined()}, and all disjoint sets can be retrieved by using the object as an iterator.

The objects being joined must be hashable and weak-referenceable.

For example:

```python
>>> from matplotlib.cbook import Grouper
>>> class Foo(object):
...     def __init__(self, s):
...         self.s = s
...     def __repr__(self):
...         return self.s
... >>> a, b, c, d, e, f = [Foo(x) for x in 'abcdef']
>>> grp = Grouper()
>>> grp.join(a, b)
>>> grp.join(b, c)
>>> grp.join(d, e)
>>> sorted(map(tuple, grp))
[(a, b, c), (d, e)]
>>> grp.joined(a, b)
True
>>> grp.joined(a, c)
True
>>> grp.joined(a, d)
False
```

clean(self)

Clean dead weak references from the dictionary.

get_siblings(self, a)

Return all of the items joined with \texttt{a}, including itself.

join(self, a, *args)

Join given arguments into the same set. Accepts one or more arguments.

joined(self, a, b)

Return whether \texttt{a} and \texttt{b} are members of the same set.

remove(self, a)

exception matplotlib.cbook.IgnoredKeywordWarning

Bases: UserWarning

A class for issuing warnings about keyword arguments that will be ignored by matplotlib
class matplotlib.cbook.Locked(**kwargs)

Bases: object

[Deprecated] Context manager to handle locks.

Based on code from conda.

(c) 2012-2013 Continuum Analytics, Inc. / https://www.continuum.io/ All Rights Reserved

conda is distributed under the terms of the BSD 3-clause license. Consult LICENSE_CONDA or https://opensource.org/licenses/BSD-3-Clause.

Notes

Deprecated since version 3.0.

LOCKFN = '.matplotlib_lock'

exception TimeoutError

Bases: RuntimeError

class matplotlib.cbook.Stack(default=None)

Bases: object

Stack of elements with a movable cursor.

Mimics home/back/forward in a web browser.

back(self)
    Move the position back and return the current element.

bubble(self, o)
    Raise o to the top of the stack. o must be present in the stack.
    o is returned.

clear(self)
    Empty the stack.

empty(self)
    Return whether the stack is empty.

forward(self)
    Move the position forward and return the current element.

home(self)
    Push the first element onto the top of the stack.
    The first element is returned.

push(self, o)
    Push o to the stack at current position. Discard all later elements.
    o is returned.

remove(self, o)
    Remove o from the stack.

matplotlib.cbook.boxplot_stats(X, whis=1.5, bootstrap=None, labels=None, autorange=False)

Returns list of dictionaries of statistics used to draw a series of box and whisker plots. The Returns section enumerates the required keys of the dictionary. Users can skip this
function and pass a user-defined set of dictionaries to the new `axes.bxp` method instead of relying on MPL to do the calculations.

**Parameters**

- **X** [array-like] Data that will be represented in the boxplots. Should have 2 or fewer dimensions.

- **whis** [float, string, or sequence (default = 1.5)] As a float, determines the reach of the whiskers beyond the first and third quartiles. In other words, where IQR is the interquartile range (Q3−Q1), the upper whisker will extend to last datum less than $Q3 + \text{whis} \times \text{IQR}$. Similarly, the lower whisker will extend to the first datum greater than $Q1 - \text{whis} \times \text{IQR}$. Beyond the whiskers, data are considered outliers and are plotted as individual points. This can be set to an ascending sequence of percentiles (e.g., [5, 95]) to set the whiskers at specific percentiles of the data. Finally, `whis` can be the string 'range' to force the whiskers to the minimum and maximum of the data. In the edge case that the 25th and 75th percentiles are equivalent, `whis` can be automatically set to 'range' via the autorange option.

- **bootstrap** [int, optional] Number of times the confidence intervals around the median should be bootstrapped (percentile method).

- **labels** [array-like, optional] Labels for each dataset. Length must be compatible with dimensions of X.

- **autorange** [bool, optional (False)] When True and the data are distributed such that the 25th and 75th percentiles are equal, `whis` is set to 'range' such that the whisker ends are at the minimum and maximum of the data.

**Returns**

- **bxpstats** [list of dict] A list of dictionaries containing the results for each column of data. Keys of each dictionary are the following:

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>tick label for the boxplot</td>
<td></td>
</tr>
<tr>
<td>mean</td>
<td>arithmetic mean value</td>
<td></td>
</tr>
<tr>
<td>med</td>
<td>50th percentile</td>
<td></td>
</tr>
<tr>
<td>q1</td>
<td>first quartile (25th percentile)</td>
<td></td>
</tr>
<tr>
<td>q3</td>
<td>third quartile (75th percentile)</td>
<td></td>
</tr>
<tr>
<td>cilo</td>
<td>lower notch around the median</td>
<td></td>
</tr>
<tr>
<td>chih</td>
<td>upper notch around the median</td>
<td></td>
</tr>
<tr>
<td>whislo</td>
<td>end of the lower whisker</td>
<td></td>
</tr>
<tr>
<td>whishi</td>
<td>end of the upper whisker</td>
<td></td>
</tr>
<tr>
<td>fliers</td>
<td>outliers</td>
<td></td>
</tr>
</tbody>
</table>

**Notes**

Non-bootstrapping approach to confidence interval uses Gaussian-based asymptotic approximation:

$$\text{med} \pm 1.57 \times \frac{\text{iqr}}{\sqrt{N}}$$

Matplotlib.cbook.contiguous_regions(mask)
Return a list of (ind0, ind1) such that mask[ind0:ind1].all() is True and we cover all such regions

Matplotlib.cbook.dedent(s)
[Deprecated] Remove excess indentation from docstring s.
Discards any leading blank lines, then removes up to n whitespace characters from each line, where n is the number of leading whitespace characters in the first line. It differs from textwrap.dedent in its deletion of leading blank lines and its use of the first non-blank line to determine the indentation.
It is also faster in most cases.

Notes
Deprecated since version 3.1.

Matplotlib.cbook.delete_masked_points(*args)
Find all masked and/or non-finite points in a set of arguments, and return the arguments with only the unmasked points remaining.
Arguments can be in any of 5 categories:
1) 1-D masked arrays
2) 1-D ndarrays
3) ndarrays with more than one dimension
4) other non-string iterables
5) anything else
The first argument must be in one of the first four categories; any argument with a length differing from that of the first argument (and hence anything in category 5) then will be passed through unchanged.
Masks are obtained from all arguments of the correct length in categories 1, 2, and 4; a point is bad if masked in a masked array or if it is a nan or inf. No attempt is made to extract a mask from categories 2, 3, and 4 if np.isfinite() does not yield a Boolean array.
All input arguments that are not passed unchanged are returned as ndarrays after removing the points or rows corresponding to masks in any of the arguments.
A vastly simpler version of this function was originally written as a helper for Axes.scatter().

Matplotlib.cbook.fileRequiresUnicode(x)
Return whether the given writable file-like object requires Unicode to be written to it.

Matplotlib.cbook.flatten(seq, scalarp=<function is_scalar_or_string at 0x7f0f7df01310>)
Return a generator of flattened nested containers
For example:
```python
>>> from matplotlib.cbook import flatten
>>> l = (('John', ['Hunter']), (1, 23), [[[42, (5, 23)], ]])
>>> print(list(flatten(l)))
['John', 'Hunter', 1, 23, 42, 5, 23]
```

By: Composite of Holger Krekel and Luther Blissett

From: https://code.activestate.com/recipes/121294/ and Recipe 1.12 in cookbook

```
matplotlib.cbook.get_label(y, default_name)

[Deprecated]
```

Notes

Deprecated since version 3.1:

```
matplotlib.cbook.get_realpath_and_stat(path)
```

```
matplotlib.cbook.get_sample_data(fname, asfileobj=True)
```

Return a sample data file. `fname` is a path relative to the `mpl-data/sample_data` directory.

If `asfileobj` is True return a file object, otherwise just a file path.

Set the rc parameter examples.directory to the directory where we should look, if sample_data files are stored in a location different than default (which is `mpl-data/sample_data` at the same level of `matplotlib` Python module files).

If the filename ends in .gz, the file is implicitly ungzipped.

```
matplotlib.cbook.index_of(y)
```

A helper function to get the index of an input to plot against if x values are not explicitly given.

Tries to get `y.index` (works if this is a pd.Series), if that fails, return `np.arange(y.shape[0])`.

This will be extended in the future to deal with more types of labeled data.

Parameters

- `y` [scalar or array-like] The proposed y-value

Returns

- `x, y` [ndarray] The x and y values to plot.

```
matplotlib.cbook.is_hashable(obj)
```

Returns true if `obj` can be hashed

```
matplotlib.cbook.is_math_text(s)
```

```
matplotlib.cbook.is_numlike(obj)
```

Returns true if `obj` looks like a number

Notes

Deprecated since version 3.1.
Notes

Deprecated since version 3.0.

matplotlib.cbook.is_scalar_or_string(val)
Return whether the given object is a scalar or string like.

matplotlib.cbook.is_writable_file_like(obj)
Return whether obj looks like a file object with a write method.

matplotlib.cbook.iterable(obj)
[Deprecated] return true if obj is iterable

Notes

Deprecated since version 3.1.

matplotlib.cbook.listFiles(root, patterns='*', recurse=1, return_folders=0)
[Deprecated] Recursively list files

from Parmar and Martelli in the Python Cookbook

Notes

Deprecated since version 3.0.

matplotlib.cbook.local_over_kwdict(local_var, kwargs, *keys)
Enforces the priority of a local variable over potentially conflicting argument(s) from a kwargs dict. The following possible output values are considered in order of priority:

local_var > kwargs[keys[0]] > ... > kwargs[keys[-1]]

The first of these whose value is not None will be returned. If all are None then None will be returned. Each key in keys will be removed from the kwargs dict in place.

Parameters

local_var [any object]
The local variable (highest priority)

kwargs [dict] Dictionary of keyword arguments; modified in place

keys [str(s)] Name(s) of keyword arguments to process, in descending order of priority

Returns

out [any object] Either local_var or one of kwargs[key] for key in keys

Raises

IgnoredKeywordWarning For each key in keys that is removed from kwargs but not used as the output value

class matplotlib.cbook.maxdict(maxsize)
Bases: dict
A dictionary with a maximum size; this doesn’t override all the relevant methods to constrain the size, just setitem, so use with caution
matplotlib.cbook.mkdirs(newdir, mode=511)

[Deprecated] make directory newdir recursively, and set mode. Equivalent to

```python
> mkdir -p NEWDIR
> chmod MODE NEWDIR
```

**Notes**

Deprecated since version 3.0.

matplotlib.cbook.normalize_kwargs(kw, alias_mapping=None, required=(), forbidden=(), allowed=None)

Helper function to normalize kwarg inputs

The order they are resolved are:

1. aliasing
2. required
3. forbidden
4. allowed

This order means that only the canonical names need appear in allowed, forbidden, required

**Parameters**

- **alias_mapping**, **dict**, **optional** A mapping between a canonical name to a list of aliases, in order of precedence from lowest to highest.
  
  If the canonical value is not in the list it is assumed to have the highest priority.

- **required** [iterable, optional] A tuple of fields that must be in kwargs.

- **forbidden** [iterable, optional] A list of keys which may not be in kwargs

- **allowed** [tuple, optional] A tuple of allowed fields. If this not None, then raise if kw contains any keys not in the union of required and allowed. To allow only the required fields pass in () for allowed

**Raises**

- **TypeError** To match what python raises if invalid args/kwargs are passed to a callable.

matplotlib.cbook.open_file_cm(path_or_file, mode='r', encoding=None)

Pass through file objects and context-manage PathLike

matplotlib.cbook.print_cycles(objects, outstream=<_io.TextIOWrapper name='<stdout>' mode='w' encoding='utf-8'>, show_progress=False)

- **objects** A list of objects to find cycles in. It is often useful to pass in gc.garbage to find the cycles that are preventing some objects from being garbage collected.

- **outstream** The stream for output.

- **show_progress** If True, print the number of objects reached as they are found.
Convert continuous line to mid-steps.

Given a set of $N$ points convert to $2N$ points which when connected linearly give a step function which changes values at the middle of the intervals.

**Parameters**

- $x$ [array] The x location of the steps. May be empty.
- $y_1, ..., y_p$ [array] $y$ arrays to be turned into steps; all must be the same length as $x$.

**Returns**

- $out$ [array] The x and y values converted to steps in the same order as the input; can be unpacked as $x_out, y_1_out, ..., y_p_out$. If the input is length $N$, each of these arrays will be length $2N$.

**Examples**

```python
>>> x_s, y1_s, y2_s = pts_to_midstep(x, y1, y2)
```

Convert continuous line to post-steps.

Given a set of $N$ points convert to $2N + 1$ points, which when connected linearly give a step function which changes values at the end of the intervals.

**Parameters**

- $x$ [array] The x location of the steps. May be empty.
- $y_1, ..., y_p$ [array] $y$ arrays to be turned into steps; all must be the same length as $x$.

**Returns**

- $out$ [array] The x and y values converted to steps in the same order as the input; can be unpacked as $x_out, y_1_out, ..., y_p_out$. If the input is length $N$, each of these arrays will be length $2N + 1$. For $N=0$, the length will be 0.

**Examples**

```python
>>> x_s, y1_s, y2_s = pts_to_poststep(x, y1, y2)
```

Convert continuous line to pre-steps.

Given a set of $N$ points, convert to $2N - 1$ points, which when connected linearly give a step function which changes values at the beginning of the intervals.

**Parameters**

- $x$ [array] The x location of the steps. May be empty.
- $y_1, ..., y_p$ [array] $y$ arrays to be turned into steps; all must be the same length as $x$.

**Returns**
out [array] The x and y values converted to steps in the same order as the input; can be unpacked as x_out, y1_out, ..., yp_out. If the input is length N, each of these arrays will be length 2N + 1. For N=0, the length will be 0.

Examples

```python
>>> x_s, y1_s, y2_s = pts_to_prestep(x, y1, y2)
```

Notes

Deprecated since version 3.1.

Parameters

- a [array, shape (n, ...)]
- steps [int]

Returns

- array, shape ((n - 1) * steps + 1, ...)

Along each column of a, (steps - 1) points are introduced between each original values; the values are linearly interpolated.

Notes

Deprecated since version 3.1.

Parameters
fname [str or PathLike or file-like object] If str or os.PathLike, the file is opened using the flags specified by flag and encoding. If a file-like object, it is passed through.

flag [str, default ‘r’] Passed as the mode argument to open when fname is str or os.PathLike; ignored if fname is file-like.

return_opened [bool, default False] If True, return both the file object and a boolean indicating whether this was a new file (that the caller needs to close). If False, return only the new file.

encoding [str or None, default None] Passed as the mode argument to open when fname is str or os.PathLike; ignored if fname is file-like.

Returns

fh [file-like] opened

opened [bool] opened is only returned if return_opened is True.

matplotlib.cbook.unicode_safe(S)

[Deprecated]

Notes

Deprecated since version 3.0:

matplotlib.cbook.violin_stats(X, method, points=100)

Returns a list of dictionaries of data which can be used to draw a series of violin plots. See the Returns section below to view the required keys of the dictionary. Users can skip this function and pass a user-defined set of dictionaries to the axes.vplot method instead of using MPL to do the calculations.

Parameters

X [array-like] Sample data that will be used to produce the gaussian kernel density estimates. Must have 2 or fewer dimensions.

method [callable] The method used to calculate the kernel density estimate for each column of data. When called via method(v, coords), it should return a vector of the values of the KDE evaluated at the values specified in coords.

points [scalar, default = 100] Defines the number of points to evaluate each of the gaussian kernel density estimates at.

Returns

A list of dictionaries containing the results for each column of data.

The dictionaries contain at least the following:

- coords: A list of scalars containing the coordinates this particular kernel density estimate was evaluated at.
- vals: A list of scalars containing the values of the kernel density estimate at each of the coordinates given in coords.
- mean: The mean value for this column of data.
- median: The median value for this column of data.
• min: The minimum value for this column of data.
• max: The maximum value for this column of data.

17.14 matplotlib.cm

Builtin colormaps, colormap handling utilities, and the ScalarMappable mixin.

See also:
/gallery/color/colormap_reference for a list of builtin colormaps.
Creating Colormaps in Matplotlib for examples of how to make colormaps and
Choosing Colormaps in Matplotlib an in-depth discussion of choosing colormaps.
Colormap Normalization for more details about data normalization

class matplotlib.cm.ScalarMappable(norm=None, cmap=None)

This is a mixin class to support scalar data to RGBA mapping. The ScalarMappable
makes use of data normalization before returning RGBA colors from the given colormap.

Parameters

  norm [matplotlib.colors.Normalize instance] The normalizing object which
  scales data, typically into the interval [0, 1]. If None, norm defaults to
  a colors.Normalize object which initializes its scaling based on the first
  data processed.

  cmap [str or Colormap instance] The colormap used to map normalized data
  values to RGBA colors.

add_checker(self, checker)
  Add an entry to a dictionary of boolean flags that are set to True when the mappable
  is changed.

autoscale(self)
  Autoscale the scalar limits on the norm instance using the current array

autoscale_None(self)
  Autoscale the scalar limits on the norm instance using the current array, changing
  only limits that are None

changed(self)
  Call this whenever the mappable is changed to notify all the callbackSM listeners to
  the ‘changed’ signal

check_update(self, checker)
  If mappable has changed since the last check, return True; else return False

cmap = None
  The Colormap instance of this ScalarMappable.

colorbar = None
  The last colorbar associated with this ScalarMappable. May be None.

get_alpha(self)

Returns

get_array(self)
    Return the array

get_clim(self)
    return the min, max of the color limits for image scaling

get_cmap(self)
    return the colormap
	norm = None
    The Normalization instance of this ScalarMappable.

set_array(self, A)
    Set the image array from numpy array A.

    Parameters
    A [ndarray]

set_clim(self, vmin=None, vmax=None)
    set the norm limits for image scaling; if vmin is a length2 sequence, interpret it as
    (vmin, vmax) which is used to support setp

    ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have
    vmin and vmax kwargs.

set_cmap(self, cmap)
    set the colormap for luminance data

    Parameters
    cmap [colormap or registered colormap name]

set_norm(self, norm)
    Set the normalization instance.

    Parameters
    norm [Normalize]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the
mappable will reset the norm, locator, and formatters on the colorbar to default.

to_rgba(self, x, alpha=None, bytes=False, norm=True)
    Return a normalized rgba array corresponding to x.

    In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding
    ndarray of rgba values will be returned, based on the norm and colormap set for
    this ScalarMappable.

    There is one special case, for handling images that are already rgb or rgba, such as
    might have been read from an image file. If x is an ndarray with 3 dimensions, and
    the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array,
    and no mapping will be done. The array can be uint8, or it can be floating point with
    values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array,
    the mask will be ignored. If the last dimension is 3, the alpha kwarg (defaulting to
    1) will be used to fill in the transparency. If the last dimension is 4, the alpha kwarg
is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if bytes is False (default), the rgba array will be floats in the 0-1 range; if it is True, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

```
matplotlib.cm.get_cmap(name=None, lut=None)
```

Get a colormap instance, defaulting to rc values if name is None.

Colormaps added with `register_cmap()` take precedence over built-in colormaps.

If name is a `matplotlib.colors.Colormap` instance, it will be returned.

If lut is not None it must be an integer giving the number of entries desired in the lookup table, and name must be a standard mpl colormap name.

```
matplotlib.cm.register_cmap(name=None, cmap=None, data=None, lut=None)
```

Add a colormap to the set recognized by `get_cmap()`.

It can be used in two ways:

```
register_cmap(name='swirly', cmap=swirly_cmap)
register_cmap(name='choppy', data=choppydata, lut=128)
```

In the first case, cmap must be a `matplotlib.colors.Colormap` instance. The name is optional; if absent, the name will be the name attribute of the cmap.

In the second case, the three arguments are passed to the `LinearSegmentedColormap` initializer, and the resulting colormap is registered.

```
matplotlib.cm.revcmap(data)
```

Can only handle specification data in dictionary format.

### 17.15 matplotlib.collections

Classes for the efficient drawing of large collections of objects that share most properties,
e.g., a large number of line segments or polygons.

The classes are not meant to be as flexible as their single element counterparts (e.g., you may not be able to select all line styles) but they are meant to be fast for common use cases (e.g., a large set of solid line segments).

class matplotlib.collections.AsteriskPolygonCollection(numsides, rotation=0, sizes=(1,), **kwargs)

Bases: matplotlib.collections.RegularPolyCollection

Draw a collection of regular asterisks with numsides points.

numsides the number of sides of the polygon

rotation the rotation of the polygon in radians

sizes gives the area of the circle circumscribing the regular polygon in points^2

Valid Collection keyword arguments:

• edgecolors: None
• facecolors: None
• linewidhts: None
• antialiaseds: None
• offsets: None
• transOffset: transforms.IdentityTransform()
• norm: None (optional for matplotlib.cm.ScalarMappable)
• cmap: None (optional for matplotlib.cm.ScalarMappable)

offsets and transOffset are used to translate the patch after rendering (default no offsets)

If any of edgecolors, facecolors, linewidhts, antialiaseds are None, they default to their matplotlib.rcParams patch setting, in sequence form.

Example: see /gallery/event_handling/lasso_demo for a complete example:

```python
offsets = np.random.rand(20, 2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]
black = (0, 0, 0, 1)

collection = RegularPolyCollection(
    numsides=5, # a pentagon
    rotation=0, sizes=(50,),
    facecolors=facecolors,
    edgecolors=black,
    linewidhts=(1,),
    offsets=offsets,
    transOffset=ax.transData,
)
```

add_callback(self, func)

Add a callback function that will be called whenever one of the Artist's properties changes.

Parameters
**func** [callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

**Returns**

**oid** [int] The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

**See also:**

*remove_callback*

**add_checker**(self, checker)

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

**aname**

**autoscale**(self)

Autoscale the scalar limits on the norm instance using the current array

**autoscale_None**(self)

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

**axes**

The *Axes* instance the artist resides in, or *None*.

**changed**(self)

Call this whenever the mappable is changed to notify all the callback listeners to the ‘changed’ signal

**check_update**(self, checker)

If mappable has changed since the last check, return True; else return False

**contains**(self, mouseevent)

Test whether the mouse event occurred in the collection.

Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

**convert_xunits**(self, x)

Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

**convert_yunits**(self, y)

Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

**draw**(self, renderer)

Draw the Artist using the given renderer.

This method will be overridden in the Artist subclasses. Typically, it is implemented to not have any effect if the Artist is not visible (*Artist.get_visible* is *False*).

**Parameters**
renderer [RendererBase subclass.]

findobj(self, match=None, include_self=True)
    Find artist objects.
    Recursively find all Artist instances contained in the artist.

Parameters

match A filter criterion for the matches. This can be
    • None: Return all objects contained in artist.
    • A function with signature def match(artist: Artist) -> bool. The result will only contain artists for which the function returns True.
    • A class instance: e.g., Line2D. The result will only contain artists of this class or its subclasses (isinstance check).

include_self [bool] Include self in the list to be checked for a match.

Returns

artists [list of Artist]

format_cursor_data(self, data)
    Return a string representation of data.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

get_cursor_data

get_agg_filter(self)
    Return filter function to be used for agg filter.

get_alpha(self)
    Return the alpha value used for blending - not supported on all backends

get_animated(self)
    Return the animated state.

get_array(self)
    Return the array

get_capstyle(self)

get_children(self)
    Return a list of the child Artists of this Artist.

g_get_clim(self)
    return the min, max of the color limits for image scaling

get_clip_box(self)
    Return the clipbox.

get_clip_on(self)
    Return whether the artist uses clipping.
get_clip_path(self)
    Return the clip path.
get_cmap(self)
    return the colormap
get_contains(self)
    Return the custom contains function of the artist if set, or None.

See also:
    set_contains

get_cursor_data(self, event)
    Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that format_cursor_data can convert the data to a string representation.

The only current use case is displaying the z-value of an AxesImage in the status bar of a plot window, while moving the mouse.

Parameters
    event [matplotlib.backend_bases.MouseEvent]

See also:
    format_cursor_data

get_dashes(self)
    Alias for get_linestyle.

get_datalim(self, transData)

gt_ec(self)
    Alias for get_edgecolor.

gt_edgecolor(self)

gt_edgecolors(self)
    Alias for get_edgecolor.

gt_facecolor(self)

gt_facecolors(self)
    Alias for get_facecolor.

gt_fc(self)
    Alias for get_facecolor.

gt_figure(self)
    Return the Figure instance the artist belongs to.
get_fill(self)
    return whether fill is set

get_gid(self)
    Return the group id.

get_hatch(self)
    Return the current hatching pattern.

get_in_layout(self)
    Return boolean flag, True if artist is included in layout calculations.
    E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname,
    bbox_inches='tight').

get_joinstyle(self)

get_label(self)
    Return the label used for this artist in the legend.

get_linestyle(self)

get_linestyles(self)
    Alias for get_linestyle.

get_linewidth(self)

get_linewidths(self)
    Alias for get_linewidth.

gt_ls(self)
    Alias for get_linestyle.

gt_lw(self)
    Alias for get_linewidth.

gt_numsides(self)

gt_offset_position(self)
    Returns how offsets are applied for the collection. If offset_position is 'screen', the
    offset is applied after the master transform has been applied, that is, the offsets are
    in screen coordinates. If offset_position is 'data', the offset is applied before the
    master transform, i.e., the offsets are in data coordinates.

gt_offset_transform(self)

get_offsets(self)
    Return the offsets for the collection.

get_path_effects(self)

get_paths(self)

get_picker(self)
    Return the picking behavior of the artist.
    The possible values are described in set_picker.

    See also:

    set_picker, pickable, pick

get_pickradius(self)
get_rasterized(self)
    Return whether the artist is to be rasterized.

get_rotation(self)

get_sizes(self)
    Returns the sizes of the elements in the collection. The value represents the ‘area’
of the element.

    Returns

    sizes [array] The ‘area’ of each element.

get_sketch_params(self)
    Returns the sketch parameters for the artist.

    Returns

    sketch_params [tuple or None] A 3-tuple with the following elements:
    • scale: The amplitude of the wiggle perpendicular to the source line.
    • length: The length of the wiggle along the line.
    • randomness: The scale factor by which the length is shrunk or expanded.

    Returns None if no sketch parameters were set.

get_snap(self)
    Returns the snap setting.

    See set_snap for details.

get_tightbbox(self, renderer)
    Like Artist.get_window_extent, but includes any clipping.

    Parameters

    renderer [RendererBase instance] renderer that will be used to draw the
    figures (i.e. fig.canvas.get_renderer())

    Returns

    bbox [BBox] The enclosing bounding box (in figure pixel co-ordinates).

get_transform(self)
    Return the Transform instance used by this artist.

get_transformed_clip_path_and_affine(self)
    Return the clip path with the non-affine part of its transformation applied, and the
    remaining affine part of its transformation.

get_transforms(self)

get_url(self)
    Return the url.

get_urls(self)

gget_visible(self)
    Return the visibility.

gget_window_extent(self, renderer)
    Get the axes bounding box in display space.

    The bounding box’ width and height are nonnegative.
Subclasses should override for inclusion in the bounding box “tight” calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder(self)
Return the artist’s zorder.

have_units(self)
Return True if units are set on the x or y axes.

is_transform_set(self)
Return whether the Artist has an explicitly set transform.
This is True after set_transform has been called.

mouseover

pchanged(self)
Call all of the registered callbacks.
This function is triggered internally when a property is changed.

See also:
add_callback
remove_callback

pick(self, mouseevent)
Process a pick event.
Each child artist will fire a pick event if mouseevent is over the artist and the artist has picker set.

See also:
set_picker, get_picker, pickable

pickable(self)
Return whether the artist is pickable.

See also:
set_picker, get_picker, pick

properties(self)
Return a dictionary of all the properties of the artist.

remove(self)
Remove the artist from the figure if possible.
The effect will not be visible until the figure is redrawn, e.g., with FigureCanvasBase.
draw_idle. Call relim to update the axes limits if desired.

Note: relim will not see collections even if the collection was added to the axes with autolim = True.
Note: there is no support for removing the artist’s legend entry.

```python
remove_callback(self, oid)
Remove a callback based on its observer id.

See also:
add_callback
```

```python
set(self, **kwargs)
A property batch setter. Pass kwargs to set properties.
```

```python
set_aa(self, aa)
Alias for set_antialiased.
```

```python
set_agg_filter(self, filter_func)
Set the agg filter.

Parameters

filter_func [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.
```

```python
set_alpha(self, alpha)
Set the alpha transparencies of the collection.

Parameters

alpha [float or None]
```

```python
set_animated(self, b)
Set the artist’s animation state.

Parameters

b [bool]
```

```python
set_antialiased(self, aa)
Set the antialiasing state for rendering.

Parameters

aa [bool or sequence of bools]
```

```python
set_antialiaseds(self, aa)
Alias for set_antialiased.
```

```python
set_array(self, A)
Set the image array from numpy array A.

Parameters

A [ndarray]
```

```python
set_capstyle(self, cs)
Set the capstyle for the collection (for all its elements).

Parameters

cs [{'butt', 'round', 'projecting'}] The capstyle
```

```python
set_clim(self, vmin=None, vmax=None)
set the norm limits for image scaling; if vmin is a length2 sequence, interpret it as (vmin, vmax) which is used to support setp
```
ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have vmin and vmax kwargs.

```python
set_clip_box(self, clipbox)

Set the artist’s clip Bbox.

Parameters

clipbox [Bbox]
```

```python
set_clip_on(self, b)

Set whether the artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

Parameters

b [bool]
```

```python
set_clip_path(self, path, transform=None)

Set the artist’s clip path, which may be:

• a Patch (or subclass) instance; or

• a Path instance, in which case a Transform instance, which will be applied to the path before using it for clipping, must be provided; or

• None, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

ACCEPTS: [(Path, Transform) | Patch | None]
```

```python
set_cmap(self, cmap)

set the colormap for luminance data

Parameters

cmap [colormap or registered colormap name]
```

```python
set_color(self, c)

Set both the edgecolor and the facecolor.

Parameters

c [color or sequence of rgba tuples]
```

See also:

Collection.set_facecolor, Collection.set_edgecolor For setting the edge or face color individually.

```python
set_contains(self, picker)

Define a custom contains test for the artist.

The provided callable replaces the default contains method of the artist.

Parameters

picker [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:
```
def contains(artist: Artist, event: MouseEvent) -> bool, dict

that returns:

• a bool indicating if the event is within the artist
• a dict of additional information. The dict should at least return the
  same information as the default contains() implementation of the re-
  spective artist, but may provide additional information.

set_dashes(self, ls)
    Alias for set linestyle.

set_ec(self, c)
    Alias for set_edgecolor.

set_edgecolor(self, c)
    Set the edgecolor(s) of the collection.

    Parameters
    c [color or sequence of colors or ‘face’] The collection edgecolor(s). If a
    sequence, the patches cycle through it. If ‘face’, match the facecolor.

set_edgecolors(self, c)
    Alias for set_edgecolor.

set_facecolor(self, c)
    Set the facecolor(s) of the collection. c can be a matplotlib color spec (all patches
    have same color), or a sequence of specs; if it is a sequence the patches will cycle
    through the sequence.

    If c is ‘none’, the patch will not be filled.

    Parameters
    c [color or sequence of colors]

set_facecolors(self, c)
    Alias for set_facecolor.

set_fc(self, c)
    Alias for set_facecolor.

set_figure(self, fig)
    Set the Figure instance the artist belongs to.

    Parameters
    fig [Figure]

set_gid(self, gid)
    Set the (group) id for the artist.

    Parameters
    gid [str]

set_hatch(self, hatch)
    Set the hatching pattern

    hatch can be one of:
Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

**Parameters**

hatch \[[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}\]]

**set_in_layout** (self, in_layout)

Set if artist is to be included in layout calculations, E.g. _Constrained Layout Guide_, _Figure.tight_layout_(), and _fig.savefig(fname, bbox_inches='tight')_.

**Parameters**

in_layout [bool]

**set_joinstyle** (self, js)

Set the joinstyle for the collection (for all its elements).

**Parameters**

js [{'miter', 'round', 'bevel'}] The joinstyle

**set_label** (self, s)

Set a label that will be displayed in the legend.

**Parameters**

s [object] s will be converted to a string by calling _str_.

**set_linestyle** (self, ls)

Set the linestyle(s) for the collection.

</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where _onoffseq_ is an even length tuple of on and off ink in points.
Parameters

**ls** [‘-‘, ‘-‘, ‘-.-’, ‘:’, ‘’, (offset, on-off-seq), ...]} The line style.

```python
set_linestyles(self, ls)
```

Alias for `set_linestyle`.

```python
set_linewidths(self, lw)
```

Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence.

Parameters

**lw** [float or sequence of floats]

```python
set_lws(self, lw)
```

Alias for `set_linewidth`.

```python
set_lw(self, lw)
```

Alias for `set_linewidth`.

```python
set_norm(self, norm)
```

Set the normalization instance.

Parameters

**norm** [Normalize]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

```python
set_offset_position(self, offset_position)
```

Set how offsets are applied. If `offset_position` is ‘screen’ (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is ‘data’, the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Parameters

**offset_position** [{‘screen’, ‘data’}]

```python
set_offsets(self, offsets)
```

Set the offsets for the collection.

Parameters

**offsets** [float or sequence of floats]

```python
set_path_effects(self, path_effects)
```

Set the path effects.

Parameters

**path_effects** [AbstractPathEffect]

```python
set_paths(self)
```

```python
set_picker(self, picker)
```

Define the picking behavior of the artist.
Parameters

picker [None or bool or float or callable] This can be one of the following:

- None: Picking is disabled for this artist (default).
- A boolean: If True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it’s data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

  \[
  \text{hit, props} = \text{picker} (\text{artist, mouseevent})
  \]

to determine the hit test. If the mouse event is over the artist, return hit=True and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(self, pr)
Set the pick radius used for containment tests.

Parameters

d [float] Pick radius, in points.

set_rasterized(self, rasterized)
Force rasterized (bitmap) drawing in vector backend output.
Defaults to None, which implies the backend’s default behavior.

Parameters

rasterized [bool or None]

set_sizes(self, sizes, dpi=72.0)
Set the sizes of each member of the collection.

Parameters

sizes [ndarray or None] The size to set for each element of the collection. The value is the ‘area’ of the element.
dpi [float] The dpi of the canvas. Defaults to 72.0.

set_sketch_params(self, scale=None, length=None, randomness=None)
Sets the sketch parameters.

Parameters

scale [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.
length [float, optional] The length of the wiggle along the line, in pixels (default 128.0)
randomness [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)
set_snap(self, snap)
    Set the snapping behavior.
    Snapping aligns positions with the pixel grid, which results in clearer images. For
example, if a black line of 1px width was defined at a position in between two pixels,
the resulting image would contain the interpolated value of that line in the pixel grid,
which would be a grey value on both adjacent pixel positions. In contrast, snapping
will move the line to the nearest integer pixel value, so that the resulting image will
really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters
    snap [bool or None] Possible values:
        • True: Snap vertices to the nearest pixel center.
        • False: Do not modify vertex positions.
        • None: (auto) If the path contains only rectilinear line segments, round
to the nearest pixel center.

set_transform(self, t)
    Set the artist transform.

    Parameters
        t [Transform]

set_url(self, url)
    Set the url for the artist.

    Parameters
        url [str]

set_urls(self, urls)
    Parameters
        urls [List[str] or None]

set_visible(self, b)
    Set the artist’s visibility.

    Parameters
        b [bool]

set_zorder(self, level)
    Set the zorder for the artist. Artists with lower zorder values are drawn first.

    Parameters
        level [float]

stale
    Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the
internal state of the artist.

sticky_edges
    x and y sticky edge lists for autoscaling.

    When performing autoscaling, if a data limit coincides with a value in the corre-
sponding sticky_edges list, then no margin will be added—the view limit “sticks” to
the edge. A typical use case is histograms, where one usually expects no margin on
the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in
place as needed.

Examples

```python
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(self, x, alpha=None, bytes=False, norm=True)

Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding
ndarray of rgba values will be returned, based on the norm and colormap set for
this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as
might have been read from an image file. If x is an ndarray with 3 dimensions, and
the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array,
and no mapping will be done. The array can be uint8, or it can be floating point with
values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array,
the mask will be ignored. If the last dimension is 3, the alpha kwarg (defaulting to
1) will be used to fill in the transparency. If the last dimension is 4, the alpha kwarg
is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if
the third dimension is other than 3 or 4.

In either case, if bytes is False (default), the rgba array will be floats in the 0-1 range;
if it is True, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed
to be in the range (0-1).

update(self, props)

Update this artist’s properties from the dictionary props.

update_from(self, other)

copy properties from other to self

update_scalarmappable(self)

Update colors from the scalar mappable array, if it is not None.

zorder = 0
class matplotlib.collections.BrokenBarHCollection(xranges, yrange, **kwargs)
Bases: matplotlib.collections.PolyCollection

A collection of horizontal bars spanning yrange with a sequence of xranges.

xranges sequence of (xmin, xwidth)
yrange ymin, ywidth

Valid Collection keyword arguments:
• edgecolors: None
• facecolors: None
• linewidths: None
• antialiaseds: None
• offsets: None
• transOffset: transforms.IdentityTransform()
• norm: None (optional for matplotlib.cm.ScalarMappable)
• cmap: None (optional for matplotlib.cm.ScalarMappable)

offsets and transOffset are used to translate the patch after rendering (default no offsets)

If any of edgecolors, facecolors, linewidths, antialiaseds are None, they default to their matplotlib.rcParams patch setting, in sequence form.

add_callback(self, func)
Add a callback function that will be called whenever one of the Artist's properties changes.

Parameters

func [callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where artist is the calling Artist. Return values may exist but are ignored.

Returns

oid [int] The observer id associated with the callback. This id can be used for removing the callback with remove_callback later.

See also:

remove_callback

add_checker(self, checker)
Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

aname

autoscale(self)
Autoscale the scalar limits on the norm instance using the current array

autoscale_None(self)
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

axes
The Axes instance the artist resides in, or None.

changed(self)
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

check_update(self, checker)
If mappable has changed since the last check, return True; else return False

contains(self, mouseevent)
Test whether the mouse event occurred in the collection.
Returns `bool, dict(ind=itemlist)`, where every item in `itemlist` contains the event.

```python
convert_xunits(self, x)
```
Convert x using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

```python
convert_yunits(self, y)
```
Convert y using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

```python
draw(self, renderer)
```
Draw the Artist using the given renderer.

This method will be overridden in the Artist subclasses. Typically, it is implemented to not have any effect if the Artist is not visible (`Artist.get_visible` is `False`).

**Parameters**

- `renderer` : `RendererBase subclass`

```python
findobj(self, match=None, include_self=True)
```
Find artist objects.

Recursively find all `Artist` instances contained in the artist.

**Parameters**

- `match` : A filter criterion for the matches. This can be
  - `None`: Return all objects contained in artist.
  - A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns `True`.
  - A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

- `include_self` : [bool] Include `self` in the list to be checked for a match.

**Returns**

- `artists` : [list of `Artist`]

```python
format_cursor_data(self, data)
```
Return a string representation of `data`.

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

- `get_cursor_data`

- `get_agg_filter` : [self]
  Return filter function to be used for agg filter.
get_alpha(self)
    Return the alpha value used for blending - not supported on all backends

get_animated(self)
    Return the animated state.

get_array(self)
    Return the array

get_capstyle(self)

get_children(self)
    Return a list of the child Artists of this Artist.

get_clim(self)
    return the min, max of the color limits for image scaling

get_clip_box(self)
    Return the clipbox.

get_clip_on(self)
    Return whether the artist uses clipping.

get_clip_path(self)
    Return the clip path.

get_cmap(self)
    return the colormap

get_contains(self)
    Return the custom contains function of the artist if set, or None.

    See also:

        set_contains

get_cursor_data(self, event)
    Return the cursor data for a given event.

    Note: This method is intended to be overridden by artist subclasses. As an end-user
        of Matplotlib you will most likely not call this method yourself.

    Cursor data can be used by Artists to provide additional context information for a
    given event. The default implementation just returns None.

    Subclasses can override the method and return arbitrary data. However, when do-
    ing so, they must ensure that format_cursor_data can convert the data to a string
    representation.

    The only current use case is displaying the z-value of an AxesImage in the status bar
    of a plot window, while moving the mouse.

    Parameters

        event [matplotlib.backend_bases.MouseEvent]

    See also:

        format_cursor_data
get_dashes(self)
    Alias for get_linestyle.

get_datalim(self, transData)

get_ec(self)
    Alias for get_edgecolor.

get_edgecolor(self)

get_edgecolors(self)
    Alias for get_edgecolor.

get_facecolor(self)

get_facecolors(self)
    Alias for get_facecolor.

get_fc(self)
    Alias for get_facecolor.

get_figure(self)
    Return the Figure instance the artist belongs to.

get_fill(self)
    return whether fill is set

get_gid(self)
    Return the group id.

get_hatch(self)
    Return the current hatching pattern.

get_in_layout(self)
    Return boolean flag, True if artist is included in layout calculations.
    
    E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname, 
        bbox_inches='tight').

get_joinstyle(self)

get_label(self)
    Return the label used for this artist in the legend.

get_linestyle(self)

get_linestyles(self)
    Alias for get_linestyle.

get_linewidth(self)

get_linewidths(self)
    Alias for get_linewidth.

get_ls(self)
    Alias for get_linestyle.

get_lw(self)
    Alias for get_linewidth.

get_offset_position(self)
    Returns how offsets are applied for the collection. If offset_position is 'screen', the
    offset is applied after the master transform has been applied, that is, the offsets are
    in screen coordinates. If offset_position is 'data', the offset is applied before the
    master transform, i.e., the offsets are in data coordinates.
get_offset_transform(self)

get_offsets(self)
    Return the offsets for the collection.

get_path_effects(self)

get_paths(self)

get_picker(self)
    Return the picking behavior of the artist.
    The possible values are described in set_picker.

    See also:

    set_picker, pickable, pick

get_pickradius(self)

get_rasterized(self)
    Return whether the artist is to be rasterized.

get_sizes(self)
    Returns the sizes of the elements in the collection. The value represents the ‘area’
    of the element.

    Returns

    sizes [array] The ‘area’ of each element.

get_sketch_params(self)
    Returns the sketch parameters for the artist.

    Returns

    sketch_params [tuple or None] A 3-tuple with the following elements:
    • scale: The amplitude of the wiggle perpendicular to the source line.
    • length: The length of the wiggle along the line.
    • randomness: The scale factor by which the length is shrunken or ex-
      panded.

    Returns None if no sketch parameters were set.

get_snap(self)
    Returns the snap setting.

    See set_snap for details.

get_tightbbox(self, renderer)
    Like Artist.get_window_extent, but includes any clipping.

    Parameters

    renderer [RendererBase instance] renderer that will be used to draw the
    figures (i.e. fig.canvas.get_renderer())

    Returns

    bbox [BBox] The enclosing bounding box (in figure pixel co-ordinates).

get_transform(self)
    Return the Transform instance used by this artist.
get_transformed_clip_path_and_affine(self)
    Return the clip path with the non-affine part of its transformation applied, and the
    remaining affine part of its transformation.

get_transforms(self)

get_url(self)
    Return the url.

get_urls(self)

get_visible(self)
    Return the visibility.

get_window_extent(self, renderer)
    Get the axes bounding box in display space.
    The bounding box’ width and height are nonnegative.
    Subclasses should override for inclusion in the bounding box “tight” calculation.
    Default is to return an empty bounding box at 0, 0.
    Be careful when using this function, the results will not update if the artist window
    extent of the artist changes. The extent can change due to any changes in the trans-
    form stack, such as changing the axes limits, the figure size, or the canvas used (as is
    done when saving a figure). This can lead to unexpected behavior where interactive
    figures will look fine on the screen, but will save incorrectly.

get_zorder(self)
    Return the artist’s zorder.

have_units(self)
    Return True if units are set on the x or y axes.

is_transform_set(self)
    Return whether the Artist has an explicitly set transform.
    This is True after set_transform has been called.

mouseover

pchanged(self)
    Call all of the registered callbacks.
    This function is triggered internally when a property is changed.

    See also:

    add_callback

    remove_callback

pick(self, mouseevent)
    Process a pick event.
    Each child artist will fire a pick event if mouseevent is over the artist and the artist
    has picker set.

    See also:

    set_picker, get_picker, pickable
**pickable**(*self*)

Return whether the artist is pickable.

**See also:**

*set_picker*, *get_picker*, *pick*

**properties**(*self*)

Return a dictionary of all the properties of the artist.

**remove**(*self*)

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist’s legend entry.

**remove_callback**(*self, oid*)

Remove a callback based on its observer id.

**See also:**

*add_callback*

**set**(*self, **kwargs*)

A property batch setter. Pass *kwargs* to set properties.

**set_aa**(*self, aa*)

Alias for *set_antialiased*.

**set_agg_filter**(*self, filter_func*)

Set the agg filter.

**Parameters**

*filter_func* [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**set_alpha**(*self, alpha*)

Set the alpha transparencies of the collection.

**Parameters**

*alpha* [float or None]

**set_animated**(*self, b*)

Set the artist’s animation state.

**Parameters**

*b* [bool]

**set_antialiased**(*self, aa*)

Set the antialiasing state for rendering.

**Parameters**

*aa* [bool or sequence of bools]
set_antialiaseds(self, aa)
    Alias for set_antialiased.

set_array(self, A)
    Set the image array from numpy array A.

    Parameters
    A [ndarray]

set_capstyle(self, cs)
    Set the capstyle for the collection (for all its elements).

    Parameters
    cs [{'butt', 'round', 'projecting'}] The capstyle

set_clim(self, vmin=None, vmax=None)
    set the norm limits for image scaling; if vmin is a length2 sequence, interpret it as
    (vmin, vmax) which is used to support setp

    ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have
    vmin and vmax kwargs.

set_clip_box(self, clipbox)
    Set the artist's clip Bbox.

    Parameters
    clipbox [Bbox]

set_clip_on(self, b)
    Set whether the artist uses clipping.
    When False artists will be visible out side of the axes which can lead to unexpected
    results.

    Parameters
    b [bool]

set_clip_path(self, path, transform=None)
    Set the artist’s clip path, which may be:
    • a Patch (or subclass) instance; or
    • a Path instance, in which case a Transform instance, which will be applied to the
      path before using it for clipping, must be provided; or
    • None, to remove a previously set clipping path.

    For efficiency, if the path happens to be an axis-aligned rectangle, this method will
    set the clipping box to the corresponding rectangle and set the clipping path to None.

    ACCEPTS: [(Path, Transform) | Patch | None]

set_cmap(self, cmap)
    set the colormap for luminance data

    Parameters
    cmap [colormap or registered colormap name]

set_color(self, c)
    Set both the edgecolor and the facecolor.

    Parameters
c [color or sequence of rgba tuples]

See also:

`Collection.set_facecolor`, `Collection.set_edgecolor` For setting the edge or face color individually.

```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

```python
set_dashes(self, ls)
```

Alias for `set_linestyle`.

```python
set_ec(self, c)
```

Alias for `set_edgecolor`.

```python
set_edgecolor(self, c)
```

Set the edgecolor(s) of the collection.

Parameters

- c [color or sequence of colors or ‘face’] The collection edgecolor(s). If a sequence, the patches cycle through it. If ‘face’, match the facecolor.

```python
set_edgecolors(self, c)
```

Alias for `set_edgecolor`.

```python
set_facecolor(self, c)
```

Set the facecolor(s) of the collection. `c` can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If `c` is ‘none’, the patch will not be filled.

Parameters

- c [color or sequence of colors]

```python
set_facecolors(self, c)
```

Alias for `set_facecolor`.

```python
set_fc(self, c)
```

Alias for `set_facecolor`.

```python
set_figure(self, fig)
```

Set the `Figure` instance the artist belongs to.
Parameters

fig [Figure]

set_gid(self, gid)
Set the (group) id for the artist.

Parameters

gid [str]

set_hatch(self, hatch)
Set the hatching pattern

hatch can be one of:

/  - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars

Letters can be combined, in which case all the specified hatchings are done. If same
letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified
for the collection as a whole, not separately for each member.

Parameters

hatch [{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(self, in_layout)
Set if artist is to be included in layout calculations, E.g. Constrained Layout Guide,
Figure.tight_layout(), and fig.savefig(fname, bbox_inches='tight').

Parameters

in_layout [bool]

set_joinstyle(self, js)
Set the joinstyle for the collection (for all its elements).

Parameters

js [{'miter', 'round', 'bevel'}] The joinstyle

set_label(self, s)
Set a label that will be displayed in the legend.

Parameters

s [object] s will be converted to a string by calling str.

set_linestyle(self, ls)
Set the linestyle(s) for the collection.
Matplotlib, Release 3.1.3

<table>
<thead>
<tr>
<th>linestyle</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-.' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

```
(offset, on-off-seq),
```

where `on-off-seq` is an even length tuple of on and off ink in points.

**Parameters**

`ls` [{',', '-', '.', ':', '', (offset, on-off-seq), ...}] The line style.

```
set_linestyles(self, ls)
```

Alias for `set_linestyle`.

```
set_linewidth(self, lw)
```

Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence.

**Parameters**

`lw` [float or sequence of floats]

```
set_linewidths(self, lw)
```

Alias for `set_linewidth`.

```
set_ls(self, ls)
```

Alias for `set_linestyle`.

```
set_lw(self, lw)
```

Alias for `set_linewidth`.

```
set_norm(self, norm)
```

Set the normalization instance.

**Parameters**

`norm` [Normalize]

**Notes**

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

```
set_offset_position(self, offset_position)
```

Set how offsets are applied. If `offset_position` is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

**Parameters**

`offset_position` [{‘screen’, ‘data’}]

```
set_offsets(self, offsets)
```

Set the offsets for the collection.
Parameters

offsets [float or sequence of floats]

set_path_effects(self, path_effects)
Set the path effects.

Parameters

path_effects [AbstractPathEffect]

set_paths(self, verts, closed=True)
This allows one to delay initialization of the vertices.

set_picker(self, picker)
Define the picking behavior of the artist.

Parameters

picker [None or bool or float or callable]
This can be one of the following:

• None: Picking is disabled for this artist (default).

• A boolean: If True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.

• A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it’s data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event.

• A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

  hit, props = picker(artist, mouseevent)

to determine the hit test. If the mouse event is over the artist, return hit=True and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(self, pr)
Set the pick radius used for containment tests.

Parameters

d [float] Pick radius, in points.

set_rasterized(self, rasterized)
Force rasterized (bitmap) drawing in vector backend output.
Defaults to None, which implies the backend’s default behavior.

Parameters

rasterized [bool or None]

set_sizes(self, sizes, dpi=72.0)
Set the sizes of each member of the collection.

Parameters

sizes [ndarray or None] The size to set for each element of the collection.
The value is the ‘area’ of the element.
**dpi** [float] The dpi of the canvas. Defaults to 72.0.

**set_sketch_params**(self, scale=None, length=None, randomness=None)

Sets the sketch parameters.

**Parameters**

- **scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.
- **length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)
- **randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

**set_snap**(self, snap)

Sets the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**

- **snap** [bool or None] Possible values:
  - True: Snap vertices to the nearest pixel center.
  - False: Do not modify vertex positions.
  - None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

**set_transform**(self, t)

Sets the artist transform.

**Parameters**

- **t** [Transform]

**set_url**(self, url)

Sets the url for the artist.

**Parameters**

- **url** [str]

**set_urls**(self, urls)

**Parameters**

- **urls** [List[str] or None]

**set_verts**(self, verts, closed=True)

This allows one to delay initialization of the vertices.

**set_verts_and_codes**(self, verts, codes)

This allows one to initialize vertices with path codes.
set_visible(self, b)
Set the artist's visibility.

Parameters
b [bool]

set_zorder(self, level)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters
level [float]

static span_where(x, ymin, ymax, where, **kwargs)
Create a BrokenBarHCollection to plot horizontal bars from over the regions in x
where where is True. The bars range on the y-axis from ymin to ymax

A BrokenBarHCollection is returned. kwargs are passed on to the collection.

stale
Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the
internal state of the artist.

sticky_edges
x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corre-
sponding sticky_edges list, then no margin will be added—the view limit “sticks” to
the edge. A typical use case is histograms, where one usually expects no margin on
the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in
place as needed.

Examples

```python
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(self, x, alpha=None, bytes=False, norm=True)
Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding
ndarray of rgba values will be returned, based on the norm and colormap set for
this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as
might have been read from an image file. If x is an ndarray with 3 dimensions, and
the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array,
and no mapping will be done. The array can be uint8, or it can be floating point with
values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array,
the mask will be ignored. If the last dimension is 3, the alpha kwarg (defaulting to
1) will be used to fill in the transparency. If the last dimension is 4, the alpha kwarg
is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if
the third dimension is other than 3 or 4.

In either case, if bytes is False (default), the rgba array will be floats in the 0-1 range;
if it is True, the returned rgba array will be uint8 in the 0 to 255 range.
If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

```python
update(self, props)
```
Update this artist's properties from the dictionary `props`.

```python
update_from(self, other)
```
copy properties from other to self

```python
update_scalarmappable(self)
```
Update colors from the scalar mappable array, if it is not None.

```python
zorder = 0
```

```python
class matplotlib.collections.CircleCollection(sizes, **kwargs)
```
Bases: matplotlib.collections._CollectionWithSizes

A collection of circles, drawn using splines.

`sizes` Gives the area of the circle in points^2

Valid Collection keyword arguments:

- `edgecolors`: None
- `facecolors`: None
- `linewidths`: None
- `antialiaseds`: None
- `offsets`: None
- `transOffset`: transforms.IdentityTransform()
- `norm`: None (optional for `matplotlib.cm.ScalarMappable`)
- `cmap`: None (optional for `matplotlib.cm.ScalarMappable`)

`offsets` and `transOffset` are used to translate the patch after rendering (default no offsets)

If any of `edgecolors`, `facecolors`, `linewidths`, `antialiaseds` are None, they default to their `matplotlib.rcParams` patch setting, in sequence form.

```python
add_callback(self, func)
```
Add a callback function that will be called whenever one of the `Artist`'s properties changes.

**Parameters**

- `func` [callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where `artist` is the calling `Artist`. Return values may exist but are ignored.

**Returns**

- `oid` [int] The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

**See also:**

- `remove_callback`
add_checker(self, checker)
    Add an entry to a dictionary of boolean flags that are set to True when the mappable
    is changed.

aname
autoscale(self)
    Autoscale the scalar limits on the norm instance using the current array
autoscale_None(self)
    Autoscale the scalar limits on the norm instance using the current array, changing
    only limits that are None

axes
    The Axes instance the artist resides in, or None.

changed(self)
    Call this whenever the mappable is changed to notify all the callback listeners to
    the ‘changed’ signal

check_update(self, checker)
    If mappable has changed since the last check, return True; else return False

contains(self, mouseevent)
    Test whether the mouse event occurred in the collection.
    Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

convert_xunits(self, x)
    Convert x using the unit type of the xaxis.
    If the artist is not in contained in an Axes or if the xaxis does not have units, x itself
    is returned.

convert_yunits(self, y)
    Convert y using the unit type of the yaxis.
    If the artist is not in contained in an Axes or if the yaxis does not have units, y itself
    is returned.

draw(self, renderer)
    Draw the Artist using the given renderer.
    This method will be overridden in the Artist subclasses. Typically, it is implemented
    to not have any effect if the Artist is not visible (Artist.get_visible is False).

    Parameters
    renderer [RendererBase subclass.]

findobj(self, match=None, include_self=True)
    Find artist objects.
    Recursively find all Artist instances contained in the artist.

    Parameters
    match A filter criterion for the matches. This can be
    • None: Return all objects contained in artist.
    • A function with signature def match(artist: Artist) -> bool. The re-
      sult will only contain artists for which the function returns True.
• A class instance: e.g., Line2D. The result will only contain artists of this class or its subclasses (isinstance check).

**include_self** [bool] Include self in the list to be checked for a match.

**Returns**

artists [list of Artist]

**format_cursor_data**(self, data)

Return a string representation of data.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

get_data

get_agg_filter(self)

Return filter function to be used for agg filter.

get_alpha(self)

Return the alpha value used for blending - not supported on all backends

get_animated(self)

Return the animated state.

get_array(self)

Return the array

get_capstyle(self)

get_children(self)

Return a list of the child Artists of this Artist.

get_clim(self)

return the min, max of the color limits for image scaling

get_clip_box(self)

Return the clipbox.

get_clip_on(self)

Return whether the artist uses clipping.

get_clip_path(self)

Return the clip path.

get_cmap(self)

return the colormaps

get_contains(self)

Return the custom contains function of the artist if set, or None.

**See also:**

set_contains
get_cursor_data(self, event)
Return the cursor data for a given event.

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns `None`.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

**Parameters**

- **event** [matplotlib.backend_bases.MouseEvent]

**See also:**

`format_cursor_data`

get_dashes(self)
Alias for `get_linestyle`.

get_datalim(self, transData)

get_ec(self)
Alias for `get_edgecolor`.

get_edgecolor(self)

get_edgecolors(self)
Alias for `get_edgecolor`.

get_facecolor(self)

get_facecolors(self)
Alias for `get_facecolor`.

get_fcc(self)
Alias for `get_facecolor`.

get_figure(self)
Return the `Figure` instance the artist belongs to.

get_fill(self)
return whether fill is set

get_gid(self)
Return the group id.

get_hatch(self)
Return the current hatching pattern.

get_in_layout(self)
Return boolean flag, True if artist is included in layout calculations.

E.g. *Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname, bbox_inches='tight').*
get_joinstyle(self)
get_label(self)
    Return the label used for this artist in the legend.
get_linestyle(self)
get_linestyles(self)
    Alias for get_linestyle.
get_linewidth(self)
get_linewidths(self)
    Alias for get_linewidth.
get_ls(self)
    Alias for get_linestyle.
get_lw(self)
    Alias for get_linewidth.
get_offset_position(self)
    Returns how offsets are applied for the collection. If offset_position is 'screen', the
    offset is applied after the master transform has been applied, that is, the offsets are
    in screen coordinates. If offset_position is 'data', the offset is applied before the
    master transform, i.e., the offsets are in data coordinates.
get_offset_transform(self)
get_offsets(self)
    Return the offsets for the collection.
get_path_effects(self)
get_paths(self)
get_picker(self)
    Return the picking behavior of the artist.
    The possible values are described in set_picker.
    See also:
    set_picker, pickable, pick
get_pickradius(self)
get_rasterized(self)
    Return whether the artist is to be rasterized.
get_sizes(self)
    Returns the sizes of the elements in the collection. The value represents the ‘area’
    of the element.
    Returns
    sizes [array] The ‘area’ of each element.
get_sketch_params(self)
    Returns the sketch parameters for the artist.
    Returns
    sketch_params [tuple or None] A 3-tuple with the following elements:
• **scale**: The amplitude of the wiggle perpendicular to the source line.

• **length**: The length of the wiggle along the line.

• **randomness**: The scale factor by which the length is shrunken or expanded.

Returns `None` if no sketch parameters were set.

```python
get_snap(self)
    Returns the snap setting.
    See `set_snap` for details.

get_tightbbox(self, renderer)
    Like `Artist.get_window_extent`, but includes any clipping.
    
    **Parameters**
    
    * renderer [RendererBase instance] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

    **Returns**

    * bbox [BBox] The enclosing bounding box (in figure pixel co-ordinates).

get_transform(self)
    Return the `Transform` instance used by this artist.

get_transformed_clip_path_and_affine(self)
    Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms(self)

get_url(self)
    Return the url.

get_urls(self)

get_visible(self)
    Return the visibility.

get_window_extent(self, renderer)
    Get the axes bounding box in display space.
    
    The bounding box’ width and height are nonnegative.
    
    Subclasses should override for inclusion in the bounding box “tight” calculation. Default is to return an empty bounding box at 0, 0.
    
    Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder(self)
    Return the artist’s zorder.

have_units(self)
    Return `True` if units are set on the x or y axes.

is_transform_set(self)
    Return whether the Artist has an explicitly set transform.
This is True after \texttt{set\_transform} has been called.

\begin{verbatim}
mouseover

\texttt{pchanged}(\texttt{self})
\quad Call all of the registered callbacks.
\quad This function is triggered internally when a property is changed.
\textbf{See also:}

\texttt{add\_callback}
\texttt{remove\_callback}

\texttt{pick}(\texttt{self}, \texttt{mouseevent})
\quad Process a pick event.
\quad Each child artist will fire a pick event if \texttt{mouseevent} is over the artist and the artist
\quad has picker set.
\textbf{See also:}

\texttt{set\_picker, get\_picker, pickable}

\texttt{pickable}(\texttt{self})
\quad Return whether the artist is pickable.
\textbf{See also:}

\texttt{set\_picker, get\_picker, pick}

\texttt{properties}(\texttt{self})
\quad Return a dictionary of all the properties of the artist.

\texttt{remove}(\texttt{self})
\quad Remove the artist from the figure if possible.
\quad The effect will not be visible until the figure is redrawn, e.g., with \texttt{FigureCanvasBase.draw\_idle}. Call \texttt{relim} to update the axes limits if desired.
\quad Note: \texttt{relim} will not see collections even if the collection was added to the axes with \texttt{autolim = True}.
\quad Note: there is no support for removing the artist’s legend entry.

\texttt{remove\_callback}(\texttt{self, oid})
\quad Remove a callback based on its observer id.
\textbf{See also:}

\texttt{add\_callback}

\texttt{set}(\texttt{self, **kwargs})
\quad A property batch setter. Pass \texttt{kwargs} to set properties.

\texttt{set\_aa}(\texttt{self, aa})
\quad Alias for \texttt{set\_antialiased}.

\texttt{set\_agg\_filter}(\texttt{self, filter\_func})
\quad Set the agg filter.
\end{verbatim}
Parameters

**filter_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**set_alpha**(self, alpha)
Set the alpha transparencies of the collection.

Parameters

**alpha** [float or None]

**set_animated**(self, b)
Set the artist’s animation state.

Parameters

**b** [bool]

**set_antialiased**(self, aa)
Set the antialiasing state for rendering.

Parameters

**aa** [bool or sequence of bools]

**set_antialiaseds**(self, aa)
Alias for **set_antialiased**.

**set_array**(self, A)
Set the image array from numpy array A.

Parameters

**A** [ndarray]

**set_capstyle**(self, cs)
Set the capstyle for the collection (for all its elements).

Parameters

**cs** [{'butt', 'round', 'projecting'}] The capstyle

**set_clim**(self, vmin=None, vmax=None)
set the norm limits for image scaling; if vmin is a length2 sequence, interpret it as (vmin, vmax) which is used to support setp

ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have vmin and vmax kwargs.

**set_clip_box**(self, clipbox)
Set the artist’s clip *Bbox*.

Parameters

**clipbox** [*Bbox*]

**set_clip_on**(self, b)
Set whether the artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

Parameters

**b** [bool]
set_clip_path(self, path, transform=None)
Set the artist’s clip path, which may be:

- a *Patch* (or subclass) instance; or
- a *Path* instance, in which case a *Transform* instance, which will be applied to the
  path before using it for clipping, must be provided; or
- *None*, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will
set the clipping box to the corresponding rectangle and set the clipping path to *None*.

ACCEPTS: [(*Path*, *Transform*) | *Patch* | *None]*

set_cmap(self, cmap)
set the colormap for luminance data

Parameters

cmap [colormap or registered colormap name]

set_color(self, c)
Set both the edgecolor and the facecolor.

Parameters

c [color or sequence of rgba tuples]

See also:

*Collection.set_facecolor*, *Collection.set_edgecolor* For setting the edge or face
color individually.

set_contains(self, picker)
Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

Parameters

picker [callable] A custom picker function to evaluate if an event is
within the artist. The function must have the signature:

```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```
that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the
  same information as the default *contains()* implementation of the re-
  spective artist, but may provide additional information.

set_dashes(self, ls)
Alias for *set_linestyle*.

set_ec(self, c)
Alias for *set_edgecolor*.

set_edgecolor(self, c)
Set the edgecolor(s) of the collection.

Parameters
c [color or sequence of colors or ‘face’] The collection edgecolor(s). If a sequence, the patches cycle through it. If ‘face’, match the facecolor.

```python
set_edgecolors(self, c)
    Alias for set_edgecolor.
```

```python
set_facecolor(self, c)
    Set the facecolor(s) of the collection. c can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

    If c is ‘none’, the patch will not be filled.
```

**Parameters**

c [color or sequence of colors]

```python
set_facecolors(self, c)
    Alias for set_facecolor.
```

```python
set_fc(self, c)
    Alias for set_facecolor.
```

```python
set_figure(self, fig)
    Set the Figure instance the artist belongs to.
```

**Parameters**

fig [Figure]

```python
set_gid(self, gid)
    Set the (group) id for the artist.
```

**Parameters**

gid [str]

```python
set_hatch(self, hatch)
    Set the hatching pattern
```

hatch can be one of:

```
/  - diagonal hatching
\  - back diagonal
|  - vertical
-  - horizontal
+  - crossed
dx  - crossed diagonal
o  - small circle
O  - large circle
.  - dots
*  - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

**Parameters**

hatch [{’/’, ’\’, ’|’, ’-’, ’+’, ’x’, ’o’, ’O’, ’.’, ’*’}]
set_in_layout(self, in_layout)
Set if artist is to be included in layout calculations, E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname, bbox_inches='tight').

Parameters
- **in_layout** [bool]

set_joinstyle(self, js)
Set the joinstyle for the collection (for all its elements).

Parameters
- **js** [{‘miter’, ‘round’, ‘bevel’}] The joinstyle

set_label(self, s)
Set a label that will be displayed in the legend.

Parameters
- **s** [object] s will be converted to a string by calling str.

set_linestyle(self, ls)
Set the linestyle(s) for the collection.

<table>
<thead>
<tr>
<th>linestyle</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-.' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq),

where onoffseq is an even length tuple of on and off ink in points.

Parameters
- **ls** [{‘–’, ‘-‘, ‘-..’, ‘:’, ‘’, (offset, on-off-seq), ...}] The line style.

set_linestyles(self, ls)
Alias for set_linestyle.

set_linewidth(self, lw)
Set the linewidth(s) for the collection. lw can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence.

Parameters
- **lw** [float or sequence of floats]

set_linewidths(self, lw)
Alias for set_linewidth.

set_ls(self, ls)
Alias for set_linestyle.

set_lw(self, lw)
Alias for set_linewidth.

set_norm(self, norm)
Set the normalization instance.
Parameters

**norm** [Normalize]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

```
set_offset_position(self, offset_position)
```

Set how offsets are applied. If `offset_position` is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Parameters

**offset_position** [{'screen', 'data'}]

```
set_offsets(self, offsets)
```

Set the offsets for the collection.

Parameters

**offsets** [float or sequence of floats]

```
set_path_effects(self, path_effects)
```

Set the path effects.

Parameters

**path_effects** [AbstractPathEffect]

```
set_paths(self)
```

```
set_picker(self, picker)
```

Define the picking behavior of the artist.

Parameters

**picker** [None or bool or float or callable] This can be one of the following:

- **None**: Picking is disabled for this artist (default).
- **A boolean**: If True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- **A float**: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event.
- **A function**: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```python
hit, props = picker(artist, mouseevent)
```

to determine the hit test. If the mouse event is over the artist, return `hit=True` and props is a dictionary of properties you want added to the PickEvent attributes.
set_pickradius(self, pr)
    Set the pick radius used for containment tests.

    **Parameters**

    *d* [float] Pick radius, in points.

set_rasterized(self, rasterized)
    Force rasterized (bitmap) drawing in vector backend output.

    Defaults to None, which implies the backend’s default behavior.

    **Parameters**

    *rasterized* [bool or None]

set_sizes(self, sizes, dpi=72.0)
    Set the sizes of each member of the collection.

    **Parameters**

    *sizes* [ndarray or None] The size to set for each element of the collection.
    The value is the ‘area’ of the element.

    *dpi* [float] The dpi of the canvas. Defaults to 72.0.

set_sketch_params(self, scale=None, length=None, randomness=None)
    Sets the sketch parameters.

    **Parameters**

    *scale* [float, optional] The amplitude of the wiggle perpendicular to the
    source line, in pixels. If scale is None, or not provided, no sketch filter
    will be provided.

    *length* [float, optional] The length of the wiggle along the line, in pixels
    (default 128.0)

    *randomness* [float, optional] The scale factor by which the length is
    shrunken or expanded (default 16.0)

set_snap(self, snap)
    Set the snapping behavior.

    Snapping aligns positions with the pixel grid, which results in clearer images. For
    example, if a black line of 1px width was defined at a position in between two pixels,
    the resulting image would contain the interpolated value of that line in the pixel grid,
    which would be a grey value on both adjacent pixel positions. In contrast, snapping
    will move the line to the nearest integer pixel value, so that the resulting image will
    really contain a 1px wide black line.

    Snapping is currently only supported by the Agg and MacOSX backends.

    **Parameters**

    *snap* [bool or None] Possible values:
    * True: Snap vertices to the nearest pixel center.
    * False: Do not modify vertex positions.
    * None: (auto) If the path contains only rectilinear line segments, round
      to the nearest pixel center.

set_transform(self, t)
    Set the artist transform.
Parameters

\( t \ [\text{Transform}] \)

set_url(self, url)
Set the url for the artist.

Parameters

url [str]

set_urls(self, urls)

Parameters

urls [List[str] or None]

set_visible(self, b)
Set the artist’s visibility.

Parameters

b [bool]

set_zorder(self, level)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level [float]

stale
Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the internal state of the artist.

sticky_edges
x and y sticky edge lists for autoscaling.
When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added—the view limit “sticks” to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

Examples

```python
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(self, x, alpha=None, bytes=False, norm=True)
Return a normalized rgba array corresponding to \( x \).
In the normal case, \( x \) is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.
There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If \( x \) is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with
values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the alpha kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the alpha kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if bytes is False (default), the rgba array will be floats in the 0-1 range; if it is True, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(self, props)
    Update this artist’s properties from the dictionary props.

update_from(self, other)
    copy properties from other to self

update_scalarmappable(self)
    Update colors from the scalar mappable array, if it is not None.

zorder = 0

class matplotlib.collections.Collection(edgecolors=None, facecolors=None, linewidths=None, linestyles='solid', capstyle=None, joinstyle=None, anti_aliaseds=None, offsets=None, transOffset=None, norm=None, cmap=None, pick_radius=5.0, hatch=None, urls=None, offset_position='screen', zorder=1, **kwargs)

Bases: matplotlib.artist.Artist, matplotlib.cm.ScalarMappable

Base class for Collections. Must be subclassed to be usable.

All properties in a collection must be sequences or scalars; if scalars, they will be converted to sequences. The property of the ith element of the collection is:

prop[i % len(props)]

Exceptions are capstyle and joinstyle properties, these can only be set globally for the whole collection.

Keyword arguments and default values:

- `edgecolors`: None
- `facecolors`: None
- `linewidths`: None
- `capstyle`: None
- `joinstyle`: None
- `anti_aliaseds`: None
- `offsets`: None
- `transOffset`: transforms.IdentityTransform()
- `offset_position`: ‘screen’ (default) or ‘data’
- `norm`: None (optional for matplotlib.cm.ScalarMappable)
- `cmap`: None (optional for matplotlib.cm.ScalarMappable)
• `hatch`: None
• `zorder`: 1

`offsets` and `transOffset` are used to translate the patch after rendering (default no offsets). If `offset_position` is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

If any of `edgecolors`, `facecolors`, `linewidths`, `antialiaseds` are None, they default to their `matplotlib.rcParams` patch setting, in sequence form.

The use of `ScalarMappable` is optional. If the `ScalarMappable` matrix `_A` is not None (i.e., a call to `set_array` has been made), at draw time a call to scalar mappable will be made to set the face colors.

Create a Collection

```python
%(Collection)s
```

`add_callback(self, func)`
Add a callback function that will be called whenever one of the `Artist`’s properties changes.

**Parameters**

- `func` [callable] The callback function. It must have the signature:

  ```python
def func(artist: Artist) -> Any
  ```

  where `artist` is the calling `Artist`. Return values may exist but are ignored.

**Returns**

- `oid` [int] The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

**See also:**

- `remove_callback`

`add_checker(self, checker)`
Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

**aname**

`autoscale(self)`
Autoscale the scalar limits on the norm instance using the current array

`autoscale_None(self)`
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`axes`
The `Axes` instance the artist resides in, or `None`.

`changed(self)`
Call this whenever the mappable is changed to notify all the callback listeners to the ‘changed’ signal.
check_update(self, checker)
    If mappable has changed since the last check, return True; else return False

contains(self, mouseevent)
    Test whether the mouse event occurred in the collection.
    Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

convert_xunits(self, x)
    Convert x using the unit type of the xaxis.
    If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

convert_yunits(self, y)
    Convert y using the unit type of the yaxis.
    If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

draw(self, renderer)
    Draw the Artist using the given renderer.
    This method will be overridden in the Artist subclasses. Typically, it is implemented to not have any effect if the Artist is not visible (Artist.get_visible is False).

    Parameters
    renderer [RendererBase subclass.]

findobj(self, match=None, include_self=True)
    Find artist objects.
    Recursively find all Artist instances contained in the artist.

    Parameters
    match A filter criterion for the matches. This can be
        • None: Return all objects contained in artist.
        • A function with signature def match(artist: Artist) -> bool. The result will only contain artists for which the function returns True.
        • A class instance: e.g., Line2D. The result will only contain artists of this class or its subclasses (isinstance check).
    include_self [bool] Include self in the list to be checked for a match.

    Returns
    artists [list of Artist]

format_cursor_data(self, data)
    Return a string representation of data.

    Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

    The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

    See also:
get_cursor_data

get_agg_filter(self)
    Return filter function to be used for agg filter.

get_alpha(self)
    Return the alpha value used for blending - not supported on all backends

get_animated(self)
    Return the animated state.

get_array(self)
    Return the array

get_capstyle(self)

get_children(self)
    Return a list of the child Artists of this Artist.

get_clim(self)
    return the min, max of the color limits for image scaling

get_clip_box(self)
    Return the clipbox.

get_clip_on(self)
    Return whether the artist uses clipping.

get_clip_path(self)
    Return the clip path.

get_cmap(self)
    return the colormap

get_contains(self)
    Return the custom contains function of the artist if set, or None.

See also:

set_contains

get_cursor_data(self, event)
    Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that format_cursor_data can convert the data to a string representation.

The only current use case is displaying the z-value of an AxesImage in the status bar of a plot window, while moving the mouse.

Parameters

    event [matplotlib.backend_bases.MouseEvent]
See also:

format_cursor_data

get_dashes(self)
    Alias for get_linestyle.

get_datalim(self, transData)

get_ec(self)
    Alias for get_edgecolor.

get_edgecolor(self)

get_edgecolors(self)
    Alias for get_edgecolor.

get_facecolor(self)

get_facecolors(self)
    Alias for get_facecolor.

get_fc(self)
    Alias for get_facecolor.

get_figure(self)
    Return the Figure instance the artist belongs to.

get_fill(self)
    return whether fill is set

get_gid(self)
    Return the group id.

get_hatch(self)
    Return the current hatching pattern.

get_in_layout(self)
    Return boolean flag, True if artist is included in layout calculations.
    E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname,
         bbox_inches='tight').

get_joinstyle(self)

get_label(self)
    Return the label used for this artist in the legend.

get_linestyle(self)

get_linestyles(self)
    Alias for get_linestyle.

get_linewidth(self)

get_linewidths(self)
    Alias for get_linewidth.

get_ls(self)
    Alias for get_linestyle.

get_lw(self)
    Alias for get_linewidth.
get_offset_position(self)
    Returns how offsets are applied for the collection. If offset_position is ‘screen’, the
    offset is applied after the master transform has been applied, that is, the offsets are
    in screen coordinates. If offset_position is ‘data’, the offset is applied before the
    master transform, i.e., the offsets are in data coordinates.

get_offset_transform(self)

get_offsets(self)
    Return the offsets for the collection.

get_path_effects(self)

get_paths(self)

get_picker(self)
    Return the picking behavior of the artist.
    The possible values are described in set_picker.

    See also:
    set_picker, pickable, pick

get_pickradius(self)

get_rasterized(self)
    Return whether the artist is to be rasterized.

get_sketch_params(self)
    Returns the sketch parameters for the artist.

    Returns
    sketch_params [tuple or None] A 3-tuple with the following elements:
    • scale: The amplitude of the wiggle perpendicular to the source line.
    • length: The length of the wiggle along the line.
    • randomness: The scale factor by which the length is shrunken or ex-
    panded.
    Returns None if no sketch parameters were set.

get_snap(self)
    Returns the snap setting.
    See set_snap for details.

get_tightbbox(self, renderer)
    Like Artist.get_window_extent, but includes any clipping.

    Parameters
    renderer [RendererBase instance] renderer that will be used to draw the
    figures (i.e. fig.canvas.get_renderer())

    Returns
    bbox [BBox] The enclosing bounding box (in figure pixel co-ordinates).

get_transform(self)
    Return the Transform instance used by this artist.
get_transformed_clip_path_and_affine(self)
    Return the clip path with the non-affine part of its transformation applied, and the
    remaining affine part of its transformation.

get_transforms(self)

get_url(self)
    Return the url.

get_urls(self)

get_visible(self)
    Return the visibility.

get_window_extent(self, renderer)
    Get the axes bounding box in display space.
    The bounding box’ width and height are nonnegative.
    Subclasses should override for inclusion in the bounding box “tight” calculation.
    Default is to return an empty bounding box at 0, 0.
    Be careful when using this function, the results will not update if the artist window
    extent of the artist changes. The extent can change due to any changes in the transform
    stack, such as changing the axes limits, the figure size, or the canvas used (as is
    done when saving a figure). This can lead to unexpected behavior where interactive
    figures will look fine on the screen, but will save incorrectly.

get_zorder(self)
    Return the artist’s zorder.

have_units(self)
    Return True if units are set on the x or y axes.

is_transform_set(self)
    Return whether the Artist has an explicitly set transform.
    This is True after set_transform has been called.

mouseover

pchanged(self)
    Call all of the registered callbacks.
    This function is triggered internally when a property is changed.
    See also:

    add_callback

    remove_callback

pick(self, mouseevent)
    Process a pick event.
    Each child artist will fire a pick event if mouseevent is over the artist and the artist
    has picker set.
    See also:

    set_picker, get_picker, pickleable
**pickle**

Return whether the artist is pickable.

**See also:**

set_picker, get_picker, pick

**properties**

Return a dictionary of all the properties of the artist.

**remove**

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist’s legend entry.

**remove_callback**

Remove a callback based on its observer id.

**See also:**

add_callback

**set**

A property batch setter. Pass `kwargs` to set properties.

**set_aa**

Alias for `set_antialiased`.

**set_agg_filter**

Set the agg filter.

**Parameters**

`filter_func` [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**set_alpha**

Set the alpha transparencies of the collection.

**Parameters**

`alpha` [float or None]

**set_animated**

Set the artist’s animation state.

**Parameters**

`b` [bool]

**set_antialiased**

Set the antialiasing state for rendering.

**Parameters**

`aa` [bool or sequence of bools]
set_antialiaseds(self, aa)
   Alias for \texttt{set_antialiased}.

set_array(self, A)
   Set the image array from numpy array \(A\).

   \textbf{Parameters}

   \hspace{1em} \texttt{A} [ndarray]

set_capstyle(self, cs)
   Set the capstyle for the collection (for all its elements).

   \textbf{Parameters}

   \hspace{1em} \texttt{cs} [{'butt', 'round', 'projecting'}] The capstyle

set_clim(self, vmin=None, vmax=None)
   Set the norm limits for image scaling; if \(vmin\) is a length2 sequence, interpret it as
   \((vmin, \, vmax)\) which is used to support \texttt{setp}

   ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have
   \(vmin\) and \(vmax\) kwargs.

set_clip_box(self, clipbox)
   Set the artist's clip \texttt{Bbox}.

   \textbf{Parameters}

   \hspace{1em} \texttt{clipbox} [\texttt{Bbox}]

set_clip_on(self, b)
   Set whether the artist uses clipping.

   When False artists will be visible out side of the axes which can lead to unexpected
   results.

   \textbf{Parameters}

   \hspace{1em} \texttt{b} [bool]

set_clip_path(self, path, transform=None)
   Set the artist's clip path, which may be:
   \begin{itemize}
   \item a \texttt{Patch} (or subclass) instance; or
   \item a \texttt{Path} instance, in which case a \texttt{Transform} instance, which will be applied to the
     path before using it for clipping, must be provided; or
   \item \texttt{None}, to remove a previously set clipping path.
   \end{itemize}

   For efficiency, if the path happens to be an axis-aligned rectangle, this method will
   set the clipping box to the corresponding rectangle and set the clipping path to \texttt{None}.

   ACCEPTS: \([\texttt{Path}, \texttt{Transform}] | \texttt{Patch} | \texttt{None}]\)

set_cmap(self, cmap)
   Set the colormap for luminance data

   \textbf{Parameters}

   \hspace{1em} \texttt{cmap} [colormap or registered colormap name]

set_color(self, c)
   Set both the edgecolor and the facecolor.

   \textbf{Parameters}
**c** [color or sequence of rgba tuples]

**See also:**

`Collection.set_facecolor`, `Collection.set_edgecolor` For setting the edge or face color individually.

`set_contains(self, picker)`

Define a custom contains test for the artist.

The provided callable replaces the default `contains` method of the artist.

**Parameters**

- **picker** [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

  ```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
  ```

  that returns:
  
  • a bool indicating if the event is within the artist
  
  • a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

`set_dashes(self, ls)`

Alias for `set_linestyle`.

`set_ec(self, c)`

Alias for `set_edgecolor`.

`set_edgecolor(self, c)`

Set the edgecolor(s) of the collection.

**Parameters**

- **c** [color or sequence of colors or ‘face’] The collection edgecolor(s). If a sequence, the patches cycle through it. If ‘face’, match the facecolor.

`set_edgecolors(self, c)`

Alias for `set_edgecolor`.

`set_facecolor(self, c)`

Set the facer color(s) of the collection. c can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If c is ‘none’, the patch will not be filled.

**Parameters**

- **c** [color or sequence of colors]

`set_facecolors(self, c)`

Alias for `set_facecolor`.

`set_fc(self, c)`

Alias for `set_facecolor`.

`set_figure(self, fig)`

Set the `Figure` instance the artist belongs to.
Parameters

fig [Figure]

set_gid(self, gid)
Set the (group) id for the artist.

Parameters

gid [str]

set_hatch(self, hatch)
Set the hatching pattern

hatch can be one of:

\/
/ - diagonal hatching
\| - back diagonal
| - vertical
| - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars

Letters can be combined, in which case all the specified hatchings are done. If same
letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified
for the collection as a whole, not separately for each member.

Parameters

set_in_layout(self, in_layout)
Set if artist is to be included in layout calculations, E.g. Constrained Layout Guide,
Figure.tight_layout(), and fig.savefig(fname, bbox_inches='tight')

Parameters

in_layout [bool]

set_joinstyle(self, js)
Set the joinstyle for the collection (for all its elements).

Parameters

js [{‘miter’, ‘round’, ‘bevel’}] The joinstyle

set_label(self, s)
Set a label that will be displayed in the legend.

Parameters

s [object] s will be converted to a string by calling str.

set_linestyle(self, ls)
Set the linestyle(s) for the collection.
<table>
<thead>
<tr>
<th>linestyle</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-.' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where onoffseq is an even length tuple of on and off ink in points.

**Parameters**

- **ls** [{',', '-', '.', ':', '', (offset, on-off-seq), ...}] The line style.

```python
set_linestyles(self, ls)
```

Alias for `set_linestyle`.

```python
set_linewidths(self, lw)
```

Alias for `set_linewidth`.

```python
set_lw(self, lw)
```

Alias for `set_linewidth`.

```python
set_norm(self, norm)
```

Set the normalization instance.

**Parameters**

- **norm** [Normalize]

**Notes**

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

```python
set_offset_position(self, offset_position)
```

Set how offsets are applied. If `offset_position` is ‘screen’ (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is ‘data’, the offset is applied before the master transform, i.e., the offsets are in data coordinates.

**Parameters**

- **offset_position** [{‘screen’, ‘data’}]
Parameters

**offsets** [float or sequence of floats]

```python
set_path_effects(self, path_effects)
```
Set the path effects.

Parameters

**path_effects** [AbstractPathEffect]

```python
set_paths(self)
```

```python
set_picker(self, picker)
```
Define the picking behavior of the artist.

Parameters

**picker** [None or bool or float or callable] This can be one of the following:

- **None**: Picking is disabled for this artist (default).
- A boolean: If True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```python
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

```python
set_pickradius(self, pr)
```
Set the pick radius used for containment tests.

Parameters

**d** [float] Pick radius, in points.

```python
set_rasterized(self, rasterized)
```
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend’s default behavior.

Parameters

**rasterized** [bool or None]

```python
set_sketch_params(self, scale=None, length=None, randomness=None)
```
Sets the sketch parameters.

Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is *None*, or not provided, no sketch filter will be provided.
**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap(self, snap)`
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**

**snap** [bool or None] Possible values:
- `True`: Snap vertices to the nearest pixel center.
- `False`: Do not modify vertex positions.
- `None`: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform(self, t)`
Set the artist transform.

**Parameters**

**t** [Transform]

`set_url(self, url)`
Set the url for the artist.

**Parameters**

**url** [str]

`set_urls(self, urls)`

**Parameters**

**urls** [List[str] or None]

`set_visible(self, b)`
Set the artist's visibility.

**Parameters**

**b** [bool]

`set_zorder(self, level)`
Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**

**level** [float]

**stale**
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.
sticky_edges
x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added—the view limit “sticks” to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

Examples

```python
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgbaself, x, alpha=None, bytes=False, norm=True)

Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the alpha kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the alpha kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if bytes is False (default), the rgba array will be floats in the 0-1 range; if it is True, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(self, props)
Update this artist’s properties from the dictionary props.

update_from(self, other)
copy properties from other to self

update_scalarmappable(self)
Update colors from the scalar mappable array, if it is not None.

zorder = 0
class matplotlib.collections.EllipseCollection(widths, heights, angles, units='points', **kwargs)

A collection of ellipses, drawn using splines.

Parameters

- **widths** [array-like] The lengths of the first axes (e.g., major axis lengths).
**heights** [array-like] The lengths of second axes.

**angles** [array-like] The angles of the first axes, degrees CCW from the x-axis.

**units** [{‘points’, ‘inches’, ‘dots’, ‘width’, ‘height’, ‘x’, ‘y’, ‘xy’}] The units in which majors and minors are given; ‘width’ and ‘height’ refer to the dimensions of the axes, while ‘x’ and ‘y’ refer to the offsets data units. ‘xy’ differs from all others in that the angle as plotted varies with the aspect ratio, and equals the specified angle only when the aspect ratio is unity. Hence it behaves the same as the Ellipse with axes.transData as its transform.

**Other Parameters**

**kwargs** Additional kwargs inherited from the base Collection.

Valid Collection keyword arguments:

- **edgecolors**: None
- **facecolors**: None
- **linewidths**: None
- **antialiaseds**: None
- **offsets**: None
- **transOffset**: transforms.IdentityTransform()
- **norm**: None (optional for matplotlib.cm.ScalarMappable)
- **cmap**: None (optional for matplotlib.cm.ScalarMappable)

offsets and transOffset are used to translate the patch after rendering (default no offsets)

If any of edgecolors, facecolors, linewidths, antialiaseds are None, they default to their matplotlib.rcParams patch setting, in sequence form.

**add_callback(self, func)**

Add a callback function that will be called whenever one of the Artist’s properties changes.

**Parameters**

**func** [callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where artist is the calling Artist. Return values may exist but are ignored.

**Returns**

**oid** [int] The observer id associated with the callback. This id can be used for removing the callback with remove_callback later.

**See also:**

remove_callback
add_checker(self, checker)
   Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

aname
autoscale(self)
   Autoscale the scalar limits on the norm instance using the current array
autoscale_None(self)
   Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

axes
   The Axes instance the artist resides in, or None.

changed(self)
   Call this whenever the mappable is changed to notify all the callbackSM listeners to the ‘changed’ signal

check_update(self, checker)
   If mappable has changed since the last check, return True; else return False

contains(self, mouseevent)
   Test whether the mouse event occurred in the collection.
   Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

convert_xunits(self, x)
   Convert x using the unit type of the xaxis.
   If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

convert_yunits(self, y)
   Convert y using the unit type of the yaxis.
   If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

draw(self, renderer)
   Draw the Artist using the given renderer.
   This method will be overridden in the Artist subclasses. Typically, it is implemented to not have any effect if the Artist is not visible (Artist.get_visible is False).

   Parameters
      renderer [RendererBase subclass.]

findobj(self, match=None, include_self=True)
   Find artist objects.
   Recursively find all Artist instances contained in the artist.

   Parameters
      match A filter criterion for the matches. This can be
         • None: Return all objects contained in artist.
         • A function with signature def match(artist: Artist) -> bool. The result will only contain artists for which the function returns True.
• A class instance: e.g., Line2D. The result will only contain artists of this class or its subclasses (isinstance check).

**include_self** [bool] Include *self* in the list to be checked for a match.

**Returns**

**artists** [list of *Artist*]

*format_cursor_data*(self, data)*

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

*get_cursor_data*

*get_agg_filter*(self)*

Return filter function to be used for agg filter.

*get_alpha*(self)*

Return the alpha value used for blending - not supported on all backends

*get_animated*(self)*

Return the animated state.

*get_array*(self)*

Return the array

*get_capstyle*(self)*

Return a list of the child *Artists* of this *Artist*.

*get_clim*(self)*

return the min, max of the color limits for image scaling

*get_clip_box*(self)*

Return the clipbox.

*get_clip_on*(self)*

Return whether the artist uses clipping.

*get_clip_path*(self)*

Return the clip path.

*get_cmap*(self)*

return the colormap

*get_contains*(self)*

Return the custom contains function of the artist if set, or *None*.

**See also:**

*set_contains*
get_cursor_data(self, event)

Return the cursor data for a given event.

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns `None`.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

**Parameters**

**event** `matplotlib.backend_bases.MouseEvent`

**See also:**

`format_cursor_data`

get_dashes(self)

Alias for `get_linestyle`.

get_datalim(self, transData)

get_ec(self)

Alias for `get_edgecolor`.

get_edgecolor(self)

get_edgecolors(self)

Alias for `get_edgecolor`.

g_get_facecolor(self)

g_get_facecolors(self)

Alias for `get_facecolor`.

g_get_fc(self)

Alias for `get_facecolor`.

g_get_figure(self)

Return the `Figure` instance the artist belongs to.

g_get_fill(self)

return whether fill is set

g_get_gid(self)

Return the group id.

g_get_hatch(self)

Return the current hatching pattern.

g_get_in_layout(self)

Return boolean flag, True if artist is included in layout calculations.

E.g. `Constrained Layout Guide`, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.
get_joinstyle(self)
get_label(self)
    Return the label used for this artist in the legend.
get_linestyle(self)
get_linestyles(self)
    Alias for get_linestyle.
get_linewidth(self)
get_linewidths(self)
    Alias for get_linewidth.
get_ls(self)
    Alias for get_linestyle.
get_lw(self)
    Alias for get_linewidth.
get_offset_position(self)
    Returns how offsets are applied for the collection. If offset_position is ‘screen’, the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is ‘data’, the offset is applied before the master transform, i.e., the offsets are in data coordinates.
get_offset_transform(self)
get_offsets(self)
    Return the offsets for the collection.
get_path_effects(self)
get_paths(self)
get_picker(self)
    Return the picking behavior of the artist.
    The possible values are described in set_picker.
    
    See also:
    
    set_picker, pickleable, pick
get_pickradius(self)
get_rasterized(self)
    Return whether the artist is to be rasterized.
get_sketch_params(self)
    Returns the sketch parameters for the artist.

Returns

sketch_params [tuple or None] A 3-tuple with the following elements:
    • scale: The amplitude of the wiggle perpendicular to the source line.
    • length: The length of the wiggle along the line.
    • randomness: The scale factor by which the length is shrunk or expanded.
    Returns None if no sketch parameters were set.
get_snap(self)
    Returns the snap setting.
    See `set_snap` for details.

get_tightbbox(self, renderer)
    Like `Artist.get_window_extent`, but includes any clipping.

    Parameters
    ----------
    renderer : `RendererBase` instance
        Renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

    Returns
    -------
    bbox : `BBox`
        The enclosing bounding box (in figure pixel co-ordinates).

get_transform(self)
    Return the `Transform` instance used by this artist.

get_transposed_clip_path_and_affine(self)
    Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms(self)

get_url(self)
    Return the url.

get_urls(self)

get_visible(self)
    Return the visibility.

get_window_extent(self, renderer)
    Get the axes bounding box in display space.
    The bounding box’ width and height are nonnegative.
    Subclasses should override for inclusion in the bounding box “tight” calculation.
    Default is to return an empty bounding box at 0, 0.
    Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder(self)
    Return the artist’s zorder.

have_units(self)
    Return `True` if units are set on the x or y axes.

is_transform_set(self)
    Return whether the Artist has an explicitly set transform.
    This is `True` after `set_transform` has been called.

mouseover

pchanged(self)
    Call all of the registered callbacks.
    This function is triggered internally when a property is changed.
See also:

add_callback
remove_callback

pick(self, mouseevent)
Process a pick event.
Each child artist will fire a pick event if mouseevent is over the artist and the artist has picker set.

See also:

set_picker, get_picker, pickable

pickable(self)
Return whether the artist is pickable.

See also:

set_picker, get_picker, pick

properties(self)
Return a dictionary of all the properties of the artist.

remove(self)
Remove the artist from the figure if possible.
The effect will not be visible until the figure is redrawn, e.g., with FigureCanvasBase.draw_idle. Call relim to update the axes limits if desired.

Note: relim will not see collections even if the collection was added to the axes with autolim = True.

Note: there is no support for removing the artist’s legend entry.

remove_callback(self, oid)
Remove a callback based on its observer id.

See also:

add_callback

set(self, **kwargs)
A property batch setter. Pass kwargs to set properties.

set_aa(self, aa)
Alias for set_antialiased.

set_agg_filter(self, filter_func)
Set the agg filter.

Parameters

filter_func [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

set_alpha(self, alpha)
Set the alpha transparencies of the collection.

Parameters
alpha [float or None]

set_animated(self, b)
    Set the artist’s animation state.

Parameters

   b [bool]

set_antialiased(self, aa)
    Set the antialiasing state for rendering.

Parameters

   aa [bool or sequence of bools]

set_antialiaseds(self, aa)
    Alias for set_antialiased.

set_array(self, A)
    Set the image array from numpy array A.

Parameters

   A [ndarray]

set_capstyle(self, cs)
    Set the capstyle for the collection (for all its elements).

Parameters

   cs [{‘butt’, ‘round’, ‘projecting’}] The capstyle

set_clim(self, vmin=None, vmax=None)
    set the norm limits for image scaling; if vmin is a length2 sequence, interpret it as
    (vmin, vmax) which is used to support setp

    ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have
    vmin and vmax kwargs.

set_clip_box(self, clipbox)
    Set the artist’s clip Bbox.

Parameters

   clipbox [Bbox]

set_clip_on(self, b)
    Set whether the artist uses clipping.

    When False artists will be visible out side of the axes which can lead to unexpected
    results.

Parameters

   b [bool]

set_clip_path(self, path, transform=None)
    Set the artist’s clip path, which may be:
    • a Patch (or subclass) instance; or
    • a Path instance, in which case a Transform instance, which will be applied to the
      path before using it for clipping, must be provided; or
    • None, to remove a previously set clipping path.
For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

**ACCEPTS:** [(Path, Transform) | Patch | None]

**set_cmap** *(self, cmap)*
set the colormap for luminance data

**Parameters**

- **cmap** [colormap or registered colormap name]  

**set_color** *(self, c)*
Set both the edgecolor and the facecolor.

**Parameters**

- **c** [color or sequence of rgba tuples]

**See also:**

*Collection.set_facecolor, Collection.set_edgecolor* For setting the edge or face color individually.

**set_contains** *(self, picker)*
Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

**Parameters**

- **picker** [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

  ```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
  ```

  that returns:

  - a bool indicating if the event is within the artist
  - a dict of additional information. The dict should at least return the same information as the default *contains()* implementation of the respective artist, but may provide additional information.

**set_dashes** *(self, ls)*
Alias for *set_linestyle.*

**set_ec** *(self, c)*
Alias for *set_edgecolor.*

**set_edgecolor** *(self, c)*
Set the edgecolor(s) of the collection.

**Parameters**

- **c** [color or sequence of colors or ‘face’] The collection edgecolor(s). If a sequence, the patches cycle through it. If ‘face’, match the facecolor.

**set_edgecolors** *(self, c)*
Alias for *set_edgecolor.*

**set_facecolor** *(self, c)*
Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches
have same color), or a sequence of specs; if it is a sequence the patches will cycle 
through the sequence.

If \( c \) is 'none', the patch will not be filled.

**Parameters**

\( c \) [color or sequence of colors]

**set_facecolors**(*self*, *c*)

Alias for **set_facecolor**.

**set_fcolor**(*self*, *c*)

Alias for **set_facecolor**.

**set_figure**(*self*, *fig*)

Set the *Figure* instance the artist belongs to.

**Parameters**

\( fig \) [*Figure*]

**set_gid**(*self*, *gid*)

Set the (group) id for the artist.

**Parameters**

\( gid \) [str]

**set_hatch**(*self*, *hatch*)

Set the hatching pattern

\( hatch \) can be one of:

```
/  - diagonal hatching
\  - back diagonal
|  - vertical
-  - horizontal
+  - crossed
x  - crossed diagonal
o  - small circle
O  - large circle
.  - dots
*  - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same 
letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified 
for the collection as a whole, not separately for each member.

**Parameters**

\( hatch \) [{’/’, ’\’, ’|’, ’-’, ’+’, ’x’, ’o’, ’O’, ’.’, ’*’}]

**set_in_layout**(*self*, *in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, 
*Figure.tight_layout()*, and *fig.savefig(fname, bbox_inches='tight�)***.

**Parameters**

\( in_layout \) [bool]
**set_joinstyle**(*self*, *js*)
Set the joinstyle for the collection (for all its elements).

**Parameters**

*js* ['miter', 'round', 'bevel'] The joinstyle

**set_label**(*self*, *s*)
Set a label that will be displayed in the legend.

**Parameters**

*s* [object] s will be converted to a string by calling str.

**set_linestyle**(*self*, *ls*)
Set the linestyle(s) for the collection.

<table>
<thead>
<tr>
<th>linestyle</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where onoffseq is an even length tuple of on and off ink in points.

**Parameters**

*ls* ['-', '-', '-', '-', ':', (offset, on-off-seq), ...] The line style.

**set_linestyles**(*self*, *ls*)
Alias for **set_linestyle**.

**set_linewidth**(*self*, *lw*)
Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence.

**Parameters**

*lw* [float or sequence of floats]

**set_linewidths**(*self*, *lw*)
Alias for **set_linewidth**.

**set_ls**(*self*, *ls*)
Alias for **set_linestyle**.

**set_Lw**(*self*, *lw*)
Alias for **set_linewidth**.

**set_norm**(*self*, *norm*)
Set the normalization instance.

**Parameters**

*norm* [Normalize]
Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position(self, offset_position)`
Set how offsets are applied. If `offset_position` is ‘screen’ (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is ‘data’, the offset is applied before the master transform, i.e., the offsets are in data coordinates.

**Parameters**

- `offset_position` [‘screen’, ‘data’]

`set_offsets(self, offsets)`
Set the offsets for the collection.

**Parameters**

- `offsets` [float or sequence of floats]

`set_path_effects(self, path_effects)`
Set the path effects.

**Parameters**

- `path_effects` [AbstractPathEffect]

`set_paths(self)`

`set_picker(self, picker)`
Define the picking behavior of the artist.

**Parameters**

- `picker` [None or bool or float or callable] This can be one of the following:
  - `None`: Picking is disabled for this artist (default).
  - A boolean: If `True` then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
  - A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it’s data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event.
  - A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

    ```python
    hit, props = picker(artist, mouseevent)
    ```

    to determine the hit test. If the mouse event is over the artist, return `hit=True` and props is a dictionary of properties you want added to the PickEvent attributes.

`set_pickradius(self, pr)`
Set the pick radius used for containment tests.

**Parameters**
set_rasterized(self, rasterized)
Force rasterized (bitmap) drawing in vector backend output.
Defaults to None, which implies the backend’s default behavior.

Parameters
rasterized [bool or None]

set_sketch_params(self, scale=None, length=128.0, randomness=16.0)
Sets the sketch parameters.

Parameters
scale [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.
length [float, optional] The length of the wiggle along the line, in pixels (default 128.0)
randomness [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

set_snap(self, snap)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters
snap [bool or None] Possible values:
• True: Snap vertices to the nearest pixel center.
• False: Do not modify vertex positions.
• None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transform(self, t)
Set the artist transform.

Parameters
t [Transform]

set_url(self, url)
Set the url for the artist.

Parameters
url [str]

set_urls(self, urls)

Parameters
urls [List[str] or None]

**set_visible**(self, b)
Set the artist’s visibility.

**Parameters**

b [bool]

**set_zorder**(self, level)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**

level [float]

**stale**
Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the internal state of the artist.

**sticky_edges**

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added—the view limit “sticks” to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

**Examples**

```python
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba**(self, x, alpha=None, bytes=False, norm=True)**
Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the alpha kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the alpha kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if bytes is False (default), the rgba array will be floats in the 0-1 range; if it is True, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).
update(self, props)
    Update this artist’s properties from the dictionary props.

update_from(self, other)
    copy properties from other to self

update_scaalarmappable(self)
    Update colors from the scalar mappable array, if it is not None.

zorder = 0
class matplotlib.collections.EventCollection(positions, orientation=None, lineoffset=0, linelength=1, linewidth=None, color=None, linestyle='solid', antialiased=None, **kwargs)

Bases: matplotlib.collections.LineCollection

A collection of discrete events.

The events are given by a 1-dimensional array, usually the position of something along an axis, such as time or length. They do not have an amplitude and are displayed as vertical or horizontal parallel bars.

Parameters

- **positions** [1D array-like object] Each value is an event.
- **orientation** [{None, ‘horizontal’, ‘vertical’}, optional] The orientation of the collection (the event bars are along the orthogonal direction). Defaults to ‘horizontal’ if not specified or None.
- **lineoffset** [scalar, optional, default: 0] The offset of the center of the markers from the origin, in the direction orthogonal to orientation.
- **linelength** [scalar, optional, default: 1] The total height of the marker (i.e. the marker stretches from lineoffset - linelength/2 to lineoffset + linelength/2).
- **linewidth** [scalar or None, optional, default: None] If it is None, defaults to its rcParams setting, in sequence form.
- **color** [color, sequence of colors or None, optional, default: None] If it is None, defaults to its rcParams setting, in sequence form.
- **linestyle** [str or tuple, optional, default: ‘solid’] Valid strings are [‘solid’, ‘dashed’, ‘dashdot’, ‘dotted’, ‘-’, ‘–’, ‘-·’, ‘-·-’]. Dash tuples should be of the form:

  (offset, onoffseq),

  where onoffseq is an even length tuple of on and off ink in points.
- **antialiased** [{None, 1, 2}, optional] If it is None, defaults to its rcParams setting, in sequence form.
- ****kwargs [optional] Other keyword arguments are line collection properties. See LineCollection for a list of the valid properties.
Examples

add_callback(self, func)
Add a callback function that will be called whenever one of the Artist's properties changes.

Parameters

func [callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where artist is the calling Artist. Return values may exist but are ignored.

Returns

oid [int] The observer id associated with the callback. This id can be used for removing the callback with remove_callback later.

See also:

remove_callback

add_checker(self, checker)
Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.
add_positions(self, position)
    add one or more events at the specified positions

append_positions(self, position)
    add one or more events at the specified positions

autoscale(self)
    Autoscale the scalar limits on the norm instance using the current array

autoscale_None(self)
    Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

axes
    The Axes instance the artist resides in, or None.

changed(self)
    Call this whenever the mappable is changed to notify all the callback listeners to the 'changed' signal

check_update(self, checker)
    If mappable has changed since the last check, return True; else return False

contains(self, mouseevent)
    Test whether the mouse event occurred in the collection.
    Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

convert_xunits(self, x)
    Convert x using the unit type of the xaxis.
    If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

convert_yunits(self, y)
    Convert y using the unit type of the yaxis.
    If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

draw(self, renderer)
    Draw the Artist using the given renderer.
    This method will be overridden in the Artist subclasses. Typically, it is implemented to not have any effect if the Artist is not visible (Artist.get_visible is False).

    Parameters
        renderer [RendererBase subclass.]

extend_positions(self, position)
    add one or more events at the specified positions

findobj(self, match=None, include_self=True)
    Find artist objects.
    Recursively find all Artist instances contained in the artist.

    Parameters
        match A filter criterion for the matches. This can be
            • None: Return all objects contained in artist.
• A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns `True`.

• A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

`include_self` [bool] Include `self` in the list to be checked for a match.

**Returns**

`artists` [list of `Artist`]  

`format_cursor_data(self, data)`  
Return a string representation of `data`.

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

`get_cursor_data`

`get_agg_filter(self)`  
Return filter function to be used for agg filter.

`get_alpha(self)`  
Return the alpha value used for blending - not supported on all backends

`get_animated(self)`  
Return the animated state.

`get_array(self)`  
Return the array

`get_capstyle(self)`

`get_children(self)`  
Return a list of the child `Artists` of this `Artist`.

`get_clim(self)`  
return the min, max of the color limits for image scaling

`get_clip_box(self)`  
Return the clipbox.

`get_clip_on(self)`  
Return whether the artist uses clipping.

`get_clip_path(self)`  
Return the clip path.

`get_cmap(self)`  
return the colormap

`get_color(self)`  
get the color of the lines used to mark each event

`get_colors(self)`
getContains(self)
    Return the custom contains function of the artist if set, or None.

See also:

setContains

getCursorData(self, event)
    Return the cursor data for a given event.

    Note: This method is intended to be overridden by artist subclasses. As an end-user
    of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a
given event. The default implementation just returns None.

Subclasses can override the method and return arbitrary data. However, when do-
ing so, they must ensure that formatCursorData can convert the data to a string
representation.

The only current use case is displaying the z-value of an AxesImage in the status bar
of a plot window, while moving the mouse.

Parameters

    event [matplotlib.backend_bases.MouseEvent]

See also:

formatCursorData

getDashes(self)
    Alias for getLinestyle.

ger_datalim(self, transData)

ger_ec(self)
    Alias for getEdgecolor.

ger_ecolor(self)

ger_ecolors(self)
    Alias for getEdgecolor.

ger_facecolor(self)

ger_facecolors(self)
    Alias for getFacecolor.

ger_fc(self)
    Alias for getFacecolor.

ger_fiil(self)
    return whether fill is set

ger_gid(self)
    Return the group id.
get_hatch(self)
    Return the current hatching pattern.

get_in_layout(self)
    Return boolean flag, True if artist is included in layout calculations.

    E.g. `Constrained Layout Guide`, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle(self)

get_label(self)
    Return the label used for this artist in the legend.

get_linelength(self)
    get the length of the lines used to mark each event

get_lineoffset(self)
    get the offset of the lines used to mark each event

get_linestyle(self)

get_linestyles(self)
    Alias for `get_linestyle`.

get_linewidth(self)
    Get the width of the lines used to mark each event.

get_linewidths(self)
    Alias for `get_linewidth`.

gt_ls(self)
    Alias for `get_linestyle`.

gt_lw(self)
    Alias for `get_linewidth`.

get_offset_position(self)
    Returns how offsets are applied for the collection. If `offset_position` is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

get_offset_transform(self)

get_offsets(self)
    Return the offsets for the collection.

get_orientation(self)
    get the orientation of the event line, may be: [ 'horizontal' | 'vertical' ]

get_path_effects(self)

get_paths(self)

get_picker(self)
    Return the picking behavior of the artist.

    The possible values are described in `set_picker`.

    See also:

    `set_picker`, `pickable`, `pick`
get_pickradius(self)
get_positions(self)
    return an array containing the floating-point values of the positions
get_rasterized(self)
    Return whether the artist is to be rasterized.
get_segments(self)

Returns

    segments [list] List of segments in the LineCollection. Each list item
    contains an array of vertices.
get_sketch_params(self)
    Returns the sketch parameters for the artist.

Returns

    sketch_params [tuple or None] A 3-tuple with the following elements:
        • scale: The amplitude of the wiggle perpendicular to the source line.
        • length: The length of the wiggle along the line.
        • randomness: The scale factor by which the length is shrunken or ex-
          panded.
    Returns None if no sketch parameters were set.
get_snap(self)
    Returns the snap setting.
    See set_snap for details.
get_tightbbox(self, renderer)
    Like Artist.get_window_extent, but includes any clipping.

Parameters

    renderer [RendererBase instance] renderer that will be used to draw the
    figures (i.e. fig.canvas.get_renderer())

Returns

    bbox [BBox] The enclosing bounding box (in figure pixel co-ordinates).
get_transform(self)
    Return the Transform instance used by this artist.
get_transformed_clip_path_and_affine(self)
    Return the clip path with the non-affine part of its transformation applied, and the
    remaining affine part of its transformation.
get_transforms(self)
get_url(self)
    Return the url.
get_urls(self)
get_visible(self)
    Return the visibility.
get_window_extent(self, renderer)
    Get the axes bounding box in display space.
    The bounding box’ width and height are nonnegative.
    Subclasses should override for inclusion in the bounding box “tight” calculation.
    Default is to return an empty bounding box at 0, 0.
    Be careful when using this function, the results will not update if the artist window
    extent of the artist changes. The extent can change due to any changes in the trans-
    form stack, such as changing the axes limits, the figure size, or the canvas used (as is
done when saving a figure). This can lead to unexpected behavior where interactive
figures will look fine on the screen, but will save incorrectly.

get_zorder(self)
    Return the artist’s zorder.

have_units(self)
    Return True if units are set on the x or y axes.

is_horizontal(self)
    True if the eventcollection is horizontal, False if vertical

is_transform_set(self)
    Return whether the Artist has an explicitly set transform.
    This is True after set_transform has been called.

mouseover

pchanged(self)
    Call all of the registered callbacks.
    This function is triggered internally when a property is changed.
    See also:

        add_callback
        remove_callback

pick(self, mouseevent)
    Process a pick event.
    Each child artist will fire a pick event if mouseevent is over the artist and the artist
    has picker set.
    See also:

        set_picker, get_picker, pickable

pickable(self)
    Return whether the artist is pickable.
    See also:

        set_picker, get_picker, pick

properties(self)
    Return a dictionary of all the properties of the artist.
remove(self)
    Remove the artist from the figure if possible.

    The effect will not be visible until the figure is redrawn, e.g., with FigureCanvasBase.
    draw_idle. Call relim to update the axes limits if desired.

    Note: relim will not see collections even if the collection was added to the axes with
    autolim = True.

    Note: there is no support for removing the artist’s legend entry.

remove_callback(self, oid)
    Remove a callback based on its observer id.

See also:

    add_callback

set(self, **kwargs)
    A property batch setter. Pass kwargs to set properties.

set_aa(self, aa)
    Alias for set_antialiased.

set_agg_filter(self, filter_func)
    Set the agg filter.

    Parameters

    filter_func [callable] A filter function, which takes a (m, n, 3) float array
    and a dpi value, and returns a (m, n, 3) array.

set_alpha(self, alpha)
    Set the alpha transparencies of the collection.

    Parameters

    alpha [float or None]

set_animated(self, b)
    Set the artist’s animation state.

    Parameters

    b [bool]

set_antialiased(self, aa)
    Set the antialiasing state for rendering.

    Parameters

    aa [bool or sequence of bools]

set_antialiaseds(self, aa)
    Alias for set_antialiased.

set_array(self, A)
    Set the image array from numpy array A.

    Parameters

    A [ndarray]

set_capstyle(self, cs)
    Set the capstyle for the collection (for all its elements).
Parameters

```
cs [{'butt', 'round', 'projecting'}] The capstyle
```

```
set_clim(self, vmin=None, vmax=None)
```
set the norm limits for image scaling; if vmin is a length2 sequence, interpret it as
(vmin, vmax) which is used to support setp

ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have
vmin and vmax kwargs.

```
set_clip_box(self, clipbox)
```
Set the artist’s clip Bbox.

Parameters

```
clipbox [Bbox]
```

```
set_clip_on(self, b)
```
Set whether the artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected
results.

Parameters

```
b [bool]
```

```
set_clip_path(self, path, transform=None)
```
Set the artist’s clip path, which may be:

- a Patch (or subclass) instance; or
- a Path instance, in which case a Transform instance, which will be applied to the
  path before using it for clipping, must be provided; or
- None, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will
set the clipping box to the corresponding rectangle and set the clipping path to None.

ACCEPTS: [(Path, Transform) | Patch | None]

```
set_cmap(self, cmap)
```
set the colormap for luminance data

Parameters

```
cmap [colormap or registered colormap name]
```

```
set_color(self, c)
```
Set the color(s) of the LineCollection.

Parameters

```
c [color or list of colors] Matplotlib color argument (all patches have
same color), or a sequence or rgba tuples; if it is a sequence the patches
will cycle through the sequence.
```

```
set_contains(self, picker)
```
Define a custom contains test for the artist.

The provided callable replaces the default contains method of the artist.

Parameters
**picker** [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

**set_dashes**

```python
set_dashes(self, ls)
```

Alias for `set_linestyle`.

**set_edgecolor**

```python
set_edgecolor(self, c)
```

Set the edgecolor(s) of the collection.

**Parameters**

- `c` [color or sequence of colors or ‘face’] The collection edgecolor(s). If a sequence, the patches cycle through it. If ‘face’, match the facecolor.

**set_facecolor**

```python
set_facecolor(self, c)
```

Set the facecolor(s) of the collection. `c` can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If `c` is ‘none’, the patch will not be filled.

**Parameters**

- `c` [color or sequence of colors]

**set_figure**

```python
set_figure(self, fig)
```

Set the `Figure` instance the artist belongs to.

**Parameters**

- `fig` [Figure]

**set_gid**

```python
set_gid(self, gid)
```

Set the (group) id for the artist.

**Parameters**

- `gid` [str]

**set_hatch**

```python
set_hatch(self, hatch)
```

Set the hatching pattern

`hatch` can be one of:
Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

**Parameters**

- **hatch** \[\{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'\}\]

**set_in_layout**(self, in_layout)

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

**Parameters**

- **in_layout** \[bool\]

**set_joinstyle**(self, js)

Set the joinstyle for the collection (for all its elements).

**Parameters**

- **js** \[\{'miter', 'round', 'bevel'\}\] The joinstyle

**set_label**(self, s)

Set a label that will be displayed in the legend.

**Parameters**

- **s** \[object\] s will be converted to a string by calling `str`.

**set_linelength**(self, linelength)

set the length of the lines used to mark each event

**set_lineoffset**(self, lineoffset)

set the offset of the lines used to mark each event

**set_linestyle**(self, ls)

Set the linestyle(s) for the collection.

<table>
<thead>
<tr>
<th>linestyle</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-.' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:
where `onoffseq` is an even length tuple of on and off ink in points.

**Parameters**

- **ls** `[{'-', '–', '-.', ':', '', (offset, on-off-seq), ...}]` The line style.

**set_linestyles** *(self, ls)*

Alias for `set_linestyle`.

**set_linewidth** *(self, lw)*

Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence.

**Parameters**

- **lw** `[float or sequence of floats]`

**set_linewidths** *(self, lw)*

Alias for `set_linewidth`.

**set_ls** *(self, ls)*

Alias for `set_linestyle`.

**set_lw** *(self, lw)*

Alias for `set_linewidth`.

**set_norm** *(self, norm)*

Set the normalization instance.

**Parameters**

- **norm** `[Normalize]`

**Notes**

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

**set_offset_position** *(self, offset_position)*

Set how offsets are applied. If `offset_position` is `screen` (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is `data`, the offset is applied before the master transform, i.e., the offsets are in data coordinates.

**Parameters**

- **offset_position** `['screen', 'data']`

**set_offsets** *(self, offsets)*

Set the offsets for the collection.

**Parameters**

- **offsets** `[float or sequence of floats]`

**set_orientation** *(self, orientation=None)*

Set the orientation of the event line `[ 'horizontal' | 'vertical' | None ]` defaults to `horizontal` if not specified or None
set_path_effects(*self*, path_effects)
    Set the path effects.

    **Parameters**

    *path_effects*: [AbstractPathEffect]

set_paths(*self*, segments)

set_picker(*self*, picker)
    Define the picking behavior of the artist.

    **Parameters**

    *picker*: [None or bool or float or callable]
        This can be one of the following:

        - *None*: Picking is disabled for this artist (default).
        - A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
        - A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it’s data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event.
        - A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

        ```python
        hit, props = picker(artist, mouseevent)
        ```

        to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(*self*, pr)
    Set the pick radius used for containment tests.

    **Parameters**

    *d*: [float] Pick radius, in points.

set_positions(*self*, positions)
    set the positions of the events to the specified value

set_rasterized(*self*, rasterized)
    Force rasterized (bitmap) drawing in vector backend output.

    Defaults to None, which implies the backend’s default behavior.

    **Parameters**

    *rasterized*: [bool or None]

set_segments(*self*, segments)

set_sketch_params(*self*, scale=None, length=None, randomness=None)
    Sets the sketch parameters.

    **Parameters**
**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

```
set_snap(self, snap)
```
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**

**snap** [bool or None] Possible values:

- `True`: Snap vertices to the nearest pixel center.
- `False`: Do not modify vertex positions.
- `None`: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

```
set_transform(self, t)
```
Set the artist transform.

**Parameters**

**t** [Transform]

```
set_url(self, url)
```
Set the url for the artist.

**Parameters**

**url** [str]

```
set_urls(self, urls)
```

**Parameters**

**urls** [List[str] or None]

```
set_verts(self, segments)
```

```
set_visible(self, b)
```
Set the artist’s visibility.

**Parameters**

**b** [bool]

```
set_zorder(self, level)
```
Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**
level [float]

stale
Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the internal state of the artist.

sticky_edges
x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added–the view limit “sticks” to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

Examples

```python
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

switch_orientation(self)
switch the orientation of the event line, either from vertical to horizontal or vice versa

to_rgba(self, x, alpha=None, bytes=False, norm=True)
Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the alpha kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the alpha kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if bytes is False (default), the rgba array will be floats in the 0-1 range; if it is True, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(self, props)
Update this artist’s properties from the dictionary props.

update_from(self, other)
copy properties from other to self

update_scalarmappable(self)
Update colors from the scalar mappable array, if it is not None.

zorder = 0
class matplotlib.collections.LineCollection(segments, linewidths=None, colors=None, antialiaseds=None, linestyles='solid', offsets=None, transOffset=None, norm=None, cmap=None, pickradius=5, zorder=2, facecolors='none', **kwargs)

Bases: matplotlib.collections.Collection

All parameters must be sequences or scalars; if scalars, they will be converted to sequences. The property of the ith line segment is:

\[
\text{prop}[i \% \text{len}(\text{props})]
\]

i.e., the properties cycle if the \text{len} of \text{props} is less than the number of segments.

**Parameters**

- **segments** A sequence of \text{(line0, line1, line2)}, where:

  \[
  \text{linen} = (x0, y0), (x1, y1), \ldots (xm, ym)
  \]

  or the equivalent numpy array with two columns. Each line can be a different length.

- **colors** [sequence, optional] A sequence of RGBA tuples (e.g., arbitrary color strings, etc, not allowed).

- **antialiaseds** [sequence, optional] A sequence of ones or zeros.

- **linestyles** [string, tuple, optional] Either one of \text{[ ‘solid’ | ‘dashed’ | ‘dash-dot’ | ‘dotted’ }], or a dash tuple. The dash tuple is:

  \[
  (\text{offset}, \text{onoffseq})
  \]

  where \text{onoffseq} is an even length tuple of on and off ink in points.

- **norm** [Normalize, optional] \text{Normalize} instance.

- **cmap** [string or Colormap, optional] Colormap name or \text{Colormap} instance.

- **pickradius** [float, optional] The tolerance in points for mouse clicks picking a line. Default is 5 pt.

- **zorder** [int, optional] zorder of the LineCollection. Default is 2.

- **facecolors** [optional] The facecolors of the LineCollection. Default is ‘none’. Setting to a value other than ‘none’ will lead to a filled polygon being drawn between points on each line.

**Notes**

If \text{linewidths}, \text{colors}, or \text{antialiaseds} is None, they default to their rcParams setting, in sequence form.

If \text{offsets} and \text{transOffset} are not None, then \text{offsets} are transformed by \text{transOffset} and applied after the segments have been transformed to display coordinates.

If \text{offsets} is not None but \text{transOffset} is None, then the \text{offsets} are added to the segments before any transformation. In this case, a single offset can be specified as:
offsets=(xo,yo)

and this value will be added cumulatively to each successive segment, so as to produce
a set of successively offset curves.

The use of ScalarMappable is optional. If the ScalarMappable array _A is not None (i.e., a
call to set_array() has been made), at draw time a call to scalar mappable will be made
to set the colors.

add_callback(self, func)

Add a callback function that will be called whenever one of the Artist's properties
changes.

Parameters

func [callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where artist is the calling Artist. Return values may exist but are ig-
nored.

Returns

oid [int] The observer id associated with the callback. This id can be
used for removing the callback with remove_callback later.

See also:

remove_callback

add_checker(self, checker)

Add an entry to a dictionary of boolean flags that are set to True when the mappable
is changed.

aname

autoscale(self)

Autoscale the scalar limits on the norm instance using the current array

autoscale_None(self)

Autoscale the scalar limits on the norm instance using the current array, changing
only limits that are None

axes

The Axes instance the artist resides in, or None.

changed(self)

Call this whenever the mappable is changed to notify all the callbackSM listeners to
the ‘changed’ signal

check_update(self, checker)

If mappable has changed since the last check, return True; else return False

contains(self, mouseevent)

Test whether the mouse event occurred in the collection.

Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

convert_xunits(self, x)

Convert x using the unit type of the xaxis.
If the artist is not in contained in an Axes or if the xaxis does not have units, $x$ itself is returned.

```python
def convert_yunits(self, y):
    Convert $y$ using the unit type of the yaxis.
```

If the artist is not in contained in an Axes or if the yaxis does not have units, $y$ itself is returned.

```python
def draw(self, renderer):
    Draw the Artist using the given renderer.
```

This method will be overridden in the Artist subclasses. Typically, it is implemented to not have any effect if the Artist is not visible ($Artist.get_visible$ is False).

**Parameters**

- `renderer` [RendererBase subclass.]

```python
def findobj(self, match=None, include_self=True):
    Recursively find all $Artist$ instances contained in the artist.
```

**Parameters**

- `match` A filter criterion for the matches. This can be
  - `None`: Return all objects contained in artist.
  - A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns `True`.
  - A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).
- `include_self` [bool] Include `self` in the list to be checked for a match.

**Returns**

- `artists` [list of $Artist$]

```python
def format_cursor_data(self, data):
    Return a string representation of `data`.
```

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

- `get_cursor_data`

```python
def get_agg_filter(self):
    Return filter function to be used for agg filter.
```

```python
def get_alpha(self):
    Return the alpha value used for blending - not supported on all backends
```

```python
def get_animated(self):
    Return the animated state.
get_array(self)
    Return the array

get_capstyle(self)

get_children(self)
    Return a list of the child Artists of this Artist.

get_clim(self)
    return the min, max of the color limits for image scaling

get_clip_box(self)
    Return the clipbox.

get_clip_on(self)
    Return whether the artist uses clipping.

get_clip_path(self)
    Return the clip path.

get_cmap(self)
    return the colormap

get_color(self)

get_colors(self)

get_contains(self)
    Return the custom contains function of the artist if set, or None.

    See also:

    set_contains

get_cursor_data(self, event)
    Return the cursor data for a given event.

    Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

    Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.

    Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that format_cursor_data can convert the data to a string representation.

    The only current use case is displaying the z-value of an AxesImage in the status bar of a plot window, while moving the mouse.

    Parameters

    event [matplotlib.backend_bases.MouseEvent]

    See also:

    format_cursor_data

get_dashes(self)
    Alias for get_linestyle.
get_datalim(self, transData)
get_ec(self)
    Alias for get_edgecolor.
get_edgecolor(self)
get_edgecolors(self)
    Alias for get_edgecolor.
get_facecolor(self)
get_facecolors(self)
    Alias for get_facecolor.
get_fc(self)
    Alias for get_facecolor.
get_figure(self)
    Return the Figure instance the artist belongs to.
get_fill(self)
    return whether fill is set
get_gid(self)
    Return the group id.
get_hatch(self)
    Return the current hatching pattern.
get_in_layout(self)
    Return boolean flag, True if artist is included in layout calculations.
    E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname, bbox_inches='tight')
get_joinstyle(self)
get_label(self)
    Return the label used for this artist in the legend.
get_linestyle(self)
get_linestyles(self)
    Alias for get_linestyle.
get_linewidth(self)
get_linewidths(self)
    Alias for get_linewidth.
get_ls(self)
    Alias for get_linestyle.
get_lw(self)
    Alias for get_linewidth.
get_offset_position(self)
    Returns how offsets are applied for the collection. If offset_position is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.
get_offset_transform(self)
get_offsets(self)
    Return the offsets for the collection.

get_path_effects(self)

get_paths(self)

get_picker(self)
    Return the picking behavior of the artist.
    
    The possible values are described in set_picker.

    See also:

    set_picker, pickable, pick

get_pickradius(self)

get_rasterized(self)
    Return whether the artist is to be rasterized.

get_segments(self)
    Returns

    segments [list] List of segments in the LineCollection. Each list item
    contains an array of vertices.

get_sketch_params(self)
    Returns the sketch parameters for the artist.

    Returns

    sketch_params [tuple or None] A 3-tuple with the following elements:
    • scale: The amplitude of the wiggle perpendicular to the source line.
    • length: The length of the wiggle along the line.
    • randomness: The scale factor by which the length is shrunken or ex-
      panded.

    Returns None if no sketch parameters were set.

get_snap(self)
    Returns the snap setting.

    See set_snap for details.

get_tightbbox(self, renderer)
    Like Artist.get_window_extent, but includes any clipping.

    Parameters

    renderer [RendererBase instance] renderer that will be used to draw the
    figures (i.e. fig.canvas.get_renderer())

    Returns

    bbox [BBox] The enclosing bounding box (in figure pixel co-ordinates).

get_transform(self)
    Return the Transform instance used by this artist.
get_transformed_clip_path_and_affine(self)
    Return the clip path with the non-affine part of its transformation applied, and the
    remaining affine part of its transformation.

get_transforms(self)

get_url(self)
    Return the url.

get_urls(self)

get_visible(self)
    Return the visibility.

get_window_extent(self, renderer)
    Get the axes bounding box in display space.
    The bounding box' width and height are nonnegative.
    Subclasses should override for inclusion in the bounding box "tight" calculation.
    Default is to return an empty bounding box at 0, 0.

    Be careful when using this function, the results will not update if the artist window
    extent of the artist changes. The extent can change due to any changes in the trans-
    form stack, such as changing the axes limits, the figure size, or the canvas used (as is
    done when saving a figure). This can lead to unexpected behavior where interactive
    figures will look fine on the screen, but will save incorrectly.

get_zorder(self)
    Return the artist’s zorder.

have_units(self)
    Return True if units are set on the x or y axes.

is_transform_set(self)
    Return whether the Artist has an explicitly set transform.

    This is True after set_transform has been called.

mouseover

pchanged(self)
    Call all of the registered callbacks.
    This function is triggered internally when a property is changed.
    
    See also:

    add_callback

    remove_callback

pick(self, mouseevent)
    Process a pick event.

    Each child artist will fire a pick event if mouseevent is over the artist and the artist
    has picker set.

    See also:

    set_picker, get_picker, pickable
pickleable(self)
    Return whether the artist is pickable.

    See also:

    set_picker, get_picker, pick

properties(self)
    Return a dictionary of all the properties of the artist.

remove(self)
    Remove the artist from the figure if possible.

    The effect will not be visible until the figure is redrawn, e.g., with FigureCanvasBase.
    draw_idle. Call relim to update the axes limits if desired.

    Note: relim will not see collections even if the collection was added to the axes with
    autolim = True.

    Note: there is no support for removing the artist’s legend entry.

remove_callback(self, oid)
    Remove a callback based on its observer id.

    See also:

    add_callback

set(self, **kwargs)
    A property batch setter. Pass kwargs to set properties.

set_aa(self, aa)
    Alias for set_antialiased.

set_agg_filter(self, filter_func)
    Set the agg filter.

    Parameters

    filter_func [callable] A filter function, which takes a (m, n, 3) float array
    and a dpi value, and returns a (m, n, 3) array.

set_alpha(self, alpha)
    Set the alpha transparencies of the collection.

    Parameters

    alpha [float or None]

set_animated(self, b)
    Set the artist’s animation state.

    Parameters

    b [bool]

set_antialiased(self, aa)
    Set the antialiasing state for rendering.

    Parameters

    aa [bool or sequence of bools]
**set_antialiaseds**(*self*, *aa*)

Alias for `set_antialiased`.

**set_array**(*self*, *A*)

Set the image array from numpy array *A*.

**Parameters**

* *A* [ndarray]

**set_capstyle**(*self*, *cs*)

Set the capstyle for the collection (for all its elements).

**Parameters**

* *cs* [{‘butt’, ‘round’, ‘projecting’}] The capstyle

**set_clim**(*self*, *vmin=None*, *vmax=None*)

Set the norm limits for image scaling; if *vmin* is a length 2 sequence, interpret it as *(vmin, vmax)* which is used to support setp

**ACCEPTS:** a length 2 sequence of floats; may be overridden in methods that have `vmin` and `vmax` kwargs.

**set_clip_box**(*self*, *clipbox*)

Set the artist’s clip Bbox.

**Parameters**

* *clipbox* [bbox]

**set_clip_on**(*self*, *b*)

Set whether the artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

**Parameters**

* *b* [bool]

**set_clip_path**(*self*, *path*, *transform=None*)

Set the artist’s clip path, which may be:

- a `Path` (or subclass) instance; or
- a `Path` instance, in which case a `Transform` instance, which will be applied to the path before using it for clipping, must be provided; or
- `None`, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

**ACCEPTS:** `[(Path, Transform) | Patch | None]`

**set_cmap**(*self*, *cmap*)

Set the colormap for luminance data

**Parameters**

* *cmap* [colormap or registered colormap name]

**set_color**(*self*, *c*)

Set the color(s) of the LineCollection.

**Parameters**
The provided callable replaces the default `contains` method of the artist.

**Parameters**

- **picker** [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

  ```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
  ```

  that returns:

  • a bool indicating if the event is within the artist
  • a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

**Parameters**

- **c** [color or sequence of colors or ‘face’] The collection edgecolor(s). If a sequence, the patches cycle through it. If ‘face’, match the facecolor.

**Parameters**

- **c** [color or sequence of colors]
**set_gid**(self, gid)

Set the (group) id for the artist.

**Parameters**

- **gid** [str]

**set_hatch**(self, hatch)

Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

**Parameters**

- **hatch** [{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

**set_in_layout**(self, in_layout)

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *Figure.tight_layout()*, and *fig.savefig(fname, bbox_inches='tight')*.

**Parameters**

- **in_layout** [bool]

**set_joinstyle**(self, js)

Set the joinstyle for the collection (for all its elements).

**Parameters**

- **js** ['miter', 'round', 'bevel'] The joinstyle

**set_label**(self, s)

Set a label that will be displayed in the legend.

**Parameters**

- **s** [object] *s* will be converted to a string by calling *str*.

**set_linestyle**(self, ls)

Set the linestyle(s) for the collection.
<table>
<thead>
<tr>
<th>linestyle</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'('--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

```
(offset, on-offseq),
```

where `on-offseq` is an even length tuple of on and off ink in points.

**Parameters**

- **ls** ["'--', 'dashed', 'dotdash', 'dotted', (offset, on-off-seq), ..."] The line style.

```
set_linestyles(self, ls)
```

Alias for `set_linestyle`.

```
set_linewidth(self, lw)
```

Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence.

**Parameters**

- **lw** [float or sequence of floats]

```
set_linewidths(self, lw)
```

Alias for `set_linewidth`.

```
set_ls(self, ls)
```

Alias for `set_linestyle`.

```
set_lw(self, lw)
```

Alias for `set_linewidth`.

```
set_norm(self, norm)
```

Set the normalization instance.

**Parameters**

- **norm** [Normalize]

**Notes**

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

```
set_offset_position(self, offset_position)
```

Set how offsets are applied. If `offset_position` is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

**Parameters**

- **offset_position** [{‘screen’, ‘data’}]

```
set_offsets(self, offsets)
```

Set the offsets for the collection.
Parameters

offsets [float or sequence of floats]

set_path_effects(self, path_effects)
   Set the path effects.

Parameters

path_effects [AbstractPathEffect]

set_paths(self, segments)

set_picker(self, picker)
   Define the picking behavior of the artist.

Parameters

picker [None or bool or float or callable] This can be one of the following:
   • None: Picking is disabled for this artist (default).
   • A boolean: If True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
   • A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it’s data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
   • A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

   ```python
   hit, props = picker(artist, mouseevent)
   ```

to determine the hit test. if the mouse event is over the artist, return hit=True and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(self, pr)
   Set the pick radius used for containment tests.

Parameters

d [float] Pick radius, in points.

set_rasterized(self, rasterized)
   Force rasterized (bitmap) drawing in vector backend output.

   Defaults to None, which implies the backend’s default behavior.

Parameters

rasterized [bool or None]

set_segments(self, segments)

set_sketch_params(self, scale=None, length=None, randomness=None)
   Sets the sketch parameters.

Parameters
scale [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.

length [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

set_snap(self, snap)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap [bool or None] Possible values:

- True: Snap vertices to the nearest pixel center.
- False: Do not modify vertex positions.
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transform(self, t)
Set the artist transform.

Parameters

t [Transform]

set_url(self, url)
Set the url for the artist.

Parameters

url [str]

set_urls(self, urls)

Parameters

urls [List[str] or None]

set_verts(self, segments)

set_visible(self, b)
Set the artist’s visibility.

Parameters

b [bool]

set_zorder(self, level)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters
level [float]

stale
Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the
internal state of the artist.

sticky_edges
x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corre-
sponding sticky_edges list, then no margin will be added—the view limit “sticks” to
the edge. A typical use case is histograms, where one usually expects no margin on
the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in
place as needed.

Examples

```python
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(self, x, alpha=None, bytes=False, norm=True)
Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding
ndarray of rgba values will be returned, based on the norm and colormap set for
this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as
might have been read from an image file. If x is an ndarray with 3 dimensions, and
the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array,
and no mapping will be done. The array can be uint8, or it can be floating point with
values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array,
the mask will be ignored. If the last dimension is 3, the alpha kwarg (defaulting to
1) will be used to fill in the transparency. If the last dimension is 4, the alpha kwarg
is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if
the third dimension is other than 3 or 4.

In either case, if bytes is False (default), the rgba array will be floats in the 0-1 range;
if it is True, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed
to be in the range (0-1).

update(self, props)
Update this artist’s properties from the dictionary props.

update_from(self, other)
copy properties from other to self

update_scalarmappable(self)
Update colors from the scalar mappable array, if it is not None.

zorder = 0

class matplotlib.collections.PatchCollection(patches, **kwargs)
Bases: matplotlib.collections.Collection
A generic collection of patches.
This makes it easier to assign a color map to a heterogeneous collection of patches.
This also may improve plotting speed, since PatchCollection will draw faster than a large number of patches.

patches a sequence of Patch objects. This list may include a heterogeneous assortment of different patch types.

match_original If True, use the colors and linewidths of the original patches. If False, new colors may be assigned by providing the standard collection arguments, face-color, edgecolor, linewidths, norm or cmap.

If any of edgecolors, facecolors, linewidths, antialiaseds are None, they default to their matplotlib.rcParams patch setting, in sequence form.

The use of ScalarMappable is optional. If the ScalarMappable matrix _A is not None (i.e., a call to set_array has been made), at draw time a call to scalar mappable will be made to set the face colors.

add_callback(self, func)
Add a callback function that will be called whenever one of the Artist's properties changes.

Parameters

func [callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where artist is the calling Artist. Return values may exist but are ignored.

Returns

oid [int] The observer id associated with the callback. This id can be used for removing the callback with remove_callback later.

See also:

remove_callback

add_checker(self, checker)
Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

aname

autoscale(self)
Autoscale the scalar limits on the norm instance using the current array

autoscale_None(self)
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

axes
The Axes instance the artist resides in, or None.

changed(self)
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal
check_update(self, checker)
    If mappable has changed since the last check, return True; else return False

contains(self, mouseevent)
    Test whether the mouse event occurred in the collection.
    Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

convert_xunits(self, x)
    Convert x using the unit type of the xaxis.
    If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

convert_yunits(self, y)
    Convert y using the unit type of the yaxis.
    If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

draw(self, renderer)
    Draw the Artist using the given renderer.
    This method will be overridden in the Artist subclasses. Typically, it is implemented to not have any effect if the Artist is not visible (Artist.get_visible is False).

    Parameters
    
    renderer [RendererBase subclass.]

findobj(self, match=None, include_self=True)
    Find artist objects.
    Recursively find all Artist instances contained in the artist.

    Parameters

    match A filter criterion for the matches. This can be

        • None: Return all objects contained in artist.
        • A function with signature def match(artist: Artist) -> bool. The result will only contain artists for which the function returns True.
        • A class instance: e.g., Line2D. The result will only contain artists of this class or its subclasses (isinstance check).

    include_self [bool] Include self in the list to be checked for a match.

    Returns

    artists [list of Artist]

format_cursor_data(self, data)
    Return a string representation of data.

    Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

    The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

    See also:
get_cursor_data

get_agg_filter(self)
    Return filter function to be used for agg filter.

get_alpha(self)
    Return the alpha value used for blending - not supported on all backends

get_animated(self)
    Return the animated state.

get_array(self)
    Return the array

g et_capstyle(self)

get_children(self)
    Return a list of the child Artists of this Artist.

get_clim(self)
    return the min, max of the color limits for image scaling

get_clip_box(self)
    Return the clipbox.

get_clip_on(self)
    Return whether the artist uses clipping.

get_clip_path(self)
    Return the clip path.

get_cmap(self)
    return the colormap

get_contains(self)
    Return the custom contains function of the artist if set, or None.

    See also:

    set_contains

g et_cursor_data(self, event)
    Return the cursor data for a given event.

    Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

    Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.

    Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that format_cursor_data can convert the data to a string representation.

    The only current use case is displaying the z-value of an AxesImage in the status bar of a plot window, while moving the mouse.

    Parameters

    event [matplotlib.backend_bases.MouseEvent]
See also:

format_cursor_data

get_dashes(self)
    Alias for get_linestyle.

get_datalim(self, transData)

get_ec(self)
    Alias for get_edgecolor.

get_edgecolor(self)

get_edgecolors(self)
    Alias for get_edgecolor.

get_facecolor(self)

get_facecolors(self)
    Alias for get_facecolor.

gt_ec(self)
    Alias for get_facecolor.

gt_figure(self)
    Return the Figure instance the artist belongs to.

gt_fill(self)
    return whether fill is set

gt_gid(self)
    Return the group id.

gt_hatch(self)
    Return the current hatching pattern.

gt_in_layout(self)
    Return boolean flag, True if artist is included in layout calculations.
    E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname,
    bbox_inches='tight').

gt_joinstyle(self)

gt_label(self)
    Return the label used for this artist in the legend.

gt_linestyle(self)

gt_linestyles(self)
    Alias for get_linestyle.

gt_linewidth(self)

gt_linewidths(self)
    Alias for get_linewidth.

gt_ls(self)
    Alias for get_linestyle.

gt_lw(self)
    Alias for get_linewidth.
get_offset_position(self)
 Returns how offsets are applied for the collection. If offset_position is ‘screen’, the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is ‘data’, the offset is applied before the master transform, i.e., the offsets are in data coordinates.

get_offset_transform(self)

get_offsets(self)
 Return the offsets for the collection.

get_path_effects(self)

get_paths(self)

get_picker(self)
 Return the picking behavior of the artist.
 The possible values are described in set_picker.

See also:
 set_picker, pickable, pick

get_pickradius(self)

get_rasterized(self)
 Return whether the artist is to be rasterized.

get_sketch_params(self)
 Returns the sketch parameters for the artist.

Returns

 sketch_params [tuple or None] A 3-tuple with the following elements:

• scale: The amplitude of the wiggle perpendicular to the source line.
• length: The length of the wiggle along the line.
• randomness: The scale factor by which the length is shrunk or expanded.

Returns None if no sketch parameters were set.

get_snap(self)
 Returns the snap setting.
 See set_snap for details.

get_tightbbox(self, renderer)
 Like Artist.get_window_extent, but includes any clipping.

Parameters

 renderer [RendererBase instance] renderer that will be used to draw the figures (i.e. fig.canvas.get_renderer())

Returns

bbox [BBox] The enclosing bounding box (in figure pixel co-ordinates).

get_transform(self)
 Return the Transform instance used by this artist.
get_transformed_clip_path_and_affine(self)
    Return the clip path with the non-affine part of its transformation applied, and the
    remaining affine part of its transformation.

get_transforms(self)

get_url(self)
    Return the url.

get_urls(self)

get_visible(self)
    Return the visibility.

get_window_extent(self, renderer)
    Get the axes bounding box in display space.
    The bounding box’ width and height are nonnegative.
    Subclasses should override for inclusion in the bounding box “tight” calculation. Default is to return an empty bounding box at 0, 0.
    Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder(self)
    Return the artist’s zorder.

have_units(self)
    Return True if units are set on the x or y axes.

is_transform_set(self)
    Return whether the Artist has an explicitly set transform.
    This is True after set_transform has been called.

mouseover

pchanged(self)
    Call all of the registered callbacks.
    This function is triggered internally when a property is changed.

    See also:

    add_callback
    remove_callback

pick(self, mouseevent)
    Process a pick event.
    Each child artist will fire a pick event if mouseevent is over the artist and the artist has picker set.

    See also:

    set_picker, get_picker, pickable
**pickable(self)**

Return whether the artist is pickable.

**See also:**

`set_picker`, `get_picker`, `pick`

**properties(self)**

Return a dictionary of all the properties of the artist.

**remove(self)**

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist’s legend entry.

**remove_callback(self, oid)**

Remove a callback based on its observer id.

**See also:**

`add_callback`

**set(self, **kwargs)**

A property batch setter. Pass `kwargs` to set properties.

**set_aa(self, aa)**

Alias for `set_antialiased`.

**set_agg_filter(self, filter_func)**

Set the agg filter.

**Parameters**

`filter_func` [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**set_alpha(self, alpha)**

Set the alpha transparencies of the collection.

**Parameters**

`alpha` [float or None]

**set_animated(self, b)**

Set the artist’s animation state.

**Parameters**

`b` [bool]

**set_antialiased(self, aa)**

Set the antialiasing state for rendering.

**Parameters**

`aa` [bool or sequence of bools]
set_antialiaseds(self, aa)
    Alias for set_antialiased.

set_array(self, A)
    Set the image array from numpy array A.

    Parameters
    A [ndarray]

set_capstyle(self, cs)
    Set the capstyle for the collection (for all its elements).

    Parameters
    cs [{'butt', 'round', 'projecting'}] The capstyle

set_clim(self, vmin=None, vmax=None)
    set the norm limits for image scaling; if vmin is a length2 sequence, interpret it as
    (vmin, vmax) which is used to support setp

    ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have
    vmin and vmax kwargs.

set_clip_box(self, clipbox)
    Set the artist’s clip Bbox.

    Parameters
    clipbox [Bbox]

set_clip_on(self, b)
    Set whether the artist uses clipping.

    When False artists will be visible out side of the axes which can lead to unexpected
    results.

    Parameters
    b [bool]

set_clip_path(self, path, transform=None)
    Set the artist’s clip path, which may be:
    • a Patch (or subclass) instance; or
    • a Path instance, in which case a Transform instance, which will be applied to the
      path before using it for clipping, must be provided; or
    • None, to remove a previously set clipping path.

    For efficiency, if the path happens to be an axis-aligned rectangle, this method will
    set the clipping box to the corresponding rectangle and set the clipping path to None.

    ACCEPTS: [(Path, Transform) | Patch | None]

set_cmap(self, cmap)
    set the colormap for luminance data

    Parameters
    cmap [colormap or registered colormap name]

set_color(self, c)
    Set both the edgecolor and the facecolor.

    Parameters
c [color or sequence of rgba tuples]

See also:

Collection.set_facecolor, Collection.set_edgecolor For setting the edge or face color individually.

set_contains(self, picker)
Define a custom contains test for the artist.

The provided callable replaces the default contains method of the artist.

Parameters

picker [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

• a bool indicating if the event is within the artist

• a dict of additional information. The dict should at least return the same information as the default contains() implementation of the respective artist, but may provide additional information.

set_dashes(self, ls)
Alias for set_linestyle.

set_ec(self, c)
Alias for set_edgecolor.

set_edgecolor(self, c)
Set the edgecolor(s) of the collection.

Parameters

• c [color or sequence of colors or ‘face’] The collection edgecolor(s). If a sequence, the patches cycle through it. If ‘face’, match the facecolor.

set_edgecolors(self, c)
Alias for set_edgecolor.

set_facecolor(self, c)
Set the facecolor(s) of the collection. c can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If c is ‘none’, the patch will not be filled.

Parameters

• c [color or sequence of colors]

set_facecolors(self, c)
Alias for set_facecolor.

set_fc(self, c)
Alias for set_facecolor.

set_figure(self, fig)
Set the Figure instance the artist belongs to.
Parameters

    fig : Figure

    set_gid(self, gid)
    Set the (group) id for the artist.

Parameters

    gid : str

    set_hatch(self, hatch)
    Set the hatching pattern

    hatch can be one of:

    / - diagonal hatching
    \ - back diagonal
    | - vertical
    - - horizontal
    + - crossed
    x - crossed diagonal
    o - small circle
    O - large circle
    . - dots
    * - stars

Letters can be combined, in which case all the specified hatchings are done. If same
letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified
for the collection as a whole, not separately for each member.

Parameters

    hatch : ['/', '\', '|', '-|', '+', 'x', 'o', 'O', '.', '*']

    set_in_layout(self, in_layout)
    Set if artist is to be included in layout calculations, e.g. Constrained Layout Guide,
    Figure.tight_layout(), and fig.savefig(fname, bbox_inches='tight').

Parameters

    in_layout : bool

    set_joinstyle(self, js)
    Set the joinstyle for the collection (for all its elements).

Parameters

    js : ['miter', 'round', 'bevel'] The joinstyle

    set_label(self, s)
    Set a label that will be displayed in the legend.

Parameters

    s : [object] s will be converted to a string by calling str.

    set_linestyle(self, ls)
    Set the linestyle(s) for the collection.
<table>
<thead>
<tr>
<th>linestyle</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-.' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

**Parameters**

- `ls` [‘-‘, ‘–‘, ‘-．’, ‘‘‘, ‘‘‘, (offset, on-off-seq), …}] The line style.

```python
def set_linestyles(self, ls)
    Alias for `set_linestyle`.
```

```python
def set_linewidths(self, lw)
    Alias for `set_linewidth`.
```

```python
def set_ls(self, ls)
    Alias for `set_linestyle`.
```

```python
def set_lw(self, lw)
    Alias for `set_linewidth`.
```

```python
def set_norm(self, norm)
    Set the normalization instance.
```

**Notes**

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

```python
def set_offset_position(self, offset_position)
    Set how offsets are applied. If `offset_position` is ‘screen’ (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is ‘data’, the offset is applied before the master transform, i.e., the offsets are in data coordinates.
```

**Parameters**

- `offset_position` [{‘screen’, ‘data’}]
Parameters

offsets [float or sequence of floats]

set_path_effects(self, path_effects)
  Set the path effects.

Parameters

path_effects [AbstractPathEffect]

set_paths(self, patches)

set_picker(self, picker)
  Define the picking behavior of the artist.

Parameters

picker [None or bool or float or callable] This can be one of the following:
  • None: Picking is disabled for this artist (default).
  • A boolean: If True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
  • A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it’s data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
  • A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```python
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return hit=True and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(self, pr)
  Set the pick radius used for containment tests.

Parameters

d [float] Pick radius, in points.

set_rasterized(self, rasterized)
  Force rasterized (bitmap) drawing in vector backend output.

  Defaults to None, which implies the backend’s default behavior.

Parameters

rasterized [bool or None]

set_sketch_params(self, scale=None, length=None, randomness=None)
  Sets the sketch parameters.

Parameters

scale [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.
**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

```python
set_snap(self, snap)
```

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**

```python
snap [bool or None] Possible values:
```

- **True**: Snap vertices to the nearest pixel center.
- **False**: Do not modify vertex positions.
- **None**: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

```python
set_transform(self, t)
```

Set the artist transform.

**Parameters**

```python
t [Transform]
```

```python
set_url(self, url)
```

Set the url for the artist.

**Parameters**

```python
url [str]
```

```python
set_urls(self, urls)
```

**Parameters**

```python
urls [List[str] or None]
```

```python
set_visible(self, b)
```

Set the artist’s visibility.

**Parameters**

```python
b [bool]
```

```python
set_zorder(self, level)
```

Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**

```python
level [float]
```

**stale**

Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the internal state of the artist.
sticky_edges
x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added—the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

Examples

```python
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(self, x, alpha=None, bytes=False, norm=True)
Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the alpha kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the alpha kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if bytes is False (default), the rgb array will be floats in the 0-1 range; if it is True, the returned rgb array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(self, props)
Update this artist’s properties from the dictionary props.

update_from(self, other)
copy properties from other to self

update_scalarmappable(self)
Update colors from the scalar mappable array, if it is not None.

zorder = 0
class matplotlib.collections.PathCollection(paths, sizes=None, **kwargs)
Bases: matplotlib.collections._CollectionWithSizes

This is the most basic Collection subclass. A PathCollection is e.g. created by a scatter() plot.

paths is a sequence of matplotlib.path.Path instances.

Valid Collection keyword arguments:
**add_callback**(self, func)

Add a callback function that will be called whenever one of the Artist's properties changes.

**Parameters**

- **func**: [callable] The callback function. It must have the signature:

  ```python
def func(artist: Artist) -> Any
  ```

  where `artist` is the calling `Artist`. Return values may exist but are ignored.

**Returns**

- **oid**: [int] The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

**See also:**

- `remove_callback`

**add_checker**(self, checker)

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

**aname**

**autoscale**(self)

Autoscale the scalar limits on the norm instance using the current array

**autoscale_None**(self)

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

**axes**

The `Axes` instance the artist resides in, or `None`.

**changed**(self)

Call this whenever the mappable is changed to notify all the callback listeners to the 'changed' signal.
check_update(self, checker)
If mappable has changed since the last check, return True; else return False

contains(self, mouseevent)
Test whether the mouse event occurred in the collection.
Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

convert_xunits(self, x)
Convert x using the unit type of the xaxis.
If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

convert_yunits(self, y)
Convert y using the unit type of the yaxis.
If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

draw(self, renderer)
Draw the Artist using the given renderer.
This method will be overridden in the Artist subclasses. Typically, it is implemented to not have any effect if the Artist is not visible (Artist.get_visible is False).

Parameters
renderer [RendererBase subclass.]

findobj(self, match=None, include_self=True)
Find artist objects.
Recursively find all Artist instances contained in the artist.

Parameters
match A filter criterion for the matches. This can be
• None: Return all objects contained in artist.
• A function with signature def match(artist: Artist) -> bool. The result will only contain artists for which the function returns True.
• A class instance: e.g., Line2D. The result will only contain artists of this class or its subclasses (isinstance check).

include_self [bool] Include self in the list to be checked for a match.

Returns
artists [list of Artist]

format_cursor_data(self, data)
Return a string representation of data.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:
get_cursor_data

get_agg_filter(self)
    Return filter function to be used for agg filter.

get_alpha(self)
    Return the alpha value used for blending - not supported on all backends

get_animated(self)
    Return the animated state.

get_array(self)
    Return the array

get_capstyle(self)

get_children(self)
    Return a list of the child Artists of this Artist.

get_clim(self)
    return the min, max of the color limits for image scaling

get_clip_box(self)
    Return the clipbox.

get_clip_on(self)
    Return whether the artist uses clipping.

get_clip_path(self)
    Return the clip path.

get_cmap(self)
    return the colormap

get_contains(self)
    Return the custom contains function of the artist if set, or None.

See also:

set_contains

get_cursor_data(self, event)
    Return the cursor data for a given event.

Note:  This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that format_cursor_data can convert the data to a string representation.

The only current use case is displaying the z-value of an AxesImage in the status bar of a plot window, while moving the mouse.

Parameters

    event [matplotlib.backend_bases.MouseEvent]
See also:

    format_cursor_data

get_dashes(self)
    Alias for get_linestyle.

get_datalim(self, transData)

get_ec(self)
    Alias for get_edgecolor.

get_edgecolor(self)

get_edgecolors(self)
    Alias for get_edgecolor.

get_facecolor(self)

get_facecolors(self)
    Alias for get_facecolor.

get_fc(self)
    Alias for get_facecolor.

get_fill(self)
    return whether fill is set

get_gid(self)
    Return the group id.

get_hatch(self)
    Return the current hatching pattern.

get_in_layout(self)
    Return boolean flag, True if artist is included in layout calculations.
    E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname, bbox_inches='tight').

get_joinstyle(self)

get_label(self)
    Return the label used for this artist in the legend.

get_linestyle(self)

get_linestyles(self)
    Alias for get_linestyle.

get_linewidth(self)

get_linewidths(self)
    Alias for get_linewidth.

get_ls(self)
    Alias for get_linestyle.

get_lw(self)
    Alias for get_linewidth.
get_offset_position(self)
Returns how offsets are applied for the collection. If offset_position is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

get_offset_transform(self)

get_offsets(self)
Return the offsets for the collection.

get_path_effects(self)

get_paths(self)

get_picker(self)
Return the picking behavior of the artist.
The possible values are described in set_picker.

See also:
set_picker, pickle, pick

get_pickradius(self)

get_rasterized(self)
Return whether the artist is to be rasterized.

get_sizes(self)
Returns the sizes of the elements in the collection. The value represents the 'area' of the element.

    Returns

        sizes [array] The 'area' of each element.

get_sketch_params(self)
Returns the sketch parameters for the artist.

    Returns

        sketch_params [tuple or None] A 3-tuple with the following elements:
        • scale: The amplitude of the wiggle perpendicular to the source line.
        • length: The length of the wiggle along the line.
        • randomness: The scale factor by which the length is shrunk or expanded.

        Returns None if no sketch parameters were set.

get_snap(self)
Returns the snap setting.

    See set_snap for details.

get_tightbbox(self, renderer)
Like Artist.get_window_extent, but includes any clipping.

    Parameters

        renderer [RendererBase instance] renderer that will be used to draw the figures (i.e. fig.canvas.get_renderer())
Returns

bbox [BBox] The enclosing bounding box (in figure pixel co-ordinates).

get_transform(self)
Return the Transform instance used by this artist.

get_transformed_clip_path_and_affine(self)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms(self)

get_url(self)
Return the url.

get_urls(self)

get_visible(self)
Return the visibility.

get_window_extent(self, renderer)
Get the axes bounding box in display space.

   The bounding box' width and height are nonnegative.

   Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

   Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder(self)
Return the artist's zorder.

have_units(self)
Return True if units are set on the x or y axes.

is_transform_set(self)
Return whether the Artist has an explicitly set transform.

   This is True after set_transform has been called.

legend_elements(self, prop='colors', num='auto', fmt=None, func=<function PathCollection.<lambda> at 0x7f0f90d22040>, **kwargs)
Creates legend handles and labels for a PathCollection. This is useful for obtaining a legend for a scatter() plot. E.g.:

    scatter = plt.scatter([1,2,3], [4,5,6], c=[7,2,3])
    plt.legend(*scatter.legend_elements())

Also see the automatedlegendcreation example.

Parameters

prop [string, optional, default "colors"] Can be "colors" or "sizes". In case of "colors", the legend handles will show the different colors of the collection. In case of "sizes", the legend will show the different sizes.
num [int, None, “auto” (default), array-like, or Locator,] optional Target number of elements to create. If None, use all unique elements of the mappable array. If an integer, target to use num elements in the normed range. If “auto”, try to determine which option better suits the nature of the data. The number of created elements may slightly deviate from num due to a Locator being used to find useful locations. If a list or array, use exactly those elements for the legend. Finally, a Locator can be provided.

fmt [string, Formatter, or None (default)] The format or formatter to use for the labels. If a string must be a valid input for a StrMethodFormatter. If None (the default), use a ScalarFormatter.

func [function, default lambda x: x] Function to calculate the labels. Often the size (or color) argument to scatter() will have been pre-processed by the user using a function s = f(x) to make the markers visible; e.g. size = np.log10(x). Providing the inverse of this function here allows that pre-processing to be inverted, so that the legend labels have the correct values; e.g. func = np.exp(x, 10).

kwags [further parameters] Allowed kwargs are color and size. E.g. it may be useful to set the color of the markers if prop=”sizes” is used; similarly to set the size of the markers if prop=”colors” is used. Any further parameters are passed onto the Line2D instance. This may be useful to e.g. specify a different markeredgecolor or alpha for the legend handles.

Returns

tuple (handles, labels) with handles being a list of Line2D objects and labels a matching list of strings.

mouseover

pchanged(self)
Call all of the registered callbacks.
This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

pick(self, mouseevent)
Process a pick event.
Each child artist will fire a pick event if mouseevent is over the artist and the artist has picker set.

See also:

set_picker, get_picker, pickable

pickable(self)
Return whether the artist is pickable.

See also:
set_picker, get_picker, pick

properties(self)
Return a dictionary of all the properties of the artist.

remove(self)
Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with FigureCanvasBase.draw_idle. Call relim to update the axes limits if desired.

Note: relim will not see collections even if the collection was added to the axes with autolim = True.

Note: there is no support for removing the artist’s legend entry.

remove_callback(self, oid)
Remove a callback based on its observer id.

See also:
add_callback

set(self, **kwargs)
A property batch setter. Pass kwargs to set properties.

set_aa(self, aa)
Alias for set_antialiased.

set_agg_filter(self, filter_func)
Set the agg filter.

Parameters

filter_func [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

set_alpha(self, alpha)
Set the alpha transparencies of the collection.

Parameters

alpha [float or None]

set_animated(self, b)
Set the artist’s animation state.

Parameters

b [bool]

set_antialiased(self, aa)
Set the antialiasing state for rendering.

Parameters

aa [bool or sequence of bools]

set_antialiaseds(self, aa)
Alias for set_antialiased.

set_array(self, A)
Set the image array from numpy array A.

Parameters
A [ndarray]

set_capstyle(self, cs)
Set the capstyle for the collection (for all its elements).

Parameters

- cs [ {'butt', 'round', 'projecting'} ] The capstyle

set_clim(self, vmin=None, vmax=None)
Set the norm limits for image scaling; if vmin is a length 2 sequence, interpret it as (vmin, vmax) which is used to support setp

ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have vmin and vmax kwargs.

set_clip_box(self, clipbox)
Set the artist’s clip Bbox.

Parameters

- clipbox [Bbox]

set_clip_on(self, b)
Set whether the artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

Parameters

- b [bool]

set_clip_path(self, path, transform=None)
Set the artist’s clip path, which may be:

- a Patch (or subclass) instance; or
- a Path instance, in which case a Transform instance, which will be applied to the path before using it for clipping, must be provided; or
- None, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

ACCEPTS: [(Path, Transform) | Patch | None]

set_cmap(self, cmap)
Set the colormap for luminance data

Parameters

- cmap [ colormap or registered colormap name ]

set_color(self, c)
Set both the edgecolor and the facecolor.

Parameters

- c [ color or sequence of rgba tuples ]

See also:

Collection.set_facecolor, Collection.set_edgecolor For setting the edge or face color individually.
set_contains(self, picker)
    Define a custom contains test for the artist.
    
    The provided callable replaces the default contains method of the artist.

    Parameters
    
    picker [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

    ```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
    ```

    that returns:
    
    • a bool indicating if the event is within the artist
    • a dict of additional information. The dict should at least return the same information as the default contains() implementation of the respective artist, but may provide additional information.

    set_dashes(self, ls)
        Alias for set_linestyle.

    set_ec(self, c)
        Alias for set_edgecolor.

    set_edgecolor(self, c)
        Set the edgecolor(s) of the collection.

        Parameters
        
        c [color or sequence of colors or ‘face’] The collection edgecolor(s). If a sequence, the patches cycle through it. If ‘face’, match the facecolor.

    set_edgecolors(self, c)
        Alias for set_edgecolor.

    set_facecolor(self, c)
        Set the facecolor(s) of the collection. c can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

        If c is ‘none’, the patch will not be filled.

        Parameters
        
        c [color or sequence of colors]

    set_facecolors(self, c)
        Alias for set_facecolor.

    set_fc(self, c)
        Alias for set_facecolor.

    set_figure(self, fig)
        Set the Figure instance the artist belongs to.

        Parameters
        
        fig [Figure]

    set_gid(self, gid)
        Set the (group) id for the artist.

        Parameters
        
    17.15. matplotlib.collections

1435
gid [str]

set_hatch(self, hatch)
   Set the hatching pattern

   hatch can be one of:

   /  - diagonal hatching
   \  - back diagonal
   |  - vertical
   -  - horizontal
   +  - crossed
   x  - crossed diagonal
   o  - small circle
   O  - large circle
   .  - dots
   *  - stars

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch [{ '/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(self, in_layout)
   Set if artist is to be included in layout calculations, E.g. Constrained Layout Guide,
   Figure.tight_layout(), and fig.savefig(fname, bbox_inches='tight').

Parameters

in_layout [bool]

set_joinstyle(self, js)
   Set the joinstyle for the collection (for all its elements).

Parameters

js [{ 'miter', 'round', 'bevel'}] The joinstyle

set_label(self, s)
   Set a label that will be displayed in the legend.

Parameters

s [object] s will be converted to a string by calling str.

set_linestyle(self, ls)
   Set the linestyle(s) for the collection.

<table>
<thead>
<tr>
<th>linestyle</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-.' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:
where `onoffseq` is an even length tuple of on and off ink in points.

**Parameters**

- **ls** `['-', '–', '-.', ':', '', (offset, on-off-seq), ...]` The line style.

```python
set_linestyles(self, ls)
```

Alias for `set_linestyle`.

```python
set_linewidth(self, lw)
```

Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence.

**Parameters**

- **lw** [float or sequence of floats]

```python
set_linewidths(self, lw)
```

Alias for `set_linewidth`.

```python
set_ls(self, ls)
```

Alias for `set_linestyle`.

```python
set_lw(self, lw)
```

Alias for `set_linewidth`.

```python
set_norm(self, norm)
```

Set the normalization instance.

**Parameters**

- **norm** `[Normalize]`

**Notes**

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

```python
set_offset_position(self, offset_position)
```

Set how offsets are applied. If `offset_position` is ‘screen’ (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is ‘data’, the offset is applied before the master transform, i.e., the offsets are in data coordinates.

**Parameters**

- **offset_position** `['screen', 'data']`

```python
set_offets(self, offsets)
```

Set the offsets for the collection.

**Parameters**

- **offsets** [float or sequence of floats]

```python
set_path_effects(self, path_effects)
```

Set the path effects.

**Parameters**

- **path_effects** `[AbstractPathEffect]`
set_paths(self, paths)
set_picker(self, picker)
    Define the picking behavior of the artist.

Parameters

picker [None or bool or float or callable] This can be one of the following:

- None: Picking is disabled for this artist (default).
- A boolean: If True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it’s data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return hit=True and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(self, pr)
    Set the pick radius used for containment tests.

Parameters

d [float] Pick radius, in points.

set_rasterized(self, rasterized)
    Force rasterized (bitmap) drawing in vector backend output.
    Defaults to None, which implies the backend’s default behavior.

Parameters

rasterized [bool or None]

set_sizes(self, sizes, dpi=72.0)
    Set the sizes of each member of the collection.

Parameters

sizes [ndarray or None] The size to set for each element of the collection. The value is the ‘area’ of the element.

dpi [float] The dpi of the canvas. Defaults to 72.0.

set_sketch_params(self, scale=None, length=None, randomness=None)
    Sets the sketch parameters.

Parameters

scale [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.
**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

```
set_snap(self, snap)
```

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**

```
snap [bool or None] Possible values:

• True: Snap vertices to the nearest pixel center.

• False: Do not modify vertex positions.

• None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.
```

```
set_transform(self, t)
```

Set the artist transform.

**Parameters**

```
t [Transform]
```

```
set_url(self, url)
```

Set the url for the artist.

**Parameters**

```
url [str]
```

```
set_urls(self, urls)
```

**Parameters**

```
urls [List[str] or None]
```

```
set_visible(self, b)
```

Set the artist’s visibility.

**Parameters**

```
b [bool]
```

```
set_zorder(self, level)
```

Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**

```
level [float]
```

**stale**

Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the internal state of the artist.
**sticky_edges**

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added—the view limit “sticks” to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

**Examples**

```python
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

**to_rgba**

```python
def to_rgba(self, x, alpha=None, bytes=False, norm=True)
```

Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the alpha kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the alpha kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if bytes is False (default), the rgba array will be floats in the 0-1 range; if it is True, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

**update**

```python
def update(self, props)
```

Update this artist’s properties from the dictionary props.

**update_from**

```python
def update_from(self, other)
```

copy properties from other to self

**update_scalarmappable**

```python
def update_scalarmappable(self)
```

Update colors from the scalar mappable array, if it is not None.

**zorder = 0**

---

**class matplotlib.collections.PolyCollection(verts, sizes=None, closed=True, **kwargs)**

Bases: matplotlib.collections._CollectionWithSizes

verts is a sequence of ( verts0, verts1, ...) where verts.i is a sequence of xy tuples of vertices, or an equivalent numpy array of shape (nv, 2).

sizes is None (default) or a sequence of floats that scale the corresponding verts.i. The scaling is applied before the Artist master transform; if the latter is an identity transform,
then the overall scaling is such that if \( \text{verts}_i \) specify a unit square, then \( \text{sizes}_i \) is the area of that square in points\(^2\). If \( \text{len(sizes)} < n_v \), the additional values will be taken cyclically from the array.

\( \text{closed} \), when True, will explicitly close the polygon.

Valid Collection keyword arguments:

- \( \text{edgecolors} \): None
- \( \text{facecolors} \): None
- \( \text{linewidths} \): None
- \( \text{antialiaseds} \): None
- \( \text{offsets} \): None
- \( \text{transOffset} \): transforms.IdentityTransform()
- \( \text{norm} \): None (optional for matplotlib.cm.ScalarMappable)
- \( \text{cmap} \): None (optional for matplotlib.cm.ScalarMappable)

\( \text{offsets} \) and \( \text{transOffset} \) are used to translate the patch after rendering (default no offsets)

If any of \( \text{edgecolors}, \text{facecolors}, \text{linewidths}, \text{antialiaseds} \) are None, they default to their matplotlib.rcParams patch setting, in sequence form.

\text{add_callback}(\text{self}, \text{func})

Add a callback function that will be called whenever one of the \textit{Artist}'s properties changes.

**Parameters**

- \textbf{func} [callable] The callback function. It must have the signature:

  ```python
def func(artist: Artist) -> Any
  ```

  where \( \text{artist} \) is the calling \textit{Artist}. Return values may exist but are ignored.

**Returns**

- \( \text{oid} \) [int] The observer id associated with the callback. This id can be used for removing the callback with \text{remove_callback} later.

**See also:**

- remove_callback

\text{add_checker}(\text{self}, \text{checker})

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

\textbf{aname}

\text{autoscale}(\text{self})

Autoscale the scalar limits on the norm instance using the current array

\text{autoscale_None}(\text{self})

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None
axes
    The Axes instance the artist resides in, or None.

changed(self)
    Call this whenever the mappable is changed to notify all the callback listeners to
    the ‘changed’ signal

check_update(self, checker)
    If mappable has changed since the last check, return True; else return False

contains(self, mouseevent)
    Test whether the mouse event occurred in the collection.
    Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

call_xunits(self, x)
    Convert x using the unit type of the xaxis.
    If the artist is not in contained in an Axes or if the xaxis does not have units, x itself
    is returned.

call_yunits(self, y)
    Convert y using the unit type of the yaxis.
    If the artist is not in contained in an Axes or if the yaxis does not have units, y itself
    is returned.

draw(self, renderer)
    Draw the Artist using the given renderer.
    This method will be overridden in the Artist subclasses. Typically, it is implemented
to not have any effect if the Artist is not visible (Artist.get_visible is False).

Parameters
    renderer [RendererBase subclass.]

findobj(self, match=None, include_self=True)
    Find artist objects.
    Recursively find all Artist instances contained in the artist.

Parameters
    match A filter criterion for the matches. This can be
    • None: Return all objects contained in artist.
    • A function with signature def match(artist: Artist) -> bool. The re-
      sult will only contain artists for which the function returns True.
    • A class instance: e.g., Line2D. The result will only contain artists of
      this class or its subclasses (isinstance check).

    include_self [bool] Include self in the list to be checked for a match.

Returns
    artists [list of Artist]

format_cursor_data(self, data)
    Return a string representation of data.
Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

get_cursor_data

get_agg_filter(self)
    Return filter function to be used for agg filter.

geta_alpha(self)
    Return the alpha value used for blending - not supported on all backends

get_animated(self)
    Return the animated state.

get_array(self)
    Return the array

get_capstyle(self)

get_children(self)
    Return a list of the child Artists of this Artist.

get_clim(self)
    return the min, max of the color limits for image scaling

get_clip_box(self)
    Return the clipbox.

get_clip_on(self)
    Return whether the artist uses clipping.

get_clip_path(self)
    Return the clip path.

get_cmap(self)
    return the colormap

get_contains(self)
    Return the custom contains function of the artist if set, or None.

See also:

set_contains

get_cursor_data(self, event)
    Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.
Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

**Parameters**

- `event` ([`matplotlib.backend_bases.MouseEvent`]

**See also:**

`format_cursor_data`

---

```python
get_dashes(self)
    Alias for `get_linestyle`.
get_datalim(self, transData)
get_ec(self)
    Alias for `get_edgecolor`.
get_edgecolor(self)
get_edgecolors(self)
    Alias for `get_edgecolor`.
get_facecolor(self)
get_facecolors(self)
    Alias for `get_facecolor`.
get_fc(self)
    Alias for `get_facecolor`.
get_figure(self)
    Return the `Figure` instance the artist belongs to.
get_fill(self)
    return whether fill is set
get_gid(self)
    Return the group id.
get_hatch(self)
    Return the current hatching pattern.
get_in_layout(self)
    Return boolean flag, True if artist is included in layout calculations.
    E.g.  *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.
get_joinstyle(self)
get_label(self)
    Return the label used for this artist in the legend.
get_linestyle(self)
get_linestyles(self)
    Alias for `get_linestyle`.
get_linewidth(self)
```
get_linewidths(self)
    Alias for get_linewidth.

get_ls(self)
    Alias for get_linestyle.

get_lw(self)
    Alias for get_linewidth.

get_offset_position(self)
    Returns how offsets are applied for the collection. If offset_position is 'screen', the
    offset is applied after the master transform has been applied, that is, the offsets are
    in screen coordinates. If offset_position is 'data', the offset is applied before the
    master transform, i.e., the offsets are in data coordinates.

get_offset_transform(self)

get_offsets(self)
    Return the offsets for the collection.

get_path_effects(self)

get_paths(self)

get_picker(self)
    Return the picking behavior of the artist.
    The possible values are described in set_picker.

    See also:

    set_picker, pickable, pick

get_pickradius(self)

get_rasterized(self)
    Return whether the artist is to be rasterized.

get_sizes(self)
    Returns the sizes of the elements in the collection. The value represents the 'area'
    of the element.

    Returns

    sizes [array] The 'area' of each element.

get_sketch_params(self)
    Returns the sketch parameters for the artist.

    Returns

    sketch_params [tuple or None] A 3-tuple with the following elements:
    • scale: The amplitude of the wiggle perpendicular to the source line.
    • length: The length of the wiggle along the line.
    • randomness: The scale factor by which the length is shrunken or ex-
      panded.
    
    Returns None if no sketch parameters were set.

get_snap(self)
    Returns the snap setting.
See `set_snap` for details.

```python
def get_tightbbox(self, renderer):
    Like Artist.get_window_extent, but includes any clipping.

    Parameters
    ----------
    renderer : [RendererBase instance] renderer that will be used to draw the figures (i.e. fig.canvas.get_renderer())

    Returns
    -------
    bbox : [BBox] The enclosing bounding box (in figure pixel co-ordinates).
```

```python
def get_transform(self):
    Return the Transform instance used by this artist.

def get_transformed_clip_path_and_affine(self):
    Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

def get_transforms(self):

def get_url(self):
    Return the url.

def get_urls(self):

def get_visible(self):
    Return the visibility.

def get_window_extent(self, renderer):
    Get the axes bounding box in display space.

    The bounding box' width and height are nonnegative.

    Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

    Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

    Returns
    -------
    bbox : [BBox] The enclosing bounding box (in figure pixel co-ordinates).
```

```python
def get_zorder(self):
    Return the artist’s zorder.

def have_units(self):
    Return True if units are set on the x or y axes.

def is_transform_set(self):
    Return whether the Artist has an explicitly set transform.

    This is True after `set_transform` has been called.

    Returns
    -------
    True : `bool`

    mouseover

def pchanged(self):
    Call all of the registered callbacks.

    This function is triggered internally when a property is changed.

    See also:
add_callback
remove_callback

pick(self, mouseevent)
Process a pick event.
Each child artist will fire a pick event if mouseevent is over the artist and the artist has picker set.

See also:

set_picker, get_picker, pickable

pickable(self)
Return whether the artist is pickable.

See also:

set_picker, get_picker, pick

properties(self)
Return a dictionary of all the properties of the artist.

remove(self)
Remove the artist from the figure if possible.
The effect will not be visible until the figure is redrawn, e.g., with FigureCanvasBase.draw_idle. Call relim to update the axes limits if desired.
Note: relim will not see collections even if the collection was added to the axes with autolim = True.
Note: there is no support for removing the artist’s legend entry.

remove_callback(self, oid)
Remove a callback based on its observer id.

See also:

add_callback

set(self, **kwargs)
A property batch setter. Pass kwargs to set properties.

set_aa(self, aa)
Alias for set_antialiased.

set_agg_filter(self, filter_func)
Set the agg filter.

Parameters

filter_func [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

set_alpha(self, alpha)
Set the alpha transparencies of the collection.

Parameters

alpha [float or None]
set_animated(self, b)
    Set the artist’s animation state.

    Parameters
    b [bool]

set_antialiased(self, aa)
    Set the antialiasing state for rendering.

    Parameters
    aa [bool or sequence of bools]

set_antialiaseds(self, aa)
    Alias for `set_antialiased`.

set_array(self, A)
    Set the image array from numpy array A.

    Parameters
    A [ndarray]

set_capstyle(self, cs)
    Set the capstyle for the collection (for all its elements).

    Parameters
    cs [{’butt’, ’round’, ’projecting’}] The capstyle

set_clim(self, vmin=None, vmax=None)
    Set the norm limits for image scaling; if vmin is a length 2 sequence, interpret it as
    (vmin, vmax) which is used to support setp

    ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have
    vmin and vmax kwargs.

set_clip_box(self, clipbox)
    Set the artist’s clip Bbox.

    Parameters
    clipbox [Bbox]

set_clip_on(self, b)
    Set whether the artist uses clipping.

    When False artists will be visible out side of the axes which can lead to unexpected
    results.

    Parameters
    b [bool]

set_clip_path(self, path, transform=None)
    Set the artist’s clip path, which may be:
    
    * a Patch (or subclass) instance; or
    * a Path instance, in which case a Transform instance, which will be applied to the
      path before using it for clipping, must be provided; or
    * None, to remove a previously set clipping path.
For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

**ACCEPTS:** `[(Path, Transform) | Patch | None]`

### set_cmap(self, cmap)
- set the colormap for luminance data

**Parameters**

- **cmap** [colormap or registered colormap name]

### set_color(self, c)
- Set both the edgecolor and the facecolor.

**Parameters**

- **c** [color or sequence of rgba tuples]

**See also:**

- `Collection.set_facecolor`, `Collection.set_edgecolor` For setting the edge or face color individually.

### set_contains(self, picker)
- Define a custom contains test for the artist.

The provided callable replaces the default `contains` method of the artist.

**Parameters**

- **picker** [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

  ```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
  ```

  that returns:
  
  - a bool indicating if the event is within the artist
  - a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

### set_dashes(self, ls)
- Alias for `set_linestyle`.

### set_ec(self, c)
- Alias for `set_edgecolor`.

### set_edgecolor(self, c)
- Set the edgeline color(s) of the collection.

**Parameters**

- **c** [color or sequence of colors or ‘face’] The collection edgeline color(s). If a sequence, the patches cycle through it. If ‘face’, match the facecolor.

**See also:**

- `Collection.set_facecolor`  
  
### set_edgecolors(self, c)
- Alias for `set_edgecolor`.

### set_facecolor(self, c)
- Set the facecolor(s) of the collection. `c` can be a matplotlib color spec (all patches
have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If \( c \) is ‘none’, the patch will not be filled.

**Parameters**

- \( c \) [color or sequence of colors]

```python
set_facecolors(self, c)
```

Alias for `set_facecolor`.

```python
set_fc(self, c)
```

Alias for `set_facecolor`.

```python
set_figure(self, fig)
```

Set the `Figure` instance the artist belongs to.

**Parameters**

- \( fig \) [Figure]

```python
set_gid(self, gid)
```

Set the (group) id for the artist.

**Parameters**

- \( gid \) [str]

```python
set_hatch(self, hatch)
```

Set the hatching pattern

\( hatch \) can be one of:

<table>
<thead>
<tr>
<th>/</th>
<th>\</th>
<th></th>
<th>-</th>
<th>-</th>
<th>-</th>
<th>-</th>
<th>-</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>diagonal hatching</td>
<td>back diagonal</td>
<td>vertical</td>
<td>horizontal</td>
<td>crossed</td>
<td>crossed diagonal</td>
<td>small circle</td>
<td>large circle</td>
</tr>
</tbody>
</table>

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

**Parameters**

- \( hatch \) [{’/’, ’\’, ’|’, ’-’, ’+’, ’x’, ’o’, ’O’, ’.’, ’*’}]

```python
set_in_layout(self, in_layout)
```

Set if artist is to be included in layout calculations, E.g. `Constrained Layout Guide`, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

**Parameters**

- \( in\_layout \) [bool]
set_joinstyle(self, js)
Set the joinstyle for the collection (for all its elements).

Parameters

js [{‘miter’, ‘round’, ‘bevel’}] The joinstyle

set_label(self, s)
Set a label that will be displayed in the legend.

Parameters

s [object] s will be converted to a string by calling str.

set_linestyle(self, ls)
Set the linestyle(s) for the collection.

<table>
<thead>
<tr>
<th>linestyle</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>‘-’ or ‘solid’</td>
<td>solid line</td>
</tr>
<tr>
<td>‘--’ or ‘dashed’</td>
<td>dashed line</td>
</tr>
<tr>
<td>‘-.’ or ‘dashdot’</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>‘:’ or ‘dotted’</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq),

where onoffseq is an even length tuple of on and off ink in points.

Parameters

ls [{‘-’, ‘–’, ‘.-’, ‘.’, ”, (offset, on-off-seq), ...}] The line style.

set_linestyles(self, ls)
Alias for set_linestyle.

set_linewidth(self, lw)
Set the linewidth(s) for the collection. lw can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw [float or sequence of floats]

set_linewidths(self, lw)
Alias for set_linewidth.

set_ls(self, ls)
Alias for set_linestyle.

set_lw(self, lw)
Alias for set_linewidth.

set_norm(self, norm)
Set the normalization instance.

Parameters

norm [Normalize]
Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

set_offset_position(self, offset_position)
Set how offsets are applied. If offset_position is ‘screen’ (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is ‘data’, the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Parameters

offset_position [{‘screen’, ‘data’}]

set_offsets(self, offsets)
Set the offsets for the collection.

Parameters

offsets [float or sequence of floats]

set_path_effects(self, path_effects)
Set the path effects.

Parameters

path_effects [AbstractPathEffect]

set_paths(self, verts, closed=True)
This allows one to delay initialization of the vertices.

set_picker(self, picker)
Define the picking behavior of the artist.

Parameters

picker [None or bool or float or callable] This can be one of the following:

• None: Picking is disabled for this artist (default).

• A boolean: If True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.

• A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it’s data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event.

• A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```python
hit, props = picker(artist, mouseevent)
```
to determine the hit test. If the mouse event is over the artist, return hit=True and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(self, pr)
Set the pick radius used for containment tests.
Parameters

d [float] Pick radius, in points.

`set_rasterized(self, rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend’s default behavior.

Parameters

rasterized [bool or None]

`set_sizes(self, sizes, dpi=72.0)`

Set the sizes of each member of the collection.

Parameters

sizes [ndarray or None] The size to set for each element of the collection. The value is the ‘area’ of the element.

dpi [float] The dpi of the canvas. Defaults to 72.0.

`set_sketch_params(self, scale=None, length=None, randomness=None)`

Sets the sketch parameters.

Parameters

scale [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.

length [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap(self, snap)`

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap [bool or None] Possible values:

- True: Snap vertices to the nearest pixel center.
- False: Do not modify vertex positions.
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform(self, t)`

Set the artist transform.

Parameters
Matplotlib, Release 3.1.3

```
t [Transform]

set_url(self, url)
    Set the url for the artist.

Parameters
    url [str]

set_urls(self, urls)

Parameters
    urls [List[bool] or None]

set_verts(self, verts, closed=True)
    This allows one to delay initialization of the vertices.

set_verts_and_codes(self, verts, codes)
    This allows one to initialize vertices with path codes.

set_visible(self, b)
    Set the artist’s visibility.

Parameters
    b [bool]

set_zorder(self, level)
    Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters
    level [float]

stale
    Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the
    internal state of the artist.

sticky_edges
    x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corre-
spanding sticky_edges list, then no margin will be added—the view limit “sticks”
to the edge. A typical use case is histograms, where one usually expects no margin on
the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in
place as needed.

Examples

>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)

to_rgba(self, x, alpha=None, bytes=False, norm=True)
    Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding
ndarray of rgba values will be returned, based on the norm and colormap set for
this ScalarMappable.
```
There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If \( x \) is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the \( \text{alpha} \) kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the \( \text{alpha} \) kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if \( \text{bytes} \) is \text{False} (default), the rgba array will be floats in the 0-1 range; if it is \text{True}, the returned rgba array will be uint8 in the 0 to 255 range.

If \( \text{norm} \) is \text{False}, no normalization of the input data is performed, and it is assumed to be in the range \((0-1)\).

\[
\text{update}(\text{self}, \text{props})
\]
Update this artist’s properties from the dictionary \( \text{props} \).

\[
\text{update_from}(\text{self}, \text{other})
\]
copy properties from other to self

\[
\text{update_scalarmappable}(\text{self})
\]
Update colors from the scalar mappable array, if it is not None.

\[
zorder = 0
\]

\[\text{class \ matplotlib.collections.QuadMesh}(\text{meshWidth}, \text{meshHeight}, \text{coordinates}, \text{antialiased=True}, \text{shading='flat', **kwargs})\]

Class for the efficient drawing of a quadrilateral mesh.

A quadrilateral mesh consists of a grid of vertices. The dimensions of this array are \((\text{meshWidth} + 1, \text{meshHeight} + 1)\). Each vertex in the mesh has a different set of “mesh coordinates” representing its position in the topology of the mesh. For any values \((m, n)\) such that \(0 \leq m \leq \text{meshWidth}\) and \(0 \leq n \leq \text{meshHeight}\), the vertices at mesh coordinates \((m, n), (m, n + 1), (m + 1, n + 1), \) and \((m + 1, n)\) form one of the quadrilaterals in the mesh. There are thus \((\text{meshWidth} \times \text{meshHeight})\) quadrilaterals in the mesh. The mesh need not be regular and the polygons need not be convex.

A quadrilateral mesh is represented by a \((2 \times (\text{meshWidth} + 1) \times (\text{meshHeight} + 1))\) numpy array \text{coordinates}, where each row is the \(x\) and \(y\) coordinates of one of the vertices. To define the function that maps from a data point to its corresponding color, use the \text{set_cmap()} method. Each of these arrays is indexed in row-major order by the mesh coordinates of the vertex (or the mesh coordinates of the lower left vertex, in the case of the colors).

For example, the first entry in \text{coordinates} is the coordinates of the vertex at mesh coordinates \((0, 0)\), then the one at \((0, 1)\), then at \((0, 2)\) .. \((0, \text{meshWidth})\), \((1, 0)\), \((1, 1)\), and so on.

\(\text{shading}\) may be ‘flat’, or ‘gouraud’

\[
\text{add_callback}(\text{self}, \text{func})
\]
Add a callback function that will be called whenever one of the \text{Artist’s} properties changes.

**Parameters**

\[
\text{func} \ [\text{callable}] \text{The callback function. It must have the signature:}
\]
```python
def func(artist: Artist) -> Any
```

where `artist` is the calling `Artist`. Return values may exist but are ignored.

**Returns**

- **oid** [int] The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

**See also:**

- `remove_callback`

**add_checker(self, checker)**

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

**aname**

**autoscale(self)**

Autoscale the scalar limits on the norm instance using the current array

**autoscale_None(self)**

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

**axes**

The `Axes` instance the artist resides in, or `None`.

**changed(self)**

Call this whenever the mappable is changed to notify all the callback listeners to the ‘changed’ signal

**check_update(self, checker)**

If mappable has changed since the last check, return True; else return False

**contains(self, mouseevent)**

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

**static convert_mesh_to_paths(meshWidth, meshHeight, coordinates)**

Converts a given mesh into a sequence of `Path` objects.

This function is primarily of use to implementers of backends that do not directly support quadmeshes.

**convert_mesh_to_triangles(self, meshWidth, meshHeight, coordinates)**

Converts a given mesh into a sequence of triangles, each point with its own color. This is useful for experiments using `draw_gouraud_triangle`.

**convert_xunits(self, x)**

Convert `x` using the unit type of the xaxis.

If the artist is not in contained in an `Axes` or if the xaxis does not have units, `x` itself is returned.

**convert_yunits(self, y)**

Convert `y` using the unit type of the yaxis.
If the artist is not in contained in an Axes or if the yaxis does not have units, \( y \) itself is returned.

\[
\text{draw}(\text{self, renderer})
\]
Draw the Artist using the given renderer.

This method will be overridden in the Artist subclasses. Typically, it is implemented to not have any effect if the Artist is not visible (\( \text{Artist.get_visible} \) is False).

**Parameters**

- \( \text{renderer} \) [\( \text{RendererBase} \) subclass.]

\[
\text{findobj}(\text{self, match=\text{None}, include_self=\text{True}})
\]
Find artist objects.

Recursively find all \( \text{Artist} \) instances contained in the artist.

**Parameters**

- \( \text{match} \) A filter criterion for the matches. This can be
  - \( \text{None} \): Return all objects contained in artist.
  - A function with signature \( \text{def match(artist: Artist) \rightarrow bool} \). The result will only contain artists for which the function returns \( \text{True} \).
  - A class instance: e.g., \( \text{Line2D} \). The result will only contain artists of this class or its subclasses (\( \text{isinstance} \) check).

- \( \text{include_self} \) [\( \text{bool} \)] Include \( \text{self} \) in the list to be checked for a match.

**Returns**

- \( \text{artists} \) [\( \text{list of Artist} \)]

\[
\text{format_cursor_data}(\text{self, data})
\]
Return a string representation of \( \text{data} \).

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

- \( \text{get_cursor_data} \)
- \( \text{get_agg_filter} \)
- \( \text{get_alpha} \)
- \( \text{get_animated} \)
- \( \text{get_array} \)
- \( \text{get_capstyle} \)
get_children(self)
    Return a list of the child Artists of this Artist.

get_clim(self)
    return the min, max of the color limits for image scaling

get_clip_box(self)
    Return the clipbox.

get_clip_on(self)
    Return whether the artist uses clipping.

get_clip_path(self)
    Return the clip path.

get_cmap(self)
    return the colormap

get_contains(self)
    Return the custom contains function of the artist if set, or None.

    See also:
    set_contains

get_cursor_data(self, event)
    Return the cursor data for a given event.

    Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

    Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.

    Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that format_cursor_data can convert the data to a string representation.

    The only current use case is displaying the z-value of an AxesImage in the status bar of a plot window, while moving the mouse.

    Parameters
    event [matplotlib.backend_bases.MouseEvent]

    See also:
    format_cursor_data

get_dashes(self)
    Alias for get_linestyle.

get_datalim(self, transData)

get_ec(self, transData)
    Alias for get_edgecolor.

get_edgecolor(self)

get_edgecolors(self)
    Alias for get_edgecolor.
get_facecolor(self)
get_facecolors(self)
    Alias for get_facecolor.
get_fc(self)
    Alias for get_facecolor.
get_figure(self)
    Return the Figure instance the artist belongs to.
get_fill(self)
    return whether fill is set
get_gid(self)
    Return the group id.
get_hatch(self)
    Return the current hatching pattern.
get_in_layout(self)
    Return boolean flag, True if artist is included in layout calculations.
E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname,
    bbox_inches='tight').
get_joinstyle(self)
get_label(self)
    Return the label used for this artist in the legend.
get_linestyle(self)
get_linestyles(self)
    Alias for get_linestyle.
get_linewidth(self)
get_linewidths(self)
    Alias for get_linewidth.
get_ls(self)
    Alias for get_linestyle.
get_lw(self)
    Alias for get_linewidth.
get_offset_position(self)
    Returns how offsets are applied for the collection. If offset_position is 'screen',
    the offset is applied after the master transform has been applied, that is, the offsets
    are in screen coordinates. If offset_position is 'data', the offset is applied before the
    master transform, i.e., the offsets are in data coordinates.
get_offset_transform(self)
get_offsets(self)
    Return the offsets for the collection.
get_path_effects(self)
get_paths(self)
get_picker(self)
    Return the picking behavior of the artist.
The possible values are described in `set_picker`.

**See also:**

`set_picker`, `pickable`, `pick`

get_pickradius(self)

get_rasterized(self)
  Return whether the artist is to be rasterized.

get_sketch_params(self)
  Returns the sketch parameters for the artist.

**Returns**

**sketch_params** [tuple or None] A 3-tuple with the following elements:
- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.
  Returns `None` if no sketch parameters were set.

get_snap(self)
  Returns the snap setting.
  See `set_snap` for details.

get_tightbbox(self, renderer)
  Like `Artist.get_window_extent`, but includes any clipping.

**Parameters**

**renderer** `RendererBase` instance] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**Returns**

**bbox** [BBox] The enclosing bounding box (in figure pixel co-ordinates).

get_transform(self)
  Return the `Transform` instance used by this artist.

get_transformed_clip_path_and_affine(self)
  Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms(self)

get_url(self)
  Return the url.

get_urls(self)

get_visible(self)
  Return the visibility.

get_window_extent(self, renderer)
  Get the axes bounding box in display space.
  The bounding box’ width and height are nonnegative.
Subclasses should override for inclusion in the bounding box “tight” calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

```python
get_zorder(self)
    Return the artist’s zorder.

have_units(self)
    Return True if units are set on the x or y axes.

is_transform_set(self)
    Return whether the Artist has an explicitly set transform.
    This is True after set_transform has been called.

mouseover

pchanged(self)
    Call all of the registered callbacks.
    This function is triggered internally when a property is changed.

    See also:
    add_callback
    remove_callback

pick(self, mouseevent)
    Process a pick event.
    Each child artist will fire a pick event if mouseevent is over the artist and the artist has picker set.

    See also:
    set_picker, get_picker, pickable

pickable(self)
    Return whether the artist is pickable.

    See also:
    set_picker, get_picker, pick

properties(self)
    Return a dictionary of all the properties of the artist.

remove(self)
    Remove the artist from the figure if possible.
    The effect will not be visible until the figure is redrawn, e.g., with FigureCanvasBase.
    draw_idle. Call relim to update the axes limits if desired.

    Note: relim will not see collections even if the collection was added to the axes with autolim = True.
```
Note: there is no support for removing the artist’s legend entry.

```
remove_callback(self, oid)
    Remove a callback based on its observer id.

See also:
    add_callback
```

```
set(self, **kwargs)
    A property batch setter. Pass kwargs to set properties.

set_aa(self, aa)
    Alias for set_antialiased.

set_agg_filter(self, filter_func)
    Set the agg filter.

Parameters
    filter_func [callable] A filter function, which takes a (m, n, 3) float array
                 and a dpi value, and returns a (m, n, 3) array.

set_alpha(self, alpha)
    Set the alpha transparencies of the collection.

Parameters
    alpha [float or None]

set_animated(self, b)
    Set the artist’s animation state.

Parameters
    b [bool]

set_antialiased(self, aa)
    Set the antialiasing state for rendering.

Parameters
    aa [bool or sequence of bools]

set_antialiaseds(self, aa)
    Alias for set_antialiased.

set_array(self, A)
    Set the image array from numpy array A.

Parameters
    A [ndarray]

set_capstyle(self, cs)
    Set the capstyle for the collection (for all its elements).

Parameters
    cs [{‘butt’, ‘round’, ‘projecting’}] The capstyle

set_clim(self, vmin=None, vmax=None)
    set the norm limits for image scaling; if vmin is a length2 sequence, interpret it as
    (vmin, vmax) which is used to support setp
ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have
vmin and vmax kwargs.

```python
def set_clip_box(self, clipbox):
    Set the artist’s clip Bbox.

    Parameters
    clipbox [Bbox]
```

```python
def set_clip_on(self, b):
    Set whether the artist uses clipping.
    When False artists will be visible out side of the axes which can lead to unexpected
    results.

    Parameters
    b [bool]
```

```python
def set_clip_path(self, path, transform=None):
    Set the artist’s clip path, which may be:
    • a Patch (or subclass) instance; or
    • a Path instance, in which case a Transform instance, which will be applied to the
      path before using it for clipping, must be provided; or
    • None, to remove a previously set clipping path.
    For efficiency, if the path happens to be an axis-aligned rectangle, this method will
    set the clipping box to the corresponding rectangle and set the clipping path to None.

    ACCEPTS: [(Path, Transform) | Patch | None]
```

```python
def set_cmap(self, cmap):
    set the colormap for luminance data

    Parameters
    cmap [colormap or registered colormap name]
```

```python
def set_color(self, c):
    Set both the edgecolor and the facecolor.

    Parameters
    c [color or sequence of rgba tuples]
```

See also:

`Collection.set_facecolor, Collection.set_edgecolor` For setting the edge or face
color individually.

```python
def set_contains(self, picker):
    Define a custom contains test for the artist.
    The provided callable replaces the default contains method of the artist.

    Parameters
    picker [callable] A custom picker function to evaluate if an event is
    within the artist. The function must have the signature:
that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

```python
set_dashes(self, ls)
    Alias for `set_linestyle`.
```

```python
set_ec(self, c)
    Alias for `set_edgecolor`.
```

```python
set_edgecolor(self, c)
    Set the edgecolor(s) of the collection.

    Parameters
    ----------
    c : color or sequence of colors or 'face'
        The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.
```

```python
set_edgecolors(self, c)
    Alias for `set_edgecolor`.
```

```python
set_facecolor(self, c)
    Set the facecolor(s) of the collection. c can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

    If c is 'none', the patch will not be filled.

    Parameters
    ----------
    c : color or sequence of colors
```

```python
set_facecolors(self, c)
    Alias for `set_facecolor`.
```

```python
set_fc(self, c)
    Alias for `set_facecolor`.
```

```python
set_figure(self, fig)
    Set the `Figure` instance the artist belongs to.

    Parameters
    ----------
    fig : `Figure`
```

```python
set_gid(self, gid)
    Set the (group) id for the artist.

    Parameters
    ----------
    gid : str
```

```python
set_hatch(self, hatch)
    Set the hatching pattern

    hatch can be one of:
Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch [\{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}\]

set_in_layout(self, in_layout)
Set if artist is to be included in layout calculations, E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname, bbox_inches='tight').

Parameters

in_layout [bool]

set_joingstyle(self, js)
Set the joingstyle for the collection (for all its elements).

Parameters

js [{‘miter’, ‘round’, ‘bevel’}] The joingstyle

set_label(self, s)
Set a label that will be displayed in the legend.

Parameters

s [object] s will be converted to a string by calling str.

set_linestyle(self, ls)
Set the linestyle(s) for the collection.

<table>
<thead>
<tr>
<th>linestyle</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-.' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where onoffseq is an even length tuple of on and off ink in points.
Parameters

ls [{‘-’, ‘–’, ‘-.’, ‘:’, ’, (offset, on-off-seq), ...}] The line style.

set_linestyles(self, ls)
   Alias for set_linestyle.

set_linewidths(self, lw)
   Set the linewidth(s) for the collection. lw can be a scalar or a sequence; if it is a
   sequence the patches will cycle through the sequence

   Parameters
   
   lw [float or sequence of floats]

   set_linewidths(self, lw)
   Alias for set_linewidth.

   set_ls(self, ls)
   Alias for set_linestyle.

   set_lw(self, lw)
   Alias for set_linewidth.

set_norm(self, norm)
   Set the normalization instance.

   Parameters
   
   norm [Normalize]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the
mappable will reset the norm, locator, and formatters on the colorbar to default.

set_offset_position(self, offset_position)
   Set how offsets are applied. If offset_position is ‘screen’ (default) the offset is applied
   after the master transform has been applied, that is, the offsets are in screen coor-
   dinates. If offset_position is ‘data’, the offset is applied before the master transform,
   i.e., the offsets are in data coordinates.

   Parameters
   
   offset_position [{‘screen’, ‘data’}]

set_offsets(self, offsets)
   Set the offsets for the collection.

   Parameters
   
   offsets [float or sequence of floats]

set_path_effects(self, path_effects)
   Set the path effects.

   Parameters
   
   path_effects [AbstractPathEffect]

set_paths(self)

set_picker(self, picker)
   Define the picking behavior of the artist.
Parameters

**picker** [None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it’s data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

  ```python
def picker(artist, mouseevent):
  hit, props = picker(artist, mouseevent)
```

to determine the hit test. If the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the PickEvent attributes.

**set_pickradius**(self, *pr*)
Set the pick radius used for containment tests.

Parameters

**d** [float] Pick radius, in points.

**set_rasterized**(self, *rasterized*)
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend’s default behavior.

Parameters

**rasterized** [bool or None]

**set_sketch_params**(self, *scale=None, length=None, randomness=None*)
Sets the sketch parameters.

Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is *None*, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

**set_snap**(self, *snap*)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping
will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**

**snap** [bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

```python
def set_transform(self, t):
    Set the artist transform.
```

**Parameters**

**t** [Transform]

```python
def set_url(self, url):
    Set the url for the artist.
```

**Parameters**

**url** [str]

```python
def set_urls(self, urls):
    Parameters

**urls** [List[str] or None]
```

```python
def set_visible(self, b):
    Set the artist’s visibility.
```

**Parameters**

**b** [bool]

```python
def set_zorder(self, level):
    Set the zorder for the artist. Artists with lower zorder values are drawn first.
```

**Parameters**

**level** [float]

```python
stale
Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the internal state of the artist.
```

```python
sticky_edges
x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added—the view limit “sticks” to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.
```
Examples

```python
>>> artist.sticky_edges.x[:1] = (xmin, xmax)
>>> artist.sticky_edges.y[:1] = (ymin, ymax)
```

to_rgba(self, x, alpha=None, bytes=False, norm=True)

Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the alpha kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the alpha kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if bytes is False (default), the rgba array will be floats in the 0-1 range; if it is True, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(self, props)

Update this artist’s properties from the dictionary props.

update_from(self, other)

copy properties from other to self

update_scalarmappable(self)

Update colors from the scalar mappable array, if it is not None.

zorder = 0

class matplotlib.collections.RegularPolyCollection(numsides, rotation=0, sizes=(1,), **kwargs)

Bases: matplotlib.collections._CollectionWithSizes

Draw a collection of regular polygons with numsides.

numsides the number of sides of the polygon

rotation the rotation of the polygon in radians

sizes gives the area of the circle circumscribing the regular polygon in points^2

Valid Collection keyword arguments:

- edgecolors: None
- facecolors: None
- linewidths: None
- antialiaseds: None
- offsets: None
- transOffset: transforms.IdentityTransform()
Matplotlib, Release 3.1.3

- `norm`: None (optional for `matplotlib.cm.ScalarMappable`)
- `cmap`: None (optional for `matplotlib.cm.ScalarMappable`)

`offsets` and `transOffset` are used to translate the patch after rendering (default no offsets)

If any of `edgecolors`, `facecolors`, `linewidths`, `antialiaseds` are None, they default to their `matplotlib.rcParams` patch setting, in sequence form.

Example: see `/gallery/event_handling/lasso_demo` for a complete example:

```python
offsets = np.random.rand(20,2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]
black = (0,0,0,1)

collection = RegularPolyCollection(
    numsides=5,  # a pentagon
    rotation=0, sizes=(50,),
    facecolors=facecolors,
    edgecolors=black,
    linewidths=1,
    offsets=offsets,
    transOffset=ax.transData,
)
```

```python
add_callback(self, func)
Add a callback function that will be called whenever one of the Artist's properties changes.

Parameters

    func [callable] The callback function. It must have the signature:

    \[
    \text{def } func(\text{artist: Artist}) \rightarrow \text{Any}
    \]

    where `artist` is the calling Artist. Return values may exist but are ignored.

Returns

    oid [int] The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

See also:

    remove_callback

add_checker(self, checker)
Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

aname

autoscale(self)
Autoscale the scalar limits on the norm instance using the current array

autoscale_None(self)
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None
axes
   The Axes instance the artist resides in, or None.

changed(self)
   Call this whenever the mappable is changed to notify all the callback listeners to
   the ‘changed’ signal

check_update(self, checker)
   If mappable has changed since the last check, return True; else return False

contains(self, mouseevent)
   Test whether the mouse event occurred in the collection.

   Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

convert_xunits(self, x)
   Convert x using the unit type of the xaxis.

   If the artist is not in contained in an Axes or if the xaxis does not have units, x itself
   is returned.

convert_yunits(self, y)
   Convert y using the unit type of the yaxis.

   If the artist is not in contained in an Axes or if the yaxis does not have units, y itself
   is returned.

draw(self, renderer)
   Draw the Artist using the given renderer.

   This method will be overridden in the Artist subclasses. Typically, it is implemented
to not have any effect if the Artist is not visible (Artist.get_visible is False).

   Parameters

   renderer [RendererBase subclass.]

findobj(self, match=None, include_self=True)
   Find artist objects.

   Recursively find all Artist instances contained in the artist.

   Parameters

   match A filter criterion for the matches. This can be
   • None: Return all objects contained in artist.
   • A function with signature def match(artist: Artist) -> bool. The re-
     sult will only contain artists for which the function returns True.
   • A class instance: e.g., Line2D. The result will only contain artists of
     this class or its subclasses (isinstance check).

   include_self [bool] Include self in the list to be checked for a match.

   Returns

   artists [list of Artist]

format_cursor_data(self, data)
   Return a string representation of data.
Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

get_cursor_data

get_agg_filter(self)
Return filter function to be used for agg filter.

get_alpha(self)
Return the alpha value used for blending - not supported on all backends

get_animated(self)
Return the animated state.

get_array(self)
Return the array

get_capstyle(self)

get_children(self)
Return a list of the child Artists of this Artist.

get_clim(self)
return the min, max of the color limits for image scaling

get_clip_box(self)
Return the clipbox.

get_clip_on(self)
Return whether the artist uses clipping.

get_clip_path(self)
Return the clip path.

get_cmap(self)
return the colormap

get_contains(self)
Return the custom contains function of the artist if set, or None.

See also:

set_contains

get_cursor_data(self, event)
Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.
Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

**Parameters**

- **event** [matplotlib.backend_bases.MouseEvent]

  See also:

  - `format_cursor_data`

  - `get_dashes`
  - `get_datalim`
  - `get_ec`
  - `get_edgecolor`
  - `get_edgecolors`
  - `get_facecolor`
  - `get_facecolors`
  - `get_fc`
  - `get_fill`
  - `get_gid`
  - `get_hatch`
  - `get_in_layout`
  - `get_joinstyle`
  - `get_label`
  - `get_linestyle`
  - `get_linestyles`
  - `get_linewidth`

    17.15. matplotlib.collections 1473
get_linewidths(self)
    Alias for get_linewidth.

get_ls(self)
    Alias for get_linestyle.

get_lw(self)
    Alias for get_linewidth.

get_num_sides(self)

get_offset_position(self)
    Returns how offsets are applied for the collection. If offset_position is ‘screen’, the
    offset is applied after the master transform has been applied, that is, the offsets are
    in screen coordinates. If offset_position is ‘data’, the offset is applied before the
    master transform, i.e., the offsets are in data coordinates.

get_offset_transform(self)

get_offsets(self)
    Return the offsets for the collection.

get_path_effects(self)

get_paths(self)

get_picker(self)
    Return the picking behavior of the artist.
    The possible values are described in set_picker.

    See also:

    set_picker, pickable, pick

get_pick_radius(self)

get_rasterized(self)
    Return whether the artist is to be rasterized.

get_rotation(self)

get_sizes(self)
    Returns the sizes of the elements in the collection. The value represents the ‘area’
    of the element.

    Returns

    sizes [array] The ‘area’ of each element.

get_sketch_params(self)
    Returns the sketch parameters for the artist.

    Returns

    sketch_params [tuple or None] A 3-tuple with the following elements:
    • scale: The amplitude of the wiggle perpendicular to the source line.
    • length: The length of the wiggle along the line.
    • randomness: The scale factor by which the length is shrunken or expanded.

    Returns None if no sketch parameters were set.
get_snap(self)
    Returns the snap setting.
    See set_snap for details.

get_tightbbox(self, renderer)
    Like Artist.get_window_extent, but includes any clipping.

    Parameters
        renderer [RendererBase instance] renderer that will be used to draw the
        figures (i.e. fig.canvas.get_renderer())

    Returns
        bbox [BBox] The enclosing bounding box (in figure pixel co-ordinates).

get_transform(self)
    Return the Transform instance used by this artist.

get_transformed_clip_path_and_affine(self)
    Return the clip path with the non-affine part of its transformation applied, and the
    remaining affine part of its transformation.

get_transforms(self)

get_url(self)
    Return the url.

get_urls(self)

get_visible(self)
    Return the visibility.

get_window_extent(self, renderer)
    Get the axes bounding box in display space.
    The bounding box’ width and height are nonnegative.
    Subclasses should override for inclusion in the bounding box ”tight” calculation.
    Default is to return an empty bounding box at 0, 0.

    Be careful when using this function, the results will not update if the artist window
    extent of the artist changes. The extent can change due to any changes in the trans-
    form stack, such as changing the axes limits, the figure size, or the canvas used (as is
done when saving a figure). This can lead to unexpected behavior where interactive
    figures will look fine on the screen, but will save incorrectly.

get_zorder(self)
    Return the artist’s zorder.

have_units(self)
    Return True if units are set on the x or y axes.

is_transform_set(self)
    Return whether the Artist has an explicitly set transform.

    This is True after set_transform has been called.

mouseover

pchanged(self)
    Call all of the registered callbacks.

    This function is triggered internally when a property is changed.
See also:

add_callback
remove_callback

pick(self, mouseevent)
Process a pick event.
Each child artist will fire a pick event if mouseevent is over the artist and the artist has picker set.
See also:

set_picker, get_picker, pickable

pickable(self)
Return whether the artist is pickable.
See also:

set_picker, get_picker, pick

properties(self)
Return a dictionary of all the properties of the artist.

remove(self)
Remove the artist from the figure if possible.
The effect will not be visible until the figure is redrawn, e.g., with FigureCanvasBase.draw_idle. Call relim to update the axes limits if desired.
Note: relim will not see collections even if the collection was added to the axes with autolim = True.
Note: there is no support for removing the artist’s legend entry.

remove_callback(self, oid)
Remove a callback based on its observer id.
See also:

add_callback

set(self, **kwargs)
A property batch setter. Pass kwargs to set properties.

set_aa(self, aa)
Alias for set_antialiased.

set_agg_filter(self, filter_func)
Set the agg filter.

Parameters

filter_func [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

set_alpha(self, alpha)
Set the alpha transparencies of the collection.

Parameters
**alpha** [float or None]

```python
set_animated(self, b)
```
Set the artist’s animation state.

**Parameters**

- **b** [bool]

```python
set_antialiased(self, aa)
```
Set the antialiasing state for rendering.

**Parameters**

- **aa** [bool or sequence of bools]

```python
set_antialiaseds(self, aa)
```
Alias for `set_antialiased`.

```python
set_array(self, A)
```
Set the image array from numpy array A.

**Parameters**

- **A** [ndarray]

```python
set_capstyle(self, cs)
```
Set the capstyle for the collection (for all its elements).

**Parameters**

- **cs** [‘butt’, ‘round’, ‘projecting’] The capstyle

```python
set_clim(self, vmin=None, vmax=None)
```
Set the norm limits for image scaling; if `vmin` is a length2 sequence, interpret it as `(vmin, vmax)` which is used to support setp

ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have `vmin` and `vmax` kwargs.

```python
set_clip_box(self, clipbox)
```
Set the artist’s clip `Bbox`.

**Parameters**

- **clipbox** [Bbox]

```python
set_clip_on(self, b)
```
Set whether the artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

**Parameters**

- **b** [bool]

```python
set_clip_path(self, path, transform=None)
```
Set the artist’s clip path, which may be:

- a `Patch` (or subclass) instance; or
- a `Path` instance, in which case a `Transform` instance, which will be applied to the path before using it for clipping, must be provided; or
- `None`, to remove a previously set clipping path.
For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

ACCEPTS: [(Path, Transform) | Patch | None]

set_cmap(self, cmap)
set the colormap for luminance data

Parameters

cmap [colormap or registered colormap name]

set_color(self, c)
Set both the edgecolor and the facecolor.

Parameters

c [color or sequence of rgba tuples]

See also:

Collection.set_facecolor, Collection.set_edgescolor For setting the edge or face color individually.

set_contains(self, picker)
Define a custom contains test for the artist.

The provided callable replaces the default contains method of the artist.

Parameters

picker [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default contains() implementation of the respective artist, but may provide additional information.

set_dashes(self, ls)
Alias for set_linestyle.

set_ec(self, c)
Alias for set_edgecolor.

set_edgecolor(self, c)
Set the edgecolor(s) of the collection.

Parameters

c [color or sequence of colors or ‘face’] The collection edgecolor(s). If a sequence, the patches cycle through it. If ‘face’, match the facecolor.

set_edgecolors(self, c)
Alias for set_edgecolor.

set_facecolor(self, c)
Set the facecolor(s) of the collection. c can be a matplotlib color spec (all patches
have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If c is ‘none’, the patch will not be filled.

**Parameters**

- **c** [color or sequence of colors]

```python
set_facecolors(self, c)
```

Alias for `set_facecolor`.

```python
set_fc(self, c)
```

Alias for `set_facecolor`.

```python
set_figure(self, fig)
```

Set the Figure instance the artist belongs to.

**Parameters**

- **fig** [Figure]

```python
set_gid(self, gid)
```

Set the (group) id for the artist.

**Parameters**

- **gid** [str]

```python
set_hatch(self, hatch)
```

Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

**Parameters**

```python
set_in_layout(self, in_layout)
```

Set if artist is to be included in layout calculations, E.g. `Constrained Layout Guide`, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

**Parameters**

- **in_layout** [bool]
set_joinstyle(self, js)
Set the joinstyle for the collection (for all its elements).

Parameters
js ['miter', 'round', 'bevel'] The joinstyle

set_label(self, s)
Set a label that will be displayed in the legend.

Parameters
s [object] s will be converted to a string by calling str.

set_linestyle(self, ls)
Set the linestyle(s) for the collection.

<table>
<thead>
<tr>
<th>linestyle</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-.' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where onoffseq is an even length tuple of on and off ink in points.

Parameters
ls ['-', '-', '-', '-', ':', ...] The line style.

set_linestyles(self, ls)
Alias for set_linestyle.

set_linewidth(self, lw)
Set the linewidth(s) for the collection. lw can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence.

Parameters
lw [float or sequence of floats]

set_linewidths(self, lw)
Alias for set_linewidth.

set_ls(self, ls)
Alias for set_linestyle.

set_lw(self, lw)
Alias for set_linewidth.

set_norm(self, norm)
Set the normalization instance.

Parameters
norm [Normalize]
Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

set_offset_position(self, offset_position)
Set how offsets are applied. If offset_position is ‘screen’ (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is ‘data’, the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Parameters

offset_position [{‘screen’, ‘data’}]

set_offsets(self, offsets)
Set the offsets for the collection.

Parameters

offsets [float or sequence of floats]

set_path_effects(self, path_effects)
Set the path effects.

Parameters

path_effects [AbstractPathEffect]

set_paths(self)

set_picker(self, picker)
Define the picking behavior of the artist.

Parameters

picker [None or bool or float or callable] This can be one of the following:

• None: Picking is disabled for this artist (default).

• A boolean: If True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.

• A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it’s data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event.

• A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

    hit, props = picker(artist, mouseevent)

to determine the hit test. If the mouse event is over the artist, return hit=True and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(self, pr)
Set the pick radius used for containment tests.

Parameters
set_rasterized(self, rasterized)

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend’s default behavior.

Parameters

rasterized [bool or None]

set_sizes(self, sizes, dpi=72.0)

Set the sizes of each member of the collection.

Parameters

sizes [ndarray or None] The size to set for each element of the collection.

The value is the ‘area’ of the element.

dpi [float] The dpi of the canvas. Defaults to 72.0.

set_sketch_params(self, scale=None, length=None, randomness=None)

Sets the sketch parameters.

Parameters

scale [float, optional] The amplitude of the wiggle perpendicular to the

source line, in pixels. If scale is None, or not provided, no sketch filter

will be provided.

length [float, optional] The length of the wiggle along the line, in pixels

(default 128.0)

randomness [float, optional] The scale factor by which the length is

shrunken or expanded (default 16.0)

set_snap(self, snap)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For

example, if a black line of 1px width was defined at a position in between two pixels,

the resulting image would contain the interpolated value of that line in the pixel grid,

which would be a grey value on both adjacent pixel positions. In contrast, snapping

will move the line to the nearest integer pixel value, so that the resulting image will

really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap [bool or None] Possible values:

• True: Snap vertices to the nearest pixel center.

• False: Do not modify vertex positions.

• None: (auto) If the path contains only rectilinear line segments, round

to the nearest pixel center.

set_transform(self, t)

Set the artist transform.

Parameters

t [Transform]
set_url(self, url)
    Set the url for the artist.

    Parameters
    url [str]

set_urls(self, urls)

    Parameters
    urls [List[str] or None]

set_visible(self, b)
    Set the artist’s visibility.

    Parameters
    b [bool]

set_zorder(self, level)
    Set the zorder for the artist. Artists with lower zorder values are drawn first.

    Parameters
    level [float]

stale
    Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the internal state of the artist.

sticky_edges
    x and y sticky edge lists for autoscaling.

    When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added—the view limit “sticks” to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

    This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

Examples

    >>> artist.sticky_edges.x[:] = (xmin, xmax)
    >>> artist.sticky_edges.y[:] = (ymin, ymax)

to_rgba(self, x, alpha=None, bytes=False, norm=True)
    Return a normalized rgba array corresponding to x.

    In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

    There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the alpha kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the alpha kwarg
is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if
the third dimension is other than 3 or 4.

In either case, if bytes is False (default), the rgba array will be floats in the 0-1 range;
if it is True, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed
to be in the range (0-1).

update(self, props)
    Update this artist’s properties from the dictionary props.

update_from(self, other)
    Copy properties from other to self

update_scalarmappable(self)
    Update colors from the scalar mappable array, if it is not None.

zorder = 0
class matplotlib.collections.StarPolygonCollection(numsides, rotation=0, sizes=(1,),
**kwargs)

Bases: matplotlib.collections.RegularPolyCollection

Draw a collection of regular stars with numsides points.

numsides  the number of sides of the polygon

rotation  the rotation of the polygon in radians

sizes  gives the area of the circle circumscribing the regular polygon in points^2

Valid Collection keyword arguments:

•  edgecolors: None
•  facecolors: None
•  linewidths: None
•  antialiaseds: None
•  offsets: None
•  transOffset: transforms.IdentityTransform()
•  norm: None (optional for matplotlib.cm.ScalarMappable)
•  cmap: None (optional for matplotlib.cm.ScalarMappable)

offsets and transOffset are used to translate the patch after rendering (default no
offsets)

If any of edgecolors, facecolors, linewidths, antialiaseds are None, they default to
their matplotlib.rcParams patch setting, in sequence form.

Example: see /gallery/event_handling/lasso_demo for a complete example:

offsets = np.random.rand(20,2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]
black = (0,0,0,1)

collection = RegularPolyCollection(
    numsides=5, # a pentagon
    rotation=0, sizes=(50,),
)
add_callback(self, func)
Add a callback function that will be called whenever one of the Artist's properties changes.

**Parameters**

*func* [callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where *artist* is the calling Artist. Return values may exist but are ignored.

**Returns**

*oid* [int] The observer id associated with the callback. This id can be used for removing the callback with remove_callback later.

**See also:**

remove_callback

add_checker(self, checker)
Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

aname
autoscale(self)
Autoscale the scalar limits on the norm instance using the current array

autoscale_None(self)
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

axes
The Axes instance the artist resides in, or None.

changed(self)
Call this whenever the mappable is changed to notify all the callback listeners to the 'changed' signal

check_update(self, checker)
If mappable has changed since the last check, return True; else return False

contains(self, mouseevent)
Test whether the mouse event occurred in the collection.

Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

convert_xunits(self, x)
Convert x using the unit type of the xaxis.
If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

\texttt{convert_yunits}(\texttt{self}, \texttt{y})

Convert y using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

\texttt{draw}(\texttt{self}, \texttt{renderer})

Draw the Artist using the given renderer.

This method will be overridden in the Artist subclasses. Typically, it is implemented to not have any effect if the Artist is not visible (\texttt{Artist.get_visible} is \texttt{False}).

Parameters

\texttt{renderer} [\texttt{RendererBase} subclass.]

\texttt{findobj}(\texttt{self}, \texttt{match}=\texttt{None}, \texttt{include_self}=\texttt{True})

Find artist objects.

Recursively find all \texttt{Artist} instances contained in the artist.

Parameters

\texttt{match} A filter criterion for the matches. This can be

- \texttt{None}: Return all objects contained in artist.
- A function with signature \texttt{def match(artist: Artist) -> bool}. The result will only contain artists for which the function returns \texttt{True}.
- A class instance: e.g., \texttt{Line2D}. The result will only contain artists of this class or its subclasses (\texttt{isinstance} check).

\texttt{include_self} [bool] Include \texttt{self} in the list to be checked for a match.

Returns

\texttt{artists} [list of \texttt{Artist}]

\texttt{format_cursor_data}(\texttt{self}, \texttt{data})

Return a string representation of \texttt{data}.

\textbf{Note:} This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

\textbf{See also:}

\texttt{get_cursor_data}

\texttt{get_agg_filter}(\texttt{self})

Return filter function to be used for agg filter.

\texttt{get_alpha}(\texttt{self})

Return the alpha value used for blending - not supported on all backends

\texttt{get_animated}(\texttt{self})

Return the animated state.
get_array(self)
    Return the array

get_capstyle(self)

get_children(self)
    Return a list of the child Artists of this Artist.

get_clim(self)
    return the min, max of the color limits for image scaling

get_clip_box(self)
    Return the clipbox.

get_clip_on(self)
    Return whether the artist uses clipping.

get_clip_path(self)
    Return the clip path.

get_cmap(self)
    return the colormap

get_contains(self)
    Return the custom contains function of the artist if set, or None.

    See also:

    set_contains

get_cursor_data(self, event)
    Return the cursor data for a given event.

    Note: This method is intended to be overridden by artist subclasses. As an end-user
    of Matplotlib you will most likely not call this method yourself.

    Cursor data can be used by Artists to provide additional context information for a
given event. The default implementation just returns None.

    Subclasses can override the method and return arbitrary data. However, when do-
ing so, they must ensure that format_cursor_data can convert the data to a string
representation.

    The only current use case is displaying the z-value of an AxesImage in the status bar
of a plot window, while moving the mouse.

    Parameters

    event [matplotlib.backend_bases.MouseEvent]

    See also:

    format_cursor_data

get_dashes(self)
    Alias for get_linestyle.

get_datalim(self, transData)

get_ec(self)
    Alias for get_edgecolor.
get_edgecolor(self)
get_edgecolors(self)
    Alias for get_edgecolor.
get_facecolor(self)
get_facecolors(self)
    Alias for get_facecolor.
get_fc(self)
    Alias for get_facecolor.
get_figure(self)
    Return the Figure instance the artist belongs to.
get_fill(self)
    return whether fill is set
get_gid(self)
    Return the group id.
get_hatch(self)
    Return the current hatching pattern.
get_in_layout(self)
    Return boolean flag, True if artist is included in layout calculations.
    E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname, bbox_inches='tight').
get_joinstyle(self)
get_label(self)
    Return the label used for this artist in the legend.
get_linestyle(self)
get_linestyles(self)
    Alias for get_linestyle.
get_linewidth(self)
get_linewidths(self)
    Alias for get_linewidth.
get_ls(self)
    Alias for get_linestyle.
get_lw(self)
    Alias for get_linewidth.
get_numsides(self)
get_offset_position(self)
    Returns how offsets are applied for the collection. If offset_position is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.
get_offset_transform(self)
get_offsets(self)
    Return the offsets for the collection.
get_path_effects(self)
get_paths(self)
get_picker(self)
    Return the picking behavior of the artist.
    The possible values are described in \texttt{set_picker}.

See also:

set_picker, \texttt{pickable}, \texttt{pick}

get_pickradius(self)
get_rasterized(self)
    Return whether the artist is to be rasterized.
get_rotation(self)
get_sizes(self)
    Returns the sizes of the elements in the collection. The value represents the 'area'
of the element.

Returns

sizes [array] The 'area' of each element.

get_sketch_params(self)
    Returns the sketch parameters for the artist.

Returns

sketch_params [tuple or None] A 3-tuple with the following elements:
    • \texttt{scale}: The amplitude of the wiggle perpendicular to the source line.
    • \texttt{length}: The length of the wiggle along the line.
    • \texttt{randomness}: The scale factor by which the length is shrunken or expanded.

Returns \texttt{None} if no sketch parameters were set.

get_snap(self)
    Returns the snap setting.

See \texttt{set_snap} for details.

get_tightbbox(self, renderer)
    Like \texttt{Artist.get_window_extent}, but includes any clipping.

Parameters

renderer [RendererBase instance] renderer that will be used to draw the figures (i.e. \texttt{fig.canvas.get_renderer()})

Returns

bbox [BBox] The enclosing bounding box (in figure pixel co-ordinates).

get_transform(self)
    Return the \texttt{Transform} instance used by this artist.
get_transformed_clip_path_and_affine(self)
    Return the clip path with the non-affine part of its transformation applied, and the
    remaining affine part of its transformation.

get_transforms(self)

get_url(self)
    Return the url.

get_urls(self)

get_visible(self)
    Return the visibility.

get_window_extent(self, renderer)
    Get the axes bounding box in display space.
    The bounding box' width and height are nonnegative.
    Subclasses should override for inclusion in the bounding box "tight" calculation. Default
    is to return an empty bounding box at 0, 0.
    Be careful when using this function, the results will not update if the artist window
    extent of the artist changes. The extent can change due to any changes in the trans-
    form stack, such as changing the axes limits, the figure size, or the canvas used (as is
    done when saving a figure). This can lead to unexpected behavior where interactive
    figures will look fine on the screen, but will save incorrectly.

get_zorder(self)
    Return the artist's zorder.

have_units(self)
    Return True if units are set on the x or y axes.

is_transform_set(self)
    Return whether the Artist has an explicitly set transform.
    This is True after set_transform has been called.

mouseover

p_changed(self)
    Call all of the registered callbacks.
    This function is triggered internally when a property is changed.

    See also:

    add_callback

    remove_callback

pick(self, mouseevent)
    Process a pick event.
    Each child artist will fire a pick event if mouseevent is over the artist and the artist
    has picker set.

    See also:

    set_picker, get_picker, pickable
pickleable(self)
    Return whether the artist is pickable.

    See also:
    
    set_picker, get_picker, pick

properties(self)
    Return a dictionary of all the properties of the artist.

remove(self)
    Remove the artist from the figure if possible.

    The effect will not be visible until the figure is redrawn, e.g., with FigureCanvasBase.
    draw_idle. Call relim to update the axes limits if desired.

    Note: relim will not see collections even if the collection was added to the axes with
    autolim = True.

    Note: there is no support for removing the artist’s legend entry.

remove_callback(self, oid)
    Remove a callback based on its observer id.

    See also:
    
    add_callback

set(self, **kwargs)
    A property batch setter. Pass kwargs to set properties.

set_aa(self, aa)
    Alias for set_antialiased.

set_agg_filter(self, filter_func)
    Set the agg filter.

    Parameters
    
    filter_func [callable] A filter function, which takes a (m, n, 3) float array
    and a dpi value, and returns a (m, n, 3) array.

set_alpha(self, alpha)
    Set the alpha transparencies of the collection.

    Parameters
    
    alpha [float or None]

set_animated(self, b)
    Set the artist’s animation state.

    Parameters
    
    b [bool]

set_antialiased(self, aa)
    Set the antialiasing state for rendering.

    Parameters
    
    aa [bool or sequence of bools]
set_antialiaseds(self, aa)

    Alias for \texttt{set_antialiased}.

set_array(self, A)

    Set the image array from numpy array \(A\).

    \textbf{Parameters}

    A [ndarray]

set_capstyle(self, cs)

    Set the capstyle for the collection (for all its elements).

    \textbf{Parameters}

    cs [{'butt', 'round', 'projecting'}] The capstyle

set_clim(self, vmin=None, vmax=None)

    set the norm limits for image scaling; if vmin is a length2 sequence, interpret it as
    \((vmin, vmax)\) which is used to support setp

    ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have
    vmin and vmax kwargs.

set_clip_box(self, clipbox)

    Set the artist's clip \texttt{Bbox}.

    \textbf{Parameters}

    clipbox [\texttt{Bbox}]

set_clip_on(self, b)

    Set whether the artist uses clipping.

    When False artists will be visible out side of the axes which can lead to unexpected
    results.

    \textbf{Parameters}

    b [bool]

set_clip_path(self, path, transform=None)

    Set the artist's clip path, which may be:

    \begin{itemize}
    \item a \texttt{Patch} (or subclass) instance; or
    \item a \texttt{Path} instance, in which case a \texttt{Transform} instance, which will be applied to the
      path before using it for clipping, must be provided; or
    \item \texttt{None}, to remove a previously set clipping path.
    \end{itemize}

    For efficiency, if the path happens to be an axis-aligned rectangle, this method will
    set the clipping box to the corresponding rectangle and set the clipping path to \texttt{None}.

    ACCEPTS: [(\texttt{Path}, \texttt{Transform}) | \texttt{Patch} | \texttt{None}]

set_cmap(self, cmap)

    set the colormap for luminance data

    \textbf{Parameters}

    cmap [colormap or registered colormap name]

set_color(self, c)

    Set both the edgecolor and the facecolor.

    \textbf{Parameters}
c [color or sequence of rgba tuples]

See also:

Collection.set_facecolor, Collection.set_edgecolor For setting the edge or face color individually.

set_contains(self, picker)
Define a custom contains test for the artist.

The provided callable replaces the default contains method of the artist.

Parameters

picker [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

• a bool indicating if the event is within the artist
• a dict of additional information. The dict should at least return the same information as the default contains() implementation of the respective artist, but may provide additional information.

set_dashes(self, ls)
Alias for set_linestyle.

set_ec(self, c)
Alias for set_edgecolor.

set_edgecolor(self, c)
Set the edgecolor(s) of the collection.

Parameters

• c [color or sequence of colors] The collection edgecolor(s). If a sequence, the patches cycle through it. If ‘face’, match the facecolor.

set_edgecolors(self, c)
Alias for set_edgecolor.

set_facecolor(self, c)
Set the facecolor(s) of the collection. c can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If c is ‘none’, the patch will not be filled.

Parameters

• c [color or sequence of colors]

set_facecolors(self, c)
Alias for set_facecolor.

set_fc(self, c)
Alias for set_facecolor.

set_figure(self, fig)
Set the Figure instance the artist belongs to.
**Parameters**

```
fig [Figure]
```

```
def set_gid(self, gid):
    Set the (group) id for the artist.
```

**Parameters**

```
gid [str]
```

```
def set_hatch(self, hatch):
    Set the hatching pattern
```

```
hatch can be one of:
```

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/</td>
<td>diagonal hatching</td>
</tr>
<tr>
<td>\</td>
<td>back diagonal</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>-</td>
<td>horizontal</td>
</tr>
<tr>
<td>+</td>
<td>crossed</td>
</tr>
<tr>
<td>x</td>
<td>crossed diagonal</td>
</tr>
<tr>
<td>o</td>
<td>small circle</td>
</tr>
<tr>
<td>O</td>
<td>large circle</td>
</tr>
<tr>
<td>.</td>
<td>dots</td>
</tr>
<tr>
<td>*</td>
<td>stars</td>
</tr>
</tbody>
</table>

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

**Parameters**

```
hatch [{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]
```

```
def set_in_layout(self, in_layout):
    Set if artist is to be included in layout calculations, E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname, bbox_inches='tight').
```

**Parameters**

```
in_layout [bool]
```

```
def set_joinstyle(self, js):
    Set the joinstyle for the collection (for all its elements).
```

**Parameters**

```
js [{'miter', 'round', 'bevel'}] The joinstyle
```

```
def set_label(self, s):
    Set a label that will be displayed in the legend.
```

**Parameters**

```
s [object] s will be converted to a string by calling str.
```

```
def set_linestyle(self, ls):
    Set the linestyle(s) for the collection.
```

```
```
<table>
<thead>
<tr>
<th>linestyle</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'-.' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>':' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

```python
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

**Parameters**

- `ls` [{',', '-', '.', ':', '', (offset, on-off-seq), ...}] The line style.

```python
def set_linestyles(self, ls)
    Alias for set_linestyle.
```

```python
def set_linewidths(self, lw)
    Alias for set_linewidth.
```

```python
def set_ls(self, ls)
    Alias for set_linestyle.
```

```python
def set_lw(self, lw)
    Alias for set_linewidth.
```

```python
def set_norm(self, norm)
    Set the normalization instance.
```

**Parameters**

- `norm` [Normalize]

**Notes**

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

```python
def set_offset_position(self, offset_position)
    Set how offsets are applied. If `offset_position` is ‘screen’ (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is ‘data’, the offset is applied before the master transform, i.e., the offsets are in data coordinates.
```

**Parameters**

- `offset_position` [{‘screen’, ‘data’}]

```python
def set_offsets(self, offsets)
    Set the offsets for the collection.
```
Parameters

offsets [float or sequence of floats]

set_path_effects(self, path_effects)
Set the path effects.

Parameters

path_effects [AbstractPathEffect]

set_paths(self)

set_picker(self, picker)
Define the picking behavior of the artist.

Parameters

picker [None or bool or float or callable] This can be one of the following:

• None: Picking is disabled for this artist (default).
• A boolean: If True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
• A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
• A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```python
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return hit=True and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(self, pr)
Set the pick radius used for containment tests.

Parameters

d [float] Pick radius, in points.

set_rasterized(self, rasterized)
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

Parameters

rasterized [bool or None]

set_sizes(self, sizes, dpi=72.0)
Set the sizes of each member of the collection.

Parameters

sizes [ndarray or None] The size to set for each element of the collection. The value is the ‘area’ of the element.

dpi [float] The dpi of the canvas. Defaults to 72.0.
set_sketch_params(self, scale=None, length=None, randomness=None)
Sets the sketch parameters.

Parameters

scale [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.

length [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

set_snap(self, snap)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap [bool or None] Possible values:
• True: Snap vertices to the nearest pixel center.
• False: Do not modify vertex positions.
• None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transform(self, t)
Set the artist transform.

Parameters

t [Transform]

set_url(self, url)
Set the url for the artist.

Parameters

url [str]

set_urls(self, urls)

Parameters

urls [List[str] or None]

set_visible(self, b)
Set the artist’s visibility.

Parameters

b [bool]
set_zorder(self, level)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters
level [float]

stale
Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the internal state of the artist.

sticky_edges
x and y sticky edge lists for autoscaling.
When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added—the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

Examples

```python
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(self, x, alpha=None, bytes=False, norm=True)
Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the alpha kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the alpha kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if bytes is False (default), the rgba array will be floats in the 0-1 range; if it is True, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(self, props)
Update this artist’s properties from the dictionary props.

update_from(self, other)
copy properties from other to self

update_scalarmappable(self)
Update colors from the scalar mappable array, if it is not None.

zorder = 0
class matplotlib.collections.TriMesh(triangulation, **kwargs)

Bases: matplotlib.collections.Collection

Class for the efficient drawing of a triangular mesh using Gouraud shading.

A triangular mesh is a Triangulation object.

add_callback(self, func)

Add a callback function that will be called whenever one of the Artist's properties changes.

**Parameters**

func [callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where artist is the calling Artist. Return values may exist but are ignored.

**Returns**

oid [int] The observer id associated with the callback. This id can be used for removing the callback with remove_callback later.

See also:

remove_callback

add_checker(self, checker)

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

aname

autoscale(self)

Autoscale the scalar limits on the norm instance using the current array

autoscale_None(self)

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

axes

The Axes instance the artist resides in, or None.

changed(self)

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

check_update(self, checker)

If mappable has changed since the last check, return True; else return False

contains(self, mouseevent)

Test whether the mouse event occurred in the collection.

    Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

static convert_mesh_to_paths(tri)

Converts a given mesh into a sequence of Path objects.

    This function is primarily of use to implementers of backends that do not directly support meshes.
convert_xunits(self, x)
   Convert x using the unit type of the xaxis.
   If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

convert_yunits(self, y)
   Convert y using the unit type of the yaxis.
   If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

draw(self, renderer)
   Draw the Artist using the given renderer.
   This method will be overridden in the Artist subclasses. Typically, it is implemented to not have any effect if the Artist is not visible (Artist.get_visible is False).

   Parameters

   renderer [RendererBase subclass.]

findobj(self, match=None, include_self=True)
   Find artist objects.
   Recursively find all Artist instances contained in the artist.

   Parameters

   match A filter criterion for the matches. This can be
   • None: Return all objects contained in artist.
   • A function with signature def match(artist: Artist) -> bool. The result will only contain artists for which the function returns True.
   • A class instance: e.g., Line2D. The result will only contain artists of this class or its subclasses (isinstance check).

   include_self [bool] Include self in the list to be checked for a match.

   Returns

   artists [list of Artist]

format_cursor_data(self, data)
   Return a string representation of data.

   Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

   The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

   See also:

get_cursor_data

get_agg_filter(self)
   Return filter function to be used for agg filter.

get_alpha(self)
   Return the alpha value used for blending - not supported on all backends
get_animated(self)
    Return the animated state.

get_array(self)
    Return the array

get_capstyle(self)

get_children(self)
    Return a list of the child Artists of this Artist.

get_clim(self)
    return the min, max of the color limits for image scaling

get_clip_box(self)
    Return the clipbox.

get_clip_on(self)
    Return whether the artist uses clipping.

get_clip_path(self)
    Return the clip path.

get_cmap(self)
    return the colormap

get_contains(self)
    Return the custom contains function of the artist if set, or None.

    See also:

    set_contains

get_cursor_data(self, event)
    Return the cursor data for a given event.

    Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

    Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.

    Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that format_cursor_data can convert the data to a string representation.

    The only current use case is displaying the z-value of an AxesImage in the status bar of a plot window, while moving the mouse.

    Parameters

    event [matplotlib.backend_bases.MouseEvent]

    See also:

    format_cursor_data

get_dashes(self)
    Alias for get_linestyle.

get_datalim(self, transData)
get_ec(self)
    Alias for get_edgecolor.

get_edgecolor(self)

get_edgecolors(self)
    Alias for get_edgecolor.

get_facecolor(self)

get_facecolors(self)
    Alias for get_facecolor.

g_f(self)
    Alias for get_facecolor.

g_figure(self)
    Return the Figure instance the artist belongs to.

g_fill(self)
    return whether fill is set

g_gid(self)
    Return the group id.

g_hatch(self)
    Return the current hatching pattern.

g_in_layout(self)
    Return boolean flag, True if artist is included in layout calculations.

    E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname, 
bbox_inches='tight').

g_joinstyle(self)

g_label(self)
    Return the label used for this artist in the legend.

g_linecolor(self)

g_linesyles(self)
    Alias for get_linestyle.

g_linewidth(self)

g_linewidths(self)
    Alias for get_linewidth.

g_ls(self)
    Alias for get_linestyle.

g_lw(self)
    Alias for get_linewidth.

g_offset_position(self)
    Returns how offsets are applied for the collection. If offset_position is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

g_offset_transform(self)

g_offsets(self)
    Return the offsets for the collection.
get_path_effects(self)
get_paths(self)
get_picker(self)
    Return the picking behavior of the artist.
    The possible values are described in set_picker.
    See also:
        set_picker, pickable, pick

get_pickradius(self)
get_rasterized(self)
    Return whether the artist is to be rasterized.
get_sketch_params(self)
    Returns the sketch parameters for the artist.

    Returns
        sketch_params [tuple or None] A 3-tuple with the following elements:
            • scale: The amplitude of the wiggle perpendicular to the source line.
            • length: The length of the wiggle along the line.
            • randomness: The scale factor by which the length is shrunken or ex-panded.
    Returns None if no sketch parameters were set.

get_snap(self)
    Returns the snap setting.
    See set_snap for details.

get_tightbbox(self, renderer)
    Like Artist.get_window_extent, but includes any clipping.

    Parameters
        renderer [RendererBase instance] renderer that will be used to draw the figures (i.e. fig.canvas.get_renderer())

    Returns
        bbox [BBox] The enclosing bounding box (in figure pixel co-ordinates).

get_transform(self)
    Return the Transform instance used by this artist.

get_transformed_clip_path_and_affine(self)
    Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms(self)
get_url(self)
    Return the url.
get_urls(self)
get_visible(self)
    Return the visibility.

get_window_extent(self, renderer)
    Get the axes bounding box in display space.
    The bounding box' width and height are nonnegative.
    Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.
    Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder(self)
    Return the artist's zorder.

have_units(self)
    Return True if units are set on the x or y axes.

is_transform_set(self)
    Return whether the Artist has an explicitly set transform.
    This is True after set_transform has been called.

mouseover

pchanged(self)
    Call all of the registered callbacks.
    This function is triggered internally when a property is changed.
    See also:
      add_callback
      remove_callback

pick(self, mouseevent)
    Process a pick event.
    Each child artist will fire a pick event if mouseevent is over the artist and the artist has picker set.
    See also:
      set_picker, get_picker, pickable

pickable(self)
    Return whether the artist is pickable.
    See also:
      set_picker, get_picker, pick

properties(self)
    Return a dictionary of all the properties of the artist.
**remove***(self)***
Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist’s legend entry.

**remove_callback**(self, oid)
Remove a callback based on its observer id.

**See also:**
*add_callback*

**set**(self, **kwargs)
A property batch setter. Pass *kwargs* to set properties.

**set_aa**(self, aa)
Alias for *set_antialiased*.

**set_agg_filter**(self, filter_func)
Set the agg filter.

**Parameters**

*filter_func* [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**set_alpha**(self, alpha)
Set the alpha transparencies of the collection.

**Parameters**

*alpha* [float or None]

**set_animated**(self, b)
Set the artist’s animation state.

**Parameters**

*b* [bool]

**set_antialiased**(self, aa)
Set the antialiasing state for rendering.

**Parameters**

*aa* [bool or sequence of bools]

**set_antialiaseds**(self, aa)
Alias for *set_antialiased*.

**set_array**(self, A)
Set the image array from numpy array *A*.

**Parameters**

*A* [ndarray]

**set_capstyle**(self, cs)
Set the capstyle for the collection (for all its elements).
Parameters

   cs [{‘butt’, ‘round’, ‘projecting’}] The capstyle

set_clim(self, vmin=None, vmax=None)
set the norm limits for image scaling; if vmin is a length2 sequence, interpret it as
(vmin, vmax) which is used to support setp

ACCEPTS: a length 2 sequence of floats; may be overridden in methods that have
vmin and vmax kwargs.

set_clip_box(self, clipbox)
Set the artist’s clip Bbox.

   Parameters

   clipbox [Bbox]

set_clip_on(self, b)
Set whether the artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected
results.

   Parameters

   b [bool]

set_clip_path(self, path, transform=None)
Set the artist’s clip path, which may be:
   • a Patch (or subclass) instance; or
   • a Path instance, in which case a Transform instance, which will be applied to the
     path before using it for clipping, must be provided; or
   • None, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will
set the clipping box to the corresponding rectangle and set the clipping path to None.

ACCEPTS: [(Path, Transform) | Patch | None]

set_cmap(self, cmap)
set the colormap for luminance data

   Parameters

   cmap [colormap or registered colormap name]

set_color(self, c)
Set both the edgecolor and the facecolor.

   Parameters

   c [color or sequence of rgba tuples]

See also:

Collection.set_facecolor, Collection.set_edgecolor For setting the edge or face
color individually.

set_contains(self, picker)
Define a custom contains test for the artist.

The provided callable replaces the default contains method of the artist.
Parameters

**picker** [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:
- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

---

```python
set_dashes(self, ls)
    Alias for set_linestyle.
```

```python
set_ec(self, c)
    Alias for set_edgecolor.
```

```python
set_edgecolor(self, c)
    Set the edgecolor(s) of the collection.

**Parameters**

- **c** [color or sequence of colors or ‘face’] The collection edgecolor(s). If a sequence, the patches cycle through it. If ‘face’, match the facecolor.

```python
set_edgecolors(self, c)
    Alias for set_edgecolor.
```

```python
set_facecolor(self, c)
    Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

    If *c* is ‘none’, the patch will not be filled.

**Parameters**

- **c** [color or sequence of colors]

```python
set_facecolors(self, c)
    Alias for set_facecolor.
```

```python
set_fc(self, c)
    Alias for set_facecolor.
```

```python
set_figure(self, fig)
    Set the *Figure* instance the artist belongs to.

**Parameters**

- **fig** [*Figure*]

```python
set_gid(self, gid)
    Set the (group) id for the artist.

**Parameters**

- **gid** [str]
set_hatch(self, hatch)
Set the hatching pattern

hatch can be one of:

/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch [{', ', ', ', ', ', ', ', ', ', ', ', ', '}

set_in_layout(self, in_layout)
Set if artist is to be included in layout calculations, E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname, bbox_inches='tight').

Parameters

in_layout [bool]

set_joinstyle(self, js)
Set the joinstyle for the collection (for all its elements).

Parameters

js [{'miter', 'round', 'bevel'}] The joinstyle

set_label(self, s)
Set a label that will be displayed in the legend.

Parameters

s [object] s will be converted to a string by calling str.

set_linestyle(self, ls)
Set the linestyle(s) for the collection.

<table>
<thead>
<tr>
<th>linestyle</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--)' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-.' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:
where \texttt{onoffseq} is an even length tuple of on and off ink in points.

**Parameters**

\texttt{ls} \[\{\text{‘-’, ‘–’, ‘.-’, ‘:’, ‘’, (offset, on-off-seq), ...}\}\] The line style.

\texttt{set_linestyles(self, ls)}

Alias for \texttt{set_linestyle}.

\texttt{set_linewidth(self, lw)}

Set the linewidth(s) for the collection. \texttt{lw} can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence.

**Parameters**

\texttt{lw} \[\text{float or sequence of floats}\]

\texttt{set_linewidths(self, lw)}

Alias for \texttt{set_linewidth}.

\texttt{set_ls(self, ls)}

Alias for \texttt{set_linestyle}.

\texttt{set_lw(self, lw)}

Alias for \texttt{set_linewidth}.

\texttt{set_norm(self, norm)}

Set the normalization instance.

**Parameters**

\texttt{norm} \[\text{Normalize}\]

**Notes**

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

\texttt{set_offset_position(self, offset_position)}

Set how offsets are applied. If \texttt{offset_position} is ‘screen’ (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If \texttt{offset_position} is ‘data’, the offset is applied before the master transform, i.e., the offsets are in data coordinates.

**Parameters**

\texttt{offset_position} \[\{\text{‘screen’, ‘data’}\}\]

\texttt{set_offsets(self, offsets)}

Set the offsets for the collection.

**Parameters**

\texttt{offsets} \[\text{float or sequence of floats}\]

\texttt{set_path_effects(self, path_effects)}

Set the path effects.

**Parameters**

\texttt{path_effects} \[\text{AbstractPathEffect}\]
set_paths(self)

set_picker(self, picker)
    Define the picking behavior of the artist.

Parameters
    picker [None or bool or float or callable] This can be one of the following:
    • None: Picking is disabled for this artist (default).
    • A boolean: If True then picking will be enabled and the artist will fire
      a pick event if the mouse event is over the artist.
    • A float: If picker is a number it is interpreted as an epsilon toler-
      ance in points and the artist will fire off an event if it’s data is within
      epsilon of the mouse event. For some artists like lines and patch col-
     lections, the artist may provide additional data to the pick event that
      is generated, e.g., the indices of the data within epsilon of the pick
      event
    • A function: If picker is callable, it is a user supplied function which
      determines whether the artist is hit by the mouse event:

      ```python
      hit, props = picker(artist, mouseevent)
      ```

to determine the hit test. if the mouse event is over the artist, return
hit=True and props is a dictionary of properties you want added to
the PickEvent attributes.

set_pickradius(self, pr)
    Set the pick radius used for containment tests.

Parameters
    d [float] Pick radius, in points.

set_rasterized(self, rasterized)
    Force rasterized (bitmap) drawing in vector backend output.
    Defaults to None, which implies the backend’s default behavior.

Parameters
    rasterized [bool or None]

set_sketch_params(self, scale=None, length=None, randomness=None)
    Sets the sketch parameters.

Parameters
    scale [float, optional] The amplitude of the wiggle perpendicular to the
    source line, in pixels. If scale is None, or not provided, no sketch filter
    will be provided.
    length [float, optional] The length of the wiggle along the line, in pixels
    (default 128.0)
    randomness [float, optional] The scale factor by which the length is
    shrunken or expanded (default 16.0)

set_snap(self, snap)
    Set the snapping behavior.
Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**

- **snap** [bool or None] Possible values:
  - True: Snap vertices to the nearest pixel center.
  - False: Do not modify vertex positions.
  - None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

```python
set_transform(self, t)
```
Set the artist transform.

**Parameters**

- **t** [Transform]

```python
set_url(self, url)
```
Set the url for the artist.

**Parameters**

- **url** [str]

```python
set_urls(self, urls)
```
Parameters

- **urls** [List[str] or None]

```python
set_visible(self, b)
```
Set the artist’s visibility.

**Parameters**

- **b** [bool]

```python
set_zorder(self, level)
```
Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**

- **level** [float]

```python
stale
```
Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the internal state of the artist.

```python
sticky_edges
```
x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added—the view limit “sticks” to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.
This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

Examples

```python
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba

Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the alpha kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the alpha kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if bytes is False (default), the rgba array will be floats in the 0-1 range; if it is True, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update

Update this artist’s properties from the dictionary props.

update_from

copy properties from other to self

update_scalarmappable

Update colors from the scalar mappable array, if it is not None.

zorder = 0

17.16 matplotlib.colorbar

Colorbar toolkit with two classes and a function:

- ColorbarBase: the base class with full colorbar drawing functionality. It can be used as-is to make a colorbar for a given colormap; a mappable object (e.g., image) is not needed.

- Colorbar: the derived class for use with images or contour plots.

- make_axes(): a function for resizing an axes and adding a second axes suitable for a colorbar
The `colorbar()` method uses `make_axes()` and `Colorbar`; the `colorbar()` function is a thin wrapper over `colorbar()`.

class matplotlib.colorbar.Colorbar(ax, mappable, **kw)

    Bases: matplotlib.colorbar.ColorbarBase

This class connects a `ColorbarBase` to a `ScalarMappable` such as a `AxesImage` generated via `imshow()`.

It is not intended to be instantiated directly; instead, use `colorbar()` or `colorbar()` to make your colorbar.

    add_lines(self, CS, erase=True)

Add the lines from a non-filled `ContourSet` to the colorbar.

    Set erase to False if these lines should be added to any pre-existing lines.

    on_mappable_changed(self, mappable)

Updates this colorbar to match the mappable’s properties.

    Typically this is automatically registered as an event handler by `colorbar_factory()` and should not be called manually.

    remove(self)

Remove this colorbar from the figure. If the colorbar was created with `use_gridspec=True` then restore the gridspec to its previous value.

    update_bruteforce(self, mappable)

Destroy and rebuild the colorbar. This is intended to become obsolete, and will probably be deprecated and then removed. It is not called when the pyplot.colorbar function or the Figure.colorbar method are used to create the colorbar.

    update_normal(self, mappable)

Update solid patches, lines, etc.

    Unlike `update_bruteforce`, this does not clear the axes. This is meant to be called when the norm of the image or contour plot to which this colorbar belongs changes.

    If the norm on the mappable is different than before, this resets the locator and formatter for the axis, so if these have been customized, they will need to be customized again. However, if the norm only changes values of `vmin`, `vmax` or `cmap` then the old formatter and locator will be preserved.

class matplotlib.colorbar.ColorbarBase(ax, cmap=None, norm=None, alpha=None, values=None, boundaries=None, orientation='vertical', ticklocation='auto', extend='neither', spacing='uniform', ticks=None, format=None, drawedges=False, filled=True, extendfrac=None, extendrect=False, label='')

    Bases: matplotlib.colorbar._ColorbarMappableDummy

Draw a colorbar in an existing axes.

    This is a base class for the `Colorbar` class, which is the basis for the `colorbar()` function and the `colorbar()` method, which are the usual ways of creating a colorbar.

    It is also useful by itself for showing a colormap. If the `cmap` kwarg is given but `boundaries` and `values` are left as None, then the colormap will be displayed on a 0-1 scale. To show the under- and over-value colors, specify the `norm` as:
To show the colors versus index instead of on the 0-1 scale, use:

```python
norm = colors.Normalize(clip=False)
```

Useful public methods are `set_label()` and `add_lines()`.

**Attributes**

- **ax** [Axes] The Axes instance in which the colorbar is drawn.
- **lines** [list] A list of LineCollection if lines were drawn, otherwise an empty list.
- **dividers** [LineCollection] A LineCollection if `drawedges` is True, otherwise None.

```python
add_lines(self, levels, colors, linewidths, erase=True)
```

Draw lines on the colorbar:

- `colors` and `linewidths` must be scalars or sequences the same length as `levels`.
- Set `erase` to False to add lines without first removing any previously added lines.

```python
ax = None
```

The axes that this colorbar lives in.

```python
config_axis(self)
```

```python
draw_all(self)
```

Calculate any free parameters based on the current cmap and norm, and do all the drawing.

```python
get_ticks(self, minor=False)
```

Return the x ticks as a list of locations.

```python
minorticks_off(self)
```

Turns off the minor ticks on the colorbar.

```python
minorticks_on(self)
```

Turns on the minor ticks on the colorbar without extruding into the “extend regions”.

```python
n_rasterize = 50
```

```python
remove(self)
```

Remove this colorbar from the figure.

```python
set_alpha(self, alpha)
```

```python
set_label(self, label, **kw)
```

Label the long axis of the colorbar.

```python
set_ticklabels(self, ticklabels, update_ticks=True)
```

Set tick labels.

- Tick labels are updated immediately unless `update_ticks` is `False`, in which case one should call `update_ticks` explicitly.

```python
set_ticks(self, ticks, update_ticks=True)
```

Set tick locations.
ticks {{None, sequence, Locator instance}} If None, a default Locator will be used.

update_ticks {{True, False}, optional} If True, tick locations are updated immediately. If False, use update_ticks() to manually update the ticks.

update_ticks(self)
    Force the update of the ticks and ticklabels. This must be called whenever the tick locator and/or tick formatter changes.

class matplotlib.colorbar.ColorbarPatch(ax, mappable, **kw)
    Bases: matplotlib.colorbar.Colorbar

    A Colorbar which is created using Patch rather than the default pcolor().

    It uses a list of Patch instances instead of a PatchCollection because the latter does not allow the hatch pattern to vary among the members of the collection.

matplotlib.colorbar.colorbar_factory(cax, mappable, **kwargs)
    Creates a colorbar on the given axes for the given mappable.

    Typically, for automatic colorbar placement given only a mappable use colorbar().

matplotlib.colorbar.make_axes(parents, location=None, orientation=None, fraction=0.15, shrink=1.0, aspect=20, **kw)
    Resize and reposition parent axes, and return a child axes suitable for a colorbar.

    Keyword arguments may include the following (with defaults):

    location {{None, 'left', 'right', 'top', 'bottom'}} The position, relative to parents, where the colorbar axes should be created. If None, the value will either come from the given orientation, else it will default to 'right'.

    orientation {{None, 'vertical', 'horizontal'}} The orientation of the colorbar. Typically, this keyword shouldn't be used, as it can be derived from the location keyword.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>orientation</td>
<td>vertical or horizontal</td>
</tr>
<tr>
<td>fraction</td>
<td>0.15; fraction of original axes to use for colorbar</td>
</tr>
<tr>
<td>pad</td>
<td>0.05 if vertical, 0.15 if horizontal; fraction of original axes between colorbar and new image axes</td>
</tr>
<tr>
<td>shrink</td>
<td>1.0; fraction by which to multiply the size of the colorbar</td>
</tr>
<tr>
<td>aspect</td>
<td>20; ratio of long to short dimensions</td>
</tr>
<tr>
<td>anchor</td>
<td>(0.0, 0.5) if vertical; (0.5, 1.0) if horizontal; the anchor point of the colorbar axes</td>
</tr>
<tr>
<td>parent</td>
<td>(1.0, 0.5) if vertical; (0.5, 0.0) if horizontal; the anchor point of the colorbar parent axes. If False, the parent axes’ anchor will be unchanged</td>
</tr>
</tbody>
</table>

    Returns (cax, kw), the child axes and the reduced kw dictionary to be passed when creating the colorbar instance.

matplotlib.colorbar.make_axes_gridspec(parent, *, fraction=0.15, shrink=1.0, aspect=20, **kw)
Resize and reposition a parent axes, and return a child axes suitable for a colorbar. This function is similar to make_axes. Primary differences are

- **make_axes_gridspec** only handles the `orientation` keyword and cannot handle the "location" keyword.
- **make_axes_gridspec** should only be used with a subplot parent.
- **make_axes creates an instance of Axes. make_axes_gridspec** creates an instance of Subplot.
- **make_axes updates the position of the** parent. **make_axes_gridspec** replaces the grid_spec attribute of the parent with a new one.

While this function is meant to be compatible with **make_axes**, there could be some minor differences.

Keyword arguments may include the following (with defaults):

- **orientation** 'vertical' or 'horizontal'
- **fraction** 0.15; fraction of original axes to use for colorbar
- **pad** 0.05 if vertical, 0.15 if horizontal; fraction of original axes between colorbar and new image axes
- **shrink** 1.0; fraction by which to multiply the size of the colorbar
- **aspect** 20; ratio of long to short dimensions
- **anchor** (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal; the anchor point of the colorbar axes
- **panchor** (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal; the anchor point of the colorbar parent axes. If False, the parent axes' anchor will be unchanged

All but the first of these are stripped from the input kw set.

Returns (cax, kw), the child axes and the reduced kw dictionary to be passed when creating the colorbar instance.

### 17.17 matplotlib.colors

For a visual representation of the Matplotlib colormaps, see:

- The **color_examples** examples for examples of controlling color with Matplotlib.
- The **Colors** tutorial for an in-depth guide on controlling color.

A module for converting numbers or color arguments to **RGB** or **RGBA**. 

**RGB** and **RGBA** are sequences of, respectively, 3 or 4 floats in the range 0-1.

This module includes functions and classes for color specification conversions, and for mapping numbers to colors in a 1-D array of colors called a colormap.
Mapping data onto colors using a colormap typically involves two steps: a data array is first mapped onto the range 0-1 using a subclass of `Normalize`, then this number is mapped to a color using a subclass of `Colormap`. Two are provided here: `LinearSegmentedColormap`, which uses piecewise-linear interpolation to define colormaps, and `ListedColormap`, which makes a colormap from a list of colors.

**See also:**

*Creating Colormaps in Matplotlib* for examples of how to make colormaps and

*Choosing Colormaps in Matplotlib* for a list of built-in colormaps.

*Colormap Normalization* for more details about data normalization

More colormaps are available at [palettable](https://raw.githubusercontent.com/palettable/palettable/master/palettes.py).

The module also provides functions for checking whether an object can be interpreted as a color (`is_color_like()`), for converting such an object to an RGBA tuple (`to_rgba()`) or to an HTML-like hex string in the #rrggbb format (`to_hex()`), and a sequence of colors to an (n, 4) RGBA array (`to_rgba_array()`). Caching is used for efficiency.

Matplotlib recognizes the following formats to specify a color:

- an RGB or RGBA tuple of float values in [0, 1] (e.g., (0.1, 0.2, 0.5) or (0.1, 0.2, 0.5, 0.3));
- a hex RGB or RGBA string (e.g., '#0f0f0f' or '#0f0f0f80'; case-insensitive);
- a string representation of a float value in [0, 1] inclusive for gray level (e.g., '0.5');
- one of {'b', 'g', 'r', 'c', 'm', 'y', 'k', 'w'};
- a X11/CSS4 color name (case-insensitive);
- a name from the [xkcd color survey](https://xkcd.com/color/), prefixed with 'xkcd:' (e.g., 'xkcd:sky blue'; case insensitive);
- one of the Tableau Colors from the 'T10' categorical palette (the default color cycle): {'tab:blue', 'tab:orange', 'tab:green', 'tab:red', 'tab:purple', 'tab:brown', 'tab:pink', 'tab:gray', 'tab:olive', 'tab:cyan'} (case-insensitive);
- a "CN" color spec, i.e. 'C' followed by a number, which is an index into the default property cycle (`matplotlib.rcParams['axes.prop_cycle']`); the indexing is intended to occur at rendering time, and defaults to black if the cycle does not include color.

### 17.17.1 Classes

<table>

</tr>
</tbody>
</table>

**matplotlib.colors.BoundaryNorm**

```python
class matplotlib.colors.BoundaryNorm(boundaries, ncolors, clip=False)
    Bases: matplotlib.colors.Normalize
```

Generate a colormap index based on discrete intervals.

Unlike `Normalize` or `LogNorm`, `BoundaryNorm` maps values to integers instead of to the interval 0-1.

Mapping to the 0-1 interval could have been done via piece-wise linear interpolation, but using integers seems simpler, and reduces the number of conversions back and forth between integer and floating point.

**Parameters**

- `boundaries` [array-like] Monotonically increasing sequence of boundaries
- `ncolors` [int] Number of colors in the colormap to be used
- `clip` [bool, optional] If clip is True, out of range values are mapped to 0 if they are below `boundaries[0]` or mapped to `ncolors - 1` if they are above `boundaries[-1]`.

If clip is False, out of range values are mapped to -1 if they are below `boundaries[0]` or mapped to `ncolors` if they are above `boundaries[-1]`. These are then converted to valid indices by `Colormap.__call__()`. 

**Notes**

`boundaries` defines the edges of bins, and data falling within a bin is mapped to the color with the same index.

If the number of bins doesn’t equal `ncolors`, the color is chosen by linear interpolation of the bin number onto color numbers.

**inverse(self, value)**

**Raises**

- `ValueError` BoundaryNorm is not invertible, so calling this method will always raise an error
Examples using `matplotlib.colors.BoundaryNorm`

- `sphx_glr_gallery_lines_bars_and_markers_multicolored_line.py`
- `sphx_glr_gallery_images_contours_and_fields_image.annotated_heatmap.py`

- `sphx_glr_gallery_userdemo_colormap_normalizations_bounds.py`
- Customized Colorbars Tutorial
- Colormap Normalization

`matplotlib.colors.Colormap`

class `matplotlib.colors.Colormap(name, N=256)`

    Bases: `object`

    Baseclass for all scalar to RGBA mappings.

    Typically Colormap instances are used to convert data values (floats) from the interval $[0, 1]$ to
    the RGBA color that the respective Colormap represents. For scaling of data into the $[0, 1]$ interval
    see `matplotlib.colors.Normalize`. It is worth noting that `matplotlib.cm.ScalarMappable`
    subclasses make heavy use of this data->normalize->map-to-color processing chain.

    Parameters
    ----------
    name : [str]
        The name of the colormap.
    N : [int]
        The number of rgb quantization levels.

    colorbar_extend = None

    When this colormap exists on a scalar mappable and colorbar_extend is not False, colorbar
    creation will pick up colorbar_extend as the default value for the extend keyword in
    the `matplotlib.colorbar.Colorbar` constructor.

    is_gray(self)

    reversed(self, name=None)

    Make a reversed instance of the Colormap.

    Note: Function not implemented for base class.

    Parameters
    ----------
    name : [str, optional]
        The name for the reversed colormap. If it's None the name will be the name of
        the parent colormap + "_r".

    See also:

    `LinearSegmentedColormap.reversed`
ListedColormap.reversed

```python
set_bad(self, color='k', alpha=None)
```
Set color to be used for masked values.

```python
set_over(self, color='k', alpha=None)
```
Set color to be used for high out-of-range values. Requires norm.clip = False

```python
set_under(self, color='k', alpha=None)
```
Set color to be used for low out-of-range values. Requires norm.clip = False

---

**Examples using matplotlib.colors.Colormap**

- sphx_glr_gallery_images_contours_and_fields_contourf_demo.py

---

**matplotlib.colors.DivergingNorm**

```python
class matplotlib.colors.DivergingNorm(vcenter, vmin=None, vmax=None)
```
Bases: `matplotlib.colors.Normalize`

Normalize data with a set center.

Useful when mapping data with an unequal rates of change around a conceptual center, e.g., data that range from -2 to 4, with 0 as the midpoint.

**Parameters**

- `vcenter` [float] The data value that defines 0.5 in the normalization.
- `vmin` [float, optional] The data value that defines 0.0 in the normalization. Defaults to the min value of the dataset.
- `vmax` [float, optional] The data value that defines 1.0 in the normalization. Defaults to the the max value of the dataset.

**Examples**

This maps data value -4000 to 0., 0 to 0.5, and +10000 to 1.0; data between is linearly interpolated:

```python
>>> import matplotlib.colors as mcolors

>>> offset = mcolors.DivergingNorm(vmin=-4000.,
                                    vcenter=0.,
                                    vmax=10000)

>>> data = [-4000., -2000., 0., 2500., 5000., 7500., 10000.]

>>> offset(data)
array([0., 0.25, 0.5, 0.625, 0.75, 0.875, 1.0])
```

```python
autoscale_None(self, A)
```
Get vmin and vmax, and then clip at vcenter

**Examples using matplotlib.colors.DivergingNorm**

- sphx_glr_gallery_userdemo_colormap_normalizations_diverging.py
• Colormap Normalization

**matplotlib.colors.LightSource**

class matplotlib.colors.LightSource(azdeg=315, altdeg=45, hsv_min_val=0, hsv_max_val=1, hsv_min_sat=1, hsv_max_sat=0)

Bases: object

Create a light source coming from the specified azimuth and elevation. Angles are in degrees, with the azimuth measured clockwise from north and elevation up from the zero plane of the surface.

The shade() is used to produce “shaded” rgb values for a data array. shade_rgb() can be used to combine an rgb image with The shade_rgb() The hillshade() produces an illumination map of a surface.

Specify the azimuth (measured clockwise from south) and altitude (measured up from the plane of the surface) of the light source in degrees.

**Parameters**

- **azdeg** [number, optional] The azimuth (0-360, degrees clockwise from North) of the light source. Defaults to 315 degrees (from the northwest).
- **altdeg** [number, optional] The altitude (0-90, degrees up from horizontal) of the light source. Defaults to 45 degrees from horizontal.

**Notes**

For backwards compatibility, the parameters hsv_min_val, hsv_max_val, hsv_min_sat, and hsv_max_sat may be supplied at initialization as well. However, these parameters will only be used if “blend_mode=’hsv’” is passed into shade() or shade_rgb(). See the documentation for blend_hsv() for more details.

**blend_hsv**(self, rgb, intensity, hsv_max_sat=None, hsv_max_val=None, hsv_min_val=None, hsv_min_sat=None)

Take the input data array, convert to HSV values in the given colormap, then adjust those color values to give the impression of a shaded relief map with a specified light source. RGBA values are returned, which can then be used to plot the shaded image with imshow.

The color of the resulting image will be darkened by moving the (s,v) values (in hsv colorspace) toward (hsv_min_sat, hsv_min_val) in the shaded regions, or lightened by sliding (s,v) toward (hsv_max_sat hsv_max_val) in regions that are illuminated. The default extremes are chose so that completely shaded points are nearly black (s = 1, v = 0) and completely illuminated points are nearly white (s = 0, v = 1).

**Parameters**

- **rgb** [ndarray] An MxNx3 RGB array of floats ranging from 0 to 1 (color image).
- **intensity** [ndarray] An MxNx1 array of floats ranging from 0 to 1 (grayscale image).
- **hsv_max_sat** [number, optional] The maximum saturation value that the intensity map can shift the output image to. Defaults to 1.
**hsv_min_sat** [number, optional] The minimum saturation value that the intensity map can shift the output image to. Defaults to 0.

**hsv_max_val** [number, optional] The maximum value (“v” in “hsv”) that the intensity map can shift the output image to. Defaults to 1.

**hsv_min_val** [number, optional] The minimum value (“v” in “hsv”) that the intensity map can shift the output image to. Defaults to 0.

**Returns**

**rgb** [ndarray] An MxNx3 RGB array representing the combined images.

**blend_overlay**(self, rgb, intensity)
Combines an rgb image with an intensity map using “overlay” blending.

**Parameters**

**rgb** [ndarray] An MxNx3 RGB array of floats ranging from 0 to 1 (color image).

**intensity** [ndarray] An MxNx1 array of floats ranging from 0 to 1 (grayscale image).

**Returns**

**rgb** [ndarray] An MxNx3 RGB array representing the combined images.

**blend_soft_light**(self, rgb, intensity)
Combines an rgb image with an intensity map using “soft light” blending. Uses the “pegtop” formula.

**Parameters**

**rgb** [ndarray] An MxNx3 RGB array of floats ranging from 0 to 1 (color image).

**intensity** [ndarray] An MxNx1 array of floats ranging from 0 to 1 (grayscale image).

**Returns**

**rgb** [ndarray] An MxNx3 RGB array representing the combined images.

direction
The unit vector direction towards the light source.

**hillshade**(self, elevation, vert_exag=1, dx=1, dy=1, fraction=1.0)
Calculates the illumination intensity for a surface using the defined azimuth and elevation for the light source.

This computes the normal vectors for the surface, and then passes them on to shade_normals

**Parameters**

**elevation** [array-like] A 2d array (or equivalent) of the height values used to generate an illumination map

**vert_exag** [number, optional] The amount to exaggerate the elevation values by when calculating illumination. This can be used either to correct for differences in units between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs meters) or to exaggerate or de-emphasize topographic effects.
dx [number, optional] The x-spacing (columns) of the input elevation grid.
dy [number, optional] The y-spacing (rows) of the input elevation grid.
fraction [number, optional] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

Returns

intensity [ndarray] A 2d array of illumination values between 0-1, where 0 is completely in shadow and 1 is completely illuminated.

shade(self, data, cmap, norm=None, blend_mode='overlay', vmin=None, vmax=None, vert_exag=1, dx=1, dy=1, fraction=1, **kwargs)
Combine colormapped data values with an illumination intensity map (a.k.a. "hillshade") of the values.

Parameters

data [array-like] A 2d array (or equivalent) of the height values used to generate a shaded map.
cmap [Colormap instance] The colormap used to color the data array. Note that this must be a Colormap instance. For example, rather than passing in cmap='gist_earth', use cmap=plt.get_cmap('gist_earth') instead.
norm [Normalize instance, optional] The normalization used to scale values before colormapping. If None, the input will be linearly scaled between its min and max.
blend_mode [{‘hsv’, ‘overlay’, ‘soft’} or callable, optional] The type of blending used to combine the colormapped data values with the illumination intensity. Default is “overlay”. Note that for most topographic surfaces, “overlay” or “soft” appear more visually realistic. If a user-defined function is supplied, it is expected to combine an MxNx3 RGB array of floats (ranging 0 to 1) with an MxNx1 hillshade array (also 0 to 1). (Call signature func(rgb, illum, **kwargs)) Additional kwargs supplied to this function will be passed on to the blend_mode function.
vmin [scalar or None, optional] The minimum value used in colormapping data. If None the minimum value in data is used. If norm is specified, then this argument will be ignored.
vmax [scalar or None, optional] The maximum value used in colormapping data. If None the maximum value in data is used. If norm is specified, then this argument will be ignored.
vert_exag [number, optional] The amount to exaggerate the elevation values by when calculating illumination. This can be used either to correct for differences in units between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs meters) or to exaggerate or de-emphasize topography.
dx [number, optional] The x-spacing (columns) of the input elevation grid.
dy [number, optional] The y-spacing (rows) of the input elevation grid.
fraction [number, optional] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

**Additional kwarg are passed on to the *blend_mode* function.**

Returns

rgba [ndarray] An MxNx4 array of floats ranging between 0-1.

shade_normals(self, normals, fraction=1.0)
Calculates the illumination intensity for the normal vectors of a surface using the defined azimuth and elevation for the light source.

Imagine an artificial sun placed at infinity in some azimuth and elevation position illuminating our surface. The parts of the surface that slope toward the sun should brighten while those sides facing away should become darker.

Parameters

fraction [number, optional] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

Returns

intensity [ndarray] A 2d array of illumination values between 0-1, where 0 is completely in shadow and 1 is completely illuminated.

shade_rgb(self, rgb, elevation, fraction=1.0, blend_mode='hsv', vert_exag=1, dx=1, dy=1, **kwargs)
Use this light source to adjust the colors of the rgb input array to give the impression of a shaded relief map with the given elevation.

Parameters

rgb [array-like] An (M, N, 3) RGB array, assumed to be in the range of 0 to 1.

elevation [array-like] An (M, N) array of the height values used to generate a shaded map.

fraction [number] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

blend_mode [{‘hsv’, ‘overlay’, ‘soft’} or callable, optional] The type of blending used to combine the colormapped data values with the illumination intensity. For backwards compatibility, this defaults to “hsv”. Note that for most topographic surfaces, “overlay” or “soft” appear more visually realistic. If a user-defined function is supplied, it is expected to combine an MxNx3 RGB array of floats (ranging 0 to 1) with an MxNx1 hillshade array (also 0 to 1). (Call signature func(rgb, illum, **kwargs)) Additional kwargs supplied to this function will be passed on to the blend_mode function.
vert_exag [number, optional] The amount to exaggerate the elevation values by when calculating illumination. This can be used either to correct for differences in units between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs meters) or to exaggerate or de-emphasize topography.

dx [number, optional] The x-spacing (columns) of the input elevation grid. 
dy [number, optional] The y-spacing (rows) of the input elevation grid.

Additional kwargs are passed on to the *blend_mode* function.

Returns

shaded_rgb [ndarray] An (m, n, 3) array of floats ranging between 0-1.

Examples using matplotlib.colors.LightSource

matplotlib.colors.LinearSegmentedColormap

class matplotlib.colors.LinearSegmentedColormap(name, segmentdata, N=256, gamma=1.0)

Bases: matplotlib.colors.Colormap

Colormap objects based on lookup tables using linear segments.

The lookup table is generated using linear interpolation for each primary color, with the 0-1 domain divided into any number of segments.

Create color map from linear mapping segments

segmentdata argument is a dictionary with a red, green and blue entries. Each entry should be a list of x, y0, y1 tuples, forming rows in a table. Entries for alpha are optional.

Example: suppose you want red to increase from 0 to 1 over the bottom half, green to do the same over the middle half, and blue over the top half. Then you would use:

```python
cdict = {'red': [(0.0, 0.0, 0.0),
                 (0.5, 1.0, 1.0),
                 (1.0, 1.0, 1.0)],

           'green': [(0.0, 0.0, 0.0),
                     (0.25, 0.0, 0.0),
                     (0.75, 1.0, 1.0),
                     (1.0, 1.0, 1.0)],
```

(continues on next page)
Each row in the table for a given color is a sequence of \(x, \ y_0, \ y_1\) tuples. In each sequence, \(x\) must increase monotonically from 0 to 1. For any input value \(z\) falling between \(x[i]\) and \(x[i+1]\), the output value of a given color will be linearly interpolated between \(y_1[i]\) and \(y_0[i+1]\):

\[
\text{row } i: \quad x \quad y_0 \quad y_1 \\
\text{row } i+1: \quad x \quad y_0 \quad y_1
\]

Hence \(y_0\) in the first row and \(y_1\) in the last row are never used.

**See also:**

- `LinearSegmentedColormap.from_list` Static method; factory function for generating a smoothly-varying `LinearSegmentedColormap`.
- `makeMappingArray` For information about making a mapping array.

```python
static from_list(name, colors, N=256, gamma=1.0)
Make a linear segmented colormap with name from a sequence of colors which
evenly transitions from colors[0] at val=0 to colors[-1] at val=1. N is the number of
rgb quantization levels. Alternatively, a list of (value, color) tuples can be given to
divide the range unevenly.

reversed(self, name=None)
Make a reversed instance of the Colormap.
```

**Parameters**

- `name` [str, optional] The name for the reversed colormap. If it’s None
  the name will be the name of the parent colormap + "_r".

**Returns**

- `LinearSegmentedColormap` The reversed colormap.

```python
set_gamma(self, gamma)
Set a new gamma value and regenerate color map.
```

Creating Colormaps in Matplotlib

Colormap Normalization

matplotlib.colors.ListedColormap
class matplotlib.colors.ListedColormap(colors, name='from_list', N=None)
Bases: matplotlib.colors.Colormap

Colormap object generated from a list of colors. This may be most useful when indexing directly into a colormap, but it can also be used to generate special colormaps for ordinary mapping.

Parameters

- **colors** [list, array] List of Matplotlib color specifications, or an equivalent Nx3 or Nx4 floating point array (N rgb or rgba values).
- **name** [str, optional] String to identify the colormap.
- **N** [int, optional] Number of entries in the map. The default is None, in which case there is one colormap entry for each element in the list of colors. If:

  \[ N < \text{len}(colors) \]

  the list will be truncated at N. If:

  \[ N > \text{len}(colors) \]

  the list will be extended by repetition.

reversed(self, name=None)
Make a reversed instance of the Colormap.

Parameters

- **name** [str, optional] The name for the reversed colormap. If it’s None the name will be the name of the parent colormap + ”_r”.

Returns

ListedColormap A reversed instance of the colormap.
Examples using `matplotlib.colors.ListedColormap`

- `sphx_glr_gallery_lines_bars_and_markers_multicolored_line.py`

`matplotlib.colors.LogNorm`

class `matplotlib.colors.LogNorm(vmin=None, vmax=None, clip=False)`
Bases: `matplotlib.colors.Normalize`

Normalize a given value to the 0-1 range on a log scale.

If `vmin` or `vmax` is not given, they are initialized from the minimum and maximum value respectively of the first input processed. That is, `__call__(A)` calls `autoscale_None(A)`. If `clip` is `True` and the given value falls outside the range, the returned value will be 0 or 1, whichever is closer. Returns 0 if:

\[
\text{vmin} = \text{vmax}
\]

Works with scalars or arrays, including masked arrays. If `clip` is `True`, masked values are set to 1; otherwise they remain masked. Clipping silently defeats the purpose of setting the over, under, and masked colors in the colormap, so it is likely to lead to surprises; therefore the default is `clip = False`.

`autoscale(self, A)`
Set `vmin`, `vmax` to min, max of `A`.

`autoscale_None(self, A)`
Autoscale only None-valued vmin or vmax.

`inverse(self, value)`

Examples using `matplotlib.colors.LogNorm`

- `sphx_glr_gallery_images_contours_and_fields_pcolor_demo.py`
- `sphx_glr_gallery_statistics_hist.py`
- `sphx_glr_gallery_userdemo_colormap_normalizations.py`
- `sphx_glr_gallery_userdemo_colormap_normalizations_lognorm.py`
- Colormap Normalization

`matplotlib.colors.NoNorm`

class `matplotlib.colors.NoNorm(vmin=None, vmax=None, clip=False)`
Bases: `matplotlib.colors.Normalize`

1528 Chapter 17. Modules
Dummy replacement for Normalize, for the case where we want to use indices directly in a ScalarMappable.

If vmin or vmax is not given, they are initialized from the minimum and maximum value respectively of the first input processed. That is, __call__(A) calls autoscale_None(A). If clip is True and the given value falls outside the range, the returned value will be 0 or 1, whichever is closer. Returns 0 if:

\[
\text{vmin} = \text{vmax}
\]

Works with scalars or arrays, including masked arrays. If clip is True, masked values are set to 1; otherwise they remain masked. Clipping silently defeats the purpose of setting the over, under, and masked colors in the colormap, so it is likely to lead to surprises; therefore the default is clip = False.

inverse(self, value)

matplotlib.colors.Normalize

class matplotlib.colors.Normalize(vmin=None, vmax=None, clip=False)
  Bases: object

A class which, when called, can normalize data into the \([0.0, 1.0]\) interval.

If vmin or vmax is not given, they are initialized from the minimum and maximum value respectively of the first input processed. That is, __call__(A) calls autoscale_None(A). If clip is True and the given value falls outside the range, the returned value will be 0 or 1, whichever is closer. Returns 0 if:

\[
\text{vmin} = \text{vmax}
\]

Works with scalars or arrays, including masked arrays. If clip is True, masked values are set to 1; otherwise they remain masked. Clipping silently defeats the purpose of setting the over, under, and masked colors in the colormap, so it is likely to lead to surprises; therefore the default is clip = False.

autoscale(self, A)
  Set vmin, vmax to min, max of A.

autoscale_None(self, A)
  Autoscale only None-valued vmin or vmax.

inverse(self, value)

static process_value(value)
  Homogenize the input value for easy and efficient normalization.

  value can be a scalar or sequence.

  Returns result, is_scalar, where result is a masked array matching value. Float dtypes are preserved; integer types with two bytes or smaller are converted to np.float32, and larger types are converted to np.float64. Preserving float32 when possible, and using in-place operations, can greatly improve speed for large arrays.

  Experimental; we may want to add an option to force the use of float32.

scaled(self)
  Return whether vmin and vmax are set.
Examples using `matplotlib.colors.Normalize`

- `sphx_glr_gallery_images_contours_and_fields_contour_image.py`
- `sphx_glr_gallery_images_contours_and_fields_image_masked.py`
- `sphx_glr_gallery_images_contours_and_fields_image_transparency_blend.py`

- `sphx_glr_gallery_userdemo_colormap_normalizations_custom.py`

- `Constrained Layout Guide`
- `Customized Colorbars Tutorial`
- `Colormap Normalization`

`matplotlib.colors.PowerNorm`

class `matplotlib.colors.PowerNorm`(gamma, vmin=None, vmax=None, clip=False)

Bases: `matplotlib.colors.Normalize`

Linearly map a given value to the 0-1 range and then apply a power-law normalization over that range.

`inverse(self, value)`

Examples using `matplotlib.colors.PowerNorm`

- `sphx_glr_gallery_showcase_mandelbrot.py`
- `sphx_glr_gallery_scales_power_norm.py`
- `sphx_glr_gallery_userdemo_colormap_normalizations.py`
- `sphx_glr_gallery_userdemo_colormap_normalizations_power.py`

- `Colormap Normalization`

`matplotlib.colors.SymLogNorm`

class `matplotlib.colors.SymLogNorm`(linthresh, linscale=1.0, vmin=None, vmax=None, clip=False)

Bases: `matplotlib.colors.Normalize`

The symmetrical logarithmic scale is logarithmic in both the positive and negative directions from the origin.
Since the values close to zero tend toward infinity, there is a need to have a range around zero that is linear. The parameter `linthresh` allows the user to specify the size of this range (-linthresh, linthresh).

`linthresh`: The range within which the plot is linear (to avoid having the plot go to infinity around zero).

`linscale`: This allows the linear range (-linthresh to linthresh) to be stretched relative to the logarithmic range. Its value is the number of decades to use for each half of the linear range. For example, when linscale == 1.0 (the default), the space used for the positive and negative halves of the linear range will be equal to one decade in the logarithmic range. Defaults to 1.

```python
autoscale(self, A)
    Set vmin, vmax to min, max of A.
autoscale_None(self, A)
    Autoscale only None-valued vmin or vmax.
inverse(self, value)
```

`matplotlib.colors.from_levels_and_colors` un

`matplotlib.colors.from_levels_and_colors(levels, colors, extend='neither')` A helper routine to generate a cmap and a norm instance which behave similar to contour’s levels and colors arguments.
Parameters

levels [sequence of numbers] The quantization levels used to construct the BoundaryNorm. Value v is quantized to level i if lev[i] <= v < lev[i+1].

colors [sequence of colors] The fill color to use for each level. If extend is “neither” there must be n_level - 1 colors. For an extend of “min” or “max” add one extra color, and for an extend of “both” add two colors.

extend [{‘neither’, ‘min’, ‘max’, ‘both’}, optional] The behaviour when a value falls out of range of the given levels. See contourf() for details.

Returns

(cmap, norm) [tuple containing a Colormap and a Normalize instance]

matplotlib.colors.hsv_to_rgb

matplotlib.colors.hsv_to_rgb(hsv)
Convert hsv values to rgb.

Parameters

hsv [(..., 3) array-like] All values assumed to be in range [0, 1]

Returns

rgb [(..., 3) ndarray] Colors converted to RGB values in range [0, 1]

matplotlib.colors.rgb_to_hsv

matplotlib.colors.rgb_to_hsv(arr)
Convert float rgb values (in the range [0, 1]), in a numpy array to hsv values.

Parameters

arr [(..., 3) array-like] All values must be in the range [0, 1]

Returns

hsv [(..., 3) ndarray] Colors converted to hsv values in range [0, 1]

Examples using matplotlib.colors.rgb_to_hsv

• sphx_glr_gallery_color_named_colors.py

matplotlib.colors.to_hex

matplotlib.colors.to_hex(c, keep_alpha=False)
Convert c to a hex color.

Uses the #rrggbb format if keep_alpha is False (the default), #rrggbbb otherwise.
matplotlib.colors.to_rgb

matplotlib.colors.to_rgb(c)
   Convert c to an RGB color, silently dropping the alpha channel.

Examples using matplotlib.colors.to_rgb

   • sphx_glr_gallery_color_named_colors.py

matplotlib.colors.to_rgba

matplotlib.colors.to_rgba(c, alpha=None)
   Convert c to an RGBA color.

Parameters
   c [Matplotlib color or np.ma.masked]
   alpha [scalar, optional] If alpha is not None, it forces the alpha value, except
   if c is "none" (case-insensitive), which always maps to (0, 0, 0, 0).

Returns
   tuple Tuple of (r, g, b, a) scalars.

Examples using matplotlib.colors.to_rgba

   • sphx_glr_gallery_color_named_colors.py
   • sphx_glr_gallery_shapes_and_collections_collections.py
   • sphx_glr_gallery_shapes_and_collections_line_collection.py
   • sphx_glr_gallery_event_handling_lasso_demo.py
   • sphx_glr_gallery_misc_demo_ribbon_box.py
   • sphx_glr_gallery_widgets_menu.py

matplotlib.colors.to_rgba_array

matplotlib.colors.to_rgba_array(c, alpha=None)
   Convert c to a (n, 4) array of RGBA colors.
   If alpha is not None, it forces the alpha value. If c is "none" (case-insensitive) or an empty
   list, an empty array is returned. If c is a masked array, an ndarray is returned with a (0,
   0, 0, 0) row for each masked value or row in c.

matplotlib.colors.is_color_like

matplotlib.colors.is_color_like(c)
   Return whether c can be interpreted as an RGB(A) color.
matplotlib.colors.makeMappingArray

matplotlib.colors.makeMappingArray(N, data, gamma=1.0)

Create an N-element 1-d lookup table.

This assumes a mapping \( f : [0, 1] \rightarrow [0, 1] \). The returned data is an array of N values \( y = f(x) \) where \( x \) is sampled from [0, 1].

By default (\( gamma = 1 \)) \( x \) is equidistantly sampled from [0, 1]. The \( gamma \) correction factor \( \gamma \) distorts this equidistant sampling by \( x \rightarrow x^\gamma \).

Parameters

- \( N \) [int] The number of elements of the created lookup table. This must be \( N \geq 1 \).
- \( data \) [Mx3 array-like or callable] Defines the mapping \( f \).
  - If a Mx3 array-like, the rows define values \((x, y_0, y_1)\). The \( x \) values must start with \( x=0 \), end with \( x=1 \), and all \( x \) values be in increasing order.
  - A value between \( x_i \) and \( x_{i+1} \) is mapped to the range \( y_{i-1}^1 \ldots y_0^i \) by linear interpolation.
  - For the simple case of a \( y \)-continuous mapping, \( y_0 \) and \( y_1 \) are identical.
  - The two values of \( y \) are to allow for discontinuous mapping functions.
  - E.g. a sawtooth with a period of 0.2 and an amplitude of 1 would be:

| \((0, 1, 0)\), \((0.2, 1, 0)\), \((0.4, 1, 0)\), \ldots, \|(1, 1, 0)\] |

In the special case of \( N = 1 \), by convention the returned value is \( y_0 \) for \( x = 1 \).

- If \( data \) is a callable, it must accept and return numpy arrays:

  `data(x : ndarray) -> ndarray`

  and map values between 0 - 1 to 0 - 1.

- \( gamma \) [float] Gamma correction factor for input distribution \( x \) of the mapping.

  See also https://en.wikipedia.org/wiki/Gamma_correction.

Returns

- \( lut \) [array] The lookup table where \( lut[x \ast (N-1)] \) gives the closest value for values of \( x \) between 0 and 1.

Notes

This function is internally used for LinearSegmentedColormaps.

matplotlib.colors.get_named_colors_mapping

matplotlib.colors.get_named_colors_mapping()

Return the global mapping of names to named colors.
17.18 matplotlib.container

class matplotlib.container.BarContainer(patches, errorbar=None, **kwargs)
Bases: matplotlib.container.Container

Container for the artists of bar plots (e.g. created by Axes.bar).
The container can be treated as a tuple of the patches themselves. Additionally, you can access these and further parameters by the attributes.

Attributes

- **patches** [list of Rectangle] The artists of the bars.
- **errorbar** [None or ErrorbarContainer] A container for the error bar artists if error bars are present. None otherwise.

class matplotlib.container.Container(kl, label=None)
Bases: tuple

Base class for containers.
Containers are classes that collect semantically related Artists such as the bars of a bar plot.

add_callback(self, func)
- Adds a callback function that will be called whenever one of the Artist’s properties changes.
- Returns an id that is useful for removing the callback with remove_callback() later.

get_children(self)

get_label(self)
- Get the label used for this artist in the legend.

pchanged(self)
- Fire an event when property changed, calling all of the registered callbacks.

remove(self)

remove_callback(self, oid)
- Remove a callback based on its id.

See also:

add_callback() For adding callbacks

set_label(self, s)
- Set the label to s for auto legend.

Parameters

- **s** [object] Any object other than None gets converted to its str.

Notes

Deprecated since version 3.0:
class matplotlib.container.ErrorbarContainer(lines, has_xerr=False, has_yerr=False, **kwargs)

Bases: matplotlib.container.Container

Container for the artists of error bars (e.g. created by Axes.errorbar).

The container can be treated as the lines tuple itself. Additionally, you can access these and further parameters by the attributes.

Attributes

**lines** [tuple] Tuple of (data_line, caplines, barlinecols).
  - data_line : Line2D instance of x, y plot markers and/or line.
  - caplines : tuple of Line2D instances of the error bar caps.
  - barlinecols : list of LineCollection with the horizontal and vertical error ranges.

**has_xerr, has_yerr** [bool] True if the errorbar has x/y errors.

class matplotlib.container.StemContainer(markerline_stemlines_baseline, **kwargs)

Bases: matplotlib.container.Container

Container for the artists created in a Axes.stem() plot.

The container can be treated like a namedtuple (markerline, stemlines, baseline).

Attributes

**markerline** [Line2D] The artist of the markers at the stem heads.

**stemlines** [list of Line2D] The artists of the vertical lines for all stems.

**baseline** [Line2D] The artist of the horizontal baseline.

Parameters

**markerline_stemlines_baseline** [tuple] Tuple of (markerline, stemlines, baseline). markerline contains the LineCollection of the markers, stemlines is a LineCollection of the main lines, baseline is the Line2D of the baseline.

17.19 matplotlib.contour

These are classes to support contour plotting and labelling for the Axes class.

class matplotlib.contour.ClabelText(x=0, y=0, text=", color=None, verticalalignment=’baseline’, horizontalalignment=’left’, multialignment=None, fontproperties=None, rotation=None, linespacing=None, rotation_mode=None, usetex=None, wrap=False, **kwargs)

Bases: matplotlib.text.Text

Unlike the ordinary text, the get_rotation returns an updated angle in the pixel coordinate assuming that the input rotation is an angle in data coordinate (or whatever transform set).

Create a Text instance at x, y with string text.
Valid kwargs are

</table>

get_rotation(self)

Return the text angle as float in degrees.

class matplotlib.contour.ContourLabeler
Bases: object

17.19. matplotlib.contour 1537
Mixins to provide labelling capability to `ContourSet`.

```python
add_label(self, x, y, rotation, lev, cvalue)
    Add contour label using `Text` class.
```

```python
add_label_clabeltext(self, x, y, rotation, lev, cvalue)
    Add contour label using `ClabelText` class.
```

```python
add_label_near(self, x, y, inline=True, inline_spacing=5, transform=None)
    Add a label near the point (x, y). If transform is None (default), (x, y) is in data coordinates; if transform is False, (x, y) is in display coordinates; otherwise, the specified transform will be used to translate (x, y) into display coordinates.
```

**Parameters**

- `x, y` [float] The approximate location of the label.
- `inline` [bool, optional, default: True] If `True` remove the segment of the contour beneath the label.
- `inline_spacing` [int, optional, default: 5] Space in pixels to leave on each side of label when placing inline. This spacing will be exact for labels at locations where the contour is straight, less so for labels on curved contours.

```python
calc_label_rot_and_inline(self, slc, ind, lw, lc=None, spacing=5)
    This function calculates the appropriate label rotation given the linecontour coordinates in screen units, the index of the label location and the label width.
```

```python
    It will also break contour and calculate inlining if `lc` is not empty (`lc` defaults to the empty list if None). `spacing` is the space around the label in pixels to leave empty.

    Do both of these tasks at once to avoid calculating path lengths multiple times, which is relatively costly.

    The method used here involves calculating the path length along the contour in pixel coordinates and then looking approximately label width / 2 away from central point to determine rotation and then to break contour if desired.

```python
c1

```python
c1_cvalues

```python
c1_xy

```python
clabel(self, *args, fontsize=None, inline=True, inline_spacing=5, fmt='%1.3f', colors=None, use_clabeltext=False, manual=False, rightside_up=True)
    Label a contour plot.
```

**Call signature:**

```python
clabel(cs, [levels], **kwargs)
```

Adds labels to line contours in `cs`, where `cs` is a `ContourSet` object returned by `contour()`.

**Parameters**

- `cs` [`ContourSet`] The ContourSet to label.
- `levels` [array-like, optional] A list of level values, that should be labeled. The list must be a subset of `cs.levels`. If not given, all levels are labeled.
**fontsize** [string or float, optional] Size in points or relative size e.g., 'smaller', 'x-large'. See :func:`Text.set_size` for accepted string values.

**colors** [color-spec, optional] The label colors:

- If None, the color of each label matches the color of the corresponding contour.
- If one string color, e.g., colors = 'r' or colors = 'red', all labels will be plotted in this color.
- If a tuple of matplotlib color args (string, float, rgb, etc), different labels will be plotted in different colors in the order specified.

**inline** [bool, optional] If True the underlying contour is removed where the label is placed. Default is True.

**inline_spacing** [float, optional] Space in pixels to leave on each side of label when placing inline. Defaults to 5.

This spacing will be exact for labels at locations where the contour is straight, less so for labels on curved contours.

**fmt** [string or dict, optional] A format string for the label. Default is '%1.3f'

Alternatively, this can be a dictionary matching contour levels with arbitrary strings to use for each contour level (i.e., fmt[level]=string), or it can be any callable, such as a :class:`Formatter` instance, that returns a string when called with a numeric contour level.

**manual** [bool or iterable, optional] If True, contour labels will be placed manually using mouse clicks. Click the first button near a contour to add a label, click the second button (or potentially both mouse buttons at once) to finish adding labels. The third button can be used to remove the last label added, but only if labels are not inline. Alternatively, the keyboard can be used to select label locations (enter to end label placement, delete or backspace act like the third mouse button, and any other key will select a label location).

*manual* can also be an iterable object of x,y tuples. Contour labels will be created as if mouse is clicked at each x,y positions.

**rightside_up** [bool, optional] If True, label rotations will always be plus or minus 90 degrees from level. Default is True.

**use_clabeltext** [bool, optional] If True, :class:`ClabelText` class (instead of :class:`Text`) is used to create labels. :class:`ClabelText` recalculates rotation angles of texts during the drawing time, therefore this can be used if aspect of the axes changes. Default is False.

**Returns**

**labels** A list of :class:`Text` instances for the labels.

**get_label_coords**

Return x, y, and the index of a label location.

Labels are plotted at a location with the smallest deviation of the contour from a straight line unless there is another label nearby, in which case the next best place on the contour is picked up. If all such candidates are rejected, the beginning of the contour is chosen.
get_label_width(self, lev, fmt, fsize)
Return the width of the label in points.

get_text(self, lev, fmt)
Get the text of the label.

labels(self, inline, inline_spacing)

locate_label(self, linecontour, labelwidth)
Find good place to draw a label (relatively flat part of the contour).

pop_label(self, index=-1)
Defaults to removing last label, but any index can be supplied

print_label(self, linecontour, labelwidth)
Return False if contours are too short for a label.

set_label_props(self, label, text, color)
Set the label properties - color, fontsize, text.

too_close(self, x, y, lw)
Return True if a label is already near this location.

class matplotlib.contour.ContourSet(ax, *args, levels=None, filled=False, linewidens=None, linestyles=None, alpha=None, origin=None, extent=None, cmap=None, colors=None, norm=None, vmin=None, vmax=None, extend='neither', antialiased=None, **kwargs)

Bases: matplotlib.cm.ScalarMappable, matplotlib.contour.ContourLabeler

Store a set of contour lines or filled regions.
User-callable method: clabel

Parameters

ax [Axes]

levels [[level0, level1, ..., leveln]] A list of floating point numbers indicating the contour levels.

allsegs [[level0segs, level1segs, ...]] List of all the polygon segments for all the levels. For contour lines len(allsegs) == len(levels), and for filled contour regions len(allsegs) = len(levels)-1. The lists should look like:

level0segs = [polygon0, polygon1, ...]
polygon0 = array_like [[x0,y0], [x1,y1], ...]

allkinds [None or [level0kinds, level1kinds, ...]] Optional list of all the polygon vertex kinds (code types), as described and used in Path. This is used to allow multiply-connected paths such as holes within filled polygons. If not None, len(allkinds) == len(allsegs). The lists should look like:

level0kinds = [polygon0kinds, ...]
polygon0kinds = [vertexcode0, vertexcode1, ...]

If allkinds is not None, usually all polygons for a particular contour level are grouped together so that level0segs = [polygon0] and level0kinds = [polygon0kinds].

**kwargs Keyword arguments are as described in the docstring of contour.
Attributes

- **ax**: The axes object in which the contours are drawn.
- **collections**: A list of LineCollections or PolyCollections.
- **levels**: Contour levels.
- **layers**: Same as levels for line contours; half-way between levels for filled contours. See `_process_colors()`.

Draw contour lines or filled regions, depending on whether keyword arg `filled` is `False` (default) or `True`.

Call signature:

```python
ContourSet(ax, levels, allsegs, [allkinds], **kwargs)
```

Parameters

- **ax** (*Axes*) The `Axes` object to draw on.
- **levels** ([level0, level1, ..., leveln]) A list of floating point numbers indicating the contour levels.
- **allsegs** ([level0segs, level1segs, ...]) List of all the polygon segments for all the `levels`. For contour lines `len(allsegs) == len(levels)`, and for filled contour regions `len(allsegs) = len(levels)-1`. The lists should look like:

```python
level0segs = [polygon0, polygon1, ...]
polygon0 = array_like [[x0,y0], [x1,y1], ...]
```

- **allkinds** ([level0kinds, level1kinds, ...], optional) Optional list of all the polygon vertex kinds (code types), as described and used in Path. This is used to allow multiply-connected paths such as holes within filled polygons. If not `None`, `len(allkinds) == len(allsegs)`. The lists should look like:

```python
level0kinds = [polygon0kinds, ...]
polygon0kinds = [vertexcode0, vertexcode1, ...]
```

If `allkinds` is not `None`, usually all polygons for a particular contour level are grouped together so that `level0segs = [polygon0]` and `level0kinds = [polygon0kinds]`.

- **kwargs**: Keyword arguments are as described in the docstring of `contour`.

changed(self)

Call this whenever the mappable is changed to notify all the callback listeners to the ‘changed’ signal.

find_nearest_contour(self, x, y, indices=None, pixel=True)

Finds contour that is closest to a point. Defaults to measuring distance in pixels (screen space - useful for manual contour labeling), but this can be controlled via a keyword argument.

Returns a tuple containing the contour, segment, index of segment, x & y of segment point and distance to minimum point.

Optional keyword arguments:
indices: Indexes of contour levels to consider when looking for nearest point. Defaults to using all levels.

pixel: If True, measure distance in pixel space, if not, measure distance in axes space. Defaults to True.

get_alpha(self)
returns alpha to be applied to all ContourSet artists

get_transform(self)
Return the Transform instance used by this ContourSet.

legend_elements(self, variable_name='x', str_format=<class 'str'>)
Return a list of artists and labels suitable for passing through to plt.legend() which represent this ContourSet.

The labels have the form “0 < x <= 1” stating the data ranges which the artists represent.

Parameters

variable_name [str] The string used inside the inequality used on the labels.

str_format [function: float -> str] Function used to format the numbers in the labels.

Returns

artists [List[Artist]] A list of the artists.

labels [List[str]] A list of the labels.

set_alpha(self, alpha)
Set the alpha blending value for all ContourSet artists. alpha must be between 0 (transparent) and 1 (opaque).

class matplotlib.contour.QuadContourSet(ax, *args, levels=None, filled=False, linewidths=None, linestyles=None, alpha=None, origin=None, extent=None, cmap=None, colors=None, norm=None, vmin=None, vmax=None, extend='neither', antialiased=None, **kwargs)

Bases: matplotlib.contour.ContourSet

Create and store a set of contour lines or filled regions.

User-callable method: clabel

Attributes

ax The axes object in which the contours are drawn.

collections A silent list of LineCollections or PolyCollections.

levels Contour levels.

layers Same as levels for line contours; half-way between levels for filled contours. See _process_colors() method.

Draw contour lines or filled regions, depending on whether keyword arg filled is False (default) or True.

Call signature:
**ContourSet(ax, levels, allsegs, [allkinds], **kwargs)**

### Parameters

- **ax** ([Axes] The Axes object to draw on.

- **levels** ([level0, level1, ..., leveln]) A list of floating point numbers indicating the contour levels.

- **allsegs** ([level0segs, level1segs, ...]) List of all the polygon segments for all the levels. For contour lines len(allsegs) == len(levels), and for filled contour regions len(allsegs) = len(levels)-1. The lists should look like:

  ```python
  level0segs = [polygon0, polygon1, ...]
polygon0 = array_like [[x0,y0], [x1,y1], ...]
  ```

- **allkinds** ([level0kinds, level1kinds, ...], optional) Optional list of all the polygon vertex kinds (code types), as described and used in Path. This is used to allow multiply- connected paths such as holes within filled polygons. If not None, len(allkinds) == len(allsegs). The lists should look like:

  ```python
  level0kinds = [polygon0kinds, ...]
polygon0kinds = [vertexcode0, vertexcode1, ...]
  ```

  If *allkinds* is not None, usually all polygons for a particular contour level are grouped together so that level0segs = [polygon0] and level0kinds = [polygon0kinds].

- **kwargs** Keyword arguments are as described in the docstring of `contour`.
Matplotlib provides sophisticated date plotting capabilities, standing on the shoulders of python `datetime` and the add-on module `dateutil`.

### 17.20.1 Matplotlib date format

Matplotlib represents dates using floating point numbers specifying the number of days since 0001-01-01 UTC, plus 1. For example, 0001-01-01, 06:00 is 1.25, not 0.25. Values < 1, i.e. dates before 0001-01-01 UTC, are not supported.

There are a number of helper functions to convert between `datetime` objects and Matplotlib dates:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>datestr2num</code></td>
<td>Convert a date string to a datenum using <code>dateutil.parser.parse()</code>.</td>
</tr>
<tr>
<td><code>date2num</code></td>
<td>Convert datetime objects to Matplotlib dates.</td>
</tr>
<tr>
<td><code>num2date</code></td>
<td>Convert Matplotlib dates to <code>datetime</code> objects.</td>
</tr>
<tr>
<td><code>num2timedelta</code></td>
<td>Convert number of days to a <code>timedelta</code> object.</td>
</tr>
<tr>
<td><code>epoch2num</code></td>
<td>Convert an epoch or sequence of epochs to the new date format, that is days since 0001.</td>
</tr>
<tr>
<td><code>num2epoch</code></td>
<td>Convert days since 0001 to epoch.</td>
</tr>
<tr>
<td><code>mx2num</code></td>
<td>Convert mx <code>datetime</code> instance (or sequence of mx instances) to the new date format.</td>
</tr>
</tbody>
</table>
Table 134 – continued from previous page

drange  
Return a sequence of equally spaced Matplotlib dates.

Note: Like Python's datetime, mpl uses the Gregorian calendar for all conversions between dates and floating point numbers. This practice is not universal, and calendar differences can cause confusing differences between what Python and mpl give as the number of days since 0001-01-01 and what other software and databases yield. For example, the US Naval Observatory uses a calendar that switches from Julian to Gregorian in October, 1582. Hence, using their calculator, the number of days between 0001-01-01 and 2006-04-01 is 732403, whereas using the Gregorian calendar via the datetime module we find:

```python
In [1]: date(2006, 4, 1).toordinal() - date(1, 1, 1).toordinal()
Out[1]: 732401
```

All the Matplotlib date converters, tickers and formatters are timezone aware. If no explicit timezone is provided, `rcParams["timezone"]` (default: 'UTC') is assumed. If you want to use a custom time zone, pass a `datetime.tzinfo` instance with the tz keyword argument to `num2date`, `plot_date`, and any custom date tickers or locators you create.

A wide range of specific and general purpose date tick locators and formatters are provided in this module. See `matplotlib.ticker` for general information on tick locators and formatters. These are described below.

The `dateutil` module provides additional code to handle date ticking, making it easy to place ticks on any kinds of dates. See examples below.

## 17.20.2 Date tickers

Most of the date tickers can locate single or multiple values. For example:

```python
# import constants for the days of the week
from matplotlib.dates import MO, TU, WE, TH, FR, SA, SU

# tick on mondays every week
loc = WeekdayLocator(byweekday=MO, tz=tz)

# tick on mondays and saturdays
loc = WeekdayLocator(byweekday=(MO, SA))
```

In addition, most of the constructors take an interval argument:

```python
# tick on mondays every second week
loc = WeekdayLocator(byweekday=MO, interval=2)
```

The rule locator allows completely general date ticking:

```python
# tick every 5th easter
rule = rrulewrapper(YEARLY, byeaster=1, interval=5)
loc = RRULELocator(rule)
```

The available date tickers are:
• `MicrosecondLocator`: locate microseconds
• `SecondLocator`: locate seconds
• `MinuteLocator`: locate minutes
• `HourLocator`: locate hours
• `DayLocator`: locate specified days of the month
• `WeekdayLocator`: locate days of the week, e.g., MO, TU
• `MonthLocator`: locate months, e.g., 7 for july
• `YearLocator`: locate years that are multiples of base
• `RRuleLocator`: locate using a `matplotlib.dates.rrulewrapper`. `rrulewrapper` is a simple wrapper around `dateutil`'s `dateutil.rrule` which allow almost arbitrary date tick specifications. See rrule example.
• `AutoDateLocator`: on autoscale, this class picks the best `DateLocator` (e.g., `RRuleLocator`) to set the view limits and the tick locations. If called with `interval_multiples=True` it will make ticks line up with sensible multiples of the tick intervals. E.g. if the interval is 4 hours, it will pick hours 0, 4, 8, etc as ticks. This behaviour is not guaranteed by default.

### 17.20.3 Date formatters

The available date formatters are:

• `AutoDateFormatter`: attempts to figure out the best format to use. This is most useful when used with the `AutoDateLocator`.
• `ConciseDateFormatter`: also attempts to figure out the best format to use, and to make the format as compact as possible while still having complete date information. This is most useful when used with the `AutoDateLocator`.
• `DateFormatter`: use `strftime` format strings.
• `IndexDateFormatter`: date plots with implicit x indexing.

```python
matplotlib.dates.datestr2num(d, default=None)
```

Convert a date string to a datenum using `dateutil.parser.parse()`.

**Parameters**

- `d` [string or sequence of strings] The dates to convert.
- `default` [datetime instance, optional] The default date to use when fields are missing in `d`.

```python
matplotlib.dates.date2num(d)
```

Convert datetime objects to Matplotlib dates.

**Parameters**

- `d` [datetime.datetime or numpy.datetime64 or sequences of these]

**Returns**

- `float or sequence of floats` Number of days (fraction part represents hours, minutes, seconds, ms) since 0001-01-01 00:00:00 UTC, plus one.
Notes

The addition of one here is a historical artifact. Also, note that the Gregorian calendar is assumed; this is not universal practice. For details see the module docstring.

matlablib.dates.num2date(x, tz=None)
Convert Matplotlib dates to datetime objects.

Parameters

x [float or sequence of floats] Number of days (fraction part represents hours, minutes, seconds) since 0001-01-01 00:00:00 UTC, plus one.

tz [string, optional] Timezone of x (defaults to rcparams timezone).

Returns
datetime or sequence of datetime Dates are returned in timezone tz.
If x is a sequence, a sequence of datetime objects will be returned.

Notes

The addition of one here is a historical artifact. Also, note that the Gregorian calendar is assumed; this is not universal practice. For details, see the module docstring.

matlablib.dates.num2timedelta(x)
Convert number of days to a timedelta object.
If x is a sequence, a sequence of timedelta objects will be returned.

Parameters

x [float, sequence of floats] Number of days. The fraction part represents hours, minutes, seconds.

Returns
datetime.timedelta or list[datetime.timedelta]

matlablib.dates.drange(dstart, dend, delta)
Return a sequence of equally spaced Matplotlib dates.
The dates start at dstart and reach up to, but not including dend. They are spaced by delta.

Parameters
dstart, dend [datetime] The date limits.
delta [datetime.timedelta] Spacing of the dates.

Returns
drange [numpy.array] A list floats representing Matplotlib dates.

matlablib.dates.epoch2num(e)
Convert an epoch or sequence of epochs to the new date format, that is days since 0001.

matlablib.dates.num2epoch(d)
Convert days since 0001 to epoch. d can be a number or sequence.

matlablib.dates.mx2num(mxdates)
Convert mx datetime instance (or sequence of mx instances) to the new date format.
class matplotlib.dates.DateFormatter(fmt, tz=None)
    Bases: matplotlib.ticker.Formatter

Format a tick (in seconds since the epoch) with a \texttt{strftime} format string.

Parameters

fmt [str] \texttt{strftime} format string

tz [tzinfo]

illegal_s = re.compile('(^|[^\%])(\%\%)\*\%s)')

set_tzinfo(self, tz)

\texttt{strftime}(self, dt, fmt=None)

[\texttt{ Deprecated }] Refer to documentation for \texttt{datetime.datetime.strftime()}

fmt is a \texttt{datetime.datetime.strftime()} format string.

Warning: For years before 1900, depending upon the current locale it is possible
that the year displayed with \texttt{%x} might be incorrect. For years before 100, \texttt{%y} and
\texttt{%Y} will yield zero-padded strings.

Notes

Deprecated since version 3.0.

\texttt{strftime\_pre\_1900}(self, dt, fmt=None)

[\texttt{ Deprecated }] Call \texttt{time.strftime} for years before 1900 by rolling forward a multiple
of 28 years.

fmt is a \texttt{strftime()} format string.

Dalke: I hope I did this math right. Every 28 years the calendar repeats, except
through century leap years excepting the 400 year leap years. But only if you’re
using the Gregorian calendar.

Notes

Deprecated since version 3.0.

class matplotlib.dates.ConciseDateFormatter(locator, tz=None, formats=None, off-
setformats=None, zero_formats=None, show_offset=True)
    Bases: matplotlib.ticker.Formatter

This class attempts to figure out the best format to use for the date, and to make it
as compact as possible, but still be complete. This is most useful when used with the
\texttt{AutoDateLocator}:

```python
>>> locator = AutoDateLocator()
>>> formatter = ConciseDateFormatter(locator)
```

Parameters

locator [ticker.Locator] Locator that this axis is using.

tz [string, optional] Passed to \texttt{dates.date2num}.
**formats** [list of 6 strings, optional] Format strings for 6 levels of tick labelling: mostly years, months, days, hours, minutes, and seconds. Strings use the same format codes as `strftime`. Default is `['%Y', '%b', '%d', '%H:%M', '%H:%M', '%S.%f']`

**zero_formats** [list of 6 strings, optional] Format strings for tick labels that are "zeros" for a given tick level. For instance, if most ticks are months, ticks around 1 Jan 2005 will be labeled “Dec”, “2005”, “Feb”. The default is `['', '%Y', '%b', '%b-%d', '%H:%M', '%H:%M']`

**offset_formats** [list of 6 strings, optional] Format strings for the 6 levels that is applied to the "offset" string found on the right side of an x-axis, or top of a y-axis. Combined with the tick labels this should completely specify the date. The default is:

```
["", "%Y", "%Y-%b", "%Y-%b-%d", "%Y-%b-%d", "%Y-%b-%d %H:%M"]
```

**show_offset** [bool] Whether to show the offset or not. Default is True.

### Examples

See `/gallery/ticks_and_spines/date_concise_formatter`

![Concise Date Formatter](image)

Autoformat the date labels. The default format is used to form an initial string, and then redundant elements are removed.
format_data_short(self, value)
   Return a short string version of the tick value.
   Defaults to the position-independent long value.

format_ticks(self, values)
   Return the tick labels for all the ticks at once.

get_offset(self)

class matplotlib.dates.IndexDateFormatter(t, fmt, tz=None)
   Bases: matplotlib.ticker.Formatter

   Use with IndexLocator to cycle format strings by index.
   t is a sequence of dates (floating point days). fmt is a strftime() format string.

class matplotlib.dates.AutoDateFormatter(locator, tz=None, defaultfmt='%Y-%m-%d')
   Bases: matplotlib.ticker.Formatter

   This class attempts to figure out the best format to use. This is most useful when used
   with the AutoDateLocator.

   The AutoDateFormatter has a scale dictionary that maps the scale of the tick (the dis-
   tance in days between one major tick) and a format string. The default looks like this:

   ```python
   self.scaled = {
       DAYS_PER_YEAR: rcParams['date.autoformat.year'],
       DAYS_PER_MONTH: rcParams['date.autoformat.month'],
       1.0: rcParams['date.autoformat.day'],
       1. / HOURS_PER_DAY: rcParams['date.autoformat.hour'],
       1. / (MINUTES_PER_DAY): rcParams['date.autoformat.minute'],
       1. / (SEC_PER_DAY): rcParams['date.autoformat.second'],
       1. / (MUSECONDS_PER_DAY): rcParams['date.autoformat.microsecond'],
   }
   ```

   The algorithm picks the key in the dictionary that is >= the current scale and uses that
   format string. You can customize this dictionary by doing:

   ```python
   >>> locator = AutoDateLocator()
   >>> formatter = AutoDateFormatter(locator)
   >>> formatter.scaled[1/(24.*60.)] = '%M:%S' # only show min and sec
   ```

   A custom FuncFormatter can also be used. The following example shows how to use a
   custom format function to strip trailing zeros from decimal seconds and adds the date
to the first ticklabel:

   ```python
   >>> def my_format_function(x, pos=None):
   ...     x = matplotlib.dates.num2date(x)
   ...     if pos == 0:
   ...         fmt = '%D %H:%M:%S.%f'
   ...     else:
   ...         fmt = '%H:%M:%S.%f'
   ...     label = x.strftime(fmt)
   ...     label = label.rstrip("0")
   ...     label = label.rstrip(".")
   ...     return label
   >>> from matplotlib.ticker import FuncFormatter
   >>> formatter.scaled[1/(24.*60.)] = FuncFormatter(my_format_function)
   ```
Autoformat the date labels. The default format is the one to use if none of the values in self.scaled are greater than the unit returned by locator._get_unit().

```python
class matplotlib.dates.DateLocator(tz=None)
Bases: matplotlib.ticker.Locator
Determines the tick locations when plotting dates.
This class is subclassed by other Locators and is not meant to be used on its own.
tz is a tzinfo instance.
datalim_to_dt(self)
    Convert axis data interval to datetime objects.
hms0d = {'byhour': 0, 'byminute': 0, 'bysecond': 0}
nonsingular(self, vmin, vmax)
    Given the proposed upper and lower extent, adjust the range if it is too close to being singular (i.e. a range of ~0).
set_tzinfo(self, tz)
    Set time zone info.
viewlim_to_dt(self)
    Converts the view interval to datetime objects.
```

```python
class matplotlib.dates.RRuleLocator(o, tz=None)
Bases: matplotlib.dates.DateLocator
autoscale(self)
    Set the view limits to include the data range.
static get_unit_generic(freq)
tick_values(self, vmin, vmax)
    Return the values of the located ticks given vmin and vmax.
```

**Note:** To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

```python
class matplotlib.dates.AutoDateLocator(tz=None, minticks=5, maxticks=None, interval_multiples=True)
Bases: matplotlib.dates.DateLocator
On autoscale, this class picks the best DateLocator to set the view limits and the tick locations.
minticks is the minimum number of ticks desired, which is used to select the type of ticking (yearly, monthly, etc.).
maxticks is the maximum number of ticks desired, which controls any interval between ticks (ticking every other, every 3, etc.). For really fine-grained control, this can be a dictionary mapping individual rrule frequency constants (YEARLY, MONTHLY, etc.) to their own maximum number of ticks. This can be used to keep the number of ticks
```
appropriate to the format chosen in \textit{AutoDateFormatter}. Any frequency not specified in this dictionary is given a default value.

\textit{tz} is a \texttt{tzinfo} instance.

\textit{interval multiples} is a boolean that indicates whether ticks should be chosen to be multiple of the interval. This will lock ticks to ‘nicer’ locations. For example, this will force the ticks to be at hours 0, 6, 12, 18 when hourly ticking is done at 6 hour intervals.

The AutoDateLocator has an interval dictionary that maps the frequency of the tick (a constant from dateutil.rrule) and a multiple allowed for that ticking. The default looks like this:

\begin{verbatim}
self.intervalmd = {
    YEARLY : [1, 2, 4, 5, 10, 20, 40, 50, 100, 200, 400, 500, 1000, 2000, 4000, 5000, 10000],
    MONTHLY : [1, 2, 3, 4, 6],
    DAILY : [1, 2, 3, 7, 14],
    HOURLY : [1, 2, 3, 4, 6, 12],
    MINUTELY: [1, 5, 10, 15, 30],
    SECONDLY: [1, 5, 10, 15, 30],
    MICROSECONDLY: [1, 2, 5, 10, 20, 50, 100, 200, 500, 1000, 2000, 5000, 10000, 20000, 50000, 100000, 200000, 500000, 1000000],
}
\end{verbatim}

The interval is used to specify multiples that are appropriate for the frequency of ticking. For instance, every 7 days is sensible for daily ticks, but for minutes/seconds, 15 or 30 make sense. You can customize this dictionary by doing:

\begin{verbatim}
locator = AutoDateLocator()
locator.intervalmd[HOURLY] = [3]  # only show every 3 hours
\end{verbatim}

\texttt{autoscale}(\texttt{self})

Try to choose the view limits intelligently.

\texttt{get locator}(\texttt{self, dmin, dmax})

Pick the best locator based on a distance.

\texttt{nonsingular}(\texttt{self, vmin, vmax})

Given the proposed upper and lower extent, adjust the range if it is too close to being singular (i.e. a range of ~0).

\texttt{refresh}(\texttt{self})

Refresh internal information based on current limits.

\texttt{set_axis}(\texttt{self, axis})

\texttt{tick_values}(\texttt{self, vmin, vmax})

Return the values of the located ticks given \texttt{vmin} and \texttt{vmax}.

\textbf{Note:} To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

\begin{verbatim}
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
\end{verbatim}
class matplotlib.dates.YearLocator(base=1, month=1, day=1, tz=None)
    Bases: matplotlib.dates.DateLocator
    Make ticks on a given day of each year that is a multiple of base.

Examples:

    # Tick every year on Jan 1st
    locator = YearLocator()

    # Tick every 5 years on July 4th
    locator = YearLocator(5, month=7, day=4)

Mark years that are multiple of base on a given month and day (default jan 1).

autoscale(self)
    Set the view limits to include the data range.

tick_values(self, vmin, vmax)
    Return the values of the located ticks given vmin and vmax.

Note: To get tick locations with the vmin and vmax values defined automatically
for the associated axis simply call the Locator instance:

    >>> print(type(loc))
    <type 'Locale'>
    >>> print(loc())
    [1, 2, 3, 4]

class matplotlib.dates.MonthLocator(bymonth=None, bymonthday=1, interval=1, tz=None)
    Bases: matplotlib.dates.RRuleLocator
    Make ticks on occurrences of each month, e.g., 1, 3, 12.

Mark every month in bymonth; bymonth can be an int or sequence. Default is range(1,
    13), i.e. every month.

    interval is the interval between each iteration. For example, if interval=2, mark every
    second occurrence.

class matplotlib.dates.WeekdayLocator(byweekday=1, interval=1, tz=None)
    Bases: matplotlib.dates.RRuleLocator
    Make ticks on occurrences of each weekday.

Mark every weekday in byweekday; byweekday can be a number or sequence.

Elements of byweekday must be one of MO, TU, WE, TH, FR, SA, SU, the constants from
dateutil.rrule, which have been imported into the matplotlib.dates namespace.

    interval specifies the number of weeks to skip. For example, interval=2 plots every sec-
    ond week.

class matplotlib.dates.DayLocator(bymonthday=None, interval=1, tz=None)
    Bases: matplotlib.dates.RRuleLocator
    Make ticks on occurrences of each day of the month. For example, 1, 15, 30.
Mark every day in `bymonthday`; `bymonthday` can be an int or sequence.
Default is to tick every day of the month: `bymonthday=range(1,32)`

```python
class matplotlib.dates.HourLocator(byhour=None, interval=1, tz=None)
    Bases: matplotlib.dates.RRuleLocator
Make ticks on occurrences of each hour.
Mark every hour in `byhour`; `byhour` can be an int or sequence. Default is to tick every hour: `byhour=range(24)`
`interval` is the interval between each iteration. For example, if `interval=2`, mark every second occurrence.
```

```python
class matplotlib.dates.MinuteLocator(byminute=None, interval=1, tz=None)
    Bases: matplotlib.dates.RRuleLocator
Make ticks on occurrences of each minute.
Mark every minute in `byminute`; `byminute` can be an int or sequence. Default is to tick every minute: `byminute=range(60)`
`interval` is the interval between each iteration. For example, if `interval=2`, mark every second occurrence.
```

```python
class matplotlib.dates.SecondLocator(bysecond=None, interval=1, tz=None)
    Bases: matplotlib.dates.RRuleLocator
Make ticks on occurrences of each second.
Mark every second in `bysecond`; `bysecond` can be an int or sequence. Default is to tick every second: `bysecond = range(60)`
`interval` is the interval between each iteration. For example, if `interval=2`, mark every second occurrence.
```

```python
class matplotlib.dates.MicrosecondLocator(interval=1, tz=None)
    Bases: matplotlib.dates.DateLocator
Make ticks on regular intervals of one or more microsecond(s).
```

**Note:** Due to the floating point representation of time in days since 0001-01-01 UTC (plus 1), plotting data with microsecond time resolution does not work well with current dates.

If you want microsecond resolution time plots, it is strongly recommended to use floating point seconds, not datetime-like time representation.

If you really must use `datetime.datetime()` or similar and still need microsecond precision, your only chance is to use very early years; using year 0001 is recommended.

`interval` is the interval between each iteration. For example, if `interval=2`, mark every second microsecond.

```python
set_axis(self, axis)
set_data_interval(self, vmin, vmax)
set_view_interval(self, vmin, vmax)
tick_values(self, vmin, vmax)
```

Return the values of the located ticks given `vmin` and `vmax`. 

---

1554 Chapter 17. Modules
Note: To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

```python
class matplotlib.dates.rrule(freq, dtstart=None, interval=1, wkst=None, count=None, until=None, bysetpos=None, bymonth=None, bymonthday=None, byyearday=None, byeaster=None, byweekno=None, byweekday=None, byhour=None, byminute=None, bysecond=None, cache=False)
```

Bases: dateutil.rrule.rrulebase

That's the base of the rrule operation. It accepts all the keywords defined in the RFC as its constructor parameters (except byday, which was renamed to byweekday) and more. The constructor prototype is:

```python
rrule(freq)
```

Where freq must be one of YEARLY, MONTHLY, WEEKLY, DAILY, HOURLY, MINUTELY, or SECONDLY.

Note: Per RFC section 3.3.10, recurrence instances falling on invalid dates and times are ignored rather than coerced:

```
Recurrence rules may generate recurrence instances with an invalid date (e.g., February 30) or nonexistent local time (e.g., 1:30 AM on a day where the local time is moved forward by an hour at 1:00 AM). Such recurrence instances MUST be ignored and MUST NOT be counted as part of the recurrence set.
```

This can lead to possibly surprising behavior when, for example, the start date occurs at the end of the month:

```python
>>> from dateutil.rrule import rrule, MONTHLY
>>> from datetime import datetime
>>> start_date = datetime(2014, 12, 31)
>>> list(rrule(freq=MONTHLY, count=4, dtstart=start_date))
[datetime.datetime(2014, 12, 31, 0, 0),
datetime.datetime(2015, 1, 31, 0, 0),
datetime.datetime(2015, 3, 31, 0, 0),
datetime.datetime(2015, 5, 31, 0, 0)]
```

Additionally, it supports the following keyword arguments:

**Parameters**

- `dtstart` – The recurrence start. Besides being the base for the recurrence, missing parameters in the final recurrence instances will also be extracted from this date. If not given, datetime.now() will be used instead.
• interval – The interval between each freq iteration. For example, when using YEARLY, an interval of 2 means once every two years, but with HOURLY, it means once every two hours. The default interval is 1.

• wkst – The week start day. Must be one of the MO, TU, WE constants, or an integer, specifying the first day of the week. This will affect recurrences based on weekly periods. The default week start is got from calendar.firstweekday(), and may be modified by calendar.setfirstweekday().

• count – If given, this determines how many occurrences will be generated.

Note: As of version 2.5.0, the use of the keyword until in conjunction with count is deprecated, to make sure dateutil is fully compliant with RFC-5545 Sec. 3.3.10. Therefore, until and count must not occur in the same call to rrule.

• until – If given, this must be a datetime instance specifying the upper-bound limit of the recurrence. The last recurrence in the rule is the greatest datetime that is less than or equal to the value specified in the until parameter.

Note: As of version 2.5.0, the use of the keyword until in conjunction with count is deprecated, to make sure dateutil is fully compliant with RFC-5545 Sec. 3.3.10. Therefore, until and count must not occur in the same call to rrule.

• bysetpos – If given, it must be either an integer, or a sequence of integers, positive or negative. Each given integer will specify an occurrence number, corresponding to the nth occurrence of the rule inside the frequency period. For example, a bysetpos of -1 if combined with a MONTHLY frequency, and a byweekday of (MO, TU, WE, TH, FR), will result in the last work day of every month.

• bymonth – If given, it must be either an integer, or a sequence of integers, meaning the months to apply the recurrence to.

• bymonthday – If given, it must be either an integer, or a sequence of integers, meaning the month days to apply the recurrence to.

• byyearday – If given, it must be either an integer, or a sequence of integers, meaning the year days to apply the recurrence to.

• byeaster – If given, it must be either an integer, or a sequence of integers, positive or negative. Each integer will define an offset from the Easter Sunday. Passing the offset 0 to byeaster will yield the Easter Sunday itself. This is an extension to the RFC specification.

• byweekno – If given, it must be either an integer, or a sequence of integers, meaning the week numbers to apply the recurrence to. Week numbers have the meaning described in ISO8601, that is, the first week of the year is that containing at least four days of the new year.

• byweekday – If given, it must be either an integer (0 == MO), a sequence of integers, one of the weekday constants (MO, TU, etc), or a sequence
of these constants. When given, these variables will define the weekdays where the recurrence will be applied. It's also possible to use an argument n for the weekday instances, which will mean the nth occurrence of this weekday in the period. For example, with MONTHLY, or with YEARLY and BYMONTH, using FR(+1) in byweekday will specify the first friday of the month where the recurrence happens. Notice that in the RFC documentation, this is specified as BYDAY, but was renamed to avoid the ambiguity of that keyword.

- **byhour** – If given, it must be either an integer, or a sequence of integers, meaning the hours to apply the recurrence to.
- **byminute** – If given, it must be either an integer, or a sequence of integers, meaning the minutes to apply the recurrence to.
- **bysecond** – If given, it must be either an integer, or a sequence of integers, meaning the seconds to apply the recurrence to.
- **cache** – If given, it must be a boolean value specifying to enable or disable caching of results. If you will use the same rrule instance multiple times, enabling caching will improve the performance considerably.

```python
replace(self, **kwargs)
```

Return new rrule with same attributes except for those attributes given new values by whichever keyword arguments are specified.

```python
class matplotlib.dates.relativedelta(dt1=None, dt2=None, years=0, months=0, days=0, leapdays=0, weeks=0, hours=0, minutes=0, seconds=0, microseconds=0, year=None, month=None, day=None, weekday=None, yearday=None, nlyearday=None, hour=None, minute=None, second=None, microsecond=None)
```

Bases: object

The relativedelta type is designed to be applied to an existing datetime and can replace specific components of that datetime, or represents an interval of time. It is based on the specification of the excellent work done by M.-A. Lemburg in his `mx.DateTime` extension. However, notice that this type does NOT implement the same algorithm as his work. Do NOT expect it to behave like mx.DateTime’s counterpart.

There are two different ways to build a relativedelta instance. The first one is passing it two date/datetime classes:

```python
relativedelta(datetime1, datetime2)
```

The second one is passing it any number of the following keyword arguments:

```python
relativedelta(arg1=x, arg2=y, arg3=z...)
```

year, month, day, hour, minute, second, microsecond:

Absolute information (argument is singular); adding or subtracting a relativedelta with absolute information does not perform an arithmetic operation, but rather REPLACES the corresponding value in the original datetime with the value(s) in relativedelta.

years, months, weeks, days, hours, minutes, seconds, microseconds:

(continues on next page)
Relative information, may be negative (argument is plural); adding
or subtracting a relativedelta with relative information performs
the corresponding arithmetic operation on the original datetime value
with the information in the relativedelta.

weekday:
One of the weekday instances (MO, TU, etc) available in the
relativedelta module. These instances may receive a parameter N,
specifying the Nth weekday, which could be positive or negative
(like MO(+1) or MO(-2)). Not specifying it is the same as specifying
+1. You can also use an integer, where 0=MO. This argument is always
relative e.g. if the calculated date is already Monday, using MO(1)
or MO(-1) won’t change the day. To effectively make it absolute, use
it in combination with the day argument (e.g. day=1, MO(1) for first
Monday of the month).

leapdays:
Will add given days to the date found, if year is a leap
year, and the date found is post 28 of february.

yearday, nlyeaday:
Set the yearday or the non-leap year day (jump leap days).
These are converted to day/month/leapdays information.

There are relative and absolute forms of the keyword arguments. The plural is relative,
and the singular is absolute. For each argument in the order below, the absolute form
is applied first (by setting each attribute to that value) and then the relative form (by
adding the value to the attribute).

The order of attributes considered when this relativedelta is added to a datetime is:

1. Year
2. Month
3. Day
4. Hours
5. Minutes
6. Seconds
7. Microseconds

Finally, weekday is applied, using the rule described above.

For example

```python
>>> from datetime import datetime
>>> from dateutil.relativedelta import relativedelta, MO
>>> dt = datetime(2018, 4, 9, 13, 37, 0)
>>> delta = relativedelta(hours=25, day=1, weekday=MO(1))
>>> dt + delta
datetime.datetime(2018, 4, 2, 14, 37)
```

First, the day is set to 1 (the first of the month), then 25 hours are added, to get to the
2nd day and 14th hour; finally the weekday is applied, but since the 2nd is already a
Monday there is no effect.

**normalized(self)**

Return a version of this object represented entirely using integer values for the relative attributes.

```python
>>> relativedelta(days=1.5, hours=2).normalized()
relativedelta(days=+1, hours=+14)
```

**Returns** Returns a `dateutil.relativedelta.relativedelta` object.

---

### weeks

`matplotlib.dates.seconds(s)`

*Deprecated* Return seconds as days.

**Notes**

Deprecated since version 3.1.

---

### minutes

`matplotlib.dates.minutes(m)`

*Deprecated* Return minutes as days.

**Notes**

Deprecated since version 3.1.

---

### hours

`matplotlib.dates.hours(h)`

*Deprecated* Return hours as days.

**Notes**

Deprecated since version 3.1.

---

### weeks

`matplotlib.dates.weeks(w)`

*Deprecated* Return weeks as days.

**Notes**

Deprecated since version 3.1.

---

### 17.21 matplotlib.dviread

A module for reading dvi files output by TeX. Several limitations make this not (currently) useful as a general-purpose dvi preprocessor, but it is currently used by the pdf backend for processing usetex text.

**Interface:**
with Dvi(filename, 72) as dvi:
    # iterate over pages:
    for page in dvi:
        w, h, d = page.width, page.height, page.descent
        for x, y, font, glyph, width in page.text:
            fontname = font.texname
            pointsize = font.size
            ...
        for x, y, height, width in page.boxes:
            ...

class matplotlib.dviread.Dvi(filename, dpi)
    Bases: object

A reader for a dvi (“device-independent”) file, as produced by TeX. The current implementation can only iterate through pages in order, and does not even attempt to verify the postamble.

This class can be used as a context manager to close the underlying file upon exit. Pages can be read via iteration. Here is an overly simple way to extract text without trying to detect whitespace:

```python
>>> with matplotlib.dviread.Dvi('input.dvi', 72) as dvi:
...     for page in dvi:
...         print(''.join(chr(t.glyph) for t in page.text))
```

Read the data from the file named filename and convert TeX’s internal units to units of dpi per inch. dpi only sets the units and does not limit the resolution. Use None to return TeX’s internal units.

```python
close(self)
```

Close the underlying file if it is open.

class matplotlib.dviread.DviFont(scale, tfm, texname, vf)
    Bases: object

Encapsulation of a font that a DVI file can refer to.

This class holds a font’s texname and size, supports comparison, and knows the widths of glyphs in the same units as the AFM file. There are also internal attributes (for use by dviread.py) that are not used for comparison.

The size is in Adobe points (converted from TeX points).

**Parameters**

- `scale` [float] Factor by which the font is scaled from its natural size.
- `tfm` [Tfm] TeX font metrics for this font
- `texname` [bytes] Name of the font as used internally by TeX and friends, as an ASCII bytestring. This is usually very different from any external font names, and dviread.PsfontsMap can be used to find the external name of the font.
- `vf` [Vf] A TeX “virtual font” file, or None if this font is not virtual.

**Attributes**

- `texname` [bytes]
size [float] Size of the font in Adobe points, converted from the slightly smaller TeX points.

widths [list] Widths of glyphs in glyph-space units, typically 1/1000ths of the point size.

```python
for name in Encoding(filename):
    whatever(name)
```

Parameters

filename [string or bytestring]

Attributes

encoding [list] List of character names

encoding

matplotlib.dviread.PsFont
alias of matplotlib.dviread.Font

class matplotlib.dviread.PsfontsMap
Bases: object

A psfonts.map formatted file, mapping TeX fonts to PS fonts.

Usage:

```python
>>> map = PsfontsMap(find_tex_file('pdftex.map'))
>>> entry = map['bptmbo8r']
>>> entry.texname
'bptmbo8r'
>>> entry.psnme
'b'Times-Bold'
>>> entry.encoding
'/usr/local/texlive/2008/texmf-dist/fonts/enc/dvips/base/8r.enc'
>>> entry.effects
{'slant': 0.16700000000000001}
>>> entry.filename
```
Notes

For historical reasons, TeX knows many Type-1 fonts by different names than the outside world. (For one thing, the names have to fit in eight characters.) Also, TeX’s native fonts are not Type-1 but Metafont, which is nontrivial to convert to PostScript except as a bitmap. While high-quality conversions to Type-1 format exist and are shipped with modern TeX distributions, we need to know which Type-1 fonts are the counterparts of which native fonts. For these reasons a mapping is needed from internal font names to font file names.

A texmf tree typically includes mapping files called e.g. psfonts.map, pdftex.map, or dvipdfm.map. The file psfonts.map is used by dvips, pdftex.map by pdfTeX, and dvipdfm.map by dvipdfm. psfonts.map might avoid embedding the 35 PostScript fonts (i.e., have no filename for them, as in the Times-Bold example above), while the pdf-related files perhaps only avoid the “Base 14” pdf fonts. But the user may have configured these files differently.

class matplotlib.dviread.Tfm(filename)
Bases: object
A TeX Font Metric file.
This implementation covers only the bare minimum needed by the Dvi class.

Parameters

filename [string or bytestring]

Attributes

checksum [int] Used for verifying against the dvi file.
design_size [int] Design size of the font (unknown units)
width, height, depth [dict] Dimensions of each character, need to be scaled by the factor specified in the dvi file. These are dicts because indexing may not start from 0.

checksum
depth
design_size
height
width
class matplotlib.dviread.Vf(filename)
Bases: matplotlib.dviread.Dvi
A virtual font (*.vf file) containing subroutines for dvi files.

Usage:

vf = Vf(filename)
glyph = vf[code]
glyph.text, glyph.boxes, glyph.width

Parameters

filename [string or bytestring]
Notes

The virtual font format is a derivative of dvi: http://mirrors.ctan.org/info/knuth/virtual-fonts This class reuses some of the machinery of Dvi but replaces the _read loop and dispatch mechanism.

matplotlib.dviread.find_tex_file(filename, format=None)
Find a file in the texmf tree.

Calls kpsewhich which is an interface to the kpathsea library [1]. Most existing TeX distributions on Unix-like systems use kpathsea. It is also available as part of MikTeX, a popular distribution on Windows.

If the file is not found, an empty string is returned.

Parameters

filename [string or bytestring]
format [string or bytestring] Used as the value of the --format option to kpsewhich. Could be e.g. ‘tfm’ or ‘vf’ to limit the search to that type of files.

[1]

17.22 matplotlib.figure

The figure module provides the top-level Artist, the Figure, which contains all the plot elements. The following classes are defined

SubplotParams control the default spacing of the subplots

Figure Top level container for all plot elements.

17.22.1 Classes

<table>
<thead>
<tr>
<th>AxesStack</th>
<th>Specialization of the Stack to handle all tracking of Axes in a Figure.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Figure</td>
<td>The top level container for all the plot elements.</td>
</tr>
<tr>
<td>SubplotParams</td>
<td>A class to hold the parameters for a subplot.</td>
</tr>
</tbody>
</table>

matplotlib.figure.AxesStack
class matplotlib.figure.AxesStack
Bases: matplotlib.cbook.Stack

Specialization of the Stack to handle all tracking of Axes in a Figure. This stack stores key, (ind, axes) pairs, where:

- **key** should be a hash of the args and kwargs used in generating the Axes.
• **ind** is a serial number for tracking the order in which axes were added.

The AxesStack is a callable, where `ax_stack()` returns the current axes. Alternatively the `current_key_axes()` will return the current key and associated axes.

```python
add(self, key, a)
    Add Axes a, with key key, to the stack, and return the stack.
    If key is unhashable, replace it by a unique, arbitrary object.
    If a is already on the stack, don’t add it again, but return None.
```

```python
as_list(self)
    Return a list of the Axes instances that have been added to the figure.
```

```python
bubble(self, a)
    Move the given axes, which must already exist in the stack, to the top.
```

```python
current_key_axes(self)
    Return a tuple of (key, axes) for the active axes.
    If no axes exists on the stack, then returns (None, None).
```

```python
get(self, key)
    Return the Axes instance that was added with key. If it is not present, return None.
```

```python
remove(self, a)
    Remove the axes from the stack.
```

```python
matplotlib.figure.Figure

class matplotlib.figure.Figure(figsize=None, dpi=None, facecolor=None, edgecolor=None, linewidth=0.0, frameon=None, subplotpars=None, tight_layout=None, constrained_layout=None)
```

Bases: `matplotlib.artist.Artist`

The top level container for all the plot elements.

The Figure instance supports callbacks through a `callbacks` attribute which is a `CallbackRegistry` instance. The events you can connect to are ‘dpi_changed’, and the callback will be called with `func(fig)` where fig is the `Figure` instance.

**Attributes**

- **patch** The `Rectangle` instance representing the figure background patch.

- **suppressComposite** For multiple figure images, the figure will make composite images depending on the renderer option `image_nocomposite` function. If `suppressComposite` is a boolean, this will override the renderer.

**Parameters**

- **figsize** [2-tuple of floats, default: `rcParams["figure.figsize"]` (default: [6.4, 4.8])] Figure dimension (width, height) in inches.

- **dpi** [float, default: `rcParams["figure.dpi"]` (default: 100.0)] Dots per inch.

- **facecolor** [default: `rcParams["figure.facecolor"]` (default: ‘white’)] The figure patch facecolor.
edgecolor [default: rcParams["figure.edgecolor"] (default: ‘white’)] The figure patch edge color.

linewidth [float] The linewidth of the frame (i.e. the edge linewidth of the figure patch).

frameon [bool, default: rcParams["figure.frameon"] (default: True)] If False, suppress drawing the figure background patch.

subplotpars [SubplotParams] Subplot parameters. If not given, the default subplot parameters rcParams["figure.subplot.*"] are used.

tight_layout [bool or dict, default: rcParams["figure.autolayout"] (default: False)] If False use subplotpars. If True adjust subplot parameters using tight_layout with default padding. When providing a dict containing the keys pad, w_pad, h_pad, and rect, the default tight_layout paddings will be overridden.

constrained_layout [bool] If True use constrained layout to adjust positioning of plot elements. Like tight_layout, but designed to be more flexible. See Constrained Layout Guide for examples. (Note: does not work with subplot() or subplot2grid().) Defaults to rcParams["figure.constrained_layout.use"] (default: False).

add_artist(self, artist, clip=False)
Add any Artist to the figure.

Usually artists are added to axes objects using matplotlib.axes.Axes.add_artist(), but use this method in the rare cases that adding directly to the figure is necessary.

Parameters

artist [Artist] The artist to add to the figure. If the added artist has no transform previously set, its transform will be set to figure.transFigure.

clip [bool, optional, default: False] An optional parameter clip determines whether the added artist should be clipped by the figure patch. Default is False, i.e. no clipping.

Returns

artist [The added Artist]

add_axes(self, *args, **kwargs)
Add an axes to the figure.

Call signatures:

add_axes(rect, projection=None, polar=False, **kwargs)
add_axes(ax)

Parameters

rect [sequence of float] The dimensions [left, bottom, width, height] of the new axes. All quantities are in fractions of figure width and height.

	polar [boolean, optional] If True, equivalent to projection=’polar’.
sharex, sharey [Axes, optional] Share the x or y axis with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

label [str] A label for the returned axes.

Returns

axes [Axes (or a subclass of Axes)] The returned axes class depends on the projection used. It is Axes if rectilinear projection are used and projections.polar.PolarAxes if polar projection are used.

Other Parameters

**kwargs This method also takes the keyword arguments for the returned axes class. The keyword arguments for the rectilinear axes class Axes can be found in the following table but there might also be other keyword arguments if another projection is used, see the actual axes class.

Figure.subplots
pyplot.subplots
Notes
If the figure already has an axes with key (args, kwargs) then it will simply make
that axes current and return it. This behavior is deprecated. Meanwhile, if you do
not want this behavior (i.e., you want to force the creation of a new axes), you must
use a unique set of args and kwargs. The axes label attribute has been exposed for
this purpose: if you want two axes that are otherwise identical to be added to the
figure, make sure you give them unique labels.
In rare circumstances, add_axes may be called with a single argument, a axes instance already created in the present figure but not in the figure’s list of axes.
Examples
Some simple examples:
rect = l, b, w, h
fig = plt.figure()
fig.add_axes(rect,label=label1)
fig.add_axes(rect,label=label2)
fig.add_axes(rect, frameon=False, facecolor='g')
(continues on next page)

17.22. matplotlib.figure

1567


add_axes(rect, polar=True)
ax=fig.add_axes(rect, projection='polar')
fig.delaxes(ax)
fig.add_axes(ax)

add_axobserver(self, func)
Whenever the axes state change, func(self) will be called.

add_gridspec(self, nrows, ncols, **kwargs)
Return a GridSpec that has this figure as a parent. This allows complex layout of axes in the figure.

Parameters

nrows [int] Number of rows in grid.
ncols [int] Number or columns in grid.

Returns

gridspec [GridSpec]

Other Parameters

**kwargs Keyword arguments are passed to GridSpec.

See also:

matplotlib.pyplot.subplots

Examples

Adding a subplot that spans two rows:

```python
fig = plt.figure()
gs = fig.add_gridspec(2, 2)
ax1 = fig.add_subplot(gs[0, 0])
ax2 = fig.add_subplot(gs[1, 0])
# spans two rows:
ax3 = fig.add_subplot(gs[:, 1])
```

add_subplot(self, *args, **kwargs)
Add an Axes to the figure as part of a subplot arrangement.

Call signatures:

add_subplot(nrows, ncols, index, **kwargs)
add_subplot(pos, **kwargs)
add_subplot(ax)
add_subplot()
rows and \texttt{ncols} columns. \texttt{index} starts at 1 in the upper left corner and increases to the right.

\texttt{pos} is a three digit integer, where the first digit is the number of rows, the second the number of columns, and the third the index of the subplot. i.e. \texttt{fig.add_subplot(235)} is the same as \texttt{fig.add_subplot(2, 3, 5)}. Note that all integers must be less than 10 for this form to work.

If no positional arguments are passed, defaults to (1, 1, 1).

In rare circumstances, \texttt{add_subplot} may be called with a single argument, a subplot axes instance already created in the present figure but not in the figure’s list of axes.

\textbf{projection} [{\texttt{None}, ‘aitoff’, ‘hammer’, ‘lambert’, ‘mollweide’, ‘polar’, ‘rectilinear’, \texttt{str}}, optional] The projection type of the subplot (\texttt{Axes}). \texttt{str} is the name of a custom projection, see \texttt{projections}. The default \texttt{None} results in a ‘rectilinear’ projection.

\textbf{polar} [boolean, optional] If True, equivalent to \texttt{projection=’polar’}.

\textbf{sharex, sharey} [\texttt{Axes}, optional] Share the x or y axis with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

\textbf{label} [str] A label for the returned axes.

\textbf{Returns}

\textbf{axes} [\texttt{axes.SubplotBase}, or another subclass of \texttt{Axes}] The axes of the subplot. The returned axes base class depends on the projection used. It is \texttt{Axes} if rectilinear projection are used and \texttt{projections.polar.PolarAxes} if polar projection are used. The returned axes is then a subplot subclass of the base class.

\textbf{Other Parameters}

**\textbf{kwargs}** This method also takes the keyword arguments for the returned axes base class. The keyword arguments for the rectilinear base class \texttt{Axes} can be found in the following table but there might also be other keyword arguments if another projection is used.

Notes

If the figure already has a subplot with key (args, kwargs) then it will simply make that subplot current and return it. This behavior is deprecated. Meanwhile, if you
do not want this behavior (i.e., you want to force the creation of a new subplot), you must use a unique set of args and kwargs. The axes label attribute has been exposed for this purpose: if you want two subplots that are otherwise identical to be added to the figure, make sure you give them unique labels.

Examples

```python
fig = plt.figure()
fig.add_subplot(221)

# equivalent but more general
tax1 = fig.add_subplot(2, 2, 1)

# add a subplot with no frame
ax2 = fig.add_subplot(222, frameon=False)

# add a polar subplot
fig.add_subplot(223, projection='polar')

# add a red subplot that share the x-axis with ax1
fig.add_subplot(224, sharex=ax1, facecolor='red')

# delete ax2 from the figure
fig.delaxes(ax2)

# add ax2 to the figure again
fig.add_subplot(ax2)
```

align_labels(self, axs=None)
Align the xlabels and ylabels of subplots with the same subplots row or column (respectively) if label alignment is being done automatically (i.e. the label position is not manually set).
Alignment persists for draw events after this is called.

Parameters

- **axs** [list of Axes] Optional list (or ndarray) of Axes to align the labels. Default is to align all axes on the figure.

See also:

- matplotlib.figure.Figure.align_xlabels
- matplotlib.figure.Figure.align_ylabels

align_xlabels(self, axs=None)
Align the ylabels of subplots in the same subplot column if label alignment is being done automatically (i.e. the label position is not manually set).
Alignment persists for draw events after this is called.
If a label is on the bottom, it is aligned with labels on axes that also have their label on the bottom and that have the same bottom-most subplot row. If the label is on the top, it is aligned with labels on axes with the same top-most row.

Parameters
Matplotlib, Release 3.1.3

**axs** [list of *Axes*] Optional list of (or ndarray) *Axes* to align the xlabels. Default is to align all axes on the figure.

**See also:**

`matplotlib.figure.Figure.align_ylabels`

`matplotlib.figure.Figure.align_labels`

**Notes**

This assumes that *axs* are from the same *GridSpec*, so that their *SubplotSpec* positions correspond to figure positions.

**Examples**

Example with rotated xtick labels:

```python
fig, axs = plt.subplots(1, 2)
for tick in axs[0].get_xticklabels():
    tick.set_rotation(55)
axs[0].set_xlabel('XLabel 0')
axs[1].set_xlabel('XLabel 1')
fig.align_xlabels()
```

**align_ylabels**

Align the ylabels of subplots in the same subplot column if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

If a label is on the left, it is aligned with labels on axes that also have their label on the left and that have the same left-most subplot column. If the label is on the right, it is aligned with labels on axes with the same right-most column.

**Parameters**

`axs` [list of *Axes*] Optional list (or ndarray) of *Axes* to align the ylabels. Default is to align all axes on the figure.

**See also:**

`matplotlib.figure.Figure.align_xlabels`

`matplotlib.figure.Figure.align_labels`

**Notes**

This assumes that *axs* are from the same *GridSpec*, so that their *SubplotSpec* positions correspond to figure positions.
Examples

Example with large yticks labels:

```python
fig, axs = plt.subplots(2, 1)
axs[0].plot(np.arange(0, 1000, 50))
axs[0].set_ylabel('YLabel 0')
axs[1].set_ylabel('YLabel 1')
fig.align_ylabels()
```

`autofmt_xdate(self, bottom=0.2, rotation=30, ha='right', which=None)`

Date ticklabels often overlap, so it is useful to rotate them and right align them. Also, a common use case is a number of subplots with shared x axes where the x-axis is date data. The ticklabels are often long, and it helps to rotate them on the bottom subplot and turn them off on other subplots, as well as turn off xlabels.

**Parameters**

- `bottom` [scalar] The bottom of the subplots for `subplots_adjust()`.
- `rotation` [angle in degrees] The rotation of the xtick labels.
- `ha` [string] The horizontal alignment of the xticklabels.
- `which` [{None, 'major', 'minor', 'both'}] Selects which ticklabels to rotate. Default is None which works the same as major.

**axes**

List of axes in the Figure. You can access the axes in the Figure through this list. Do not modify the list itself. Instead, use `add_axes`, `subplot` or `delaxes` to add or remove an axes.

`clear(self, keep_observers=False)`

Clear the figure – synonym for `clf()`.

`clf(self, keep_observers=False)`

Clear the figure.

Set `keep_observers` to True if, for example, a gui widget is tracking the axes in the figure.

`colorbar(self, mappable, cax=None, ax=None, use_gridspec=True, **kw)`

Create a colorbar for a ScalarMappable instance, `mappable`.

Documentation for the `pyplot` thin wrapper:

Add a colorbar to a plot.

Function signatures for the `pyplot` interface; all but the first are also method signatures for the `colorbar()` method:

```python
colorbar(**kwargs)
colorbar(mappable, **kwargs)
colorbar(mappable, cax=cax, **kwargs)
colorbar(mappable, ax=ax, **kwargs)
```

**Parameters**

- `mappable` The `matplotlib.cm.ScalarMappable` (i.e., `Image`, `ContourSet`, etc.) described by this colorbar. This argument is mandatory for the `Figure`.  

17.22. `matplotlib.figure`
colorbar method but optional for the pyplot.colorbar function, which
sets the default to the current image.

Note that one can create a ScalarMappable “on-the-fly” to generate col-
orbars not attached to a previously drawn artist, e.g.

```python
fig.colorbar(cm.ScalarMappable(norm=norm, cmap=cmap), ax=ax)
```

cax [Axes object, optional] Axes into which the colorbar will be drawn.

ax [Axes, list of Axes, optional] Parent axes from which space for a new
colorbar axes will be stolen. If a list of axes is given they will all be
resized to make room for the colorbar axes.

use_gridspec [bool, optional] If cax is None, a new cax is created as an
instance of Axes. If ax is an instance of Subplot and use_gridspec is True,
cax is created as an instance of Subplot using the gridspec module.

Returns

colorbar [Colorbar] See also its base class, ColorbarBase. Use set_label
to label the colorbar.

Notes

Additional keyword arguments are of two kinds:

axes properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>orientation</td>
<td>vertical or horizontal</td>
</tr>
<tr>
<td>fraction</td>
<td>0.15; fraction of original axes to use for colorbar</td>
</tr>
<tr>
<td>pad</td>
<td>0.05 if vertical, 0.15 if horizontal; fraction of original axes</td>
</tr>
<tr>
<td>shrink</td>
<td>1.0; fraction by which to multiply the size of the colorbar</td>
</tr>
<tr>
<td>aspect</td>
<td>20; ratio of long to short dimensions</td>
</tr>
<tr>
<td>anchor</td>
<td>(0.0, 0.5) if vertical; (0.5, 1.0) if horizontal; the anchor point of the</td>
</tr>
<tr>
<td></td>
<td>colorbar axes</td>
</tr>
<tr>
<td>parent</td>
<td>(1.0, 0.5) if vertical; (0.5, 0.0) if horizontal; the anchor point of the</td>
</tr>
<tr>
<td></td>
<td>colorbar parent axes. If False, the parent axes’ anchor will be unchanged</td>
</tr>
</tbody>
</table>

colorbar properties:
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>extend</strong></td>
<td>If not ‘neither’, make pointed end(s) for out-of-range values. These are set for a given colormap using the colormap set_under and set_over methods.</td>
</tr>
<tr>
<td><strong>extendfrac</strong></td>
<td>If set to None, both the minimum and maximum triangular colorbar extensions with have a length of 5% of the interior colorbar length (this is the default setting). If set to ‘auto’, makes the triangular colorbar extensions the same lengths as the interior boxes (when spacing is set to ‘uniform’) or the same lengths as the respective adjacent interior boxes (when spacing is set to ‘proportional’). If a scalar, indicates the length of both the minimum and maximum triangular colorbar extensions as a fraction of the interior colorbar length. A two-element sequence of fractions may also be given, indicating the lengths of the minimum and maximum colorbar extensions respectively as a fraction of the interior colorbar length.</td>
</tr>
<tr>
<td><strong>extendrect</strong></td>
<td>If False the minimum and maximum colorbar extensions will be triangular (the default). If True the extensions will be rectangular.</td>
</tr>
<tr>
<td><strong>spacing</strong></td>
<td>Uniform spacing gives each discrete color the same space; proportional makes the space proportional to the data interval.</td>
</tr>
<tr>
<td><strong>ticks</strong></td>
<td>If None, ticks are determined automatically from the input.</td>
</tr>
<tr>
<td><strong>format</strong></td>
<td>If None, the ScalarFormatter is used. If a format string is given, e.g., ‘%.3f’, that is used. An alternative Formatter object may be given instead.</td>
</tr>
<tr>
<td><strong>drawedges</strong></td>
<td>Whether to draw lines at color boundaries.</td>
</tr>
</tbody>
</table>

The following will probably be useful only in the context of indexed colors (that is, when the mappable has norm=NoNorm()), or other unusual circumstances.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>boundaries</strong></td>
<td>None or a sequence</td>
</tr>
<tr>
<td><strong>values</strong></td>
<td>None or a sequence which must be of length 1 less than the sequence of boundaries. For each region delimited by adjacent entries in boundaries, the color mapped to the corresponding value in values will be used.</td>
</tr>
</tbody>
</table>

If mappable is a ContourSet, its extend kwarg is included automatically.

The shrink kwarg provides a simple way to scale the colorbar with respect to the axes. Note that if cax is specified, it determines the size of the colorbar and shrink and aspect kwargs are ignored.

For more precise control, you can manually specify the positions of the axes objects.
in which the mappable and the colorbar are drawn. In this case, do not use any of
the axes properties kwargs.

It is known that some vector graphics viewers (svg and pdf) renders white gaps
between segments of the colorbar. This is due to bugs in the viewers, not Matplotlib.
As a workaround, the colorbar can be rendered with overlapping segments:

```python
cbar = colorbar()
cbar.solids.set_edgecolor("face")
draw()
```

However this has negative consequences in other circumstances, e.g. with semi-
transparent images (alpha < 1) and colorbar extensions; therefore, this workaround
is not used by default (see issue #1188).

`contains(self, mouseevent)`
Test whether the mouse event occurred on the figure.

**Returns**

`bool, {}`

`delaxes(self, ax)`
Remove the `Axes` `ax` from the figure and update the current axes.

`dpi` The resolution in dots per inch.

`draw(self, renderer)`
Render the figure using `matplotlib.backend_bases.RendererBase` instance `renderer`.

`draw_artist(self, a)`
Draw `matplotlib.artist.Artist` instance `a` only. This is available only after the figure
is drawn.

`execute_constrained_layout(self, renderer=None)`
Use `layoutbox` to determine pos positions within axes.

See also `set_constrained_layout_pads`.

`figimage(self, X, xo=0, yo=0, alpha=None, norm=None, cmap=None, vmin=None,
vmax=None, origin=None, resize=False, **kwargs)`
Add a non-resampled image to the figure.

The image is attached to the lower or upper left corner depending on `origin`.

**Parameters**

`X` The image data. This is an array of one of the following shapes:
- MxN: luminance (grayscale) values
- MxNx3: RGB values
- MxNx4: RGBA values

`xo, yo` [int] The x/y image offset in pixels.

`alpha` [None or float] The alpha blending value.

`norm` [`matplotlib.colors.Normalize`] A `Normalize` instance to map the lu-
minance to the interval [0, 1].

`cmap` [str or `matplotlib.colors.Colormap`] The colormap to use. Default:
`rcParams["image.cmap"]` (default: ‘viridis’).
**vmin, vmax** [scalar] If *norm* is not given, these values set the data limits for the colormap.

**origin** [{‘upper’, ‘lower’}] Indicates where the [0, 0] index of the array is in the upper left or lower left corner of the axes. Defaults to *rcParams["image.origin"]* (default: ‘upper’).

**resize** [bool] If True, resize the figure to match the given image size.

**Returns**

`matplotlib.image.FigureImage`

**Other Parameters**

****kwargs** Additional kwargs are *Artist* kwargs passed on to *FigureImage*.

**Notes**

`figimage` complements the axes image (*imshow*) which will be resampled to fit the current axes. If you want a resampled image to fill the entire figure, you can define an *Axes* with extent [0,0,1,1].

**Examples:**

```python
f = plt.figure()
nx = int(f.get_figwidth() * f.dpi)
ny = int(f.get_figheight() * f.dpi)
data = np.random.random((ny, nx))
f.figimage(data)
plt.show()
```

**frameon**

Return the figure’s background patch visibility, i.e. whether the figure background will be drawn. Equivalent to *Figure.patch.get_visible()*.

**gca(self, **kwargs)**

Get the current axes, creating one if necessary.

The following kwargs are supported for ensuring the returned axes adheres to the given projection etc., and for axes creation if the active axes does not exist:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>adjustable</td>
<td>{‘box’, ‘datalim’}</td>
</tr>
<tr>
<td>agg_filter</td>

**get_axes(self)**

Return a list of axes in the Figure. You can access and modify the axes in the Figure through this list.

Do not modify the list itself. Instead, use add_axes, subplot or delaxes to add or remove an axes.

Note: This is equivalent to the property axes.

**get_children(self)**

Get a list of artists contained in the figure.

**get_constrained_layout(self)**

1578 Chapter 17. Modules
Return a boolean: True means constrained layout is being used.

See *Constrained Layout Guide*.

`get_constrained_layout_pads(self, relative=False)`
Get padding for constrained layout.

Returns a list of w_pad, h_pad in inches and wspace and hspace as fractions of the subplot.

See *Constrained Layout Guide*.

**Parameters**

- `relative` [boolean] If True, then convert from inches to figure relative.

`get_default_bbox_extra_artists(self)`

`get_dpi(self)`
Return the resolution in dots per inch as a float.

`get_edgecolor(self)`
Get the edge color of the Figure rectangle.

`get_facecolor(self)`
Get the face color of the Figure rectangle.

`get_figheight(self)`
Return the figure height as a float.

`get_figwidth(self)`
Return the figure width as a float.

`get_frameon(self)`
Return the figure’s background patch visibility, i.e. whether the figure background will be drawn. Equivalent to `Figure.patch.get_visible()`.

`get_size_inches(self)`
Returns the current size of the figure in inches.

**Returns**

- `size` [ndarray] The size (width, height) of the figure in inches.

See also:

`matplotlib.Figure.set_size_inches`

`get_tight_layout(self)`
Return whether `tight_layout` is called when drawing.

`get_tightbbox(self, renderer, bbox_extra_artists=None)`
Return a (tight) bounding box of the figure in inches.

Artists that have `artist.set_in_layout(False)` are not included in the bbox.

**Parameters**

- `renderer` [RendererBase instance] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

- `bbox_extra_artists` [list of Artist or None] List of artists to include in the tight bounding box. If None (default), then all artist children of each axes are included in the tight bounding box.
Returns

`bbox` [BboxBase] containing the bounding box (in figure inches).

`get_window_extent` (self, *args, **kwargs)
Return the figure bounding box in display space. Arguments are ignored.

`ginput` (self, n=1, timeout=30, show_clicks=True, mouse_add=1, mouse_pop=3, mouse_stop=2)
Blocking call to interact with a figure.
Wait until the user clicks n times on the figure, and return the coordinates of each click in a list.
There are three possible interactions:

- Add a point.
- Remove the most recently added point.
- Stop the interaction and return the points added so far.

The actions are assigned to mouse buttons via the arguments `mouse_add`, `mouse_pop` and `mouse_stop`. Mouse buttons are defined by the numbers:

- 1: left mouse button
- 2: middle mouse button
- 3: right mouse button
- None: no mouse button

Parameters

- `n` [int, optional, default: 1] Number of mouse clicks to accumulate. If negative, accumulate clicks until the input is terminated manually.
- `timeout` [scalar, optional, default: 30] Number of seconds to wait before timing out. If zero or negative will never timeout.
- `show_clicks` [bool, optional, default: True] If True, show a red cross at the location of each click.
- `mouse_add` [{1, 2, 3, None}, optional, default: 1 (left click)] Mouse button used to add points.
- `mouse_pop` [{1, 2, 3, None}, optional, default: 3 (right click)] Mouse button used to remove the most recently added point.
- `mouse_stop` [{1, 2, 3, None}, optional, default: 2 (middle click)] Mouse button used to stop input.

Returns

- `points` [list of tuples] A list of the clicked (x, y) coordinates.

Notes

The keyboard can also be used to select points in case your mouse does not have one or more of the buttons. The delete and backspace keys act like right clicking (i.e., remove last point), the enter key terminates input and any other key (not already used by the window manager) selects a point.
init_layoutbox(self)
    Initialize the layoutbox for use in constrained_layout.

legend(self, *args, **kwargs)
    Place a legend on the figure.

    To make a legend from existing artists on every axes:
    legend()

    To make a legend for a list of lines and labels:
    legend(
        (line1, line2, line3),
        ('label1', 'label2', 'label3'),
        loc='upper right')

    These can also be specified by keyword:
    legend(
        handles=(line1, line2, line3),
        labels=('label1', 'label2', 'label3'),
        loc='upper right')

Parameters
    handles [sequence of Artist, optional] A list of Artists (lines, patches) to
    be added to the legend. Use this together with labels, if you need full
    control on what is shown in the legend and the automatic mechanism
    described above is not sufficient.

    labels [sequence of strings, optional] A list of labels to show next to the
    artists. Use this together with handles, if you need full control on what
    is shown in the legend and the automatic mechanism described above is not sufficient.

Returns
    matplotlib.legend.Legend instance

Other Parameters
    loc [str or pair of floats, default: rcParams["legend.loc"] (default: 'best')
    ('best' for axes, 'upper right' for figures)] The location of the legend.

    The strings 'upper left', 'upper right', 'lower left', 'lower right'
    place the legend at the corresponding corner of the axes/figure.

    The strings 'upper center', 'lower center', 'center left', 'center right'
    place the legend at the center of the corresponding edge of the
    axes/figure.

    The string 'center' places the legend at the center of the axes/figure.

    The string 'best' places the legend at the location, among the nine
    locations defined so far, with the minimum overlap with other drawn
    artists. This option can be quite slow for plots with large amounts of
    data; your plotting speed may benefit from providing a specific location.
The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case `bbox_to_anchor` will be ignored).

For back-compatibility, 'center right' (but no other location) can also be spelled 'right', and each "string" locations can also be given as a numeric value:

<table>
<thead>
<tr>
<th>Location String</th>
<th>Location Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>'best'</td>
<td>0</td>
</tr>
<tr>
<td>'upper right'</td>
<td>1</td>

<tr>
<td>'lower center'</td>
<td>8</td>
</tr>
<tr>
<td>'upper center'</td>
<td>9</td>
</tr>
<tr>
<td>'center'</td>
<td>10</td>
</tr>
</tbody>
</table>

`bbox_to_anchor` ([`BboxBase`, 2-tuple, or 4-tuple of floats]) Box that is used to position the legend in conjunction with `loc`. Defaults to `axes.bbox` (if called as a method to `Axes.legend`) or `figure.bbox` (if `Figure.legend`). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by `bbox_transform`, with the default transform `Axes` or `Figure` coordinates, depending on which `legend` is called.

If a 4-tuple or `BboxBase` is given, then it specifies the bbox `(x, y, width, height)` that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0.5, 0.5)
```

A 2-tuple `(x, y)` places the corner of the legend specified by `loc` at `x, y`. For example, to put the legend’s upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

`ncol` [integer] The number of columns that the legend has. Default is 1.

`prop` [None or `matplotlib.font_manager.FontProperties` or dict] The font properties of the legend. If None (default), the current `matplotlib.rcParams` will be used.

`fontsize` [int or float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] Controls the font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if `prop` is not specified.

`numpoints` [None or int] The number of marker points in the legend when creating a legend entry for a `Line2D` (line). Default is None, which will take the value from `rcParams["legend.numpoints"]` (default: 1).
**scatterpoints** [None or int] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot). Default is None, which will take the value from `rcParams["legend.scatterpoints"]` (default: 1).

**scatteryoffsets** [iterable of floats] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5]. Default is [0.375, 0.5, 0.3125].

**markerscale** [None or int or float] The relative size of legend markers compared with the originally drawn ones. Default is None, which will take the value from `rcParams["legend.markerscale"]` (default: 1.0).

**markerfirst** [bool] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label. Default is *True*.

**frameon** [None or bool] Control whether the legend should be drawn on a patch (frame). Default is None, which will take the value from `rcParams["legend.frameon"]` (default: True).

**fancybox** [None or bool] Control whether round edges should be enabled around the *FancyBboxPatch* which makes up the legend’s background. Default is None, which will take the value from `rcParams["legend.fancybox"]` (default: True).

**shadow** [None or bool] Control whether to draw a shadow behind the legend. Default is None, which will take the value from `rcParams["legend.shadow"]` (default: False).

**framealpha** [None or float] Control the alpha transparency of the legend’s background. Default is None, which will take the value from `rcParams["legend.framealpha"]` (default: 0.8). If shadow is activated and `framealpha` is None, the default value is ignored.

**facecolor** [None or “inherit” or a color spec] Control the legend’s background color. Default is None, which will take the value from `rcParams["legend.facecolor"]` (default: ‘inherit’). If “inherit”, it will take `rcParams["axes.facecolor"]` (default: ‘white’).

**edgecolor** [None or “inherit” or a color spec] Control the legend’s background patch edge color. Default is None, which will take the value from `rcParams["legend.edgecolor"]` (default: ‘0.8’) If “inherit”, it will take `rcParams["axes.edgecolor"]` (default: ‘black’).

**mode** ["expand", None] If *mode* is set to "expand" the legend will be horizontally expanded to fill the axes area (or *bbox_to_anchor* if defines the legend’s size).

**bbox_transform** [None or *matplotlib.transforms.Transform*] The transform for the bounding box (*bbox_to_anchor*). For a value of None (default) the Axes’ *transAxes* transform will be used.

**title** [str or None] The legend’s title. Default is no title (None).

**title_fontsize**: str or None The fontsize of the legend’s title. Default is the default fontsize.

**borderpad** [float or None] The fractional whitespace inside the legend border. Measured in font-size units. Default is None, which will take the
value from `rcParams["legend.borderpad"]` (default: 0.4).

**labelspacing** [float or None] The vertical space between the legend entries. Measured in font-size units. Default is None, which will take the value from `rcParams["legend.labelspacing"]` (default: 0.5).

**handlelength** [float or None] The length of the legend handles. Measured in font-size units. Default is None, which will take the value from `rcParams["legend.handlelength"]` (default: 2.0).

**handletextpad** [float or None] The pad between the legend handle and text. Measured in font-size units. Default is None, which will take the value from `rcParams["legend.handletextpad"]` (default: 0.8).

**borderaxespad** [float or None] The pad between the axes and legend border. Measured in font-size units. Default is None, which will take the value from `rcParams["legend.borderaxespad"]` (default: 0.5).

**columnspacing** [float or None] The spacing between columns. Measured in font-size units. Default is None, which will take the value from `rcParams["legend.columnspacing"]` (default: 2.0).

**handler_map** [dict or None] The custom dictionary mapping instances or types to a legend handler. This `handler_map` updates the default handler map found at `matplotlib.legend.Legend.get_legend_handler_map()`.

**Notes**

Not all kinds of artist are supported by the legend command. See Legend guide for details.

```python
savefig(self, fname, *, transparent=None, **kwargs)
```

Save the current figure.

Call signature:

```python
savefig(fname, dpi=None, facecolor='w', edgecolor='w',
        orientation='portrait', papertype=None, format=None,
        transparent=False, bbox_inches=None, pad_inches=0.1,
        frameon=None, metadata=None)
```

The output formats available depend on the backend being used.

**Parameters**

- **fname** [str or PathLike or file-like object] A path, or a Python file-like object, or possibly some backend-dependent object such as `matplotlib.backends.backend_pdf.PdfPages`.

  If `format` is not set, then the output format is inferred from the extension of `fname`, if any, and from `rcParams["savefig.format"]` (default: 'png') otherwise. If `format` is set, it determines the output format.

  Hence, if `fname` is not a path or has no extension, remember to specify `format` to ensure that the correct backend is used.

**Other Parameters**
**dpi** [None | scalar > 0 | 'figure'] The resolution in dots per inch. If None, defaults to `rcParams['savefig.dpi']` (default: ‘figure’). If ‘figure’, uses the figure’s dpi value.

**quality** [None | 1 <= scalar <= 100] The image quality, on a scale from 1 (worst) to 95 (best). Applicable only if *format* is jpg or jpeg, ignored otherwise. If None, defaults to `rcParams['savefig.jpeg_quality']` (default: 95) (95 by default). Values above 95 should be avoided; 100 completely disables the JPEG quantization stage.

**optimize** [bool] If True, indicates that the JPEG encoder should make an extra pass over the image in order to select optimal encoder settings. Applicable only if *format* is jpg or jpeg, ignored otherwise. Is False by default.

**progressive** [bool] If True, indicates that this image should be stored as a progressive JPEG file. Applicable only if *format* is jpg or jpeg, ignored otherwise. Is False by default.

**facecolor** [color spec or None, optional] The facecolor of the figure; if None, defaults to `rcParams['savefig.facecolor']` (default: 'white').

**edgecolor** [color spec or None, optional] The edgecolor of the figure; if None, defaults to `rcParams['savefig.edgecolor']` (default: 'white')

**orientation** ['landscape', 'portrait'] Currently only supported by the postscript backend.

**papertype** [str] One of 'letter', 'legal', 'executive', 'ledger', 'a0' through 'a10', 'b0' through 'b10'. Only supported for postscript output.

**format** [str] The file format, e.g. ‘png’, ‘pdf’, ‘svg’, ... The behavior when this is unset is documented under *fname*.

**transparent** [bool] If True, the axes patches will all be transparent; the figure patch will also be transparent unless facecolor and/or edgecolor are specified via kwargs. This is useful, for example, for displaying a plot on top of a colored background on a web page. The transparency of these patches will be restored to their original values upon exit of this function.

**bbox_inches** [str or Bbox, optional] Bbox in inches. Only the given portion of the figure is saved. If ‘tight’, try to figure out the tight bbox of the figure. If None, use savefig.bbox

**pad_inches** [scalar, optional] Amount of padding around the figure when *bbox_inches* is ‘tight’. If None, use savefig.pad_inches

**bbox_extra_artists** [list of Artist, optional] A list of extra artists that will be considered when the tight bbox is calculated.

**metadata** [dict, optional] Key/value pairs to store in the image metadata. The supported keys and defaults depend on the image format and backend:

- ‘png’ with Agg backend: See the parameter metadata of `print_png`.
- ‘pdf’ with pdf backend: See the parameter metadata of `PdfPages`.
- ‘eps’ and ‘ps’ with PS backend: Only ‘Creator’ is supported.
**pil_kwargs** [dict, optional] Additional keyword arguments that are passed to PIL.Image.save when saving the figure. Only applicable for formats that are saved using Pillow, i.e. JPEG, TIFF, and (if the keyword is set to a non-None value) PNG.

```python
sca(self, a)
    Set the current axes to be a and return a.
```

```python
set_canvas(self, canvas)
    Set the canvas that contains the figure
```

**Parameters**

canvas [FigureCanvas]

```python
set_constrained_layout(self, constrained)
    Set whether constrained_layout is used upon drawing. If None, the rc-Params['figure.constrained_layout.use'] value will be used.
    
    When providing a dict containing the keys w_pad, h_pad the default constrained_layout paddings will be overridden. These pads are in inches and default to 3.0/72.0. w_pad is the width padding and h_pad is the height padding.
    
    See [Constrained Layout Guide](#).
```

**Parameters**

constrained [bool or dict or None]

```python
set_constrained_layout_pads(self, **kwargs)
    Set padding for constrained_layout. Note the kwargs can be passed as a dictionary
    fig.set_constrained_layout(**paddict).
    
    See [Constrained Layout Guide](#).
```

**Parameters**

w_pad [scalar] Width padding in inches. This is the pad around axes and is meant to make sure there is enough room for fonts to look good. Defaults to 3 pts = 0.04167 inches

h_pad [scalar] Height padding in inches. Defaults to 3 pts.

wspace [scalar] Width padding between subplots, expressed as a fraction of the subplot width. The total padding ends up being w_pad + wspace.

hspace [scalar] Height padding between subplots, expressed as a fraction of the subplot width. The total padding ends up being h_pad + hspace.

```python
set_dpi(self, val)
    Set the resolution of the figure in dots-per-inch.
```

**Parameters**

val [float]

```python
set_edgecolor(self, color)
    Set the edge color of the Figure rectangle.
```

**Parameters**

color [color]
set_facecolor(self, color)
    Set the face color of the Figure rectangle.

    **Parameters**
    
    color [color]

set_figheight(self, val, forward=True)
    Set the height of the figure in inches.

    **Parameters**
    
    val [float]
    forward [bool]

set_figwidth(self, val, forward=True)
    Set the width of the figure in inches.

    **Parameters**
    
    val [float]
    forward [bool]

set_frameon(self, b)
    Set the figure’s background patch visibility, i.e. whether the figure background will be drawn. Equivalent to Figure.patch.set_visible().

    **Parameters**
    
    b [bool]

set_size_inches(self, w, h=None, forward=True)
    Set the figure size in inches.

    Call signatures:

    ```
    fig.set_size_inches(w, h)  # OR
    fig.set_size_inches((w, h))
    ```

    optional kwarg `forward=True` will cause the canvas size to be automatically updated; e.g., you can resize the figure window from the shell

    ACCEPTS: a (w, h) tuple with w, h in inches

    **See also:**

    matplotlib.Figure.get_size_inches

set_tight_layout(self, tight)
    Set whether and how `tight_layout` is called when drawing.

    **Parameters**

    tight [bool or dict with keys "pad", "w_pad", "h_pad", "rect" or None]
    If a bool, sets whether to call `tight_layout` upon drawing. If None, use the `figure.autolayout` rcparam instead. If a dict, pass it as kwargs to `tight_layout`, overriding the default paddings.

show(self, warn=True)
    If using a GUI backend with pyplot, display the figure window.

    If the figure was not created using `figure()`, it will lack a `FigureManagerBase`, and will raise an AttributeError.
**Warning:** This does not manage an GUI event loop. Consequently, the figure may only be shown briefly or not shown at all if you or your environment are not managing an event loop.

Proper use cases for `Figure.show` include running this from a GUI application or an IPython shell.

If you’re running a pure python shell or executing a non-GUI python script, you should use `matplotlib.pyplot.show` instead, which takes care of managing the event loop for you.

### Parameters

**warn** [bool] If True and we are not running headless (i.e. on Linux with an unset DISPLAY), issue warning when called on a non-GUI backend.

```python
subplots(self, nrows=1, ncols=1, sharex=False, sharey=False, squeeze=True, subplot_kw=None, gridspec_kw=None)
```

Add a set of subplots to this figure.

This utility wrapper makes it convenient to create common layouts of subplots in a single call.

### Parameters

**nrows, ncols** [int, optional, default: 1] Number of rows/columns of the subplot grid.

**sharex, sharey** [bool or {'none', 'all', 'row', 'col'}, default: False] Controls sharing of properties among x (sharex) or y (sharey) axes:

- True or ‘all’: x- or y-axis will be shared among all subplots.
- False or ‘none’: each subplot x- or y-axis will be independent.
- ‘row’: each subplot row will share an x- or y-axis.
- ‘col’: each subplot column will share an x- or y-axis.

When subplots have a shared x-axis along a column, only the x tick labels of the bottom subplot are created. Similarly, when subplots have a shared y-axis along a row, only the y tick labels of the first column subplot are created. To later turn other subplots’ ticklabels on, use `tick_params`.

**squeeze** [bool, optional, default: True]

- If True, extra dimensions are squeezed out from the returned array of Axes:
  - if only one subplot is constructed (nrows=ncols=1), the resulting single Axes object is returned as a scalar.
  - for Nx1 or 1xM subplots, the returned object is a 1D numpy object array of Axes objects.
  - for NxM, subplots with N>1 and M>1 are returned as a 2D array.
- If False, no squeezing at all is done: the returned Axes object is always a 2D array containing Axes instances, even if it ends up being 1x1.
**subplot_kw** [dict, optional] Dict with keywords passed to the `add_subplot()` call used to create each subplot.

**gridspec_kw** [dict, optional] Dict with keywords passed to the `GridSpec` constructor used to create the grid the subplots are placed on.

**Returns**

**ax** [Axes object or array of Axes objects.] `ax` can be either a single `Axes` object or an array of Axes objects if more than one subplot was created. The dimensions of the resulting array can be controlled with the `squeeze` keyword, see above.

**Examples**

```python
# First create some toy data:
x = np.linspace(0, 2*np.pi, 400)
y = np.sin(x**2)

# Create a figure
plt.figure()

# Creates a subplot
ax = fig.subplots()
ax.plot(x, y)
ax.set_title('Simple plot')

# Creates two subplots and unpacks the output array immediately
ax1, ax2 = fig.subplots(1, 2, sharey=True)
ax1.plot(x, y)
ax1.set_title('Sharing Y axis')
ax2.scatter(x, y)

# Creates four polar axes, and accesses them through the returned array
axes = fig.subplots(2, 2, subplot_kw=dict(polar=True))
axes[0, 0].plot(x, y)
axes[1, 1].scatter(x, y)

# Share a X axis with each column of subplots
fig.subplots(2, 2, sharex='col')

# Share a Y axis with each row of subplots
fig.subplots(2, 2, sharey='row')

# Share both X and Y axes with all subplots
fig.subplots(2, 2, sharex='all', sharey='all')

# Note that this is the same as
fig.subplots(2, 2, sharex=True, sharey=True)
```

**subplots_adjust**

```python
subplots_adjust(self, left=None, bottom=None, right=None, top=None, wspace=None, hspace=None)
```

Update the `SubplotParams` with `kwargs` (defaulting to `rc` when `None`) and update the
subplot locations.

`suptitle(self, t, **kwargs)`
Add a centered title to the figure.

**Parameters**

- `t` [str] The title text.
- `x` [float, default 0.5] The x location of the text in figure coordinates.
- `y` [float, default 0.98] The y location of the text in figure coordinates.
- `horizontalalignment, ha` [{'center', 'left', right'}, default: 'center']
  The horizontal alignment of the text relative to (x, y).
- `verticalalignment, va` [{'top', 'center', 'bottom', 'baseline'}, default: 'top']
  The vertical alignment of the text relative to (x, y).
- `fontsize, size` [default: `rcParams["figure.titlesize"]` (default: 'large')] The font size of the text. See `Text.set_size` for possible values.
- `fontweight, weight` [default: `rcParams["figure.titleweight"]` (default: 'normal')] The font weight of the text. See `Text.set_weight` for possible values.

**Returns**

- `text` The `Text` instance of the title.

**Other Parameters**

- `fontproperties` [None or dict, optional] A dict of font properties. If `fontproperties` is given the default values for font size and weight are taken from the FontProperties defaults. `rcParams["figure.titlesize"]` (default: 'large') and `rcParams["figure.titleweight"]` (default: 'normal') are ignored in this case.

- `**kwargs` Additional kwargs are `matplotlib.text.Text` properties.

**Examples**

```python
>>> fig.suptitle('This is the figure title', fontsize=12)
```

`suptitle` function in Matplotlib is used to add a centered title to a figure. It takes the following parameters:

- `t`: The title text.
- `x`: The x location of the text in figure coordinates (default 0.5).
- `y`: The y location of the text in figure coordinates (default 0.98).
- `horizontalalignment`: The horizontal alignment of the text relative to (x, y) (default 'center').
- `verticalalignment`: The vertical alignment of the text relative to (x, y) (default 'top').
- `fontsize`: The font size of the text (default: `rcParams["figure.titlesize"]`).
- `fontweight`: The font weight of the text (default: `rcParams["figure.titleweight"]`).

The function returns a `Text` instance of the title. Additional parameters allow for further customization of the title, such as specifying font properties through a dictionary. Example usage demonstrates adding a title to a figure. The function is part of the `matplotlib` library, which is used for creating visualizations in Python. The examples include using the `suptitle` function to add a centered title to a figure, with various parameters to control the alignment, size, and weight of the title text.
**withdash** [boolean, optional, default: False] Creates a `TextWithDash` instance instead of a `Text` instance.

**Returns**

- **text** [Text]

**Other Parameters**

- **kwargs** [Text properties] Other miscellaneous text parameters.

Axes.text
pyplot.text
tight_layout(self, renderer=None, pad=1.08, h_pad=None, w_pad=None, rect=None)
Automatically adjust subplot parameters to give specified padding.
To exclude an artist on the axes from the bounding box calculation that determines the subplot parameters (i.e. legend, or annotation), then set a.set_in_layout(False) for that artist.

Parameters

renderer [subclass of RendererBase, optional] Defaults to the renderer for the figure.
pad [float, optional] Padding between the figure edge and the edges of subplots, as a fraction of the font size.
h_pad, w_pad [float, optional] Padding (height/width) between edges of adjacent subplots, as a fraction of the font size. Defaults to pad.
rect [tuple (left, bottom, right, top), optional] A rectangle (left, bottom, right, top) in the normalized figure coordinate that the whole subplots area (including labels) will fit into. Default is (0, 0, 1, 1).

See also:

Figure.set_tight_layout
pyplot.tight_layout

waitforbuttonpress(self, timeout=-1)
Blocking call to interact with the figure.
This will return True is a key was pressed, False if a mouse button was pressed and None if timeout was reached without either being pressed.
If timeout is negative, does not timeout.

Examples using matplotlib.figure.Figure

• sphx_glr_gallery_user_interfaces_embedding_in_gtk3_panzoom_sgskip.py

matplotlib.figure.SubplotParams

class matplotlib.figure.SubplotParams(left=None, bottom=None, right=None, top=None, wspace=None, hspace=None)

Bases: object

A class to hold the parameters for a subplot.

All dimensions are fractions of the figure width or height. Defaults are given by 
rcParams["figure.subplot.[name]"].

Parameters

  - left [float] The left side of the subplots of the figure.
  - right [float] The right side of the subplots of the figure.
  - bottom [float] The bottom of the subplots of the figure.
  - top [float] The top of the subplots of the figure.
  - wspace [float] The amount of width reserved for space between subplots, expressed as a fraction of the average axis width.
  - hspace [float] The amount of height reserved for space between subplots, expressed as a fraction of the average axis height.

update(self, left=None, bottom=None, right=None, top=None, wspace=None, hspace=None)

Update the dimensions of the passed parameters. None means unchanged.

Examples using matplotlib.figure.SubplotParams

  - sphx_glr_gallery_pyplots_auto_subplots_adjust.py

17.22.2 Functions

figaspect

Calculate the width and height for a figure with a specified aspect ratio.
matplotlib.figure.figaspect

matplotlib.figure.figaspect(arg)
Calculate the width and height for a figure with a specified aspect ratio.

While the height is taken from rcParams["figure.figsize"] (default: [6.4, 4.8]), the width is adjusted to match the desired aspect ratio. Additionally, it is ensured that the width is in the range [4., 16.] and the height is in the range [2., 16.]. If necessary, the default height is adjusted to ensure this.

**Parameters**

arg [scalar or 2d array] If a scalar, this defines the aspect ratio (i.e. the ratio height / width). In case of an array the aspect ratio is number of rows / number of columns, so that the array could be fitted in the figure undistorted.

**Returns**

width, height The figure size in inches.

**Notes**

If you want to create an axes within the figure, that still preserves the aspect ratio, be sure to create it with equal width and height. See examples below.

Thanks to Fernando Perez for this function.

**Examples**

Make a figure twice as tall as it is wide:

```python
w, h = figaspect(2.)
fig = Figure(figsize=(w, h))
ax = fig.add_axes([0.1, 0.1, 0.8, 0.8])
ax.imshow(A, **kwargs)
```

Make a figure with the proper aspect for an array:

```python
A = rand(5,3)
w, h = figaspect(A)
fig = Figure(figsize=(w, h))
ax = fig.add_axes([0.1, 0.1, 0.8, 0.8])
ax.imshow(A, **kwargs)
```

## 17.23 matplotlib.font_manager

A module for finding, managing, and using fonts across platforms.

This module provides a single `FontManager` instance that can be shared across backends and platforms. The `findfont()` function returns the best TrueType (TTF) font file in the local or system font path that matches the specified `FontProperties` instance. The `FontManager` also handles Adobe Font Metrics (AFM) font files for use by the PostScript backend.
The design is based on the W3C Cascading Style Sheet, Level 1 (CSS1) font specification. Future versions may implement the Level 2 or 2.1 specifications.

class matplotlib.font_manager.FontEntry(fname=", name=", style=’normal’, variant=’normal’, weight=’normal’, stretch=’normal’, size=’medium’)

Bases: object

A class for storing Font properties. It is used when populating the font lookup dictionary.

class matplotlib.font_manager.FontManager(size=None, weight=’normal’)
Bases: object

On import, the FontManager singleton instance creates a list of TrueType fonts based on the font properties: name, style, variant, weight, stretch, and size. The findfont() method does a nearest neighbor search to find the font that most closely matches the specification. If no good enough match is found, a default font is returned.

afmfiles

defaultFont

findfont(self, prop, fontext=’ttf’, directory=None, fallback_to_default=True, rebuild_if_missing=True)

Find a font that most closely matches the given font properties.

Parameters

prop [str or FontProperties] The font properties to search for. This can be either a FontProperties object or a string defining a fontconfig patterns.

fontext [{’ttf’, ’afm’}, optional, default: ’ttf’] The extension of the font file:
  • ’ttf’: TrueType and OpenType fonts (.ttf, .ttc, .otf)
  • ’afm’: Adobe Font Metrics (.afm)

directory [str, optional] If given, only search this directory and its sub-directories.

fallback_to_default [bool] If True, will fallback to the default font family (usually “DejaVu Sans” or “Helvetica”) if the first lookup hard-fails.

rebuild_if_missing [bool] Whether to rebuild the font cache and search again if no match is found.

Returns

Notes

This performs a nearest neighbor search. Each font is given a similarity score to the target font properties. The first font with the highest score is returned. If no matches below a certain threshold are found, the default font (usually DejaVu Sans) is returned.

The result is cached, so subsequent lookups don’t have to perform the O(n) nearest neighbor search.
See the W3C Cascading Style Sheet, Level 1 documentation for a description of the font finding algorithm.

```cpp
static get_default_size()
  Return the default font size.

get_default_weight(self)
  Return the default font weight.

score_family(self, families, family2)
  Returns a match score between the list of font families in families and the font family name family2.
  An exact match at the head of the list returns 0.0.
  A match further down the list will return between 0 and 1.
  No match will return 1.0.

score_size(self, size1, size2)
  Returns a match score between size1 and size2.
  If size2 (the size specified in the font file) is ‘scalable’, this function always returns 0.0, since any font size can be generated.
  Otherwise, the result is the absolute distance between size1 and size2, normalized so that the usual range of font sizes (6pt - 72pt) will lie between 0.0 and 1.0.

score_stretch(self, stretch1, stretch2)
  Returns a match score between stretch1 and stretch2.
  The result is the absolute value of the difference between the CSS numeric values of stretch1 and stretch2, normalized between 0.0 and 1.0.

score_style(self, style1, style2)
  Returns a match score between style1 and style2.
  An exact match returns 0.0.
  A match between ‘italic’ and ‘oblique’ returns 0.1.
  No match returns 1.0.

score_variant(self, variant1, variant2)
  Returns a match score between variant1 and variant2.
  An exact match returns 0.0, otherwise 1.0.

score_weight(self, weight1, weight2)
  Returns a match score between weight1 and weight2.
  The result is 0.0 if both weight1 and weight 2 are given as strings and have the same value.
  Otherwise, the result is the absolute value of the difference between the CSS numeric values of weight1 and weight2, normalized between 0.05 and 1.0.

set_default_weight(self, weight)
  Set the default font weight. The initial value is ‘normal’.
```

```python
class matplotlib.font_manager.FontProperties(family=None, style=None, variant=None, weight=None, stretch=None, size=None, fname=None):

Bases: object
```
A class for storing and manipulating font properties.

The font properties are those described in the W3C Cascading Style Sheet, Level 1 font specification. The six properties are:

- **family**: A list of font names in decreasing order of priority. The items may include a generic font family name, either ‘serif’, ‘sans-serif’, ‘cursive’, ‘fantasy’, or ‘monospace’. In that case, the actual font to be used will be looked up from the associated rcParam.
- **style**: Either ‘normal’, ‘italic’ or ‘oblique’.
- **variant**: Either ‘normal’ or ‘small-caps’.

The default font property for TrueType fonts (as specified in the default rcParams) is:

```
sans-serif, normal, normal, normal, normal, scalable.
```

Alternatively, a font may be specified using an absolute path to a .ttf file, by using the **fname** kwarg.

The preferred usage of font sizes is to use the relative values, e.g., ‘large’, instead of absolute font sizes, e.g., 12. This approach allows all text sizes to be made larger or smaller based on the font manager’s default font size.

This class will also accept a **fontconfig pattern**, if it is the only argument provided. This support does not require fontconfig to be installed. We are merely borrowing its pattern syntax for use here.

Note that Matplotlib’s internal font manager and fontconfig use a different algorithm to lookup fonts, so the results of the same pattern may be different in Matplotlib than in other applications that use fontconfig.

`copy(self)`  
Return a copy of self.

`get_family(self)`  
Return a list of font names that comprise the font family.

`get_file(self)`  
Return the filename of the associated font.

`get_fontconfig_pattern(self)`  
Get a **fontconfig pattern** suitable for looking up the font as specified with fontconfig’s fc-match utility.

This support does not require fontconfig to be installed or support for it to be enabled. We are merely borrowing its pattern syntax for use here.

`get_name(self)`  
Return the name of the font that best matches the font properties.
get_size(self)
    Return the font size.

get_size_in_points(self)

get_slant(self)
    Return the font style. Values are: ‘normal’, ‘italic’ or ‘oblique’.

get_stretch(self)

get_style(self)
    Return the font style. Values are: ‘normal’, ‘italic’ or ‘oblique’.

get_variant(self)
    Return the font variant. Values are: ‘normal’ or ‘small-caps’.

get_weight(self)

set_family(self, family)
    Change the font family. May be either an alias (generic name is CSS parlance), such as: ‘serif’, ‘sans-serif’, ‘cursive’, ‘fantasy’, or ‘monospace’, a real font name or a list of real font names. Real font names are not supported when text.usetex is True.

set_file(self, file)
    Set the filename of the fontfile to use. In this case, all other properties will be ignored.

set_fontconfig_pattern(self, pattern)
    Set the properties by parsing a fontconfig pattern.

    This support does not require fontconfig to be installed or support for it to be enabled. We are merely borrowing its pattern syntax for use here.

set_name(self, family)
    Change the font family. May be either an alias (generic name is CSS parlance), such as: ‘serif’, ‘sans-serif’, ‘cursive’, ‘fantasy’, or ‘monospace’, a real font name or a list of real font names. Real font names are not supported when text.usetex is True.

set_size(self, size)

set_slant(self, style)
    Set the font style. Values are: ‘normal’, ‘italic’ or ‘oblique’.

set_stretch(self, stretch)

set_style(self, style)
    Set the font style. Values are: ‘normal’, ‘italic’ or ‘oblique’.

set_variant(self, variant)
    Set the font variant. Values are: ‘normal’ or ‘small-caps’.
set_weight(self, weight)
Set the font weight. May be either a numeric value in the range 0-1000 or one of
'ultralight', 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demi-
bold', 'demi', 'bold', 'heavy', 'extra bold', 'black'

class matplotlib.font_manager.JSONEncoder(*, skipkeys=False, ensure_ascii=True,
check_circular=True, allow_nan=True, sort_keys=False, indent=None, separators=None, default=None)

Bases: json.encoder.JSONEncoder

Constructor for JSONEncoder, with sensible defaults.

If skipkeys is false, then it is a TypeError to attempt encoding of keys that are not str,
int, float or None. If skipkeys is True, such items are simply skipped.

If ensure_ascii is true, the output is guaranteed to be str objects with all incoming non-ASCII characters escaped. If ensure_ascii is false, the output can contain non-ASCII characters.

If check_circular is true, then lists, dicts, and custom encoded objects will be checked for circular references during encoding to prevent an infinite recursion (which would cause an OverflowError). Otherwise, no such check takes place.

If allow_nan is true, then NaN, Infinity, and -Infinity will be encoded as such. This behavior is not JSON specification compliant, but is consistent with most JavaScript based encoders and decoders. Otherwise, it will be a ValueError to encode such floats.

If sort_keys is true, then the output of dictionaries will be sorted by key; this is useful for regression tests to ensure that JSON serializations can be compared on a day-to-day basis.

If indent is a non-negative integer, then JSON array elements and object members will be pretty-printed with that indent level. An indent level of 0 will only insert newlines. None is the most compact representation.

If specified, separators should be an (item_separator, key_separator) tuple. The default is (', ', ': ') if indent is None and (',', ':') otherwise. To get the most compact JSON representation, you should specify (',', ':') to eliminate whitespace.

If specified, default is a function that gets called for objects that can't otherwise be serialized. It should return a JSON encodable version of the object or raise a TypeError.

defaul**t**(self, o)
Implement this method in a subclass such that it returns a serializable object for o, or calls the base implementation (to raise a TypeError).

For example, to support arbitrary iterators, you could implement default like this:

```python
def default(self, o):
    try:
        iterable = iter(o)
    except TypeError:
        pass
    else:
        return list(iterable)
# Let the base class default method raise the TypeError
return JSONEncoder.default(self, o)
```
matplotlib.font_manager.OSXInstalledFonts(directories=None, fontext='ttf')

[ Deprecated ] Get list of font files on OS X.

Notes

Deprecated since version 3.1.

class matplotlib.font_manager.TempCache(**kwargs)
Bases: object

[ Deprecated ] A class to store temporary caches that are (a) not saved to disk and (b) invalidated whenever certain font-related rcParams—namely the family lookup lists—are changed or the font cache is reloaded. This avoids the expensive linear search through all fonts every time a font is looked up.

Notes

Deprecated since version 3.0.

get(self, prop)

invalidating_rcparams = ('font.serif', 'font.sans-serif', 'font.cursive', 'font.fantasy', 'font.monospace')

make_rcparams_key(self)

set(self, prop, value)

matplotlib.font_manager.afmFontProperty(fontpath, font)

Extract information from an AFM font file.

Parameters

font [AFM] The AFM font file from which information will be extracted.

Returns

FontEntry The extracted font properties.

matplotlib.font_manager.createFontList(fontfiles, fontext='ttf')

A function to create a font lookup list. The default is to create a list of TrueType fonts. An AFM font list can optionally be created.

matplotlib.font_manager.findSystemFonts(fontpaths=None, fontext='ttf')

Search for fonts in the specified font paths. If no paths are given, will use a standard set of system paths, as well as the list of fonts tracked by fontconfig if fontconfig is installed and available. A list of TrueType fonts are returned by default with AFM fonts as an option.

matplotlib.font_manager.get_font(filename, hinting_factor=None)

matplotlib.font_manager.get_fontconfig_fonts(fontext='ttf')

List the font filenames known to fc-list having the given extension.

matplotlib.font_manager.get_fontext_synonyms(fontext)

Return a list of file extensions extensions that are synonyms for the given file extension fileext.

matplotlib.font_manager.is_opentype_cff_font(filename)

Return whether the given font is a Postscript Compact Font Format Font embedded in
an OpenType wrapper. Used by the PostScript and PDF backends that can not subset these fonts.

```python
matplotlib.font_manager.json_dump(data, filename)
```

Dumps a data structure as JSON in the named file.

Handles FontManager and its fields. File paths that are children of the Matplotlib data path (typically, fonts shipped with Matplotlib) are stored relative to that data path (to remain valid across virtualenvs).

```python
matplotlib.font_manager.json_load(filename)
```

Loads a data structure as JSON from the named file.

Handles FontManager and its fields. Relative file paths are interpreted as being relative to the Matplotlib data path, and transformed into absolute paths.

```python
matplotlib.font_manager.list_fonts(directory, extensions)
```

Return a list of all fonts matching any of the extensions, found recursively under the directory.

```python
matplotlib.font_manager.ttfFontProperty(font)
```

Extract information from a TrueType font file.

**Parameters**

- **font** *(FT2Font)* The TrueType font file from which information will be extracted.

**Returns**

*FontEntry* The extracted font properties.

```python
matplotlib.font_manager.win32FontDirectory()
```

Return the user-specified font directory for Win32. This is looked up from the registry key:

```
\HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Explorer\Shell\Folders\Fonts
```

If the key is not found, `%WINDIR%\Fonts` will be returned.

```python
matplotlib.font_manager.win32InstalledFonts(directory=None, fontext='ttf')
```

Search for fonts in the specified font directory, or use the system directories if none given. Additionally, it is searched for user fonts installed. A list of TrueType font filenames are returned by default, or AFM fonts if `fontext` == `afm`.

## 17.24 `matplotlib.fontconfig_pattern`

A module for parsing and generating *fontconfig patterns*.

```python
class matplotlib.fontconfig_pattern.FontconfigPatternParser
```

Bases: `object`

A simple pyparsing-based parser for *fontconfig patterns*.

```python
parse(self, pattern)
```

Parse the given fontconfig `pattern` and return a dictionary of key/value pairs useful for initializing a `font_manager.FontProperties` object.
matplotlib.fontconfig_pattern.family_escape(repl, string, count=0)
Return the string obtained by replacing the leftmost non-overlapping occurrences of pattern in string by the replacement repl.

matplotlib.fontconfig_pattern.family_unescape(repl, string, count=0)
Return the string obtained by replacing the leftmost non-overlapping occurrences of pattern in string by the replacement repl.

matplotlib.fontconfig_pattern.generate_fontconfig_pattern(d)
Given a dictionary of key/value pairs, generates a fontconfig pattern string.

matplotlib.fontconfig_pattern.parse_fontconfig_pattern(pattern)
Parse the given fontconfig pattern and return a dictionary of key/value pairs useful for initializing a font_manager.FontProperties object.

matplotlib.fontconfig_pattern.value_escape(repl, string, count=0)
Return the string obtained by replacing the leftmost non-overlapping occurrences of pattern in string by the replacement repl.

matplotlib.fontconfig_pattern.value_unescape(repl, string, count=0)
Return the string obtained by replacing the leftmost non-overlapping occurrences of pattern in string by the replacement repl.

17.25 matplotlib.gridspec

gridspec contains classes that help to layout multiple Axes in a grid-like pattern within a figure. The GridSpec specifies the overall grid structure. Individual cells within the grid are referenced by SubplotSpecs.

See the tutorial Customizing Figure Layouts Using GridSpec and Other Functions for a comprehensive usage guide.

17.25.1 Classes

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GridSpec(nrows, ncols[, figure, left, ...])</td>
<td>Specifies the geometry of the grid that a subplot can be placed in.</td>
</tr>
<tr>
<td>SubplotSpec(gridspec, num1[, num2])</td>
<td>Specifies the location of a subplot in a GridSpec.</td>
</tr>
<tr>
<td>GridSpecBase(nrows, ncols[, height_ratios, ...])</td>
<td>A base class of GridSpec that specifies the geometry of the grid that a subplot will be placed.</td>
</tr>
<tr>
<td>GridSpecFromSubplotSpec(nrows, ncols, ...[, ...])</td>
<td>GridSpec whose subplot layout parameters are inherited from the location specified by a given SubplotSpec.</td>
</tr>
</tbody>
</table>

```
matplotlib.gridspec.GridSpec
class matplotlib.gridspec.GridSpec(nrows, ncols, figure=None, left=None, bottom=None, right=None, top=None, wspace=None, hspace=None, width_ratios=None, height_ratios=None)

Bases: matplotlib.gridspec.GridSpecBase
```
Specifies the geometry of the grid that a subplot can be placed in.
The location of grid is determined by similar way as the SubplotParams.
The number of rows and number of columns of the grid need to be set. Optionally, the
subplot layout parameters (e.g., left, right, etc.) can be tuned.

**Parameters**

- **nrows** ([int] Number of rows in grid.
- **ncols** ([int] Number or columns in grid.
- **figure** ([Figure, optional])
- **left, right, top, bottom** ([float, optional] Extent of the subplots as a
  fraction of figure width or height. Left cannot be larger than right, and
  bottom cannot be larger than top.
- **wspace** ([float, optional] The amount of width reserved for space between
  subplots, expressed as a fraction of the average axis width.
- **hspace** ([float, optional] The amount of height reserved for space between
  subplots, expressed as a fraction of the average axis height.
- **width_ratios** ([length ncols iterable, optional] Width ratios of the columns.
- **height_ratios** ([length nrows iterable, optional] Height ratios of the rows.

**Notes**

See [SubplotParams](https://matplotlib.org/stable/api/gridspec_api.html) for descriptions of the layout parameters.

- **get_subplot_params(self, figure=None)**
  Return a dictionary of subplot layout parameters. The default parameters are from
  rcParams unless a figure attribute is set.
- **locally_modified_subplot_params(self)**
- **tight_layout(self, figure, renderer=None, pad=1.08, h_pad=None, w_pad=None,
  rect=None)**
  Adjust subplot parameters to give specified padding.

**Parameters**

- **pad** ([float] Padding between the figure edge and the edges of subplots,
  as a fraction of the font-size.
- **h_pad, w_pad** ([float, optional] Padding (height/width) between edges
  of adjacent subplots. Defaults to pad.
- **rect** ([tuple of 4 floats, optional] (left, bottom, right, top) rectangle in
  normalized figure coordinates that the whole subplots area (including
  labels) will fit into. Default is (0, 0, 1, 1).

- **update(self, **kwargs)**
  Update the current values.
  Values set to None use the rcParams value.
Examples using `matplotlib.gridspec.GridSpec`

- `sphx_glr_gallery_lines_bars_and_markers_psd_demo.py`
- `sphx_glr_gallery_images_contours_and_fields_plot_streamplot.py`

`matplotlib.gridspec.SubplotSpec`

class `matplotlib.gridspec.SubplotSpec(gridspec, num1, num2=None)`

Bases: `object`

Specifies the location of a subplot in a `GridSpec`.

**Note:** Likely, you’ll never instantiate a `SubplotSpec` yourself. Instead you will typically obtain one from a `GridSpec` using item-access.

**Parameters**

- `gridspec` [`GridSpec`] The GridSpec, which the subplot is referencing.
- `num1, num2` [int] The subplot will occupy the num1-th cell of the given gridspec. If num2 is provided, the subplot will span between num1-th cell and num2-th cell. The index starts from 0.

`get_geometry(self)`

Return the subplot geometry as tuple `(n_rows, n_cols, start, stop)`.

The indices `start` and `stop` define the range of the subplot within the `GridSpec`. `stop` is inclusive (i.e. for a single cell `start == stop`).

`get_gridspec(self)`

`get_position(self, figure, return_all=False)`

Update the subplot position from `figure.subplotpars`. 

1604 Chapter 17. Modules
get_rows_columns(self)
    Return the subplot row and column numbers as a tuple (n_rows, n_cols, row_start, row_stop, col_start, col_stop).

get_topmost_subplotspec(self)
    Return the topmost SubplotSpec instance associated with the subplot.

subgridspec(self, nrows, ncols, **kwargs)
    Create a GridSpec within this subplot.

    The created GridSpecFromSubplotSpec will have this SubplotSpec as a parent.

    Parameters

    nrows [int] Number of rows in grid.
    ncols [int] Number of columns in grid.

    Returns

    gridspec [GridSpecFromSubplotSpec]

    Other Parameters

    **kwargs All other parameters are passed to GridSpecFromSubplotSpec.

    See also:

    matplotlib.pyplot.subplots

    Examples

    Adding three subplots in the space occupied by a single subplot:

    ```python
    fig = plt.figure()
    gs0 = fig.add_gridspec(3, 1)
    ax1 = fig.add_subplot(gs0[0])
    ax2 = fig.add_subplot(gs0[1])
    gssub = gs0[2].subgridspec(1, 3)
    for i in range(3):
        fig.add_subplot(gssub[0, i])
    ```

    Examples using matplotlib.gridspec.SubplotSpec

    - Constrained Layout Guide
    - Tight Layout guide

matplotlib.gridspec.GridSpecBase

class matplotlib.gridspec.GridSpecBase(nrows, ncols, height_ratios=None, width_ratios=None)

    Bases: object

    A base class of GridSpec that specifies the geometry of the grid that a subplot will be placed.
The number of rows and number of columns of the grid need to be set. Optionally, the ratio of heights and widths of rows and columns can be specified.

```python
def get_geometry(self)
    """Return a tuple containing the number of rows and columns in the grid."""

def get_grid_positions(self, fig, raw=False)
    """Return lists of bottom and top position of rows, left and right positions of columns.
    If raw=True, then these are all in units relative to the container with no margins.
    (used for constrained_layout)."

def get_height_ratios(self)

def get_subplot_params(self, figure=None, fig=None)

def get_width_ratios(self)

def new_subplotspec(self, loc, colspan=1, rowspan=1)
    """Create and return a SubplotSpec instance."""

def set_height_ratios(self, height_ratios)

def set_width_ratios(self, width_ratios)
```

## GridSpecFromSubplotSpec

```python
class GridSpecFromSubplotSpec(GridSpecBase, GridSpecFromSubplotSpec(nrows, ncols, subplot_spec, wspace=None, hspace=None, height_ratios=None, width_ratios=None))
```

**Bases:** `GridSpecBase`

GridSpec whose subplot layout parameters are inherited from the location specified by a given SubplotSpec.

The number of rows and number of columns of the grid need to be set. An instance of SubplotSpec is also needed to be set from which the layout parameters will be inherited. The wspace and hspace of the layout can be optionally specified or the default values (from the figure or rcParams) will be used.

```python
def get_subplot_params(self, figure=None)
    """Return a dictionary of subplot layout parameters."""

def get_topmost_subplotspec(self)
    """Return the topmost SubplotSpec instance associated with the subplot."""
```

**Examples using** `GridSpecFromSubplotSpec`

- sphx_glr_gallery_subplots_axes_and_figures_demo_constrained_layout.py

- *Constrained Layout Guide*
17.26 matplotlib.image

The image module supports basic image loading, rescaling and display operations.

class matplotlib.image.AxesImage(ax, cmap=None, norm=None, interpolation=None, origin=None, extent=None, filternorm=1, filterrad=4.0, resample=False, **kwargs)

Bases: matplotlib.image._ImageBase

interpolation and cmap default to their rc settings
cmap is a colors.Colormap instance norm is a colors.Normalize instance to map luminance to 0-1
extent is data axes (left, right, bottom, top) for making image plots registered with data plots. Default is to label the pixel centers with the zero-based row and column indices.
Additional kwargs are matplotlib.artist properties

format_cursor_data(self, data)
Return a string representation of data.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

get_cursor_data
get_cursor_data(self, event)
Return the image value at the event position or None if the event is outside the image.

See also:

matplotlib.artist.Artist.get_cursor_data

get_extent(self)
Get the image extent: left, right, bottom, top

get_window_extent(self, renderer=None)
Get the axes bounding box in display space.
The bounding box’ width and height are nonnegative.
Subclasses should override for inclusion in the bounding box “tight” calculation. Default is to return an empty bounding box at 0, 0.
Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.
make_image(self, renderer, magnification=1.0, unsampled=False)
    Normalize, rescale, and colormap this image’s data for rendering using renderer, with the given magnification.

    If unsampled is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

Returns
    image [(M, N, 4) uint8 array] The RGBA image, resampled unless unsampled is True.
    x, y [float] The upper left corner where the image should be drawn, in pixel space.
    trans [Affine2D] The affine transformation from image to pixel space.

set_extent(self, extent)
    extent is data axes (left, right, bottom, top) for making image plots

    This updates ax.dataLim, and, if autoscaling, sets viewLim to tightly fit the image, regardless of dataLim. Autoscaling state is not changed, so following this with ax.autoscale_view will redo the autoscaling in accord with dataLim.

class matplotlib.image.BboxImage(bbox, cmap=None, norm=None, interpolation=None, origin=None, filternorm=1, filterrad=4.0, resample=False, interp_at_native=<deprecated parameter>, **kwargs)

    Bases: matplotlib.image._ImageBase

    The Image class whose size is determined by the given bbox.

    cmap is a colors.Colormap instance norm is a colors.Normalize instance to map luminance to 0-1

    kwargs are an optional list of Artist keyword args

contains(self, mouseevent)
    Test whether the mouse event occurred within the image.

get_transform(self)
    Return the Transform instance used by this artist.

get_window_extent(self, renderer=None)
    Get the axes bounding box in display space.

    The bounding box’ width and height are nonnegative.

    Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

    Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

interp_at_native

make_image(self, renderer, magnification=1.0, unsampled=False)
    Normalize, rescale, and colormap this image’s data for rendering using renderer, with the given magnification.
If `unsampled` is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

**Returns**

- **image** [(M, N, 4) uint8 array] The RGBA image, resampled unless `unsampled` is True.
- **x, y** [float] The upper left corner where the image should be drawn, in pixel space.
- **trans** [Affine2D] The affine transformation from image to pixel space.

```python
class matplotlib.image.FigureImage(fig, cmap=None, norm=None, offsetx=0, offsety=0, origin=None, **kwargs)
```

- `cmap` is a `colors.Colormap` instance
- `norm` is a `colors.Normalize` instance to map luminance to 0-1
- `kwargs` are an optional list of Artist keyword args

```python
def get_extent(self)
    Get the image extent: left, right, bottom, top
```

```python
def make_image(self, renderer, magnification=1.0, unsampled=False)
    Normalize, rescale, and colormap this image’s data for rendering using `renderer`, with the given `magnification`.
```

- If `unsampled` is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

**Returns**

- **image** [(M, N, 4) uint8 array] The RGBA image, resampled unless `unsampled` is True.
- **x, y** [float] The upper left corner where the image should be drawn, in pixel space.
- **trans** [Affine2D] The affine transformation from image to pixel space.

```python
def set_data(self, A)
    Set the image array.
```

```python
zorder = 0
```

```python
class matplotlib.image.NonUniformImage(ax, *, interpolation='nearest', **kwargs)
```

- `kwargs` are identical to those for `AxesImage`, except that ‘nearest’ and ‘bilinear’ are the only supported ‘interpolation’ options.

```python
def get_extent(self)
    Get the image extent: left, right, bottom, top
```

```python
def make_image(self, renderer, magnification=1.0, unsampled=False)
    Normalize, rescale, and colormap this image’s data for rendering using `renderer`, with the given `magnification`.
```

- If `unsampled` is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

**Returns**
**image** [(M, N, 4) uint8 array] The RGBA image, resampled unless *unsampled* is True.

**x, y** [float] The upper left corner where the image should be drawn, in pixel space.

**trans** [Affine2D] The affine transformation from image to pixel space.

**set_array**(self, *args)
Retained for backwards compatibility - use set_data instead.

**Parameters**

**A** [array-like]

**set_cmap**(self, cmap)
set the colormap for luminance data

**Parameters**

**cmap** [colormap or registered colormap name]

**set_data**(self, x, y, A)
Set the grid for the pixel centers, and the pixel values.

**x and y are monotonic 1-D ndarrays of lengths N and M,**
respectively, specifying pixel centers

**A is an (M,N) ndarray or masked array of values to be** colormapped,
or a (M,N,3) RGB array, or a (M,N,4) RGBA array.

**set_filternorm**(self, s)
Set whether the resize filter normalizes the weights.

See help for *imshow*.

**Parameters**

**filternorm** [bool]

**set_filterrad**(self, s)
Set the resize filter radius only applicable to some interpolation schemes - see help for imshow

**Parameters**

**filterrad** [positive float]

**set_interpolation**(self, s)

**Parameters**

**s** [str, None] Either ‘nearest’, ‘bilinear’, or *None*.

**set_norm**(self, norm)
Set the normalization instance.

**Parameters**

**norm** [*Normalize*]

**Notes**

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.
class matplotlib.image.PcolorImage(ax, x=None, y=None, A=None, cmap=None, norm=None, **kwargs)

Bases: matplotlib.image.AxesImage

Make a pcolor-style plot with an irregular rectangular grid.

This uses a variation of the original irregular image code, and it is used by pcolorfast for the corresponding grid type.

cmap defaults to its rc setting
cmap is a colors.Colormap instance norm is a colors.Normalize instance to map luminance to 0-1

Additional kwargs are matplotlib.artist properties

get_cursor_data(self, event)

Return the image value at the event position or None if the event is outside the image.

See also:

matplotlib.artist.Artist.get_cursor_data

make_image(self, renderer, magnification=1.0, unsampled=False)

Normalize, rescale, and colormap this image’s data for rendering using renderer, with the given magnification.

If unsampled is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

Returns

image [(M, N, 4) uint8 array] The RGBA image, resampled unless unsampled is True.
x, y [float] The upper left corner where the image should be drawn, in pixel space.
trans [Affine2D] The affine transformation from image to pixel space.

set_array(self, *args)

Retained for backwards compatibility - use set_data instead.

Parameters

A [array-like]

set_data(self, x, y, A)

Set the grid for the rectangle boundaries, and the data values.

x and y are monotonic 1-D ndarrays of lengths N+1 and M+1, respectively, specifying rectangle boundaries. If None, they will be created as uniform arrays from 0 through N and 0 through M, respectively.

A is an (M,N) ndarray or masked array of values to be colormapped, or a (M,N,3) RGB array, or a (M,N,4) RGBA array.

matplotlib.image.composite_images(images, renderer, magnification=1.0)

Composite a number of RGBA images into one. The images are composited in the order in which they appear in the images list.

Parameters
images [list of Images] Each must have a make_image method. For each image, can_composite should return True, though this is not enforced by this function. Each image must have a purely affine transformation with no shear.

renderer [RendererBase instance]

magnification [float] The additional magnification to apply for the renderer in use.

Returns
tuple [image, offset_x, offset_y] Returns the tuple:
  • image: A numpy array of the same type as the input images.
  • offset_x, offset_y: The offset of the image (left, bottom) in the output figure.

matplotlib.image.imread(fname, format=None)
Read an image from a file into an array.

Parameters
fname [str or file-like] The image file to read: a filename, a URL or a file-like object opened in read-binary mode.

format [str, optional] The image file format assumed for reading the data. If not given, the format is deduced from the filename. If nothing can be deduced, PNG is tried.

Returns
imagedata [numpy.array] The image data. The returned array has shape
  • (M, N) for grayscale images.
  • (M, N, 3) for RGB images.
  • (M, N, 4) for RGBA images.

Notes
Matplotlib can only read PNGs natively. Further image formats are supported via the optional dependency on Pillow. Note, URL strings are not compatible with Pillow. Check the Pillow documentation for more information.

matplotlib.image.imsave(fname, arr, vmin=None, vmax=None, cmap=None, format=None, origin=None, dpi=100)
Save an array as an image file.

Parameters
fname [str or PathLike or file-like] A path or a file-like object to store the image in. If format is not set, then the output format is inferred from the extension of fname, if any, and from rcParams["savefig.format"] (default: ‘png’) otherwise. If format is set, it determines the output format.

arr [array-like] The image data. The shape can be one of MxN (luminance), MxNx3 (RGB) or MxNx4 (RGBA).
**vmin, vmax** [scalar, optional] vmin and vmax set the color scaling for the image by fixing the values that map to the colormap color limits. If either vmin or vmax is None, that limit is determined from the arr min/max value.

**cmap** [str or Colormap, optional] A Colormap instance or registered colormap name. The colormap maps scalar data to colors. It is ignored for RGB(A) data. Defaults to rcParams["image.cmap"] (default: ‘viridis’)(‘viridis’).

**format** [str, optional] The file format, e.g. ‘png’, ‘pdf’, ‘svg’, ... The behavior when this is unset is documented under fname.

**origin** [{‘upper’, ‘lower’}, optional] Indicates whether the (0, 0) index of the array is in the upper left or lower left corner of the axes. Defaults to rcParams["image.origin"] (default: ‘upper’) (‘upper’).

**dpi** [int] The DPI to store in the metadata of the file. This does not affect the resolution of the output image.

```
matplotlib.image.pil_to_array(pilImage)
```
Load a PIL image and return it as a numpy array.

**Returns**

**numpy.array** The array shape depends on the image type:

- (M, N) for grayscale images.
- (M, N, 3) for RGB images.
- (M, N, 4) for RGBA images.

```
matplotlib.image.thumbnail(infile, thumbfile, scale=0.1, interpolation='bilinear', preview=False)
```
Make a thumbnail of image in infile with output filename thumbfile.

See /gallery/misc/image_thumbnail_sgskip.

**Parameters**

**infile** [str or file-like] The image file – must be PNG, or Pillow-readable if you have Pillow installed.

**thumbfile** [str or file-like] The thumbnail filename.

**scale** [float, optional] The scale factor for the thumbnail.

**interpolation** [str, optional] The interpolation scheme used in the resampling. See the interpolation parameter of imshow for possible values.

**preview** [bool, optional] If True, the default backend (presumably a user interface backend) will be used which will cause a figure to be raised if show is called. If it is False, the figure is created using FigureCanvasBase and the drawing backend is selected as savefig would normally do.

**Returns**

**figure** [Figure] The figure instance containing the thumbnail.
17.27 matplotlib.legend

The legend module defines the Legend class, which is responsible for drawing legends associated with axes and/or figures.

**Important:** It is unlikely that you would ever create a Legend instance manually. Most users would normally create a legend via the `legend()` function. For more details on legends there is also a legend guide.

The Legend class can be considered as a container of legend handles and legend texts. Creation of corresponding legend handles from the plot elements in the axes or figures (e.g., lines, patches, etc.) are specified by the handler map, which defines the mapping between the plot elements and the legend handlers to be used (the default legend handlers are defined in the `legend_handler` module). Note that not all kinds of artist are supported by the legend yet by default but it is possible to extend the legend handler’s capabilities to support arbitrary objects. See the legend guide for more information.

```python
class matplotlib.legend.DraggableLegend(legend, use_blit=False, update='loc')
Bases: matplotlib.offsetbox.DraggableOffsetBox

Wrapper around a Legend to support mouse dragging.

Parameters

- **legend** [Legend] The Legend instance to wrap.
- **use_blit** [bool, optional] Use blitting for faster image composition. For details see FuncAnimation.
- **update** [{‘loc’, ‘bbox’}, optional] If “loc”, update the loc parameter of the legend upon finalizing. If “bbox”, update the bbox_to_anchor parameter.
```

```python
class matplotlib.legend.Legend(parent, handles, labels, loc=None, numpoints=None, markerscale=None, markerfirst=True, scatterpoints=None, scatteryoffsets=None, prop=None, fontsize=None, borderpad=None, labelspacing=None, handlelength=None, handleheight=None, handletextpad=None, borderaxespad=None, columnspacing=None, ncol=1, mode=None, fancybox=None, shadow=None, title=None, title_fontsize=None, framealpha=None, edgecolor=None, facecolor=None, bbox_to_anchor=None, bbox_transform=None, frameon=None, handler_map=None)
Bases: matplotlib.artist.Artist

Place a legend on the axes at location loc.

Parameters

- **parent** [Axes or Figure] The artist that contains the legend.
- **handles** [sequence of Artist] A list of Artists (lines, patches) to be added to the legend.
```
labels [sequence of strings] A list of labels to show next to the artists. The length of handles and labels should be the same. If they are not, they are truncated to the smaller of both lengths.

Other Parameters

loc [str or pair of floats, default: rcParams["legend.loc"] (default: 'best') ('best' for axes, 'upper right' for figures)] The location of the legend.

The strings 'upper left', 'upper right', 'lower left', 'lower right' place the legend at the corresponding corner of the axes/figure.

The strings 'upper center', 'lower center', 'center left', 'center right' place the legend at the center of the corresponding edge of the axes/figure.

The string 'center' places the legend at the center of the axes/figure.

The string 'best' places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case bbox_to_anchor will be ignored).

For back-compatibility, 'center right' (but no other location) can also be spelled 'right', and each "string" locations can also be given as a numeric value:

```
<table>
<thead>
<tr>
<th>Location String</th>
<th>Location Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>'best'</td>
<td>0</td>
</tr>
<tr>
<td>'upper right'</td>
<td>1</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4</td>
</tr>
<tr>
<td>'right'</td>
<td>5</td>
</tr>
<tr>
<td>'center left'</td>
<td>6</td>
</tr>
<tr>
<td>'center right'</td>
<td>7</td>
</tr>
<tr>
<td>'lower center'</td>
<td>8</td>
</tr>
<tr>
<td>'upper center'</td>
<td>9</td>
</tr>
<tr>
<td>'center'</td>
<td>10</td>
</tr>
</tbody>
</table>
```

bbox_to_anchor [BboxBase, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with loc. Defaults to axes.bbox (if called as a method to Axes.legend) or figure.bbox (if Figure.legend). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by bbox_transform, with the default transform Axes or Figure coordinates, depending on which legend is called.

If a 4-tuple or BboxBase is given, then it specifies the bbox (x, y, width, height) that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):
A 2-tuple \((x, y)\) places the corner of the legend specified by \(\text{loc}\) at \(x, y\). For example, to put the legend’s upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

- \(\text{loc} = \text{'best'}, \text{bbox}_\text{to_anchor}=(0.5, 0.5, 0.5, 0.5)\)

- \(\text{loc} = \text{'upper right'}, \text{bbox}_\text{to_anchor}=(0.5, 0.5)\)

**ncol** [integer] The number of columns that the legend has. Default is 1.

**prop** [None or *matplotlib.font_manager.FontProperties* or dict] The font properties of the legend. If None (default), the current *matplotlib.rcParams* will be used.

**fontsize** [int or float or \{'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'\}] Controls the font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if \(\text{prop}\) is not specified.

**numpoints** [None or int] The number of marker points in the legend when creating a legend entry for a *Line2D* (line). Default is None, which will take the value from *rcParams*["legend.numpoints"] (default: 1).

**scatterpoints** [None or int] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot). Default is None, which will take the value from *rcParams*["legend.scatterpoints"] (default: 1).

**scatteryoffsets** [iterable of floats] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5]. Default is [0.375, 0.5, 0.3125].

**markerscale** [None or int or float] The relative size of legend markers compared with the originally drawn ones. Default is None, which will take the value from *rcParams*["legend.markerscale"] (default: 1.0).

**markerfirst** [bool] If True, legend marker is placed to the left of the legend label. If False, legend marker is placed to the right of the legend label. Default is True.

**frameon** [None or bool] Control whether the legend should be drawn on a patch (frame). Default is None, which will take the value from *rcParams*["legend.frameon"] (default: True).

**fancybox** [None or bool] Control whether round edges should be enabled around the *FancyBboxPatch* which makes up the legend’s background. Default is None, which will take the value from *rcParams*["legend.fancybox"] (default: True).

**shadow** [None or bool] Control whether to draw a shadow behind the legend. Default is None, which will take the value from *rcParams*["legend.shadow"] (default: False).

**framealpha** [None or float] Control the alpha transparency of the legend’s background. Default is None, which will take the value from *rcParams*["legend.framealpha"] (default: 0.8). If shadow is activated and framealpha is None, the default value is ignored.
**facecolor** [None or "inherit" or a color spec] Control the legend's background color. Default is None, which will take the value from `rcParams["legend.facecolor"]` (default: 'inherit'). If "inherit", it will take `rcParams["axes.facecolor"]` (default: 'white').

**edgecolor** [None or "inherit" or a color spec] Control the legend's background patch edge color. Default is None, which will take the value from `rcParams["legend.edgecolor"]` (default: '0.8') If "inherit", it will take `rcParams["axes.edgecolor"]` (default: 'black').

**mode** [{"expand", None}] If mode is set to "expand" the legend will be horizontally expanded to fill the axes area (or bbox_to_anchor if defines the legend’s size).

**bbox_transform** [None or `matplotlib.transforms.Transform`] The transform for the bounding box (bbox_to_anchor). For a value of None (default) the Axes’ transAxes transform will be used.

**title** [str or None] The legend’s title. Default is no title (None).

**title_fontsize:** str or None The fontsize of the legend’s title. Default is the default fontsize.

**borderpad** [float or None] The fractional whitespace inside the legend border. Measured in font-size units. Default is None, which will take the value from `rcParams["legend.borderpad"]` (default: 0.4).

**labelsspacing** [float or None] The vertical space between the legend entries. Measured in font-size units. Default is None, which will take the value from `rcParams["legend.labellspacing"]` (default: 0.5).

**handlelength** [float or None] The length of the legend handles. Measured in font-size units. Default is None, which will take the value from `rcParams["legend.handlelength"]` (default: 2.0).

**handletextpad** [float or None] The pad between the legend handle and text. Measured in font-size units. Default is None, which will take the value from `rcParams["legend.handletextpad"]` (default: 0.8).

**borderaxespad** [float or None] The pad between the axes and legend border. Measured in font-size units. Default is None, which will take the value from `rcParams["legend.borderaxespad"]` (default: 0.5).

**columnspacing** [float or None] The spacing between columns. Measured in font-size units. Default is None, which will take the value from `rcParams["legend.columnspacing"]` (default: 2.0).

**handler_map** [dict or None] The custom dictionary mapping instances or types to a legend handler. This handler_map updates the default handler map found at `matplotlib.legend.Legend.get_legend_handler_map()`.

**Notes**

Users can specify any arbitrary location for the legend using the bbox_to_anchor keyword argument. bbox_to_anchor can be an instance of BboxBase(or its derivatives) or a tuple of 2 or 4 floats. See `set_bbox_to_anchor()` for more detail.

The legend location can be specified by setting loc with a tuple of 2 floats, which is interpreted as the lower-left corner of the legend in the normalized axes coordinate.
codes = {'best': 0, 'center': 10, 'center left': 6, 'center right': 7, 'lower center': 8, 'lower left': 3, 'lower right': 4, 'right': 5, 'upper center': 9, 'upper left': 2, 'upper right': 1}

contains(self, event)
Test whether the artist contains the mouse event.

Parameters

mouseevent [matplotlib.backend_bases.MouseEvent]

Returns

contains [bool] Whether any values are within the radius.
details [dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

See also:

set_contains, get_contains

draw(self, renderer)
Draw everything that belongs to the legend.

draw_frame(self, b)
Set draw frame to b.

Parameters

b [bool]

get_bbox_to_anchor(self)
Return the bbox that the legend will be anchored to.

get_children(self)
Return a list of child artists.

classmethod get_default_handler_map()
A class method that returns the default handler map.

get_draggable(self)
Return True if the legend is draggable, False otherwise.

get_frame(self)
Return the Rectangle instances used to frame the legend.

get_frame_on(self)
Get whether the legend box patch is drawn.

static get_legend_handler(legend_handler_map, orig_handle)
Return a legend handler from legend_handler_map that corresponds to orig_handle.

legend_handler_map should be a dictionary object (that is returned by the get_legend_handler_map method).

It first checks if the orig_handle itself is a key in the legend_handler_map and return the associated value. Otherwise, it checks for each of the classes in its method-resolution-order. If no matching key is found, it returns None.

get_legend_handler_map(self)
Return the handler map.
get_lines(self)
Return a list of Line2D instances in the legend.

get_patches(self)
Return a list of Patch instances in the legend.

get_texts(self)
Return a list of Text instances in the legend.

get_tightbbox(self, renderer)
Like Legend.get_window_extent, but uses the box for the legend.

Parameters
renderer [RendererBase instance] renderer that will be used to draw
the figures (i.e. fig.canvas.get_renderer())

Returns
'.BboxBase' [containing the bounding box in figure pixel co-
ordinates.]

get_title(self)
Return the Text instance for the legend title.

get_window_extent(self, renderer=None)
Return extent of the legend.

set_bbox_to_anchor(self, bbox, transform=None)
Set the bbox that the legend will be anchored to.

bbox can be
• A BboxBase instance
• A tuple of (left, bottom, width, height) in the given transform (normalized
  axes coordinate if None)
• A tuple of (left, bottom) where the width and height will be assumed to be
  zero.

classmethod set_default_handler_map(handler_map)
A class method to set the default handler map.

set_draggable(self, state, use_blit=False, update='loc')
Enable or disable mouse dragging support of the legend.

Parameters
state [bool] Whether mouse dragging is enabled.

use_blit [bool, optional] Use blitting for faster image composition. For
details see FuncAnimation.

update [{‘loc’, ‘bbox’}, optional] The legend parameter to be changed
when dragged:
• ‘loc’: update the loc parameter of the legend
• ‘bbox’: update the bbox_to_anchor parameter of the legend

Returns
If state is True this returns the DraggableLegend helper
instance. Otherwise this returns None.
Matplotlib, Release 3.1.3

```python
set_frame_on(self, b)
    Set whether the legend box patch is drawn.

Parameters
    b [bool]

set_title(self, title, prop=None)
    Set the legend title. Fontproperties can be optionally set with prop parameter.

classmethod update_default_handler_map(handler_map)
    A class method to update the default handler map.
```

```
zorder = 5
```

17.28 matplotlib.legend_handler

This module defines default legend handlers.

It is strongly encouraged to have read the legend guide before this documentation.

Legend handlers are expected to be a callable object with a following signature.

```python
legend_handler(legend, orig_handle, fontsize, handlebox)
```

Where `legend` is the legend itself, `orig_handle` is the original plot, `fontsize` is the fontsize in pixels, and `handlebox` is a OffsetBox instance. Within the call, you should create relevant artists (using relevant properties from the `legend` and/or `orig_handle`) and add them into the handlebox. The artists needs to be scaled according to the fontsize (note that the size is in pixel, i.e., this is dpi-scaled value).

This module includes definition of several legend handler classes derived from the base class (HandlerBase) with the following method:

```python
def legend_artist(self, legend, orig_handle, fontsize, handlebox)
```

```python
class matplotlib.legend_handler.HandlerBase(xpad=0.0, ypad=0.0, update_func=None)
    A Base class for default legend handlers.
    
    The derived classes are meant to override create_artists method, which has a following signature:
```

```python
def create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, fontsize, trans):
```

The overridden method needs to create artists of the given transform that fits in the given dimension (xdescent, ydescent, width, height) that are scaled by fontsize if necessary.

```python
adjust_drawing_area(self, legend, orig_handle, xdescent, ydescent, width, height, fontsize)
create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, fontsize, trans)
legend_artist(self, legend, orig_handle, fontsize, handlebox)
```

Return the artist that this HandlerBase generates for the given original artist/handle.
Parameters

**legend** ([matplotlib.legend.Legend instance]) The legend for which these legend artists are being created.

**orig_handle** ([matplotlib.artist.Artist or similar]) The object for which these legend artists are being created.

**fontsize** [float or int] The fontsize in pixels. The artists being created should be scaled according to the given fontsize.

**handlebox** ([matplotlib.offsetbox.OffsetBox instance]) The box which has been created to hold this legend entry’s artists. Artists created in the `legend_artist` method must be added to this handlebox inside this method.

```python
update_prop(self, legend_handle, orig_handle, legend)
```

```python
class matplotlib.legend_handler.HandlerCircleCollection(yoffsets=None, sizes=None, **kw)
```

Handler for CircleCollections.

```python
class matplotlib.legend_handler.HandlerErrorbar(xerr_size=0.5, yerr_size=None, marker_pad=0.3, numpoints=None, **kw)
```

Handler for Errorbars.

```python
class matplotlib.legend_handler.HandlerLine2D(marker_pad=0.3, numpoints=None, **kw)
```

Handler for Line2D instances.

```python
Parameters
```

**marker_pad** [float] Padding between points in legend entry.

**numpoints** [int] Number of points to show in legend entry.

Notes

Any other keyword arguments are given to `HandlerNpoints`.

```python
class matplotlib.legend_handler.HandlerLineCollection(marker_pad=0.3, numpoints=None, **kw)
```

Handler for LineCollection instances.

```python
Parameters
```

**marker_pad** [float] Padding between points in legend entry.

**numpoints** [int] Number of points to show in legend entry.
Notes

Any other keyword arguments are given to `HandlerNpoints`.

```python
create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, fontsize, trans)
```

```python
get_numpoints(self, legend)
```

class matplotlib.legend_handler.HandlerNpoints(marker_pad=0.3, numpoints=None, **kw)

A legend handler that shows `numpoints` points in the legend entry.

**Parameters**

- `marker_pad` [float] Padding between points in legend entry.
- `numpoints` [int] Number of points to show in legend entry.

Notes

Any other keyword arguments are given to `HandlerBase`.

```python
get_numpoints(self, legend)
```

```python
get_xdata(self, legend, xdescent, ydescent, width, height, fontsize)
```

class matplotlib.legend_handler.HandlerNpointsYoffsets(numpoints=None, yoffsets=None, **kw)

A legend handler that shows `numpoints` in the legend, and allows them to be individually offset in the y-direction.

**Parameters**

- `numpoints` [int] Number of points to show in legend entry.
- `yoffsets` [array of floats] Length `numpoints` list of y offsets for each point in legend entry.

Notes

Any other keyword arguments are given to `HandlerNpoints`.

```python
get_ydata(self, legend, xdescent, ydescent, width, height, fontsize)
```

class matplotlib.legend_handler.HandlerPatch(patch_func=None, **kw)

Handler for `Patch` instances.

**Parameters**

- `patch_func` [callable, optional] The function that creates the legend key artist. `patch_func` should have the signature:

```python
def patch_func(legend=legend, orig_handle=orig_handle, xdescent=xdescent, ydescent=ydescent, width=width, height=height, fontsize=fontsize)
```

Subsequently the created artist will have its `update_prop` method called and the appropriate transform will be applied.
Notes

Any other keyword arguments are given to `HandlerBase`.

```python
class matplotlib.legend_handler.HandlerPathCollection(yoffsets=None, sizes=None, **kw)
Handler for PathCollections, which are used by `scatter`.
```

```python
class matplotlib.legend_handler.HandlerPolyCollection(xpad=0.0, ypad=0.0, update_func=None)
Handler for `PolyCollection` used in `fill_between` and `stackplot`.
```

```python
class matplotlib.legend_handler.HandlerRegularPolyCollection(yoffsets=None, sizes=None, **kw)
Handler for `RegularPolyCollections`.
```

```python
class matplotlib.legend_handler.HandlerStem(marker_pad=0.3, numpoints=None, bottom=None, yoffsets=None, **kw)
Handler for plots produced by `stem`.
```

Parameters

- **marker_pad** [float] Padding between points in legend entry. Default is 0.3.
- **numpoints** [int, optional] Number of points to show in legend entry.
- **bottom** [float, optional]
- **yoffsets** [array of floats, optional] Length `numpoints` list of y offsets for each point in legend entry.

Notes

Any other keyword arguments are given to `HandlerNpointsYoffsets`.

```python
class matplotlib.legend_handler.HandlerTuple(ndivide=1, pad=None, **kwargs)
Handler for Tuple.
```

Additional kwargs are passed through to `HandlerBase`.
Parameters

ndivide [int, optional] The number of sections to divide the legend area into. If None, use the length of the input tuple. Default is 1.

pad [float, optional] If None, fall back to legend.borderpad as the default. In units of fraction of font size. Default is None.

create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, fontsize, trans)

matplotlib.legend_handler.update_from_first_child(tgt, src)

17.29 matplotlib.lines

This module contains all the 2D line class which can draw with a variety of line styles, markers and colors.

17.29.1 Classes

Line2D(xdata, ydata[, linewidth, linestyle, ...])  A line - the line can have both a solid linestyle connecting all the vertices, and a marker at each vertex.

VertexSelector(line)  Manage the callbacks to maintain a list of selected vertices for matplotlib.lines.Line2D.

matlabib.lines.Line2D

class matlabib.lines.Line2D(xdata, ydata, linewidth=None, linestyle=None, color=None, marker=None, markersize=None, markeredgewidth=None, markeredgecolor=None, markerfacecolor=None, markerfacecoloralt='none', fillstyle=None, antialiased=None, dash_capstyle=None, solid_capstyle=None, dash_joinstyle=None, solid_joinstyle=None, pickradius=5, drawstyle=None, markevery=None, **kwargs)

Bases: matlabib.artist.Artist

A line - the line can have both a solid linestyle connecting all the vertices, and a marker at each vertex. Additionally, the drawing of the solid line is influenced by the drawstyle, e.g., one can create “stepped” lines in various styles.

Create a Line2D instance with x and y data in sequences xdata, ydata.

The kwargs are Line2D properties:

See `set_linestyle()` for a description of the line styles, `set_marker()` for a description of the markers, and `set_drawstyle()` for a description of the draw styles.

**axes**

The *Axes* instance the artist resides in, or *None*.

**contains(self, mouseevent)**

Test whether the mouse event occurred on the line. The pick radius determines the precision of the location test (usually within five points of the value). Use `get_pickradius()` or `set_pickradius()` to view or modify it.

**Parameters**

- **mouseevent** *matplotlib.backend_bases.MouseEvent*

17.29. matplotlib.lines 1625
**Returns**

- **contains** [bool] Whether any values are within the radius.
- **details** [dict] A dictionary `{'ind': pointlist}`, where `pointlist` is a list of points of the line that are within the pickradius around the event position.

TODO: sort returned indices by distance

```python
def draw(self, renderer)
    Draw the Artist using the given renderer.
```

This method will be overridden in the Artist subclasses. Typically, it is implemented to not have any effect if the Artist is not visible (``Artist.get_visible`` is False).

**Parameters**

- **renderer** [``RendererBase`` subclass.]

```python
drawStyleKeys = ['default', 'steps-mid', 'steps-pre', 'steps-post', 'steps']
drawStyles = {'default': '_draw_lines', 'steps': '_draw_steps_pre', 'steps-mid': '_draw_steps_mid', 'steps-post': '_draw_steps_post', 'steps-pre': '_draw_steps_post'}
fillStyles = ('full', 'left', 'right', 'bottom', 'top', 'none')
filled_markers = ('o', 'v', '^', '<', '>', '8', 's', 'p', '*', 'h', 'H', 'D', 'd', 'P', 'X')
```

- **get_aa(self)**
  Alias for `get_antialiased`.

- **get_antialiased(self)**
  Return whether antialiased rendering is used.

- **get_c(self)**
  Alias for `get_color`.

- **get_color(self)**
  Return the line color.
  See also `set_color`.

- **get_dash_capstyle(self)**
  Return the cap style for dashed lines.
  See also `set_dash_capstyle`.

- **get_dash_joinstyle(self)**
  Return the join style for dashed lines.
  See also `set_dash_joinstyle`.

- **get_data(self, orig=True)**
  Return the xdata, ydata.
  If `orig` is True, return the original data.

- **get_drawstyle(self)**
  Return the drawstyle.
  See also `set_drawstyle`.

- **get_ds(self)**
  Alias for `get_drawstyle`.
get_fillstyle(self)
    Return the marker fill style.
    See also set_fillstyle.

get_linestyle(self)
    Return the linestyle.
    See also set_linestyle.

get_linewidth(self)
    Return the linewidth in points.
    See also set_linewidth.

get_ls(self)
    Alias for get_linestyle.

get_lw(self)
    Alias for get_linewidth.

get_marker(self)
    Return the line marker.
    See also set_marker.

get_markeredgecolor(self)
    Return the marker edge color.
    See also set_markeredgecolor.

get_markeredgewidth(self)
    Return the marker edge width in points.
    See also set_markeredgewidth.

get_markerfacecolor(self)
    Return the marker face color.
    See also set_markerfacecolor.

get_markerfacecoloralt(self)
    Return the alternate marker face color.
    See also set_markerfacecoloralt.

get_markersize(self)
    Return the marker size in points.
    See also set_markersize.

get_markevery(self)
    Return the markevery setting for marker subsampling.
    See also set_markevery.

get_mec(self)
    Alias for get_markeredgecolor.

get_mew(self)
    Alias for get_markeredgewidth.

get_mfc(self)
    Alias for get_markerfacecolor.
get_mfcalt(self)
    Alias for get_markerfacecoloralt.

get_ms(self)
    Alias for get_markersize.

get_path(self)
    Return the Path object associated with this line.

get_pickradius(self)
    Return the pick radius used for containment tests.
    See contains for more details.

get_solid_capstyle(self)
    Return the cap style for solid lines.
    See also set_solid_capstyle.

get_solid_joinstyle(self)
    Return the join style for solid lines.
    See also set_solid_joinstyle.

get_window_extent(self, renderer)
    Get the axes bounding box in display space.
    The bounding box’ width and height are nonnegative.
    Subclasses should override for inclusion in the bounding box “tight” calculation.
    Default is to return an empty bounding box at 0, 0.
    Be careful when using this function, the results will not update if the artist window
    extent of the artist changes. The extent can change due to any changes in the
    transform stack, such as changing the axes limits, the figure size, or the canvas
    used (as is done when saving a figure). This can lead to unexpected behavior where
    interactive figures will look fine on the screen, but will save incorrectly.

get_xdata(self, orig=True)
    Return the xdata.
    If orig is True, return the original data, else the processed data.

get_xydata(self)
    Return the xy data as a Nx2 numpy array.

get_ydata(self, orig=True)
    Return the ydata.
    If orig is True, return the original data, else the processed data.

is_dashed(self)
    Return whether line has a dashed linestyle.
    See also set_linestyle.

lineStyles = {'': '_draw_nothing', ' ': '_draw_nothing', '-': '_draw_solid', '--': '_draw_dashed', '-.': '_draw_dash_dot', ':': '_draw_dotted', 'None': '_draw_nothing'}

markers = {'.': 'point', ',': 'pixel', 'o': 'circle', 'v': 'triangle_down', '^': 'triangle_up', '<': 'triangle_left', ... 10: 'caretupbase', 11: 'caretdownbase', 'None': 'nothing', None: 'nothing', ' ': 'nothing', '': 'nothing'}

recache(self, always=False)
    recache_always(self)

set_aa(self, b)
    Alias for set_antialiased.
set_antialiased(self, b)
Set whether to use antialiased rendering.

Parameters

b [bool]

set_c(self, color)
Alias for set_color.

set_color(self, color)
Set the color of the line.

Parameters

color [color]

set_dash_capstyle(self, s)
Set the cap style for dashed lines.

Parameters

s [{'butt', 'round', 'projecting'}]

set_dash_joinstyle(self, s)
Set the join style for dashed lines.

Parameters

s [{'miter', 'round', 'bevel'}] For examples see /gallery/lines_bars_and_markers/joinstyle.

set_dashes(self, seq)
Set the dash sequence.

The dash sequence is a sequence of floats of even length describing the length of dashes and spaces in points.

For example, (5, 2, 1, 2) describes a sequence of 5 point and 1 point dashes separated by 2 point spaces.

Parameters

seq [sequence of floats (on/off ink in points) or (None, None)] If seq is empty or (None, None), the linestyle will be set to solid.

set_data(self, *args)
Set the x and y data.

Parameters

*args [(2, N) array or two 1D arrays]

set_drawstyle(self, drawstyle)
Set the drawstyle of the plot.

The drawstyle determines how the points are connected.

Parameters

drawstyle [{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'},
default: 'default'] For 'default', the points are connected with straight lines.
The steps variants connect the points with step-like lines, i.e. horizontal lines with vertical steps. They differ in the location of the step:

- ‘steps-pre’: The step is at the beginning of the line segment, i.e. the line will be at the y-value of point to the right.
- ‘steps-mid’: The step is halfway between the points.
- ‘steps-post’: The step is at the end of the line segment, i.e. the line will be at the y-value of the point to the left.
- ‘steps’ is equal to ‘steps-pre’ and is maintained for backward-compatibility.

```python
set_ds(self, drawstyle)
```
Alias for `set_drawstyle`.

```python
set_fillstyle(self, fs)
```
Set the marker fill style.

**Parameters**

- **fs** [{‘full’, ‘left’, ‘right’, ‘bottom’, ‘top’, ‘none’}] Possible values:
  - ‘full’: Fill the whole marker with the `markerfacecolor`.
  - ‘left’, ‘right’, ‘bottom’, ‘top’: Fill the marker half at the given side with the `markerfacecolor`. The other half of the marker is filled with `markerfacecoloralt`.
  - ‘none’: No filling.

For examples see `/gallery/lines_bars_and_markers/marker_fillstyle_reference`.

```python
set_linestyle(self, ls)
```
Set the linestyle of the line.

**Parameters**

- **ls** [{‘-‘, ‘--’, ‘-.’, ‘:’, ”, (offset, on-off-seq), …}] Possible values:
  - A string:
    - ‘-‘ or ‘solid’ solid line
    - ‘--‘ or ‘dashed’ dashed line
    - ‘-.’ or ‘dashdot’ dash-dotted line
    - ‘:’ or ‘dotted’ dotted line
    - ‘None’ or ‘ ’ or ‘’ draw nothing

Optionally, the string may be preceded by a drawstyle, e.g. ‘steps--’. See `set_drawstyle()` for details.

- Alternatively a dash tuple of the following form can be provided:
  ```python
  (offset, onoffseq)
  ```
  where `onoffseq` is an even length tuple of on and off ink in points.
  See also `set_dashes()`.

```python
set_linewidth(self, w)
```
Set the line width in points.
**Parameters**

- **w** [float] Line width, in points.

**set_ls**(*self, ls*)
Alias for `set_linestyle`.

**set_lw**(*self, w*)
Alias for `set_linewidth`.

**set_marker**(*self, marker*)
Set the line marker.

**Parameters**

- **marker** [marker style] See `markers` for full description of possible arguments.

**set_markeredgecolor**(*self, ec*)
Set the marker edge color.

**Parameters**

- **ec** [color]

**set_markeredgewidth**(*self, ew*)
Set the marker edge width in points.

**Parameters**

- **ew** [float] Marker edge width, in points.

**set_markerfacecolor**(*self, fc*)
Set the marker face color.

**Parameters**

- **fc** [color]

**set_markerfacecoloralt**(*self, fc*)
Set the alternate marker face color.

**Parameters**

- **fc** [color]

**set_markersize**(*self, sz*)
Set the marker size in points.

**Parameters**

- **sz** [float] Marker size, in points.

**set_markevery**(*self, every*)
Set the markevery property to subsample the plot when using markers.

* e.g., if `every=5`, every 5-th marker will be plotted.

**Parameters**

- **every** [None or int or (int, int) or slice or List[int] or float or (float, float)] Which markers to plot.
  - every=None, every point will be plotted.
  - every=N, every N-th marker will be plotted starting with marker 0.
• every=(start, N), every N-th marker, starting at point start, will be plotted.
• every=slice(start, end, N), every N-th marker, starting at point start, up to but not including point end, will be plotted.
• every=[i, j, m, n], only markers at points i, j, m, and n will be plotted.
• every=0.1, (i.e. a float) then markers will be spaced at approximately equal distances along the line; the distance along the line between markers is determined by multiplying the display-coordinate distance of the axes bounding-box diagonal by the value of every.
• every=(0.5, 0.1) (i.e. a length-2 tuple of float), the same functionality as every=0.1 is exhibited but the first marker will be 0.5 multiplied by the display-coordinate-diagonal-distance along the line.

Notes

Setting the markevery property will only show markers at actual data points. When using float arguments to set the markevery property on irregularly spaced data, the markers will likely not appear evenly spaced because the actual data points do not coincide with the theoretical spacing between markers.

When using a start offset to specify the first marker, the offset will be from the first data point which may be different from the first the visible data point if the plot is zoomed in.

If zooming in on a plot when using float arguments then the actual data points that have markers will change because the distance between markers is always determined from the display-coordinates axes-bounding-box-diagonal regardless of the actual axes data limits.

set_mec(self, ec)
   Alias for set_markeredgecolor.
set_mew(self, ew)
   Alias for set_markeredgewidth.
set_mfc(self, fc)
   Alias for set_markerfacecolor.
set_mfcalt(self, fc)
   Alias for set_markerfacecoloralt.
set_ms(self, sz)
   Alias for set_markersize.
set_picker(self, p)
   Sets the event picker details for the line.

Parameters

p [float or callable[[Artist, Event], Tuple[bool, dict]]] If a float, it is used as the pick radius in points.
set_pickradius(self, d)
    Set the pick radius used for containment tests.
    See contains for more details.

    Parameters
    d [float] Pick radius, in points.

set_solid_capstyle(self, s)
    Set the cap style for solid lines.

    Parameters
    s [{'butt', 'round', 'projecting'}]

set_solid_joinstyle(self, s)
    Set the join style for solid lines.

    Parameters
    s [{'miter', 'round', 'bevel'}] For examples see
    /gallery/lines_bars_and_markers/joinstyle.

set_transform(self, t)
    Set the Transformation instance used by this artist.

    Parameters
    t [matplotlib.transforms.Transform]

set_xdata(self, x)
    Set the data array for x.

    Parameters
    x [1D array]

set_ydata(self, y)
    Set the data array for y.

    Parameters
    y [1D array]

update_from(self, other)
    Copy properties from other to self.

validCap = ('butt', 'round', 'projecting')
validJoin = ('miter', 'round', 'bevel')
verticalOffset
zorder = 2

matplotlib.lines.VertexSelector

class matplotlib.lines.VertexSelector(line):
    Bases: object

    Manage the callbacks to maintain a list of selected vertices for `matplotlib.lines.Line2D`.
    Derived classes should override `process_selected()` to do something with the picks.

    Here is an example which highlights the selected verts with red circles:

    ```python
    import numpy as np
    import matplotlib.pyplot as plt
    import matplotlib.lines as lines

    class HighlightSelected(lines.VertexSelector):
        def __init__(self, line, fmt='ro', **kwargs):
            lines.VertexSelector.__init__(self, line)
            self.markers, = self.axes.plot([], [], fmt, **kwargs)

        def process_selected(self, ind, xs, ys):
            self.markers.set_data(xs, ys)
            self.canvas.draw()

    fig, ax = plt.subplots()
x, y = np.random.rand(2, 30)
line, = ax.plot(x, y, 'bs-', picker=5)
selector = HighlightSelected(line)
plt.show()
```

Initialize the class with a `matplotlib.lines.Line2D` instance. The line should already be added to some `matplotlib.axes.Axes` instance and should have the picker property set.

`onpick(self, event)`

When the line is picked, update the set of selected indices.

`process_selected(self, ind, xs, ys)`

Default “do nothing” implementation of the `process_selected()` method.

`ind` are the indices of the selected vertices. `xs` and `ys` are the coordinates of the selected vertices.
17.29.2 Functions

\texttt{segment\_hits}(cx, cy, x, y, radius) \hspace{1cm} \text{Return the indices of the segments in the polyline with coordinates (cx, cy) that are within a distance radius of the point (x, y).}

\texttt{matplotlib\_lines.segment\_hits}

\texttt{matplotlib\_lines.segment\_hits}(cx, cy, x, y, radius)

\hspace{1cm} \text{Return the indices of the segments in the polyline with coordinates (cx, cy) that are within a distance radius of the point (x, y).}

17.30 \texttt{matplotlib.markers}

This module contains functions to handle markers. Used by both the marker functionality of \texttt{plot} and \texttt{scatter}.

All possible markers are defined here:

<table>
<thead>
<tr>
<th>marker</th>
<th>symbol</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;.&quot;</td>
<td>•</td>
<td>point</td>

<td>$f$</td>
<td>Render the string using mathtext. E.g &quot;$f$&quot; for marker showing the letter f.</td>
</tr>
</tbody>
</table>

verts

A list of (x, y) pairs used for Path vertices. The center of the marker is located at (0,0) and the size is normalized, such that the created path is encapsulated inside the unit cell.

path

A Path instance.

Continued on next page
The marker can also be a tuple \((\text{numsides}, \text{style}, \text{angle})\), which will create a custom, regular symbol.

\textbf{numsides:} the number of sides

\textbf{style:} the style of the regular symbol:

- 0: a regular polygon
- 1: a star-like symbol
- 2: an asterisk
- 3: a circle \((\text{numsides} \text{ and angle is ignored});\) deprecated.

\textbf{angle:} the angle of rotation of the symbol

For backward compatibility, the form \((\text{verts}, 0)\) is also accepted, but it is deprecated and equivalent to just \text{verts} for giving a raw set of vertices that define the shape.

\texttt{None} is the default which means ‘nothing’, however this table is referred to from other docs for the valid inputs from marker inputs and in those cases \texttt{None} still means ‘default’.

Note that special symbols can be defined via the \textit{STIX math font}, e.g. \("\$\$\". For an overview over the STIX font symbols refer to the \textit{STIX font table}. Also see the \texttt{/gallery/text_labels_and_annotations/stix_fonts_demo}.

Integer numbers from 0 to 11 create lines and triangles. Those are equally accessible via capitalized variables, like \texttt{CARETDOWNBASE}. Hence the following are equivalent:

```python
plt.plot([1,2,3], marker=11)
plt.plot([1,2,3], marker=matplotlib.markers.CARETDOWNBASE)
```

Examples showing the use of markers:

- \texttt{/gallery/lines_bars_and_markers/marker_reference}
- \texttt{/gallery/lines_bars_and_markers/marker_fillstyle_reference}
- \texttt{/gallery/shapes_and_collections/marker_path}

\section*{17.30.1 Classes}
**MarkerStyle**([marker, fillstyle])

**Parameters**

*marker* [string or array like, optional, default: None] See the descriptions of possible markers in the module docstring.

**Attributes**

*markers* [list of known marks]

*fillstyles* [list of known fillstyles]

*filled_markers* [list of known filled markers.]

```
filled_markers = ('$o$', '$v$', '$^$', '$<$', '$>$', '$8$', '$s$', '$p$', '$*$', '$h$', '$H$', '$D$', '$d$', '$P$', '$X$')
fillstyles = ('full', 'left', 'right', 'bottom', 'top', 'none')
```

**get_transform**(self)

**is_filled**(self)

*markers* = {
'.': 'point', ',': 'pixel', 'o': 'circle', 'v': 'triangle_down', '^': 'triangle_up', ...

**set_fillstyle**(self, fillstyle)

Sets fillstyle

**Parameters**

*fillstyle* [string amongst known fillstyles]

**set_marker**(self, marker)
**17.31 matplotlib.mathtext**

`matplotlib.mathtext` is a module for parsing a subset of the TeX math syntax and drawing them to a `matplotlib` backend.

For a tutorial of its usage see *Writing mathematical expressions*. This document is primarily concerned with implementation details.

The module uses `pyparsing` to parse the TeX expression.

The Bakoma distribution of the TeX Computer Modern fonts, and STIX fonts are supported. There is experimental support for using arbitrary fonts, but results may vary without proper...
tweaking and metrics for those fonts.

class matplotlib.mathtext.Accent(c, state, math=True)
   Bases: matplotlib.mathtext.Char
   The font metrics need to be dealt with differently for accents, since they are already
   offset correctly from the baseline in TrueType fonts.
   grow(self)
      Grows one level larger. There is no limit to how big something can get.
   render(self, x, y)
      Render the character to the canvas.
   shrink(self)
      Shrinks one level smaller. There are only three levels of sizes, after which things
      will no longer get smaller.

class matplotlib.mathtext.AutoHeightChar(c, height, depth, state, always=False, factor=None)
   Bases: matplotlib.mathtext.Hlist
   AutoHeightChar will create a character as close to the given height and depth as possible.
   When using a font with multiple height versions of some characters (such as the BaKoMa
   fonts), the correct glyph will be selected, otherwise this will always just return a scaled
   version of the glyph.

class matplotlib.mathtext.AutoWidthChar(c, width, state, always=False, char_class=matplotlib.mathtext.Char)
   Bases: matplotlib.mathtext.Hlist
   AutoWidthChar will create a character as close to the given width as possible. When using
   a font with multiple width versions of some characters (such as the BaKoMa fonts), the
   correct glyph will be selected, otherwise this will always just return a scaled version of
   the glyph.

class matplotlib.mathtext.BakomaFonts(*args, **kwargs)
   Bases: matplotlib.mathtext.TruetypeFonts
   Use the Bakoma TrueType fonts for rendering.
   Symbols are strewn about a number of font files, each of which has its own proprietary
   8-bit encoding.
   alias = '\\'
   get_sized_alternatives_for_symbol(self, fontname, sym)
      Override if your font provides multiple sizes of the same symbol. Should return a
      list of symbols matching sym in various sizes. The expression renderer will select
      the most appropriate size for a given situation from this list.
   target = ']' 

class matplotlib.mathtext.Box(width, height, depth)
   Bases: matplotlib.mathtext.Node
   Represents any node with a physical location.
   grow(self)
      Grows one level larger. There is no limit to how big something can get.
   render(self, x1, y1, x2, y2)
shrink(self)
    Shrinks one level smaller. There are only three levels of sizes, after which things
    will no longer get smaller.

class matplotlib.mathtext.Char(c, state, math=True)
    Bases: matplotlib.mathtext.Node

    Represents a single character. Unlike TeX, the font information and metrics are stored
    with each Char to make it easier to lookup the font metrics when needed. Note that
    TeX boxes have a width, height, and depth, unlike Type1 and TrueType which use a full
    bounding box and an advance in the x-direction. The metrics must be converted to the
    TeX way, and the advance (if different from width) must be converted into a Kern node
    when the Char is added to its parent Hlist.

    get_kerning(self, next)
        Return the amount of kerning between this and the given character. Called when
        characters are strung together into Hlist to create Kern nodes.

grow(self)
    Grows one level larger. There is no limit to how big something can get.

is_slanted(self)

render(self, x, y)
    Render the character to the canvas

shrink(self)
    Shrinks one level smaller. There are only three levels of sizes, after which things
    will no longer get smaller.

class matplotlib.mathtext.ComputerModernFontConstants
    Bases: matplotlib.mathtext.FontConstantsBase

delta = 0.075
delta_integral = 0.3
delta_slanted = 0.3
script_space = 0.075
sub1 = 0.2
sub2 = 0.3
subdrop = 0.2
sup1 = 0.45

class matplotlib.mathtext.DejaVuFonts(*args, **kwargs)
    Bases: matplotlib.mathtext.UnicodeFonts

    use_cmex = False

class matplotlib.mathtext.DejaVuSansFontConstants
    Bases: matplotlib.mathtext.FontConstantsBase

class matplotlib.mathtext.DejaVuSansFonts(*args, **kwargs)
    Bases: matplotlib.mathtext.DejaVuFonts

    A font handling class for the DejaVu Sans fonts
    If a glyph is not found it will fallback to Stix Sans
class matplotlib.mathtext.DejaVuSerifFontConstants
    Bases: matplotlib.mathtext.FontConstantsBase

class matplotlib.mathtext.DejaVuSerifFonts(*args, **kwargs)
    Bases: matplotlib.mathtext.DejaVuFonts
    A font handling class for the DejaVu Serif fonts
    If a glyph is not found it will fallback to Stix Serif

matplotlib.mathtext.Error(msg)
    Helper class to raise parser errors.

class matplotlib.mathtext.Fill
    Bases: matplotlib.mathtext.Glue

class matplotlib.mathtext.Fill1
    Bases: matplotlib.mathtext.Glue

class matplotlib.mathtext.FontConstantsBase
    Bases: object
    A set of constants that controls how certain things, such as sub- and superscripts are
    laid out. These are all metrics that can't be reliably retrieved from the font metrics in
    the font itself.
    delta = 0.025
    delta_integral = 0.1
    delta_slanted = 0.2
    script_space = 0.05
    sub1 = 0.3
    sub2 = 0.5
    subdrop = 0.4
    sup1 = 0.7

class matplotlib.mathtext.Fonts(default_font_prop, mathtext_backend)
    Bases: object
    An abstract base class for a system of fonts to use for mathtext.
    The class must be able to take symbol keys and font file names and return the character
    metrics. It also delegates to a backend class to do the actual drawing.
    default_font_prop: A FontProperties object to use for the default non-math font, or the
    base font for Unicode (generic) font rendering.
    mathtext_backend: A subclass of MathTextBackend used to delegate the actual rendering.

    destroy(self)
        Fix any cyclical references before the object is about to be destroyed.

    get_kern(self, font1, fontclass1, sym1, fontsize1, font2, fontclass2, sym2, fontsize2, dpi)
        Get the kerning distance for font between sym1 and sym2.
fontX: one of the TeX font names:

```
tt, it, rm, cal, sf, bf or default/regular (non-math)
```

fontclassX: TODO

symX: a symbol in raw TeX form. e.g., ‘1’, ‘x’ or ‘sigma’

 fontsizeX: the font size in points

dpiX: the current dots-per-inch

```python
get_metrics(self, font, font_class, sym, fontsize, dpi, math=True)
```

font: one of the TeX font names:

```
tt, it, rm, cal, sf, bf or default/regular (non-math)
```

font_classX: TODO

symX: a symbol in raw TeX form. e.g., ‘1’, ‘x’ or ‘sigma’

 fontsize: font size in points

dpi: current dots-per-inch

mathX: whether sym is a math character

Returns an object with the following attributes:

- **advance**: The advance distance (in points) of the glyph.
- **height**: The height of the glyph in points.
- **width**: The width of the glyph in points.
- **xmin, xmax, ymin, ymax**: the ink rectangle of the glyph
- **iceberg**: the distance from the baseline to the top of the glyph. This corresponds to TeX’s definition of “height”.

```python
get_results(self, box)
```

Get the data needed by the backend to render the math expression. The return value is backend-specific.

```python
get_sized_alternatives_for_symbol(self, fontname, sym)
```

Override if your font provides multiple sizes of the same symbol. Should return a list of symbols matching sym in various sizes. The expression renderer will select the most appropriate size for a given situation from this list.

```python
get_underline_thickness(self, font, fontsize, dpi)
```

Get the line thickness that matches the given font. Used as a base unit for drawing lines such as in a fraction or radical.

```python
get_used_characters(self)
```

Get the set of characters that were used in the math expression. Used by backends that need to subset fonts so they know which glyphs to include.

```python
get_xheight(self, font, fontsize, dpi)
```

Get the xheight for the given font and fontsize.

```python
render_glyph(self, ox, oy, facename, font_class, sym, fontsize, dpi)
```

Draw a glyph at

- ox, oyX: position
• `facename`: One of the TeX face names
• `font_class`:
• `sym`: TeX symbol name or single character
• `fontsize`: fontsize in points
• `dpi`: The dpi to draw at.

```python
def render_rect_filled(self, x1, y1, x2, y2)
    Draw a filled rectangle from (x1, y1) to (x2, y2).
```

```python
def set_canvas_size(self, w, h, d)
    Set the size of the buffer used to render the math expression. Only really necessary
    for the bitmap backends.
```

class Glue(glue_type, copy=False)
    Bases: mathtext.Node
    Most of the information in this object is stored in the underlying `GlueSpec` class, which
    is shared between multiple glue objects. (This is a memory optimization which probably
doesn’t matter anymore, but it’s easier to stick to what TeX does.)

```python
def grow(self)
    Grows one level larger. There is no limit to how big something can get.
```

```python
def shrink(self)
    Shrinks one level smaller. There are only three levels of sizes, after which things
    will no longer get smaller.
```

class GlueSpec(width=0.0, stretch=0.0, stretch_order=0,
               shrink=0.0, shrink_order=0)
    Bases: object
    See `Glue`.

class factory(glue_type)
```

class HCentered(elements)
    Bases: mathtext.Hlist
    A convenience class to create an `Hlist` whose contents are centered within its enclosing
    box.

class Hbox(width)
    Bases: mathtext.Box
    A box with only width (zero height and depth).

class Hlist(elements, w=0.0, m=’additional’, do_kern=True)
    Bases: mathtext.List
    A horizontal list of boxes.

```python
def hpack(self, w=0.0, m=’additional’)
    The main duty of `hpack()` is to compute the dimensions of the resulting boxes, and
to adjust the glue if one of those dimensions is pre-specified. The computed sizes
normally enclose all of the material inside the new box; but some items may stick
out if negative glue is used, if the box is overfull, or if a `\vbox` includes other boxes
that have been shifted left.
```

• `w`: specifies a width
• \( m \): is either ‘exactly’ or ‘additional’.

Thus, \( \text{hpack}(w, \text{'exactly'}) \) produces a box whose width is exactly \( w \), while \( \text{hpack}(w, \text{'additional'}) \) yields a box whose width is the natural width plus \( w \). The default values produce a box with the natural width.

\( \text{kern}(self) \)
Insert \( \text{Kern} \) nodes between \( \text{Char} \) nodes to set kerning. The \( \text{Char} \) nodes themselves determine the amount of kerning they need (in \( \text{get_kerning()} \)), and this function just creates the linked list in the correct way.

class matplotlib.mathtext.Hrule(state, thickness=None)
Bases: matplotlib.mathtext.Rule

Convenience class to create a horizontal rule.

class matplotlib.mathtext.Kern(width)
Bases: matplotlib.mathtext.Node

A \( \text{Kern} \) node has a width field to specify a (normally negative) amount of spacing. This spacing correction appears in horizontal lists between letters like A and V when the font designer said that it looks better to move them closer together or further apart. A kern node can also appear in a vertical list, when its \( \text{width} \) denotes additional spacing in the vertical direction.

depth = 0

grow(self)
Grows one level larger. There is no limit to how big something can get.

height = 0

shrink(self)
Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

class matplotlib.mathtext.List(elements)
Bases: matplotlib.mathtext.Box

A list of nodes (either horizontal or vertical).

grow(self)
Grows one level larger. There is no limit to how big something can get.

shrink(self)
Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

class matplotlib.mathtext.MathTextParser(output)
Bases: object

Create a MathTextParser for the given backend \( \text{output} \).

def get_depth(self, texstr, dpi=120, fontsize=14)

Parameters

texstr [str] A valid mathtext string, e.g., r’IQ: \$\sigma_i=15\$’.

dpi [float] The dots-per-inch setting used to render the text.

Returns

depth [int] Offset of the baseline from the bottom of the image, in pixels.
parse(self, s, dpi=72, prop=None)
Parse the given math expression s at the given dpi. If prop is provided, it is a FontProperties object specifying the "default" font to use in the math expression, used for all non-math text.

The results are cached, so multiple calls to parse() with the same expression should be fast.

to_mask(self, texstr, dpi=120, fontsize=14)
Parameters
texstr [str] A valid mathtext string, e.g., r'\text{IQ}: \sigma_i=15$'.
dpi [float] The dots-per-inch setting used to render the text.
fontsize [int] The font size in points

Returns
depth [int] Offset of the baseline from the bottom of the image, in pixels.

to_png(self, filename, texstr, color='black', dpi=120, fontsize=14)
Render a tex expression to a PNG file.
Parameters
filename A writable filename or fileobject.
texstr [str] A valid mathtext string, e.g., r'\text{IQ}: \sigma_i=15$'.
color [color] The text color.
dpi [float] The dots-per-inch setting used to render the text.
fontsize [int] The font size in points.

Returns
depth [int] Offset of the baseline from the bottom of the image, in pixels.

to_rgba(self, texstr, color='black', dpi=120, fontsize=14)
Parameters
texstr [str] A valid mathtext string, e.g., r'\text{IQ}: \sigma_i=15$'.
color [color] The text color.
dpi [float] The dots-per-inch setting used to render the text.
fontsize [int] The font size in points.

Returns
array [(M, N, 4) array] RGBA color values of rasterized tex, colorized with color.
depth [int] Offset of the baseline from the bottom of the image, in pixels.

exception matplotlib.mathtext.MathTextWarning
Bases: Warning
The class `MathtextBackend` is the base class for the mathtext backend-specific code. The purpose of `MathtextBackend` subclasses is to interface between mathtext and a specific matplotlib graphics backend.

Subclasses need to override the following:

- `render_glyph()`
- `render_rect_filled()`
- `get_results()`

And optionally, if you need to use a FreeType hinting style:

- `get_hinting_type()`

```python
class matplotlib.mathtext.MathtextBackend:
    Bases: object
    The base class for the mathtext backend-specific code. The purpose of `MathtextBackend` subclasses is to interface between mathtext and a specific matplotlib graphics backend.
    Subclasses need to override the following:
    • `render_glyph()`
    • `render_rect_filled()`
    • `get_results()`
    And optionally, if you need to use a FreeType hinting style:
    • `get_hinting_type()`

get_hinting_type(self)
    Get the FreeType hinting type to use with this particular backend.

get_results(self, box)
    Return a backend-specific tuple to return to the backend after all processing is done.

render_glyph(self, ox, oy, info)
    Draw a glyph described by `info` to the reference point `(ox, oy)`.

render_rect_filled(self, x1, y1, x2, y2)
    Draw a filled black rectangle from `(x1, y1)` to `(x2, y2)`.

set_canvas_size(self, w, h, d)
    Dimension the drawing canvas
```

```python
class matplotlib.mathtext.MathtextBackendAgg:
    Bases: matplotlib.mathtext.MathtextBackend
    Render glyphs and rectangles to an FTImage buffer, which is later transferred to the Agg image by the Agg backend.

get_hinting_type(self)
    Get the FreeType hinting type to use with this particular backend.

get_results(self, box, used_characters)
    Return a backend-specific tuple to return to the backend after all processing is done.

render_glyph(self, ox, oy, info)
    Draw a glyph described by `info` to the reference point `(ox, oy)`.

render_rect_filled(self, x1, y1, x2, y2)
    Draw a filled black rectangle from `(x1, y1)` to `(x2, y2)`.

set_canvas_size(self, w, h, d)
    Dimension the drawing canvas
```

```python
class matplotlib.mathtext.MathtextBackendBitmap:
    Bases: matplotlib.mathtext.MathtextBackendAgg
    get_results(self, box, used_characters)
        Return a backend-specific tuple to return to the backend after all processing is done.

```

```python
class matplotlib.mathtext.MathtextBackendCairo:
    Bases: matplotlib.mathtext.MathtextBackend
    Store information to write a mathtext rendering to the Cairo backend.
```

1648 Chapter 17. Modules
get_results(self, box, used_characters)
Return a backend-specific tuple to return to the backend after all processing is done.

render_glyph(self, ox, oy, info)
Draw a glyph described by info to the reference point (ox, oy).

render_rect_filled(self, x1, y1, x2, y2)
Draw a filled black rectangle from (x1, y1) to (x2, y2).

class matplotlib.mathtext.MathtextBackendPath
Bases: matplotlib.mathtext.MathtextBackend
Store information to write a mathtext rendering to the text path machinery.

class matplotlib.mathtext.MathtextBackendPdf
Bases: matplotlib.mathtext.MathtextBackend
Store information to write a mathtext rendering to the PDF backend.

class matplotlib.mathtext.MathtextBackendPs
Bases: matplotlib.mathtext.MathtextBackend
Store information to write a mathtext rendering to the PostScript backend.

class matplotlib.mathtext.MathtextBackendSvg
Bases: matplotlib.mathtext.MathtextBackend
Store information to write a mathtext rendering to the SVG backend.
class matplotlib.mathtext.NegFil
    Bases: matplotlib.mathtext.Glue

class matplotlib.mathtext.NegFill
    Bases: matplotlib.mathtext.Glue

class matplotlib.mathtext.NegFillI
    Bases: matplotlib.mathtext.Glue

class matplotlib.mathtext.Node
    Bases: object
    A node in the TeX box model

    get_kerning(self, next)

    grow(self)
        Grows one level larger. There is no limit to how big something can get.

    render(self, x, y)

    shrink(self)
        Shrinks one level smaller. There are only three levels of sizes, after which things
        will no longer get smaller.

class matplotlib.mathtext.Parser
    Bases: object
    This is the pyparsing-based parser for math expressions. It actually parses full strings
    containing math expressions, in that raw text may also appear outside of pairs of $.

    The grammar is based directly on that in TeX, though it cuts a few corners.

class State(font_output, font, font_class, fontsize, dpi)
    Bases: object
    Stores the state of the parser.

    States are pushed and popped from a stack as necessary, and the “current” state is
    always at the top of the stack.

    copy(self)

    font

    accent(self, s, loc, toks)

    auto_delim(self, s, loc, toks)

    binom(self, s, loc, toks)

    c_over_c(self, s, loc, toks)

    customspace(self, s, loc, toks)

    dfrac(self, s, loc, toks)

    end_group(self, s, loc, toks)

    font(self, s, loc, toks)

    frac(self, s, loc, toks)

    function(self, s, loc, toks)

    genfrac(self, s, loc, toks)
```python
def get_state(self):
    """Get the current State of the parser."""

def group(self, s, loc, toks):

def is_between_brackets(self, s, loc):

def is_dropsub(self, nucleus):

def is_overunder(self, nucleus):

def is_slanted(self, nucleus):

def main(self, s, loc, toks):

def math(self, s, loc, toks):

def math_string(self, s, loc, toks):

def non_math(self, s, loc, toks):

def operatorname(self, s, loc, toks):

def overline(self, s, loc, toks):

def parse(self, s, fonts_object, fontsize, dpi):
    """Parse expression s using the given fonts_object for output, at the given fontsize and dpi.
    Returns the parse tree of Node instances."""

def pop_state(self):
    """Pop a State off of the stack."""

def push_state(self):
    """Push a new State onto the stack which is just a copy of the current state."""

def required_group(self, s, loc, toks):

def simple_group(self, s, loc, toks):

def snowflake(self, s, loc, toks):

def space(self, s, loc, toks):

def sqrt(self, s, loc, toks):

def stackrel1(self, s, loc, toks):
    [Deprecated]

Notes

Deprecated since version 3.1:

start_group(self, s, loc, toks):

subsuper(self, s, loc, toks):

symbol(self, s, loc, toks):

unknown_symbol(self, s, loc, toks):
```

```
```
A **Rule** node stands for a solid black rectangle; it has *width*, *depth*, and *height* fields just as in an *Hlist*. However, if any of these dimensions is inf, the actual value will be determined by running the rule up to the boundary of the innermost enclosing box. This is called a “running dimension.” The width is never running in an *Hlist*; the height and depth are never running in a *Vlist*.

```python
def render(self, x, y, w, h)
```

```python
class matplotlib.mathtext.STIXFontConstants
    Bases: matplotlib.mathtext.FontConstantsBase
delta = 0.05
delta_integra = 0.3
delta_slanted = 0.3
script_space = 0.1
sub2 = 0.6
sub1 = 0.8
```

```python
class matplotlib.mathtext.STIXSansFontConstants
    Bases: matplotlib.mathtext.FontConstantsBase
delta_integral = 0.3
delta_slanted = 0.6
script_space = 0.05
sub1 = 0.8
```

```python
class matplotlib.mathtext.Ship
    Bases: object
    Once the boxes have been set up, this sends them to output. Since boxes can be inside of boxes inside of boxes, the main work of Ship is done by two mutually recursive routines, *hlist_out()* and *vlist_out()*), which traverse the Hlist nodes and Vlist nodes inside of horizontal and vertical boxes. The global variables used in TeX to store state as it processes have become member variables here.

```python
static clamp(value)
```

```python
hlist_out(self, box)
```

```python
tlist_out(self, box)
```

```python
class matplotlib.mathtext.SsGlue
    Bases: matplotlib.mathtext.Glue
```

```python
class matplotlib.mathtext.StandardPsFonts(default_font_prop)
    Bases: matplotlib.mathtext.Fonts
    Use the standard postscript fonts for rendering to backend_ps
    Unlike the other font classes, BakomaFont and UnicodeFont, this one requires the Ps backend.

```python
basepath = '/home/tcaswell/.virtualenvs/mpl313/lib/python3.8/site-packages/matplotlib/mpl-data/fonts/afm'
fontmap = {'cal': 'pzcmi8a', 'rm': 'pncr8a', 'tt': 'pcrr8a', 'it': 'pncri8a', 'sf': 'phvr8a', 'bf': 'pncb8a'}
```
get_kern(self, font1, fontclass1, sym1, fontsize1, font2, fontclass2, sym2, fontsize2, dpi)

Get the kerning distance for font between sym1 and sym2.

fontX: one of the TeX font names:

| tt, it, rm, cal, sf, bf | default/regular (non-math) |

fontclassX: TODO

symX: a symbol in raw TeX form. e.g., '1', 'x' or 'sigma'

fontsizeX: the fontsize in points

dpi: the current dots-per-inch

get_underline_thickness(self, font, fontsize, dpi)

Get the line thickness that matches the given font. Used as a base unit for drawing lines such as in a fraction or radical.

get_xheight(self, font, fontsize, dpi)

Get the xheight for the given font and fontsize.

class matplotlib.mathtext.StixFonts(*args, **kwargs)

Bases: matplotlib.mathtext.UnicodeFonts

A font handling class for the STIX fonts.

In addition to what UnicodeFonts provides, this class:

• supports “virtual fonts” which are complete alpha numeric character sets with different font styles at special Unicode code points, such as “Blackboard”.

• handles sized alternative characters for the STIXSizeX fonts.

cm_fallback = False

get sized alternatives for symbol(self, fontname, sym)

Override if your font provides multiple sizes of the same symbol. Should return a list of symbols matching sym in various sizes. The expression renderer will select the most appropriate size for a given situation from this list.

use_cmex = False

class matplotlib.mathtext.StixSansFonts(*args, **kwargs)

Bases: matplotlib.mathtext.StixFonts

A font handling class for the STIX fonts (that uses sans-serif characters by default).

class matplotlib.mathtext.SubSuperCluster

Bases: matplotlib.mathtext.Hlist

SubSuperCluster is a sort of hack to get around that fact that this code do a two-pass parse like TeX. This lets us store enough information in the hlist itself, namely the nucleus, sub- and super-script, such that if another script follows that needs to be attached, it can be reconfigured on the fly.

class matplotlib.mathtext.TruetypeFonts(default_font_prop, mathtext_backend)

Bases: matplotlib.mathtext.Fonts

A generic base class for all font setups that use Truetype fonts (through FT2Font).

destroy(self)

Fix any cyclical references before the object is about to be destroyed.
get_kern(self, font1, fontclass1, sym1, fontsize1, font2, fontclass2, sym2, fontsize2, dpi)
Get the kerning distance for font between sym1 and sym2.

fontX: one of the TeX font names:

```	t, it, rm, cal, sf, bf or default/regular (non-math)
```

fontclassX: TODO

symX: a symbol in raw TeX form. e.g., '1', 'x' or 'sigma'

fontsizeX: the fontsize in points

dpi: the current dots-per-inch

generate_undefined_length(self, fontname, fontsize, dpi)
Get the length that matches the given font. Used as a base unit for drawing
lines such as in a fraction or radical.

generate_undefined_height(self, fontname, fontsize, dpi)
Get the height for the given font and fontsize.

class matplotlib.mathtext.UnicodeFonts(*args, **kwargs)
Bases: matplotlib.mathtext.TruetypeFonts
An abstract base class for handling Unicode fonts.
While some reasonably complete Unicode fonts (such as DejaVu) may work in some situations, the only Unicode font I’m aware of with a complete set of math symbols is STIX. This class will “fallback” on the Bakoma fonts when a required symbol can not be found in the font.

generate_undefined_width(self, fontname, fontsize, dpi)
Override if your font provides multiple sizes of the same symbol. Should return a list of symbols matching sym in various sizes. The expression renderer will select the most appropriate size for a given situation from this list.

use_cmex = True
class matplotlib.mathtext.VCentered(elements)
Bases: matplotlib.mathtext.Hlist
A convenience class to create a Vlist whose contents are centered within its enclosing box.

class matplotlib.mathtext.Vbox(height, depth)
Bases: matplotlib.mathtext.Box
A box with only height (zero width).

class matplotlib.mathtext.Vlist(elements, h=0.0, m='additional')
Bases: matplotlib.mathtext.List
A vertical list of boxes.
vpack(self, h=0.0, m='additional', l=inf)
The main duty of vpack() is to compute the dimensions of the resulting boxes, and to adjust the glue if one of those dimensions is pre-specified.

- h: specifies a height
- m: is either ‘exactly’ or ‘additional’.
• \( l \): a maximum height

Thus, \( \text{vpack}(h, \text{‘exactly’}) \) produces a box whose height is exactly \( h \), while \( \text{vpack}(h, \text{‘additional’}) \) yields a box whose height is the natural height plus \( h \). The default values produce a box with the natural width.

class matplotlib.mathtext.Vrule(state)

Bases: matplotlib.mathtext.Rule

Convenience class to create a vertical rule.

matplotlib.mathtext.get_unicode_index(symbol, math=True)

Return the integer index (from the Unicode table) of symbol.

Parameters

symbol [str] A single unicode character, a TeX command (e.g. r‘pi’) or a Type1 symbol name (e.g. ‘phi’).

math [bool, default is True] If False, always treat as a single unicode character.

matplotlib.mathtext.math_to_image(s, filename_or_obj, prop=None, dpi=None, format=None)

Given a math expression, renders it in a closely-clipped bounding box to an image file.

s A math expression. The math portion should be enclosed in dollar signs.

filename_or_obj A filepath or writable file-like object to write the image data to.

prop If provided, a FontProperties() object describing the size and style of the text.

dpi Override the output dpi, otherwise use the default associated with the output format.

format The output format, e.g., ‘svg’, ‘pdf’, ‘ps’ or ‘png’. If not provided, will be deduced from the filename.

17.32 matplotlib.mlab

Numerical python functions written for compatibility with MATLAB commands with the same names. Most numerical python functions can be found in the numpy and scipy libraries. What remains here is code for performing spectral computations.

17.32.1 Spectral functions

cohere Coherence (normalized cross spectral density)

csd Cross spectral density using Welch’s average periodogram

detrend Remove the mean or best fit line from an array

psd Power spectral density using Welch’s average periodogram

specgram Spectrogram (spectrum over segments of time)

complex_spectrum Return the complex-valued frequency spectrum of a signal

magnitude_spectrum Return the magnitude of the frequency spectrum of a signal

angle_spectrum Return the angle (wrapped phase) of the frequency spectrum of a signal
phase_spectrum  Return the phase (unwrapped angle) of the frequency spectrum of a signal

detrend_mean  Remove the mean from a line.

detrend_linear  Remove the best fit line from a line.

detrend_none  Return the original line.

stride_windows  Get all windows in an array in a memory-efficient manner

stride_repeat  Repeat an array in a memory-efficient manner

apply_window  Apply a window along a given axis

class matplotlib.mlab.GaussianKDE(dataset, bw_method=None)

Representation of a kernel-density estimate using Gaussian kernels.

Parameters

dataset  [array_like] Datapoints to estimate from. In case of univariate data this is a 1-D array, otherwise a 2-D array with shape (# of dims, # of data).

bw_method  [str, scalar or callable, optional] The method used to calculate the estimator bandwidth. This can be ‘scott’, ‘silverman’, a scalar constant or a callable. If a scalar, this will be used directly as kde.factor. If a callable, it should take a GaussianKDE instance as only parameter and return a scalar. If None (default), ‘scott’ is used.

Attributes

dataset  [ndarray] The dataset with which gaussian_kde was initialized.

dim  [int] Number of dimensions.

num_dp  [int] Number of datapoints.

factor  [float] The bandwidth factor, obtained from kde.covariance_factor, with which the covariance matrix is multiplied.

covariance  [ndarray] The covariance matrix of dataset, scaled by the calculated bandwidth (kde.factor).

inv_cov  [ndarray] The inverse of covariance.

Methods

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>kde.evaluate(points)</td>
<td>(ndarray) Evaluate the estimated pdf on a provided set of points.</td>
</tr>
<tr>
<td>kde(points)</td>
<td>(ndarray) Same as kde.evaluate(points)</td>
</tr>
</tbody>
</table>

covariance_factor(self)

evaluate(self, points)

Evaluate the estimated pdf on a set of points.

Parameters

points  [(# of dimensions, # of points)-array] Alternatively, a (# of dimensions,) vector can be passed in and treated as a single point.
**Returns**

**values** [(# of points,)-array] The values at each point.

**Raises**

**ValueError** [if the dimensionality of the input points is different] than the dimensionality of the KDE.

```python
scotts_factor(self)
silverman_factor(self)
```

**matplotlib.mlab.angle_spectrum(x, Fs=None, window=None, pad_to=None, sides=None)**

Compute the angle of the frequency spectrum (wrapped phase spectrum) of x. Data is padded to a length of `pad_to` and the windowing function `window` is applied to the signal.

**Parameters**

- **x** [1-D array or sequence] Array or sequence containing the data
- **Fs** [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, `freqs`, in cycles per time unit. The default value is 2.
- **window** [callable or ndarray] A function or a vector of length `NFFT`. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. The default is `window_hanning`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.
- **sides** [{‘default’, ‘onesided’, ‘twosided’}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.
- **pad_to** [int] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the `n` parameter in the call to `fft()`. The default is None, which sets `pad_to` equal to the length of the input signal (i.e. no padding).

**Returns**

- **spectrum** [1-D array] The values for the angle spectrum in radians (real valued)
- **freqs** [1-D array] The frequencies corresponding to the elements in `spectrum`

**See also:**

- `complex_spectrum` This function returns the angle value of `complex_spectrum`.
- `magnitude_spectrum` Returns the magnitudes of the corresponding frequencies.
- `phase_spectrum` Returns the phase (unwrapped angle) of the corresponding frequencies.
- `specgram` Can return the complex spectrum of segments within the signal.
Apply the given window to the given 1D or 2D array along the given axis.

Parameters

- **x**: [1D or 2D array or sequence] Array or sequence containing the data.
- **window**: [function or array.] Either a function to generate a window or an array with length x.shape[axis]
- **axis**: [integer] The axis over which to do the repetition. Must be 0 or 1. The default is 0
- **return_window**: [bool] If true, also return the 1D values of the window that was applied

The coherence between x and y. Coherence is the normalized cross spectral density:

\[ C_{xy} = \frac{|P_{xy}|^2}{P_{xx}P_{yy}} \]

Parameters

- **x, y**: Array or sequence containing the data
- **Fs**: [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.
- **window**: [callable or ndarray] A function or a vector of length NFFT. To create window vectors see window_hanning, window_none, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. The default is window_hanning. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.
- **sides**: [{’default’, ‘onesided’, ‘twosided’}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.
- **pad_to**: [int] The number of points to which the data segment is padded when performing the FFT. This can be different from NFFT, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the n parameter in the call to fft(). The default is None, which sets pad_to equal to NFFT
- **NFFT**: [int] The number of data points used in each block for the FFT. A power 2 is most efficient. The default value is 256. This should NOT be used to get zero padding, or the scaling of the result will be incorrect. Use pad_to for this instead.
- **detrend**: [{’none’, ‘mean’, ‘linear’} or callable, default ‘none’] The function applied to each segment before fft-ing, designed to remove the
Matplotlib, Release 3.1.3

mean or linear trend. Unlike in MATLAB, where the \texttt{detrend} parameter is a vector, in Matplotlib it is a function. The \texttt{mlab} module defines \texttt{detrend_none}, \texttt{detrend_mean}, and \texttt{detrend_linear}, but you can use a custom function as well. You can also use a string to choose one of the functions: ‘none’ calls \texttt{detrend_none}. ‘mean’ calls \texttt{detrend_mean}. ‘linear’ calls \texttt{detrend_linear}.

\texttt{scale\_by\_freq} [bool, optional] Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz\(^{-1}\). This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

\texttt{noverlap} [integer] The number of points of overlap between blocks. The default value is 0 (no overlap).

**Returns**

The return value is the tuple \((Cxy, f)\), where \(f\) are the frequencies of the coherence vector. For \texttt{cohere}, scaling the individual densities by the sampling frequency has no effect, since the factors cancel out.

See also:

\texttt{psd()}, \texttt{csd()} For information about the methods used to compute \(P_{xy}\), \(P_{xx}\) and \(P_{yy}\).

\texttt{matplotlib.mlab.complex\_spectrum(x, Fs=None, window=None, pad\_to=None, sides=None)}

Compute the complex-valued frequency spectrum of \(x\). Data is padded to a length of \texttt{pad\_to} and the windowing function \texttt{window} is applied to the signal.

**Parameters**

\(x\) [1-D array or sequence] Array or sequence containing the data

\(Fs\) [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, \texttt{freqs}, in cycles per time unit. The default value is 2.

\texttt{window} [callable or ndarray] A function or a vector of length \(NFFT\). To create window vectors see \texttt{window\_hanning}, \texttt{window\_none}, \texttt{numpy\_blackman}, \texttt{numpy\_hamming}, \texttt{numpy\_bartlett}, \texttt{scipy\_signal}, \texttt{scipy\_signal\_get\_window}, etc. The default is \texttt{window\_hanning}. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

\texttt{sides} [\{'default', ‘onesided’, ‘twosided’\}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.

\texttt{pad\_to} [int] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the \(n\) parameter in the call to \texttt{fft()}. The default is None, which sets \texttt{pad\_to} equal to the length of the input signal (i.e. no padding).

**Returns**
spectrum [1-D array] The values for the complex spectrum (complex valued)

freqs [1-D array] The frequencies corresponding to the elements in spectrum

See also:

magnitude_spectrum Returns the absolute value of this function.
angle_spectrum Returns the angle of this function.
phase_spectrum Returns the phase (unwrapped angle) of this function.
specgram Can return the complex spectrum of segments within the signal.

matplotlib.mlab.csd(x, y, NFFT=None, Fs=None, detrend=None, window=None, noverlap=None, pad_to=None, sides=None, scale_by_freq=None)

Compute the cross-spectral density.

The cross spectral density \( P_{xy} \) by Welch’s average periodogram method. The vectors \( x \) and \( y \) are divided into \( NFFT \) length segments. Each segment is detrended by function detrend and windowed by function window. noverlap gives the length of the overlap between segments. The product of the direct FFTs of \( x \) and \( y \) are averaged over each segment to compute \( P_{xy} \), with a scaling to correct for power loss due to windowing.

If len(x) < NFFT or len(y) < NFFT, they will be zero padded to NFFT.

Parameters

x, y [1-D arrays or sequences] Arrays or sequences containing the data

Fs [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.

window [callable or ndarray] A function or a vector of length NFFT. To create window vectors see window_hanning, window_none, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. The default is window_hanning. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides [{‘default’, ‘onesided’, ‘twosided’}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.

pad_to [int] The number of points to which the data segment is padded when performing the FFT. This can be different from NFFT, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the n parameter in the call to fft(). The default is None, which sets pad_to equal to NFFT.

NFFT [int] The number of data points used in each block for the FFT. A power 2 is most efficient. The default value is 256. This should NOT be used to get zero padding, or the scaling of the result will be incorrect. Use pad_to for this instead.
**detrend** [{‘none’, ‘mean’, ‘linear’} or callable, default ‘none’] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the detrend parameter is a vector, in Matplotlib it is a function. The mlab module defines detrend_none, detrend_mean, and detrend_linear, but you can use a custom function as well. You can also use a string to choose one of the functions: ‘none’ calls detrend_none. ‘mean’ calls detrend_mean. ‘linear’ calls detrend_linear.

**scale_by_freq** [bool, optional] Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

**noverlap** [integer] The number of points of overlap between segments. The default value is 0 (no overlap).

Returns

**Pxy** [1-D array] The values for the cross spectrum P_{xy} before scaling (real valued)

**freqs** [1-D array] The frequencies corresponding to the elements in Pxy

See also:

**psd** equivalent to setting y = x.

References

matplotlib.mlab.demean(x, axis=0)

[Deprecated] Return x minus its mean along the specified axis.

Parameters

**x** [array or sequence] Array or sequence containing the data Can have any dimensionality

**axis** [integer] The axis along which to take the mean. See numpy.mean for a description of this argument.

See also:

**detrend_mean** Same as demean except for the default axis.

Notes

Deprecated since version 3.1.

matplotlib.mlab.detrend(x, key=None, axis=None)

Return x with its trend removed.

Parameters

**x** [array or sequence] Array or sequence containing the data.
key [ ['default' | 'constant' | 'mean' | 'linear' | 'none'] or function] Specifies the detrend algorithm to use. 'default' is 'mean', which is the same as detrend_mean. 'constant' is the same. 'linear' is the same as detrend_linear. 'none' is the same as detrend_none. The default is 'mean'. See the corresponding functions for more details regarding the algorithms. Can also be a function that carries out the detrend operation.

axis [integer] The axis along which to do the detrending.

See also:

detrend_mean Implementation of the 'mean' algorithm.
detrend_linear Implementation of the 'linear' algorithm.
detrend_none Implementation of the 'none' algorithm.

matplotlib.mlab.detrend_linear(y)
Return x minus best fit line; 'linear' detrending.

Parameters

y [0-D or 1-D array or sequence] Array or sequence containing the data
axis [integer] The axis along which to take the mean. See numpy.mean for a description of this argument.

See also:

detrend_mean Another detrend algorithm.
detrend_none Another detrend algorithm.
detrend A wrapper around all the detrend algorithms.

matplotlib.mlab.detrend_mean(x, axis=None)
Return x minus the mean(x).

Parameters

x [array or sequence] Array or sequence containing the data Can have any dimensionality
axis [integer] The axis along which to take the mean. See numpy.mean for a description of this argument.

See also:

detrend_linear Another detrend algorithm.
detrend_none Another detrend algorithm.
detrend A wrapper around all the detrend algorithms.

matplotlib.mlab.detrend_none(x, axis=None)
Return x: no detrending.

Parameters

x [any object] An object containing the data
**axis** [integer] This parameter is ignored. It is included for compatibility with detrend_mean

**See also:**

- detrend_mean: Another detrend algorithm.
- detrend_linear: Another detrend algorithm.
- detrend: A wrapper around all the detrend algorithms.

```python
matplotlib.mlab.magnitude_spectrum(x, Fs=None, window=None, pad_to=None, sides=None)
```

Compute the magnitude (absolute value) of the frequency spectrum of \(x\). Data is padded to a length of \(pad\_to\) and the windowing function \(window\) is applied to the signal.

**Parameters**

- **x** [1-D array or sequence] Array or sequence containing the data
- **Fs** [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, `freqs`, in cycles per time unit. The default value is 2.
- **window** [callable or ndarray] A function or a vector of length `NFFT`. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. The default is `window_hanning`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.
- **sides** [{‘default’, ‘onesided’, ‘twosided’}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.
- **pad_to** [int] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the \(n\) parameter in the call to `fft()`. The default is None, which sets \(pad\_to\) equal to the length of the input signal (i.e. no padding).

**Returns**

- **spectrum** [1-D array] The values for the magnitude spectrum (real valued)
- **freqs** [1-D array] The frequencies corresponding to the elements in `spectrum`

**See also:**

- `psd` Returns the power spectral density.
- `complex_spectrum` This function returns the absolute value of `complex_spectrum`.
- `angle_spectrum` Returns the angles of the corresponding frequencies.
- `phase_spectrum` Returns the phase (unwrapped angle) of the corresponding frequencies.
- `specgram` Can return the complex spectrum of segments within the signal.
Compute the phase of the frequency spectrum (unwrapped angle spectrum) of \(x\). Data is padded to a length of \(pad\_to\) and the windowing function \(window\) is applied to the signal.

**Parameters**

- \(x\) [1-D array or sequence] Array or sequence containing the data
- \(Fs\) [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.
- \(window\) [callable or ndarray] A function or a vector of length \(NFFT\). To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. The default is `window_hanning`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.
- \(sides\) [{‘default’, ‘onesided’, ‘twosided’}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.
- \(pad\_to\) [int] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the \(n\) parameter in the call to \(fft()\). The default is None, which sets \(pad\_to\) equal to the length of the input signal (i.e. no padding).

**Returns**

- \(spectrum\) [1-D array] The values for the phase spectrum in radians (real valued)
- \(freqs\) [1-D array] The frequencies corresponding to the elements in \(spectrum\)

See also:

- `complex_spectrum` This function returns the phase value of `complex_spectrum`
- `magnitude_spectrum` Returns the magnitudes of the corresponding frequencies.
- `angle_spectrum` Returns the angle (wrapped phase) of the corresponding frequencies.
- `specgram` Can return the complex spectrum of segments within the signal.

Compute the power spectral density.

The power spectral density \(P_{xx}\) by Welch’s average periodogram method. The vector \(x\) is divided into \(NFFT\) length segments. Each segment is detrended by function \(detrend\) and windowed by function \(window\). \(noverlap\) gives the length of the overlap between segments. The \(|fft(i)|^2\) of each segment \(i\) are averaged to compute \(P_{xx}\).

If len(x) < \(NFFT\), it will be zero padded to \(NFFT\).

**Parameters**
x [1-D array or sequence] Array or sequence containing the data

Fs [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.

window [callable or ndarray] A function or a vector of length NFFT. To create window vectors see window_hanning, window_none, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. The default is window_hanning. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides [{‘default’, ‘onesided’, ‘twosided’}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.

pad_to [int] The number of points to which the data segment is padded when performing the FFT. This can be different from NFFT, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the $n$ parameter in the call to fft(). The default is None, which sets pad_to equal to NFFT

NFFT [int] The number of data points used in each block for the FFT. A power 2 is most efficient. The default value is 256. This should NOT be used to get zero padding, or the scaling of the result will be incorrect. Use pad_to for this instead.

detrend [{‘none’, ‘mean’, ‘linear’} or callable, default ‘none’] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the detrend parameter is a vector, in Matplotlib it is a function. The mlab module defines detrend_none, detrend_mean, and detrend_linear, but you can use a custom function as well. You can also use a string to choose one of the functions: ‘none’ calls detrend_none. ‘mean’ calls detrend_mean. ‘linear’ calls detrend_linear.

scale_by_freq [bool, optional] Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap [integer] The number of points of overlap between segments. The default value is 0 (no overlap).

Returns

Pxx [1-D array] The values for the power spectrum $P_{xx}$ (real valued)

freqs [1-D array] The frequencies corresponding to the elements in Pxx

See also:

specgram specgram differs in the default overlap; in not returning the mean of the segment periodograms; and in returning the times of the segments.
magnitude_spectrum returns the magnitude spectrum.

```python
matplotlib.mlab.specgram(x, NFFT=None, Fs=None, detrend=None, window=None, noverlap=None, pad_to=None, sides=None, scale_by_freq=None, mode=None)
```

Compute a spectrogram.

Compute and plot a spectrogram of data in x. Data are split into NFFT length segments and the spectrum of each section is computed. The windowing function window is applied to each segment, and the amount of overlap of each segment is specified with noverlap.

**Parameters**

- **x** [array_like] 1-D array or sequence.
- **Fs** [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.
- **window** [callable or ndarray] A function or a vector of length NFFT. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. The default is `window_hanning`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.
- **sides** [{‘default’, ‘onesided’, ‘twosided’}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.
- **pad_to** [int] The number of points to which the data segment is padded when performing the FFT. This can be different from NFFT, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the $n$ parameter in the call to `fft()`. The default is None, which sets `pad_to` equal to `NFFT`
- **NFFT** [int] The number of data points used in each block for the FFT. A power of 2 is most efficient. The default value is 256. This should NOT be used to get zero padding, or the scaling of the result will be incorrect. Use `pad_to` for this instead.
- **detrend** [{‘none’, ‘mean’, ‘linear’} or callable, default ‘none’] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the detrend parameter is a vector, in Matplotlib it is a function. The `mlab` module defines `detrend_none`, `detrend_mean`, and `detrend_linear`, but you can use a custom function as well. You can also use a string to choose one of the functions: ‘none’ calls `detrend_none`. ‘mean’ calls `detrend_mean`. ‘linear’ calls `detrend_linear`.

---

**References**

csd returns the spectral density between two signals.
scale_by_freq [bool, optional] Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap [int, optional] The number of points of overlap between blocks. The default value is 128.

mode [str, optional]

What sort of spectrum to use, default is ‘psd’.

‘psd’ Returns the power spectral density.
‘complex’ Returns the complex-valued frequency spectrum.
‘magnitude’ Returns the magnitude spectrum.
‘angle’ Returns the phase spectrum without unwrapping.
‘phase’ Returns the phase spectrum with unwrapping.

Returns

spectrum [array_like] 2-D array, columns are the periodograms of successive segments.

freqs [array_like] 1-D array, frequencies corresponding to the rows in spectrum.

t [array_like] 1-D array, the times corresponding to midpoints of segments (i.e the columns in spectrum).

See also:

psd differs in the overlap and in the return values.
complex_spectrum similar, but with complex valued frequencies.
magnitude_spectrum similar single segment when mode is ‘magnitude’.
angle_spectrum similar to single segment when mode is ‘angle’.
phase_spectrum similar to single segment when mode is ‘phase’.

Notes

detrend and scale_by_freq only apply when mode is set to ‘psd’.

matplotlib.mlab.stride_repeat(x, n, axis=0)
Repeat the values in an array in a memory-efficient manner. Array x is stacked vertically n times.

Warning: It is not safe to write to the output array. Multiple elements may point to the same piece of memory, so modifying one value may change others.

Parameters

x [1D array or sequence] Array or sequence containing the data.

n [integer] The number of time to repeat the array.
axis [integer] The axis along which the data will run.

References

stackoverflow: Repeat NumPy array without replicating data?

`matplotlib.mlab.stride_windows(x, n, noverlap=None, axis=0)`
Get all windows of x with length n as a single array, using strides to avoid data duplication.

**Warning:** It is not safe to write to the output array. Multiple elements may point to the same piece of memory, so modifying one value may change others.

Parameters

- `x` [1D array or sequence] Array or sequence containing the data.
- `n` [integer] The number of data points in each window.
- `noverlap` [integer] The overlap between adjacent windows. Default is 0 (no overlap)
- `axis` [integer] The axis along which the windows will run.

References

stackoverflow: Rolling window for 1D arrays in Numpy? stackoverflow: Using strides for an efficient moving average filter

`matplotlib.mlab.window_hanning(x)`
Return x times the hanning window of len(x).

See also:

`window_none` Another window algorithm.

`matplotlib.mlab.window_none(x)`
No window function; simply return x.

See also:

`window_hanning` Another window algorithm.

17.33 `matplotlib.offsetbox`

The OffsetBox is a simple container artist. The child artist are meant to be drawn at a relative position to its parent. The [VH]Packer, DrawingArea and TextArea are derived from the OffsetBox.

The [VH]Packer automatically adjust the relative positions of their children, which should be instances of the OffsetBox. This is used to align similar artists together, e.g., in legend.
The DrawingArea can contain any Artist as a child. The DrawingArea has a fixed width and height. The position of children relative to the parent is fixed. The TextArea contains a single Text instance. The width and height of the TextArea instance is the width and height of its child text.

```python
class matplotlib.offsetbox.AnchoredOffsetBox(loc, pad=0.4, borderpad=0.5, child=None, prop=None, frameon=True, bbox_to_anchor=None, bbox_transform=None, **kwargs)
```

Bases: `matplotlib.offsetbox.OffsetBox`

An offset box placed according to the legend location loc. AnchoredOffsetbox has a single child. When multiple children is needed, use other OffsetBox class to enclose them. By default, the offset box is anchored against its parent axes. You may explicitly specify the `bbox_to_anchor`.

loc is a string or an integer specifying the legend location. The valid location codes are:

```
{'center': 10, 'center left': 6, 'center right': 7, 'lower center': 8, 'lower left': 3, 'lower right': 4, 'right': 5, (same as 'center right', for back-compatibility) 'upper center': 9, 'upper left': 2, 'upper right': 1}
```

pad [pad around the child for drawing a frame. given in] fraction of fontsize.

borderpad : pad between offsetbox frame and the bbox_to_anchor;

child : OffsetBox instance that will be anchored.

prop : font property. This is only used as a reference for paddings.

frameon : draw a frame box if True.

bbox_to_anchor : bbox to anchor. Use self.axes.bbox if None.

bbox_transform : with which the bbox_to_anchor will be transformed.

codes = {'center': 10, 'center left': 6, 'center right': 7, 'lower center': 8, 'lower left': 3, 'lower right': 4, 'right': 5, (same as 'center right', for back-compatibility) 'upper center': 9, 'upper left': 2, 'upper right': 1}

draw(self, renderer)
    draw the artist

get_bbox_to_anchor(self)
    return the bbox that the legend will be anchored

get_child(self)
    return the child

get_children(self)
    return the list of children

get_extent(self, renderer)
    return the extent of the artist. The extent of the child added with the pad is returned
get_window_extent(self, renderer)
    get the bounding box in display space.

set_bbox_to_anchor(self, bbox, transform=None)
    set the bbox that the child will be anchored.

    bbox can be a Bbox instance, a list of [left, bottom, width, height], or a list of [left, bottom] where the width and height will be assumed to be zero. The bbox will be transformed to display coordinate by the given transform.

set_child(self, child)
    set the child to be anchored

update_frame(self, bbox, fontsize=None)

zorder = 5

class matplotlib.offsetbox.AnchoredText(s, loc, pad=0.4, borderpad=0.5, prop=None, **kwargs)

Bases: matplotlib.offsetbox.AnchoredOffsetbox

AnchoredOffsetbox with Text.

Parameters

  s [string] Text.
  loc [str] Location code.
  pad [float, optional] Pad between the text and the frame as fraction of the font size.
  borderpad [float, optional] Pad between the frame and the axes (or bbox_to_anchor).
  prop [dictionary, optional, default: None] Dictionary of keyword parameters to be passed to the Text instance contained inside AnchoredText.

Notes

Other keyword parameters of AnchoredOffsetbox are also allowed.

class matplotlib.offsetbox.AnnotationBbox(offsetbox, xy, xybox=None, xycoords='data', boxcoords=None, frameon=True, pad=0.4, annotation_clip=None, box_alignment=(0.5, 0.5), bboxprops=None, arrowprops=None, fontsize=None, **kwargs)

Bases: matplotlib.artist.Artist, matplotlib.text._AnnotationBase

Annotation-like class, but with offsetbox instead of Text.

offsetbox : OffsetBox instance

xycoords [same as Annotation but can be a tuple of two] strings which are interpreted as x and y coordinates.

boxcoords [similar to textcoords as Annotation but can be a] tuple of two strings which are interpreted as x and y coordinates.

box_alignment [a tuple of two floats for a vertical and] horizontal alignment of the offset box w.r.t. the boxcoords. The lower-left corner is (0.0) and upper-right corner is (1.1).
other parameters are identical to that of Annotation.

```
contains(self, event)
```
Test whether the artist contains the mouse event.

**Parameters**

- `mouseevent` 
  `[matplotlib.backend_bases.MouseEvent]`

**Returns**

- `contains` [bool] Whether any values are within the radius.
- `details` [dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

**See also:**

- `set_contains`, `get_contains`

```
draw(self, renderer)
```
Draw the Annotation object to the given `renderer`.

```
get_children(self)
```
Return a list of the child `Artist`s of this `Artist`.

```
get_fontsize(self, s=None)
```
Return fontsize in points

```
set_figure(self, fig)
```
Set the `Figure` instance the artist belongs to.

```
Parameters

- `fig` [Figure]
```

```
set_fontsize(self, s=None)
```
Set fontsize in points

```
update_positions(self, renderer)
```
Update the pixel positions of the annotated point and the text.

```
xyann
```

```
zorder = 3
```

```python
class matplotlib.offsetbox.AuxTransformBox(aux_transform)
    Bases: matplotlib.offsetbox.OffsetBox
```
Offset Box with the aux_transform. Its children will be transformed with the aux_transform first then will be offseted. The absolute coordinate of the aux_transform is meaning as it will be automatically adjust so that the left-lower corner of the bounding box of children will be set to (0,0) before the offset transform.

It is similar to drawing area, except that the extent of the box is not predetermined but calculated from the window extent of its children. Furthermore, the extent of the children will be calculated in the transformed coordinate.

```
add_artist(self, a)
```
Add any `Artist` to the container box
draw(self, renderer)
    Draw the children
get_extent(self, renderer)
    Return a tuple width, height, xdescent, ydescent of the box.
get_offset(self)
    return offset of the container.
get_transform(self)
    Return the Transform applied to the children
get_window_extent(self, renderer)
    get the bounding box in display space.
set_offset(self, xy)
    Set the offset of the container.

Parameters

    xy [(float, float)] The (x,y) coordinates of the offset in display units.

set_transform(self, t)
    set_transform is ignored.

class matplotlib.offsetbox.DraggableAnnotation(annotation, use_blit=False)
    Bases: matplotlib.offsetbox.DraggableBase

    save_offset(self)
    update_offset(self, dx, dy)

class matplotlib.offsetbox.DraggableBase(ref_artist, use_blit=False)
    Bases: object

    Helper base class for a draggable artist (legend, offsetbox).

    Derived classes must override the following methods:

    def save_offset(self):
        ""
        Called when the object is picked for dragging; should save the
        reference position of the artist.
        ""

    def update_offset(self, dx, dy):
        ""
        Called during the dragging; (*dx*, *dy*) is the pixel offset from
        the point where the mouse drag started.
        ""

    Optionally, you may override the following methods:

    def artist_picker(self, artist, evt):
        """The picker method that will be used."""
        return self.ref_artist.contains(evt)

    def finalize_offset(self):
        """Called when the mouse is released."""
In the current implementation of `DraggableLegend` and `DraggableAnnotation`, `update_offset` places the artists in display coordinates, and `finalize_offset` recalculates their position in axes coordinate and set a relevant attribute.

```python
artist_picker(self, artist, evt)
disconnect(self)
    Disconnect the callbacks.
finalize_offset(self)
on_motion(self, evt)
on_motion_blit(self, evt)
on_pick(self, evt)
on_release(self, event)
save_offset(self)
update_offset(self, dx, dy)
```

```python
class matplotlib.offsetbox.DraggableOffsetBox(ref_artist, offsetbox, use_blit=False)
    Bases: matplotlib.offsetbox.DraggableBase
    get_loc_in_canvas(self)
    save_offset(self)
    update_offset(self, dx, dy)
```

```python
class matplotlib.offsetbox.DrawingArea(width, height, xdescent=0.0, ydescent=0.0, clip=False)
    Bases: matplotlib.offsetbox.OffsetBox
    The DrawingArea can contain any Artist as a child. The DrawingArea has a fixed width and height. The position of children relative to the parent is fixed. The children can be clipped at the boundaries of the parent.
    width, height : width and height of the container box. xdescent, ydescent : descent of the box in x- and y-direction. clip : Whether to clip the children
    add_artist(self, a)
        Add any Artist to the container box
    clip_children
        If the children of this DrawingArea should be clipped by DrawingArea bounding box.
    draw(self, renderer)
        Draw the children
    get_extent(self, renderer)
        Return with, height, xdescent, ydescent of box
    get_offset(self)
        return offset of the container.
    get_transform(self)
        Return the Transform applied to the children
    get_window_extent(self, renderer)
        get the bounding box in display space.
```
set_offset(self, xy)
    Set the offset of the container.

Parameters
    xy  [(float, float)] The (x,y) coordinates of the offset in display units.

set_transform(self, t)
    set_transform is ignored.

class matplotlib.offsetbox.HPacker(pad=None, sep=None, width=None, height=None,
    align='baseline', mode='fixed', children=None)
    Bases: matplotlib.offsetbox.PackerBase

The HPacker has its children packed horizontally. It automatically adjusts the relative positions of children at draw time.

Parameters
    pad  [float, optional] The boundary padding in points.
    sep  [float, optional] The spacing between items in points.
    width, height  [float, optional] Width and height of the container box in pixels, calculated if None.
    align  [{'top', 'bottom', 'left', 'right', 'center', 'baseline'}] Alignment of boxes.
    mode  [{'fixed', 'expand', 'equal'}] The packing mode.
        • ‘fixed’ packs the given Artists tight with sep spacing.
        • ‘expand’ uses the maximal available space to distribute the artists with equal spacing in between.
        • ‘equal’: Each artist an equal fraction of the available space and is left-aligned (or top-aligned) therein.
    children  [list of Artist] The artists to pack.

Notes

pad and sep need to given in points and will be scale with the renderer dpi, while width and height need to be in pixels.

get_extent_offsets(self, renderer)
    Update offset of the children and return the extent of the box.

Parameters
    renderer  [RendererBase subclass]

Returns
    width
    height
    xdescent
    ydescent
    list of (xoffset, yoffset) pairs
class matplotlib.offsetbox.OffsetBox(*args, **kwargs)

Bases: matplotlib.artist.Artist

The OffsetBox is a simple container artist. The child artist are meant to be drawn at a relative position to its parent.

axes

The Axes instance the artist resides in, or None.

contains(self, mouseevent)

Delegate the mouse event contains-check to the children.

As a container, the OffsetBox does not respond itself to mouseevents.

Parameters

mouseevent [matplotlib.backend_bases.MouseEvent]

Returns

contains [bool] Whether any values are within the radius.

details [dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

See also:

Artist.contains
draw(self, renderer)

Update the location of children if necessary and draw them to the given renderer.

get_children(self)

Return a list of the child Artists.

get_extent(self, renderer)

Return a tuple width, height, xdescent, ydescent of the box.

get_extent_offsets(self, renderer)

Update offset of the children and return the extent of the box.

Parameters

renderer [RendererBase subclass]

Returns

width

height

xdescent

ydescent

list of (xoffset, yoffset) pairs

get_offset(self, width, height, xdescent, ydescent, renderer)

Return the offset as a tuple (x, y).

The extent parameters have to be provided to handle the case where the offset is dynamically determined by a callable (see set_offset).

Parameters
**width, height, xdescent, ydescent**  Extent parameters.

**renderer**  [RendererBase subclass]

**get_visible_children**  
Return a list of the visible child *Artists*.

**get_window_extent**  
Return the bounding box (Bbox) in display space.

**set_figure**  
Set the *Figure* for the *OffsetBox* and all its children.

**Parameters**

**fig**  [*Figure*]

**set_height**  
Set the height of the box.

**Parameters**

**height**  [float]

**set_offset**  
Set the offset.

**Parameters**

**xy**  [(float, float) or callable] The (x, y) coordinates of the offset in display units. These can either be given explicitly as a tuple (x, y), or by providing a function that converts the extent into the offset. This function must have the signature:

```python
def offset(width, height, xdescent, ydescent, renderer) -> (float, float)
```

**set_width**  
Set the width of the box.

**Parameters**

**width**  [float]

---

**class** matplotlib.offsetbox.OffsetImage(arr, zoom=1, cmap=None, norm=None, interpolation=None, origin=None, filternorm=1, filterrad=4.0, resample=False, dpi_cor=True, **kwargs)

**Bases:** matplotlib.offsetbox.OffsetBox

draw(self, renderer)

Draw the children

**get_children**  
Return a list of the child *Artists*.

**get_data**

**get_extent**  
Return a tuple width, height, xdescent, ydescent of the box.

**get_offset**  
return offset of the container.
get_window_extent(self, renderer)
    get the bounding box in display space.

get_zoom(self)

set_data(self, arr)

set_zoom(self, zoom)

class matplotlib.offsetbox.PackerBase(pad=None, sep=None, width=None, height=None, align=None, mode=None, children=None)

Bases: matplotlib.offsetbox.OffsetBox

Parameters

- **pad** [float, optional] The boundary padding in points.
- **sep** [float, optional] The spacing between items in points.
- **width, height** [float, optional] Width and height of the container box in pixels, calculated if None.
- **mode** [{‘fixed’, ‘expand’, ‘equal’}] The packing mode.
  - ‘fixed’ packs the given Artists tight with sep spacing.
  - ‘expand’ uses the maximal available space to distribute the artists with equal spacing in between.
  - ‘equal’: Each artist an equal fraction of the available space and is left-aligned (or top-aligned) therein.

- **children** [list of Artist] The artists to pack.

Notes

pad and sep need to given in points and will be scale with the renderer dpi, while width and height need to be in pixels.

class matplotlib.offsetbox.PaddedBox(child, pad=None, draw_frame=False, patch_attrs=None)

Bases: matplotlib.offsetbox.OffsetBox

A container to add a padding around an Artist.

The PaddedBox contains a FancyBboxPatch that is used to visualize it when rendering.

Parameters

- **child** [Artist] The contained Artist.
- **pad** [float] The padding in points. This will be scaled with the renderer dpi. In contrast width and height are in pixel and thus not scaled.
- **draw_frame** [bool] Whether to draw the contained FancyBboxPatch.
- **patch_attrs** [dict or None] Additional parameters passed to the contained FancyBboxPatch.

draw(self, renderer)
    Update the location of children if necessary and draw them to the given renderer.
draw_frame(self, renderer)

get_extent_offsets(self, renderer)
    Update offset of the children and return the extent of the box.

Parameters
    renderer [RendererBase subclass]

Returns
    width
    height
    xdescent
    ydescent
    list of (xoffset, yoffset) pairs

update_frame(self, bbox, fontsize=None)

class matplotlib.offsetbox.TextArea(s, textprops=None, multilinebaseline=None, minimumdescent=True)
    Bases: matplotlib.offsetbox.OffsetBox

    The TextArea is contains a single Text instance. The text is placed at (0,0) with baseline+left alignment. The width and height of the TextArea instance is the width and height of its child text.

Parameters
    s [str] a string to be displayed.
    textprops [dictionary, optional, default: None] Dictionary of keyword parameters to be passed to the Text instance contained inside TextArea.
    multilinebaseline [bool, optional] If True, baseline for multiline text is adjusted so that it is (approximately) center-aligned with singleline text.
    minimumdescent [bool, optional] If True, the box has a minimum descent of “p”.

draw(self, renderer)
    Draw the children

get_extent(self, renderer)
    Return a tuple width, height, xdescent, ydescent of the box.

get_minimumdescent(self)
    get minimumdescent.

get_multilinebaseline(self)
    get multilinebaseline.

get_offset(self)
    return offset of the container.

get_text(self)
    Returns the string representation of this area’s text

get_window_extent(self, renderer)
    get the bounding box in display space.
set_minimumdescent(self, t)
    Set minimumdescent.
    If True, extent of the single line text is adjusted so that it has minimum descent of "p"

set_multilinebaseline(self, t)
    Set multilinebaseline.
    If True, baseline for multiline text is adjusted so that it is (approximately) center-aligned with single-line text.

set_offset(self, xy)
    Set the offset of the container.

    Parameters
    xy [(float, float)] The (x,y) coordinates of the offset in display units.

set_text(self, s)
    Set the text of this area as a string.

set_transform(self, t)
    set_transform is ignored.

class matplotlib.offsetbox.VPacker(pad=None, sep=None, width=None, height=None,
    align='baseline', mode='fixed', children=None)

Bases: matplotlib.offsetbox.PackerBase

The VPacker has its children packed vertically. It automatically adjust the relative positions of children in the drawing time.

    Parameters
    pad [float, optional] The boundary padding in points.
    sep [float, optional] The spacing between items in points.
    width, height [float, optional] Width and height of the container box in pixels, calculated if None.
    mode [{‘fixed’, ‘expand’, ‘equal’}] The packing mode.
    • ‘fixed’ packs the given Artists tight with sep spacing.
    • ‘expand’ uses the maximal available space to distribute the artists with equal spacing in between.
    • ‘equal’: Each artist an equal fraction of the available space and is left-aligned (or top-aligned) therein.
    children [list of Artist] The artists to pack.

Notes

    pad and sep need to given in points and will be scale with the renderer dpi, while width and height need to be in pixels.

get_extent_offsets(self, renderer)
    Update offset of the children and return the extent of the box.
Parameters

renderer [RendererBase subclass]

Returns

width
height
xdescent
ydescent
list of (xoffset, yoffset) pairs

matplotlib.offsetbox.bbox_artist(*args, **kwargs)

17.34 matplotlib.patches

17.34.1 Classes

Arc(xy, width, height[, angle, theta1, theta2]) An elliptical arc, i.e.

Arrow(x, y, dx, dy[, width]) An arrow patch.

ArrowStyle

BoxStyle

Circle(xy[, radius]) A circle patch.

CirclePolygon(xy[, radius, resolution]) A polygon-approximation of a circle patch.

ConnectionPatch(xyA, xyB, coordsA[, ...]) A ConnectionPatch class is to make connecting lines between two points (possibly in different axes).

ConnectionStyle

Ellipse(xy, width, height[, angle]) A scale-free ellipse.

FancyArrow(x, y, dx, dy[, width, ...]) Like Arrow, but lets you set head width and head height independently.

FancyArrowPatch([posA, posB, path, ...]) A fancy arrow patch.

FancyBboxPatch(xy, width, height[, ...]) A fancy box around a rectangle with lower left at \( xy = (x, y) \) with specified width and height.

Patch([edgecolor, facecolor, color, ...]) A patch is a 2D artist with a face color and an edge color.

PathPatch(path, **kwargs) A general polycurve path patch.

Polygon(xy[, closed]) A general polygon patch.

Rectangle(xy, width, height[, angle]) A rectangle with lower left at \( xy = (x, y) \) with specified width, height and rotation angle.

**matplotlib.patches.Arc**

class `matplotlib.patches.Arc(xy, width, height, angle=0.0, theta1=0.0, theta2=360.0, **kwargs)`

Bases: `matplotlib.patches.Ellipse`

An elliptical arc, i.e. a segment of an ellipse.

Due to internal optimizations, there are certain restrictions on using Arc:

- The arc cannot be filled.
- The arc must be used in an Axes instance—it can not be added directly to a Figure—because it is optimized to only render the segments that are inside the axes bounding box with high resolution.

**Parameters**

- `xy` [(float, float)] The center of the ellipse.
- `width` [float] The length of the horizontal axis.
- `height` [float] The length of the vertical axis.
- `angle` [float] Rotation of the ellipse in degrees (counterclockwise).
- `theta1, theta2` [float, optional] Starting and ending angles of the arc in degrees. These values are relative to `angle`, e.g. if `angle` = 45 and `theta1` = 90 the absolute starting angle is 135. Default `theta1` = 0, `theta2` = 360, i.e. a complete ellipse. The arc is drawn in the counterclockwise direction. Angles greater than or equal to 360, or smaller than 0, are represented by an equivalent angle in the range [0, 360), by taking the input value mod 360.

**Other Parameters**

- `**kwargs` [Patch properties] Most Patch properties are supported as keyword arguments, with the exception of `fill` and `facecolor` because filling is not supported.

<td>str</td>
</tr>
<tr>
<td>visible</td>
<td>bool</td>
</tr>
<tr>
<td>zorder</td>
<td>float</td>
</tr>
</tbody>
</table>

```python
draw(self, renderer)
```

Draw the arc to the given `renderer`.

**Notes**

Ellipses are normally drawn using an approximation that uses eight cubic Bezier splines. The error of this approximation is 1.89818e-6, according to this unverified source:

Lancaster, Don.  *Approximating a Circle or an Ellipse Using Four Bezier Cubic Splines*.

There is a use case where very large ellipses must be drawn with very high accuracy, and it is too expensive to render the entire ellipse with enough segments (either splines or line segments). Therefore, in the case where either radius of the ellipse is large enough that the error of the spline approximation will be visible (greater than one pixel offset from the ideal), a different technique is used.

In that case, only the visible parts of the ellipse are drawn, with each visible arc using a fixed number of spline segments (8). The algorithm proceeds as follows:

1. The points where the ellipse intersects the axes bounding box are located. (This is done be performing an inverse transformation on the axes bbox such that it is relative to the unit circle - this makes the intersection calculation much easier than doing rotated ellipse intersection directly).

This uses the “line intersecting a circle” algorithm from:

2. The angles of each of the intersection points are calculated.

3. Proceeding counterclockwise starting in the positive x-direction, each of the
visible arc-segments between the pairs of vertices are drawn using the Bezier
arc approximation technique implemented in `matplotlib.path.Path.arc()`.

Examples using `matplotlib.patches.Arc`

- sphx_glr_gallery_units_ellipse_with_units.py

`matplotlib.patches.Arrow`

class `matplotlib.patches.Arrow(x, y, dx, dy, width=1.0, **kwargs)`

Bases: `matplotlib.patches.Patch`

An arrow patch.

Draws an arrow from \((x, y)\) to \((x + dx, y + dy)\). The width of the arrow is scaled by \(\text{width}\).

Parameters

- \(x\) [scalar] x coordinate of the arrow tail
- \(y\) [scalar] y coordinate of the arrow tail
- \(dx\) [scalar] Arrow length in the x direction
- \(dy\) [scalar] Arrow length in the y direction
- \(\text{width}\) [scalar; optional (default: 1)] Scale factor for the width of the arrow.
  With a default value of 1, the tail width is 0.2 and head width is 0.6.

**kwargs** Keyword arguments control the `Patch` properties:

**See also:**

*FancyArrow* Patch that allows independent control of the head and tail properties

```python
get_patch_transform(self)
```
Return the *Transform* instance which takes patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

```python
get_path(self)
```
Return the path of this path

**Examples using** `matplotlib.patches.Arrow`

- sphx_glr_gallery_shapes_and_collections_arrow_guide.py
- sphx_glr_gallery_shapes_and_collections_artist_reference.py

**matplotlib.patches.ArrowStyle**

```python
class matplotlib.patches.ArrowStyle
Bases: matplotlib.patches._Style
```

*ArrowStyle* is a container class which defines several arrowstyle classes, which is used to create an arrow path along a given path. These are mainly used with `FancyArrowPatch`.

A arrowstyle object can be either created as:

```python
ArrowStyle.Fancy(head_length=.4, head_width=.4, tail_width=.4)
```

or:

```python
ArrowStyle("Fancy", head_length=.4, head_width=.4, tail_width=.4)
```

or:

```python
ArrowStyle("Fancy, head_length=.4, head_width=.4, tail_width=.4")
```

The following classes are defined...

</tbody>
</table>

An instance of any arrow style class is a callable object, whose call signature is:

```
__call__(self, path, mutation_size, linewidth, aspect_ratio=1.)
```

and it returns a tuple of a Path instance and a boolean value. `path` is a Path instance along which the arrow will be drawn. `mutation_size` and `aspect_ratio` have the same meaning as in `BoxStyle`. `linewidth` is a line width to be stroked. This is meant to be used to correct the location of the head so that it does not overshoot the destination point, but not all classes support it.

return the instance of the subclass with the given style name.

```python
class BarAB(widthA=1.0, angleA=None, widthB=1.0, angleB=None):
    Bases: matplotlib.patches._Bracket
    An arrow with a bar([ ]) at both ends.

    Parameters
    ----------
    widthA [float, optional, default] Width of the bracket
    angleA [float, optional, default] Angle between the bracket and the line
    widthB [float, optional, default] Width of the bracket
    angleB [float, optional, default] Angle between the bracket and the line
```

```python
class BracketA(widthA=1.0, lengthA=0.2, angleA=None):
    Bases: matplotlib.patches._Bracket
    An arrow with a bracket([ ]) at its end.

    Parameters
    ----------
    widthA [float, optional, default] Width of the bracket
    lengthA [float, optional, default] Length of the bracket
```
angleA [float, optional, default] Angle between the bracket and the line

class BracketAB(
    widthA=1.0, 
    lengthA=0.2, 
    angleA=None, 
    widthB=1.0, 
    lengthB=0.2, 
    angleB=None)
Bases: matplotlib.patches._Bracket

An arrow with a bracket(]) at both ends.

Parameters

widthA [float, optional, default] Width of the bracket
lengthA [float, optional, default] Length of the bracket
angleA [float, optional, default] Angle between the bracket and the line

widthB [float, optional, default] Width of the bracket
lengthB [float, optional, default] Length of the bracket
angleB [float, optional, default] Angle between the bracket and the line

class BracketB(
    widthB=1.0, 
    lengthB=0.2, 
    angleB=None)
Bases: matplotlib.patches._Bracket

An arrow with a bracket([) at its end.

Parameters

widthB [float, optional, default] Width of the bracket
lengthB [float, optional, default] Length of the bracket
angleB [float, optional, default] Angle between the bracket and the line

class Curve
Bases: matplotlib.patches._Curve

A simple curve without any arrow head.

class CurveA(
    head_length=0.4, 
    head_width=0.2)
Bases: matplotlib.patches._Curve

An arrow with a head at its begin point.

Parameters

head_length [float, optional, default] Length of the arrow head
head_width [float, optional, default] Width of the arrow head

class CurveAB(
    head_length=0.4, 
    head_width=0.2)
Bases: matplotlib.patches._Curve

An arrow with heads both at the begin and the end point.

Parameters

head_length [float, optional, default] Length of the arrow head
head_width [float, optional, default] Width of the arrow head
class CurveB(
    head_length=0.4, head_width=0.2
)
Bases: matplotlib.patches._Curve

An arrow with a head at its end point.

Parameters

    head_length [float, optional, default] Length of the arrow head
    head_width [float, optional, default] Width of the arrow head

class CurveFilledA(
    head_length=0.4, head_width=0.2
)
Bases: matplotlib.patches._Curve

An arrow with filled triangle head at the begin.

Parameters

    head_length [float, optional, default] Length of the arrow head
    head_width [float, optional, default] Width of the arrow head

class CurveFilledAB(
    head_length=0.4, head_width=0.2
)
Bases: matplotlib.patches._Curve

An arrow with filled triangle heads at both ends.

Parameters

    head_length [float, optional, default] Length of the arrow head
    head_width [float, optional, default] Width of the arrow head

class CurveFilledB(
    head_length=0.4, head_width=0.2
)
Bases: matplotlib.patches._Curve

An arrow with filled triangle head at the end.

Parameters

    head_length [float, optional, default] Length of the arrow head
    head_width [float, optional, default] Width of the arrow head

class Fancy(
    head_length=0.4, head_width=0.4, tail_width=0.4
)
Bases: matplotlib.patches._Base

A fancy arrow. Only works with a quadratic Bezier curve.

Parameters

    head_length [float, optional, default] Length of the arrow head
    head_width [float, optional, default] Width of the arrow head
    tail_width [float, optional, default] Width of the arrow tail

transmute(self, path, mutation_size, linewidth)

The transmute method is the very core of the ArrowStyle class and must be overridden in the subclasses. It receives the path object along which the arrow will be drawn, and the mutation_size, with which the arrow head etc. will be scaled. The linewidth may be used to adjust the path so that it does not pass beyond the given points. It returns a tuple of a Path instance and a boolean. The boolean value indicate whether the path can be filled or not. The return value can also be a list of paths and list of booleans of a same length.
class Simple

    head_length=0.5, head_width=0.5, tail_width=0.2)
    Bases: matplotlib.patches._Base

A simple arrow. Only works with a quadratic Bezier curve.

    Parameters

    head_length [float, optional, default] Length of the arrow head

    head_width [float, optional, default] Width of the arrow head

    tail_width [float, optional, default] Width of the arrow tail

    transmute(self, path, mutation_size, linewidth)

    The transmute method is the very core of the ArrowStyle class and must be
    overridden in the subclasses. It receives the path object along which the arrow
    will be drawn, and the mutation_size, with which the arrow head etc. will be
    scaled. The linewidth may be used to adjust the path so that it does not pass
    beyond the given points. It returns a tuple of a Path instance and a boolean.
    The boolean value indicate whether the path can be filled or not. The return
    value can also be a list of paths and list of booleans of a same length.

class Wedge

    tail_width=0.3, shrink_factor=0.5)
    Bases: matplotlib.patches._Base

Wedge() shape. Only works with a quadratic Bezier curve. The begin point has a
width of the tail_width and the end point has a width of 0. At the middle, the width
is shrink_factor*tail_width.

    Parameters

    tail_width [float, optional, default] Width of the tail

    shrink_factor [float, optional, default] Fraction of the arrow width at
    the middle point

    transmute(self, path, mutation_size, linewidth)

    The transmute method is the very core of the ArrowStyle class and must be
    overridden in the subclasses. It receives the path object along which the arrow
    will be drawn, and the mutation_size, with which the arrow head etc. will be
    scaled. The linewidth may be used to adjust the path so that it does not pass
    beyond the given points. It returns a tuple of a Path instance and a boolean.
    The boolean value indicate whether the path can be filled or not. The return
    value can also be a list of paths and list of booleans of a same length.

Examples using matplotlib.patches_ARROW_STYLE

- sphx_glr_gallery_pyplots_whats_new_98_4_fancy.py

matplotlib.patches.BoxStyle

class matplotlib.patches.BoxStyle

    Bases: matplotlib.patches._Style

    BoxStyle is a container class which defines several boxstyle classes, which are used for
    FancyBboxPatch.

    A style object can be created as:
BoxStyle.Round(pad=0.2)

or:

BoxStyle("Round", pad=0.2)

or:

BoxStyle("Round, pad=0.2")

Following boxstyle classes are defined.

<table>
<thead>
<tr>
<th>Class</th>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Circle</td>
<td>circle</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>DArrow</td>
<td>darrow</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>LArrow</td>
<td>larrow</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>RArrow</td>
<td>rarrow</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>Round</td>
<td>round</td>
<td>pad=0.3, rounding_size=None</td>
</tr>
<tr>
<td>Round4</td>
<td>round4</td>
<td>pad=0.3, rounding_size=None</td>
</tr>
<tr>
<td>Roundtooth</td>
<td>roundtooth</td>
<td>pad=0.3, tooth_size=None</td>
</tr>
<tr>
<td>Sawtooth</td>
<td>sawtooth</td>
<td>pad=0.3, tooth_size=None</td>
</tr>
<tr>
<td>Square</td>
<td>square</td>
<td>pad=0.3</td>
</tr>
</tbody>
</table>

An instance of any boxstyle class is a callable object, whose call signature is:

```
__call__(self, x0, y0, width, height, mutation_size, aspect_ratio=1.)
```

and returns a `Path` instance. `x0, y0, width` and `height` specify the location and size of the box to be drawn. `mutation_scale` determines the overall size of the mutation (by which I mean the transformation of the rectangle to the fancy box). `mutation_aspect` determines the aspect-ratio of the mutation.

return the instance of the subclass with the given style name.

class Circle(pad=0.3)
    Bases: matplotlib.patches._Base
    A simple circle box.

    Parameters
    
    pad [float] The amount of padding around the original box.

transmute(self, x0, y0, width, height, mutation_size)
    The transmute method is a very core of the BboxTransmuter class and must be overridden in the subclasses. It receives the location and size of the rectangle, and the mutation_size, with which the amount of padding and etc. will be scaled. It returns a Path instance.

class DArrow(pad=0.3)
    Bases: matplotlib.patches._Base
    (Double) Arrow Box

transmute(self, x0, y0, width, height, mutation_size)
    The transmute method is a very core of the BboxTransmuter class and must be
overridden in the subclasses. It receives the location and size of the rectangle, and the mutation_size, with which the amount of padding and etc. will be scaled. It returns a `Path` instance.

class LArrow(pad=0.3)
    Bases: matplotlib.patches._Base
    (left) Arrow Box
    
    \texttt{transmute}(self, x0, y0, width, height, mutation_size)
    
    The transmute method is a very core of the BboxTransmuter class and must be overridden in the subclasses. It receives the location and size of the rectangle, and the mutation_size, with which the amount of padding and etc. will be scaled. It returns a `Path` instance.

class RArrow(pad=0.3)
    Bases: matplotlib.patches.LArrow
    (right) Arrow Box
    
    \texttt{transmute}(self, x0, y0, width, height, mutation_size)
    
    The transmute method is a very core of the BboxTransmuter class and must be overridden in the subclasses. It receives the location and size of the rectangle, and the mutation_size, with which the amount of padding and etc. will be scaled. It returns a `Path` instance.

class Round(pad=0.3, rounding_size=None)
    Bases: matplotlib.patches._Base
    A box with round corners.
    
    \texttt{pad}  amount of padding
    
    \texttt{rounding\_size}  rounding radius of corners. \texttt{pad} if None
    
    \texttt{transmute}(self, x0, y0, width, height, mutation_size)
    
    The transmute method is a very core of the BboxTransmuter class and must be overridden in the subclasses. It receives the location and size of the rectangle, and the mutation_size, with which the amount of padding and etc. will be scaled. It returns a `Path` instance.

class Round4(pad=0.3, rounding_size=None)
    Bases: matplotlib.patches._Base
    Another box with round edges.
    
    \texttt{pad}  amount of padding
    
    \texttt{rounding\_size}  rounding size of edges. \texttt{pad} if None
    
    \texttt{transmute}(self, x0, y0, width, height, mutation_size)
    
    The transmute method is a very core of the BboxTransmuter class and must be overridden in the subclasses. It receives the location and size of the rectangle, and the mutation_size, with which the amount of padding and etc. will be scaled. It returns a `Path` instance.

class Roundtooth(pad=0.3, tooth_size=None)
    Bases: matplotlib.patches.Sawtooth
    A rounded tooth box.
    
    \texttt{pad}  amount of padding
    
    \texttt{tooth\_size}  size of the sawtooth. \texttt{pad*} if None
transmute(self, x0, y0, width, height, mutation_size)

The transmute method is a very core of the BboxTransmuter class and must be
overridden in the subclasses. It receives the location and size of the rectan-
gle, and the mutation_size, with which the amount of padding and etc. will be
scaled. It returns a Path instance.

class Sawtooth(pad=0.3, tooth_size=None)

Bases: matplotlib.patches._Base

A sawtooth box.

pad amount of padding

tooth_size size of the sawtooth. pad* if None

transmute(self, x0, y0, width, height, mutation_size)

The transmute method is a very core of the BboxTransmuter class and must be
overridden in the subclasses. It receives the location and size of the rectan-
gle, and the mutation_size, with which the amount of padding and etc. will be
scaled. It returns a Path instance.

class Square(pad=0.3)

Bases: matplotlib.patches._Base

A simple square box.

pad amount of padding

transmute(self, x0, y0, width, height, mutation_size)

The transmute method is a very core of the BboxTransmuter class and must be
overridden in the subclasses. It receives the location and size of the rectan-
gle, and the mutation_size, with which the amount of padding and etc. will be
scaled. It returns a Path instance.

Examples using matplotlib.patches.BoxStyle

- sphx_glr_gallery_pyplots_whats_new_98_4_fancy.py
- sphx_glr_gallery_shapes_and_collections_artist_reference.py
- sphx_glr_gallery_shapes_and_collections_fancybox_demo.py

matplotlib.patches.Circle

class matplotlib.patches.Circle(xy, radius=5, **kwargs)

Bases: matplotlib.patches.Ellipse

A circle patch.

Create true circle at center xy = (x, y) with given radius. Unlike CirclePolygon which is
a polygonal approximation, this uses Bezier splines and is much closer to a scale-free
circle.

Valid kwargs are:

Transformations Tutorial

matplotlib.patches.CirclePolygon

class matplotlib.patches.CirclePolygon(xy, radius=5, resolution=20, **kwargs)
Bases: matplotlib.patches.RegularPolygon

A polygon-approximation of a circle patch.

Create a circle at $xy = (x, y)$ with given $radius$. This circle is approximated by a regular polygon with $resolution$ sides. For a smoother circle drawn with splines, see Circle.

Valid kwarg are:

<table>

**matplotlib.patches.ConnectionPatch**

class matplotlib.patches.ConnectionPatch(xyA, xyB, coordsA, coordsB=None, axesA=None, axesB=None, arrowstyle='-', arrow_transmuter=None, connectionstyle='arc3', connector=None, patchA=None, patchB=None, shrinkA=0.0, shrinkB=0.0, mutation_scale=10.0, mutation_aspect=None, clip_on=False, dpi_cor=1.0, **kwargs)

**Bases:** matplotlib.patches.FancyArrowPatch

A `ConnectionPatch` class is to make connecting lines between two points (possibly in different axes).

Connect point `xyA` in `coordsA` with point `xyB` in `coordsB`.

Valid keys are

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arrowstyle</td>
<td>the arrow style</td>
</tr>
<tr>
<td>connectionstyle</td>
<td>the connection style</td>
</tr>
<tr>
<td>relpos</td>
<td>default is (0.5, 0.5)</td>
</tr>
<tr>
<td>patchA</td>
<td>default is bounding box of the text</td>
</tr>
<tr>
<td>patchB</td>
<td>default is None</td>
</tr>
<tr>
<td>shrinkA</td>
<td>default is 2 points</td>
</tr>
<tr>
<td>shrinkB</td>
<td>default is 2 points</td>
</tr>
<tr>
<td>mutation_scale</td>
<td>default is text size (in points)</td>
</tr>
<tr>
<td>mutation_aspect</td>
<td>default is 1.</td>
</tr>
<tr>
<td>?</td>
<td>any key for <code>matplotlib.patches.PathPatch</code></td>
</tr>
</tbody>
</table>

`coordsA` and `coordsB` are strings that indicate the coordinates of `xyA` and `xyB`. 
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'figure points'</td>
<td>points from the lower left corner of the figure</td>
</tr>
<tr>
<td>'figure pixels'</td>
<td>pixels from the lower left corner of the figure</td>
</tr>
<tr>
<td>'figure fraction'</td>
<td>0,0 is lower left of figure and 1,1 is upper, right</td>
</tr>
<tr>
<td>'axes points'</td>
<td>points from lower left corner of axes</td>
</tr>
<tr>
<td>'axes pixels'</td>
<td>pixels from lower left corner of axes</td>
</tr>
<tr>
<td>'axes fraction'</td>
<td>0,1 is lower left of axes and 1,1 is upper right</td>
</tr>
<tr>
<td>'data'</td>
<td>use the coordinate system of the object being annotated (default)</td>
</tr>
<tr>
<td>'offset points'</td>
<td>Specify an offset (in points) from the xy value</td>
</tr>
<tr>
<td>'polar'</td>
<td>you can specify $\theta, r$ for the annotation, even in cartesian plots. Note that if you are using a polar axes, you do not need to specify polar for the coordinate system since that is the native “data” coordinate system.</td>
</tr>
</tbody>
</table>

Alternatively they can be set to any valid Transform.

**draw**(self, renderer)

Draw the Patch to the given renderer.

**get_annotation_clip**(self)

Return annotation_clip attribute. See **set_annotation_clip**() for the meaning of return values.

**get_path_in_displaycoord**(self)

Return the mutated path of the arrow in the display coord

**set_annotation_clip**(self, b)

Set annotation_clip attribute.

- **True**: the annotation will only be drawn when self.xy is inside the axes.
- **False**: the annotation will always be drawn regardless of its position.
- None: the self.xy will be checked only if xycoords is "data"

**Examples using** matplotlib.patches.ConnectionPatch

- sphx_glr_gallery_pie_and_polar_charts_bar_of_pie.py
- sphx_glr_gallery_userdemo_connect_simple01.py

17.34. matplotlib.patches 1695
Matplotlib, Release 3.1.3

matplotlib.patches.ConnectionStyle

class matplotlib.patches.ConnectionStyle
    Bases: matplotlib.patches._Style

    ConnectionStyle is a container class which defines several connectionstyle classes, which is used to create a path between two points. These are mainly used with FancyArrowPatch.

    A connectionstyle object can be either created as:

    ConnectionStyle.Arc3(rad=0.2)

    or:

    ConnectionStyle("Arc3", rad=0.2)

    or:

    ConnectionStyle("Arc3, rad=0.2")

    The following classes are defined

    | Class  | Name | Attrs |
    |--------|------|-------|
    | Angle  | angle| angleA=90, angleB=0, rad=0.0 |
    | Angle3 | angle3| angleA=90, angleB=0 |
    | Arc    | arc  | angleA=0, angleB=0, armA=None, armB=None, rad=0.0 |
    | Arc3   | arc3 | rad=0.0 |
    | Bar    | bar  | armA=0.0, armB=0.0, fraction=0.3, angle=None |

    An instance of any connection style class is an callable object, whose call signature is:

    __call__ (self, posA, posB, patchA=None, patchB=None, shrinkA=2., shrinkB=2.)

    and it returns a Path instance. posA and posB are tuples of x,y coordinates of the two points to be connected. patchA (or patchB) is given, the returned path is clipped so that it start (or end) from the boundary of the patch. The path is further shrinked by shrinkA (or shrinkB) which is given in points.

    return the instance of the subclass with the given style name.

    class Angle(angleA=90, angleB=0, rad=0.0)
        Bases: matplotlib.patches._Base

        Creates a piecewise continuous quadratic Bezier path between two points. The path has a one passing-through point placed at the intersecting point of two lines which cross the start and end point, and have a slope of angleA and angleB, respectively. The connecting edges are rounded with rad.

        angleA  starting angle of the path
        angleB  ending angle of the path
        rad     rounding radius of the edge
        connect (self, posA, posB)
class Angle3(angleA=90, angleB=0)
    Bases: matplotlib.patches._Base

    Creates a simple quadratic Bezier curve between two points. The middle control
    points is placed at the intersecting point of two lines which cross the start and end
    point, and have a slope of angleA and angleB, respectively.

    angleA  starting angle of the path
    angleB  ending angle of the path

    connect(self, posA, posB)

class Arc(angleA=0, angleB=0, armA=None, armB=None, rad=0.0)
    Bases: matplotlib.patches._Base

    Creates a piecewise continuous quadratic Bezier path between two points. The path
    can have two passing-through points, a point placed at the distance of armA and
    angle of angleA from point A, another point with respect to point B. The edges are
    rounded with rad.

    angleA  : starting angle of the path
    angleB  : ending angle of the path
    armA    : length of the starting arm
    armB    : length of the ending arm
    rad     : rounding radius of the edges

    connect(self, posA, posB)

class Arc3(rad=0.0)
    Bases: matplotlib.patches._Base

    Creates a simple quadratic Bezier curve between two points. The curve is created
    so that the middle control point (C1) is located at the same distance from the start
    (C0) and end points(C2) and the distance of the C1 to the line connecting C0-C2 is
    rad times the distance of C0-C2.

    rad  curvature of the curve.

    connect(self, posA, posB)

class Bar(armA=0.0, armB=0.0, fraction=0.3, angle=None)
    Bases: matplotlib.patches._Base

    A line with angle between A and B with armA and armB. One of the arms is extended
    so that they are connected in a right angle. The length of armA is determined by
    (armA + fraction x AB distance). Same for armB.

    Parameters

    armA  [float] minimum length of armA
    armB  [float] minimum length of armB
    fraction  [float] a fraction of the distance between two points that will
              be added to armA and armB.
    angle  [float or None] angle of the connecting line (if None, parallel to
            A and B)

    connect(self, posA, posB)
class matplotlib.patches.Ellipse(xy, width, height, angle=0, **kwargs)
    Bases: matplotlib.patches.Patch

A scale-free ellipse.

Parameters

xy  [(float, float)] xy coordinates of ellipse centre.
width  [float] Total length (diameter) of horizontal axis.
height  [float] Total length (diameter) of vertical axis.
angle  [float] Total length (diameter) of vertical axis.

Notes

Valid keyword arguments are

</tbody>
</table>
center
Return the center of the ellipse

get_center(self)
Return the center of the ellipse

get_patch_transform(self)
Return the Transform instance which takes patch coordinates to data coordinates.
For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

get_path(self)
Return the path of the ellipse

set_center(self, xy)
Set the center of the ellipse.

Parameters
xy [(float, float)]

matplotlib.patches.FancyArrow

class matplotlib.patches.FancyArrow(x, y, dx, dy, width=0.001, length_includes_head=False, head_width=None, head_length=None, shape='full', overhang=0, head_starts_at_zero=False, **kwargs)

Bases: matplotlib.patches.Polygon

Like Arrow, but lets you set head width and head height independently.

Constructor arguments
width: float (default: 0.001)  width of full arrow tail

length_includes_head: bool (default: False)  True if head is to be counted in calculating the length.

head_width: float or None (default: 3*width)  total width of the full arrow head

head_length: float or None (default: 1.5 * head_width)  length of arrow head

shape: ['full', 'left', 'right'] (default: 'full')  draw the left-half, right-half, or full arrow

overhang: float (default: 0)  fraction that the arrow is swept back (0 overhang means triangular shape). Can be negative or greater than one.

head_starts_at_zero: bool (default: False)  if True, the head starts being drawn at coordinate 0 instead of ending at coordinate 0.

Other valid kwargs (inherited from Patch) are:

matplotlib.patches.FancyArrowPatch

class matplotlib.patches.FancyArrowPatch(posA=None, posB=None, path=None, arrowstyle='simple', arrow_transmuter=None, connectionstyle='arc3', connector=None, patchA=None, patchB=None, shrinkA=2, shrinkB=2, mutation_scale=1, mutation_aspect=None, dpi_cor=1, **kwargs)

Bases: matplotlib.patches.Patch

A fancy arrow patch. It draws an arrow using the ArrowStyle.

The head and tail positions are fixed at the specified start and end points of the arrow, but the size and shape (in display coordinates) of the arrow does not change when the axis is moved or zoomed.

If posA and posB are given, a path connecting two points is created according to connectionstyle. The path will be clipped with patchA and patchB and further shrunken by shrinkA and shrinkB. An arrow is drawn along this resulting path using the arrowstyle parameter.

Alternatively if path is provided, an arrow is drawn along this path and patchA, patchB, shrinkA, and shrinkB are ignored.

Parameters

- **posA, posB** [None, tuple, optional (default: None)] (x,y) coordinates of arrow tail and arrow head respectively.
- **path** [None, Path (default: None)] matplotlib.path.Path instance. If provided, an arrow is drawn along this path and patchA, patchB, shrinkA, and shrinkB are ignored.
- **arrowstyle** [str or ArrowStyle, optional (default: ‘simple’)]
  
  Describes how the fancy arrow will be drawn. It can be string of the available arrowstyle names, with optional comma-separated attributes, or an ArrowStyle instance. The optional attributes are meant to be scaled with the mutation_scale. The following arrow styles are available:
<table>
<thead>
<tr>
<th>Class</th>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Curve</td>
<td>-</td>
<td>None</td>
</tr>
<tr>
<td>CurveB</td>
<td>-&gt;</td>
<td>head_length=0.4, head_width=0.2</td>
</tr>
<tr>
<td>BracketB</td>
<td>-[</td>
<td>widthB=1.0, lengthB=0.2, angleB=None</td>
</tr>
<tr>
<td>Curve-FilledB</td>
<td>-</td>
<td>head_length=0.4, head_width=0.2</td>
</tr>
<tr>
<td>CurveA</td>
<td>&lt;</td>
<td>head_length=0.4, head_width=0.2</td>
</tr>
<tr>
<td>CurveAB</td>
<td>&lt;-&gt;</td>
<td>head_length=0.4, head_width=0.2</td>
</tr>
<tr>
<td>Curve-FilledA</td>
<td>&lt;</td>
<td>-</td>
</tr>
<tr>
<td>Curve-FilledAB</td>
<td>&lt;</td>
<td>-</td>
</tr>
<tr>
<td>BracketA</td>

<td>widthA=1.0, lengthA=0.2, angleA=None</td>
</tr>
<tr>
<td>BracketAB</td>
<td>]-[]</td>
<td>widthA=1.0, lengthA=0.2, angleA=None, widthB=1.0, lengthB=0.2, angleB=None</td>
</tr>
<tr>
<td>Fancy</td>
<td>fancy</td>
<td>head_length=0.4, head_width=0.4, tail_width=0.4</td>
</tr>
<tr>
<td>Simple</td>
<td>simple</td>
<td>head_length=0.5, head_width=0.5, tail_width=0.2</td>
</tr>
<tr>
<td>Wedge</td>
<td>wedge</td>
<td>tail_width=0.3, shrink factor=0.5</td>
</tr>
<tr>
<td>BarAB</td>
<td></td>
<td>-[]</td>
</tr>
</tbody>
</table>

`arrow_transmuter` Ignored

`connectionstyle` [str, ConnectionStyle, or None, optional]

default: ‘arc3’

Describes how posA and posB are connected. It can be an instance of the `ConnectionStyle` class or a string of the connectionstyle name, with optional comma-separated attributes. The following connection styles are available:

<table>
<thead>
<tr>
<th>Class</th>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Angle</td>
<td>angle</td>
<td>angleA=90, angleB=0, rad=0.0</td>
</tr>
<tr>
<td>Angle3</td>
<td>angle3</td>
<td>angleA=90, angleB=0</td>
</tr>
<tr>
<td>Arc</td>
<td>arc</td>
<td>angleA=0, angleB=0, armA=None, armB=None, rad=0.0</td>
</tr>
<tr>
<td>Arc3</td>
<td>arc3</td>
<td>rad=0.0</td>
</tr>
<tr>
<td>Bar</td>
<td>bar</td>
<td>armA=0.0, armB=0.0, fraction=0.3, angle=None</td>
</tr>
</tbody>
</table>

`connector` Ignored

`patchA, patchB` [None, Patch, optional (default: None)] Head and tail patch respectively. `matplotlib.patches.Patch` instance.

`shrinkA, shrinkB` [scalar, optional (default: 2)] Shrinking factor of the tail and head of the arrow respectively

`mutation_scale` [scalar, optional (default: 1)] Value with which attributes of `arrowstyle` (e.g., `head_length`) will be scaled.
**mutation_aspect** [None, scalar, optional (default: None)] The height of the rectangle will be squeezed by this value before the mutation and the mutated box will be stretched by the inverse of it.

**dpi_cor** [scalar, optional (default: 1)] dpi_cor is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this.

**Notes**

Valid kwargs are:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>agg_filter</code></td>
<td>a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array</td>

<td>str</td>
</tr>
<tr>
<td><code>visible</code></td>
<td>bool</td>
</tr>
<tr>
<td><code>zorder</code></td>
<td>float</td>
</tr>
</tbody>
</table>

**draw(self, renderer)**

Draw the Patch to the given renderer.

**get_arrowstyle(self)**

Return the arrowstyle object.

**get_connectionstyle(self)**
Return the `ConnectionStyle` instance.

```python
get_dpi_cor(self)
```
dpi_cor is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this.

**Returns**
- `dpi_cor` [scalar]

```python
get_mutation_aspect(self)
```
Return the aspect ratio of the bbox mutation.

```python
get_mutation_scale(self)
```
Return the mutation scale.

**Returns**
- `scale` [scalar]

```python
get_path(self)
```
Return the path of the arrow in the data coordinates. Use `get_path_in_displaycoord()` method to retrieve the arrow path in display coordinates.

```python
get_path_in_displaycoord(self)
```
Return the mutated path of the arrow in display coordinates.

```python
set_arrowstyle(self, arrowstyle=None, **kw)
```
Set the arrow style. Old attributes are forgotten. Without arguments (or with `arrowstyle=None`) returns available box styles as a list of strings.

**Parameters**
- `arrowstyle` [None, ArrowStyle, str, optional (default: None)] Can be a string with arrowstyle name with optional comma-separated attributes, e.g.:

```python
set_arrowstyle("Fancy,head_length=0.2")
```
Alternatively attributes can be provided as keywords, e.g.:

```python
set_arrowstyle("fancy", head_length=0.2)
```

```python
set_connectionstyle(self, connectionstyle, **kw)
```
Set the connection style. Old attributes are forgotten.

**Parameters**
- `connectionstyle` [None, ConnectionStyle instance, or string] Can be a string with connectionstyle name with optional comma-separated attributes, e.g.:

```python
set_connectionstyle("arc,angleA=0,armA=30,rad=10")
```
Alternatively, the attributes can be provided as keywords, e.g.:

```python
set_connectionstyle("arc", angleA=0,armA=30,rad=10)
```
Without any arguments (or with `connectionstyle=None`), return available styles as a list of strings.
set_dpi_cor(self, dpi_cor)
dpi_cor is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this.

**Parameters**

- **dpi_cor [scalar]**

set_mutation_aspect(self, aspect)
Set the aspect ratio of the bbox mutation.

**Parameters**

- **aspect [scalar]**

set_mutation_scale(self, scale)
Set the mutation scale.

**Parameters**

- **scale [scalar]**

set_patchA(self, patchA)
Set the tail patch.

**Parameters**

set_patchB(self, patchB)
Set the head patch.

**Parameters**

- **patchB [Patch] matplotlib.patch.Patch instance.**

set_positions(self, posA, posB)
Set the begin and end positions of the connecting path.

**Parameters**

- **posA, posB [None, tuple] (x,y) coordinates of arrow tail and arrow head respectively. If None use current value.**

Examples using matplotlib.patches.FancyArrowPatch

- sphx_glr_gallery_shapes_and_collections_arrow_guide.py
- sphx_glr_gallery_userdemo_connectionstyle_demo.py

matplotlib.patches.FancyBboxPatch

class matplotlib.patches.FancyBboxPatch(xy, width, height, boxstyle='round', bbox_transmuter=None, mutation_scale=1.0, mutation_aspect=None, **kwargs)

Bases: matplotlib.patches.Patch

A fancy box around a rectangle with lower left at xy = (x, y) with specified width and height.
FancyBboxPatch is similar to Rectangle, but it draws a fancy box around the rectangle. The transformation of the rectangle box to the fancy box is delegated to the BoxTransmuterBase and its derived classes.

**Parameters**

- **xy** [float, float] The lower left corner of the box.
- **width** [float] The width of the box.
- **height** [float] The height of the box.
- **boxstyle** [str or matplotlib.patches.BoxStyle]
  
  The style of the fancy box. This can either be a BoxStyle instance or a string of the style name and optionally comma separated attributes (e.g. “Round, pad=0.2”). This string is passed to BoxStyle to construct a BoxStyle object. See there for a full documentation.

The following box styles are available:

<table>
<thead>
<tr>
<th>Class</th>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Circle</td>
<td>circle</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>DA arrog</td>
<td>darrow</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>L Arrow</td>
<td>larrow</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>RA arrog</td>
<td>rarrow</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>Round</td>
<td>round</td>
<td>pad=0.3, rounding_size=None</td>
</tr>
<tr>
<td>Round4</td>
<td>round4</td>
<td>pad=0.3, rounding_size=None</td>
</tr>
<tr>
<td>Roundtooth</td>
<td>roundtooth</td>
<td>pad=0.3, tooth_size=None</td>
</tr>
<tr>
<td>Sawtooth</td>
<td>sawtooth</td>
<td>pad=0.3, tooth_size=None</td>
</tr>
<tr>
<td>Square</td>
<td>square</td>
<td>pad=0.3</td>
</tr>
</tbody>
</table>

- **mutation_scale** [float, optional, default: 1] Scaling factor applied to the attributes of the box style (e.g. pad or rounding_size).

- **mutation_aspect** [float, optional] The height of the rectangle will be squeezed by this value before the mutation and the mutated box will be stretched by the inverse of it. For example, this allows different horizontal and vertical padding.

**Other Parameters**

**kwargs [Patch properties]
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>edgecolor</code> or <code>ec</code></td>
<td>color or None or 'auto'</td>

</tr>
</tbody>
</table>

```python
def get_bbox(self):
    Return the Bbox of the rectangle.

def get_boxstyle(self):
    Return the boxstyle object.

def get_height(self):
    Return the height of the rectangle.

def get_mutation_aspect(self):
    Return the aspect ratio of the bbox mutation.

def get_mutation_scale(self):
    Return the mutation scale.

def get_path(self):
    Return the mutated path of the rectangle.

def get_width(self):
    Return the width of the rectangle.

def get_x(self):
    Return the left coord of the rectangle.

def get_y(self):
    Return the bottom coord of the rectangle.

def set_bounds(self, *args):
    Set the bounds of the rectangle.
```

Call signatures:

```python
set_bounds(left, bottom, width, height)
set_bounds((left, bottom, width, height))
```
Parameters

left, bottom [float] The coordinates of the bottom left corner of the rectangle.

width, height [float] The width/height of the rectangle.

```python
set_boxstyle(self, boxstyle=None, **kw)
```
Set the box style.

`boxstyle` can be a string with boxstyle name with optional comma-separated attributes. Alternatively, the attrs can be provided as keywords:

```python
set_boxstyle("round, pad=0.2")
set_boxstyle("round", pad=0.2)
```

Old attrs simply are forgotten.
Without argument (or with boxstyle = None), it returns available box styles.
The following boxstyles are available:

<table>
<thead>
<tr>
<th>Class</th>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Circle</td>
<td>circle</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>DArrow</td>
<td>darrow</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>LArrow</td>
<td>larrow</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>RArrow</td>
<td>rarrow</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>Round</td>
<td>round</td>
<td>pad=0.3, rounding_size=None</td>
</tr>
<tr>
<td>Round4</td>
<td>round4</td>
<td>pad=0.3, rounding_size=None</td>
</tr>
<tr>
<td>Roundtooth</td>
<td>roundtooth</td>
<td>pad=0.3, tooth_size=None</td>
</tr>
<tr>
<td>Sawtooth</td>
<td>sawtooth</td>
<td>pad=0.3, tooth_size=None</td>
</tr>
<tr>
<td>Square</td>
<td>square</td>
<td>pad=0.3</td>
</tr>
</tbody>
</table>

```python
set_height(self, h)
```
Set the rectangle height.

**Parameters**

h [float]

```python
set_mutation_aspect(self, aspect)
```
Set the aspect ratio of the bbox mutation.

**Parameters**

aspect [float]

```python
set_mutation_scale(self, scale)
```
Set the mutation scale.

**Parameters**

scale [float]

```python
set_width(self, w)
```
Set the rectangle width.

**Parameters**
w [float]

```python
set_x(self, x)
```
Set the left coord of the rectangle.

**Parameters**

- **x** [float]

```python
set_y(self, y)
```
Set the bottom coord of the rectangle.

**Parameters**

- **y** [float]

**Examples using** `matplotlib.patches.FancyBboxPatch`

- `sphx_glr_gallery_shapes_and_collections_artist_reference.py`
- `sphx_glr_gallery_shapes_and_collections_fancybox_demo.py`
- `sphx_glr_gallery_userdemo_annotate_text_arrow.py`

### `matplotlib.patches.Patch`

```python
class matplotlib.patches.Patch(edgecolor=None, facecolor=None, color=None, linewidth=None, linestyle=None, antialiased=None, hatch=None, fill=True, capstyle=None, joinstyle=None, **kwargs)
```

**Bases:** `matplotlib.artist.Artist`

A patch is a 2D artist with a face color and an edge color.

If any of `edgecolor`, `facecolor`, `linewidth`, or `antialiased` are `None`, they default to their rc params setting.

The following kwarg properties are supported:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>agg_filter</code></td>
<td>a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array</td>
</tr>
<tr>
<td><code>alpha</code></td>
<td>float or None</td>
</tr>
<tr>
<td><code>animated</code></td>
<td>bool</td>
</tr>
<tr>
<td><code>antialiased</code></td>
<td>unknown</td>
</tr>
<tr>
<td><code>capstyle</code></td>
<td>{'but', 'round', 'projecting'}</td>

</tr>
</tbody>
</table>

`contains(self, mouseevent, radius=None)`
Test whether the mouse event occurred in the patch.

**Returns**

(bool, empty dict)

`contains_point(self, point, radius=None)`
Returns True if the given point is inside the path (transformed with its transform attribute).

radius allows the path to be made slightly larger or smaller.

`contains_points(self, points, radius=None)`
Returns a bool array which is True if the (closed) path contains the corresponding point. (transformed with its transform attribute).

points must be Nx2 array. radius allows the path to be made slightly larger or smaller.

draw(self, renderer)
Draw the Patch to the given renderer.

fill
return whether fill is set

get_aa(self)
Alias for get_antialiased.

get_antialiased(self)
Returns True if the Patch is to be drawn with antialiasing.

get_capstyle(self)
Return the current capstyle

get_data_transform(self)
Return the Transform instance which maps data coordinates to physical coordinates.

get_ec(self)
Alias for get_edgecolor.
get_edgecolor(self)
    Return the edge color of the Patch.

get_extents(self)
    Return a Bbox object defining the axis-aligned extents of the Patch.

get_facecolor(self)
    Return the face color of the Patch.

get_fc(self)
    Alias for get_facecolor.

get_fill(self)
    return whether fill is set

get_hatch(self)
    Return the current hatching pattern

get_joinstyle(self)
    Return the current joinstyle

get_linestyle(self)
    Return the linestyle.

get_linewidth(self)
    Return the line width in points.

get_ls(self)
    Alias for get_linestyle.

get_lw(self)
    Alias for get_linewidth.

get_patch_transform(self)
    Return the Transform instance which takes patch coordinates to data coordinates.
    For example, one may define a patch of a circle which represents a radius of 5 by
    providing coordinates for a unit circle, and a transform which scales the coordinates
    (the patch coordinate) by 5.

get_path(self)
    Return the path of this patch

get_transform(self)
    Return the Transform applied to the Patch.

get_verts(self)
    Return a copy of the vertices used in this patch
    If the patch contains Bezier curves, the curves will be interpolated by line segments.
    To access the curves as curves, use get_path().

get_window_extent(self, renderer=None)
    Get the axes bounding box in display space.
    The bounding box' width and height are nonnegative.
    Subclasses should override for inclusion in the bounding box “tight” calculation.
    Default is to return an empty bounding box at 0, 0.
    Be careful when using this function, the results will not update if the artist window
    extent of the artist changes. The extent can change due to any changes in the
    transform stack, such as changing the axes limits, the figure size, or the canvas
used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

```python
set_aa(self, aa)
Alias for set_antialiased.
```

```python
set_alpha(self, alpha)
Set the alpha transparency of the patch.

Parameters

alpha [float or None]
```

```python
set_antialiased(self, aa)
Set whether to use antialiased rendering.

Parameters

b [bool or None]
```

```python
set_capstyle(self, s)
Set the patch capstyle

Parameters

s [{'butt', 'round', 'projecting'}]
```

```python
set_color(self, c)
Set both the edgecolor and the facecolor.

Parameters

c [color]
```

See also:

- `Patch.set_facecolor`, `Patch.set_edgecolor` For setting the edge or face color individually.

```python
set_ec(self, color)
Alias for set_edgecolor.
```

```python
set_edgecolor(self, color)
Set the patch edge color.

Parameters

color [color or None or ‘auto’]
```

```python
set_facecolor(self, color)
Set the patch face color.

Parameters

color [color or None]
```

```python
set_fc(self, color)
Alias for set_facecolor.
```

```python
set_fill(self, b)
Set whether to fill the patch.

Parameters

b [bool]
```
set_hatch(self, hatch)
Set the hatching pattern
'hatch' can be one of:

/  - diagonal hatching
\ - back diagonal
|  - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Parameters

hatch [{ '/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_joinstyle(self, s)
Set the patch joinstyle

Parameters

s [{ 'miter', 'round', 'bevel'}]

set_linestyle(self, ls)
Set the patch linestyle.

<table>
<thead>
<tr>
<th>linestyle</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-.' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq),

where onoffseq is an even length tuple of on and off ink in points.

Parameters

ls [{ '-', '.', '-', '.', '+', 'x', 'o', 'O', '.', '*', ' '}] The line style.

set_linewidth(self, w)
Set the patch linewidth in points.

Parameters

w [float or None]

set_ls(self, ls)
Alias for set_linestyle.
set_lw(self, w)
    Alias for set_linewidth.
update_from(self, other)
    Updates this Patch from the properties of other.
validCap = ("butt", "round", "projecting")
validJoin = ("miter", "round", "bevel")
zorder = 1

**matplotlib.patches.Polygon**

```python
class matplotlib.patches.Polygon(xy, closed=True, **kwargs)

Bases: matplotlib.patches.Patch
```

A general polygon patch.

- `xy` is a numpy array with shape Nx2.
- If `closed` is `True`, the polygon will be closed so the starting and ending points are the same.

Valid `kwargs` are:
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agg_filter</td>
<td>a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array</td>

<td>Transform</td>
</tr>
<tr>
<td>url</td>
<td>str</td>
</tr>
<tr>
<td>visible</td>
<td>bool</td>
</tr>
<tr>
<td>zorder</td>
<td>float</td>
</tr>
</tbody>
</table>

```python
def get_closed(self)
    Returns if the polygon is closed

    Returns
def get_path(self)
    Get the path of the polygon

    Returns
def get_xy(self)
    Get the vertices of the path.

    Returns
def set_closed(self, closed)
    Set if the polygon is closed```
Parameters

**closed** [bool] True if the polygon is closed

*set_xy*(self, xy)
Set the vertices of the polygon.

Parameters

**xy** [(N, 2) array-like] The coordinates of the vertices.

xy
The vertices of the path as (N, 2) numpy array.

Examples using matplotlib.patches.Polygon

- sphx_glr_gallery_statistics_boxplot_demo.py
- sphx_glr_gallery_shapes_and_collections_hatch_demo.py

Annotations

matplotlib.patches.Rectangle

class matplotlib.patches.Rectangle(xy, width, height, angle=0.0, **kwargs)

Bases: matplotlib.patches.Patch

A rectangle with lower left at \( xy = (x, y) \) with specified \( width, height \) and rotation \( angle \).

Parameters

**xy** [(float, float)] The bottom and left rectangle coordinates

**width** [float] Rectangle width

**height** [float] Rectangle height

**angle** [float, optional] rotation in degrees anti-clockwise about \( xy \) (default is 0.0)

**fill** [bool, optional] Whether to fill the rectangle (default is True)

Notes

### Methods

- **get_bbox(self)**
  Return the height of the rectangle.

- **get_height(self)**
  Return the height of the rectangle.

- **get_patch_transform(self)**
  Return the Transform instance which takes patch coordinates to data coordinates.

  For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

- **get_path(self)**
  Return the vertices of the rectangle.

- **get_width(self)**
  Return the width of the rectangle.

- **get_x(self)**
  Return the left coord of the rectangle.

- **get_xy(self)**
  Return the left and bottom coords of the rectangle.
get_y(self)
    Return the bottom coord of the rectangle.

set_bounds(self, *args)
    Set the bounds of the rectangle: l,b,w,h
    ACCEPTS: (left, bottom, width, height)

set_height(self, h)
    Set the height of the rectangle.

set_width(self, w)
    Set the width of the rectangle.

set_x(self, x)
    Set the left coord of the rectangle.

set_xy(self, xy)
    Set the left and bottom coords of the rectangle.

Parameters

    xy [(float, float)]

set_y(self, y)
    Set the bottom coord of the rectangle.

xy
    Return the left and bottom coords of the rectangle.

matplotlib.patches.RegularPolygon
class matplotlib.patches.RegularPolygon(xy, numVertices, radius=5, orientation=0, **kwargs)
    Bases: matplotlib.patches.Patch
    A regular polygon patch.
    Constructor arguments:
    xy A length 2 tuple (x, y) of the center.
    numVertices the number of vertices.
    radius The distance from the center to each of the vertices.
    orientation rotates the polygon (in radians).
    Valid kwargs are:

<table>

- sphx_glr_gallery_specialty_plots_radar_chart.py

matplotlib.patches.Shadow

class matplotlib.patches.Shadow(patch, ox, oy, props=None, **kwargs)
    Bases: matplotlib.patches.Patch

    Create a shadow of the given patch offset by ox, oy. props, if not None, is a patch property
    update dictionary. If None, the shadow will have have the same color as the face, but
    darkened.
    
    kwags are

**matplotlib.patches.YAArrow**

**class matplotlib.patches.YAArrow(**kwargs)

**Bases:** matplotlib.patches.Patch

[Deprecated] Yet another arrow class.

This is an arrow that is defined in display space and has a tip at \(x1, y1\) and a base at \(x2, y2\).

**Notes**

Deprecated since version 3.0.

**get_patch_transform(self)**

Return the `Transform` instance which takes patch coordinates to data coordinates. For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

**get_path(self)**

Return the path of this patch

**getpoints(self, x1, y1, x2, y2, k)**

For line segment defined by \((x1, y1)\) and \((x2, y2)\) return the points on the line that is perpendicular to the line and intersects \((x2, y2)\) and the distance from \((x2, y2)\) of the returned points is \(k\).

### 17.34.2 Functions

| **bbox_artist(artist, renderer[, props, fill])** | This is a debug function to draw a rectangle around the bounding box returned by `get_window_extent()` of an artist, to test whether the artist is returning the correct bbox. |
| **draw_bbox(bbox, renderer[, color, trans])** | This is a debug function to draw a rectangle around the bounding box returned by `get_window_extent()` of an artist, to test whether the artist is returning the correct bbox. |

**matplotlib.patches.bbox_artist**

**matplotlib.patches.bbox_artist(artist, renderer, props=None, fill=True)**

This is a debug function to draw a rectangle around the bounding box returned by `get_window_extent()` of an artist, to test whether the artist is returning the correct bbox. `props` is a dict of rectangle props with the additional property 'pad' that sets the padding around the bbox in points.
**17.35 matplotlib.path**

A module for dealing with the polylines used throughout Matplotlib.

The primary class for polyline handling in Matplotlib is `Path`. Almost all vector drawing makes use of *Paths* somewhere in the drawing pipeline.

Whilst a `Path` instance itself cannot be drawn, some `Artist` subclasses, such as `PathPatch` and `PathCollection`, can be used for convenient `Path` visualisation.

```python
class matplotlib.path.Path(vertices, codes=None, _interpolation_steps=1,
                           closed=False, readonly=False)
```

*Bases: object*

`Path` represents a series of possibly disconnected, possibly closed, line and curve segments.

**The underlying storage is made up of two parallel numpy arrays:**

- `vertices`: an Nx2 float array of vertices
- `codes`: an N-length uint8 array of vertex types

These two arrays always have the same length in the first dimension. For example, to represent a cubic curve, you must provide three vertices as well as three codes `CURVE3`.

The code types are:

- `STOP` [1 vertex (ignored)] A marker for the end of the entire path (currently not required and ignored)
- `MOVETO` [1 vertex] Pick up the pen and move to the given vertex.
- `LINETO` [1 vertex] Draw a line from the current position to the given vertex.
- `CURVE3` [1 control point, 1 endpoint] Draw a quadratic Bezier curve from the current position, with the given control point, to the given end point.
- `CURVE4` [2 control points, 1 endpoint] Draw a cubic Bezier curve from the current position, with the given control points, to the given end point.
- `CLOSEPOLY` [1 vertex (ignored)] Draw a line segment to the start point of the current polyline.

Users of Path objects should not access the vertices and codes arrays directly. Instead, they should use `iter_segments()` or `cleaned()` to get the vertex/code pairs. This is important, since many `Path` objects, as an optimization, do not store a `codes` at all, but have a default one provided for them by `iter_segments()`.

Some behavior of `Path` objects can be controlled by rcParams. See the rcParams whose keys contain 'path.'.
The vertices and codes arrays should be treated as immutable - there are a number of optimizations and assumptions made up front in the constructor that will not change when the data changes.

Create a new path with the given vertices and codes.

**Parameters**

vertices [array_like] The \((n, 2)\) float array, masked array or sequence of pairs representing the vertices of the path.

If vertices contains masked values, they will be converted to NaNs which are then handled correctly by the Agg PathIterator and other consumers of path data, such as iter_segments().

codes [{None, array_like}, optional] n-length array integers representing the codes of the path. If not None, codes must be the same length as vertices. If None, vertices will be treated as a series of line segments.

_interpolation_steps [int, optional] Used as a hint to certain projections, such as Polar, that this path should be linearly interpolated immediately before drawing. This attribute is primarily an implementation detail and is not intended for public use.

closed [bool, optional] If codes is None and closed is True, vertices will be treated as line segments of a closed polygon.

readonly [bool, optional] Makes the path behave in an immutable way and sets the vertices and codes as read-only arrays.

CLOSEPOLY = 79
CURVE3 = 3
CURVE4 = 4
LINETO = 2
MOVETO = 1

A dictionary mapping Path codes to the number of vertices that the code expects.

STOP = 0

classmethod arc(theta1, theta2, n=None, is_wedge=False)
Return the unit circle arc from angles theta1 to theta2 (in degrees).

theta2 is unwrapped to produce the shortest arc within 360 degrees. That is, if theta2 > theta1 + 360, the arc will be from theta1 to theta2 - 360 and not a full circle plus some extra overlap.

If n is provided, it is the number of spline segments to make. If n is not provided, the number of spline segments is determined based on the delta between theta1 and theta2.

Masionobe, L. 2003. Drawing an elliptical arc using polylines, quadratic or cubic Bezier curves.

classmethod circle(center=(0.0, 0.0), radius=1.0, readonly=False)
Return a Path representing a circle of a given radius and center.
Parameters

center [pair of floats] The center of the circle. Default (0, 0).
radius [float] The radius of the circle. Default is 1.
readonly [bool] Whether the created path should have the “readonly” argument set when creating the Path instance.

Notes

The circle is approximated using 8 cubic Bezier curves, as described in

Lancaster, Don. Approximating a Circle or an Ellipse Using Four Bezier Cubic Splines.

cleaned(self, transform=None, remove_nans=False, clip=None, quantize=False, simplify=False, curves=False, stroke_width=1.0, snap=False, sketch=None)

Return a new Path with vertices and codes cleaned according to the parameters.

See also:

Path.iter_segments for details of the keyword arguments.

clip_to_bbox(self, bbox, inside=True)

Clip the path to the given bounding box.

The path must be made up of one or more closed polygons. This algorithm will not behave correctly for unclosed paths.

If inside is True, clip to the inside of the box, otherwise to the outside of the box.

code_type

alias of numpy.uint8

codes

The list of codes in the Path as a 1-D numpy array. Each code is one of STOP, MOVETO, LINETO, CURVE3, CURVE4 or CLOSEPOLY. For codes that correspond to more than one vertex (CURVE3 and CURVE4), that code will be repeated so that the length of self.vertices and self.codes is always the same.

contains_path(self, path, transform=None)

Returns whether this (closed) path completely contains the given path.

If transform is not None, the path will be transformed before performing the test.

contains_point(self, point, transform=None, radius=0.0)

Returns whether the (closed) path contains the given point.

If transform is not None, the path will be transformed before performing the test.

radius allows the path to be made slightly larger or smaller.

contains_points(self, points, transform=None, radius=0.0)

Returns a bool array which is True if the (closed) path contains the corresponding point.

If transform is not None, the path will be transformed before performing the test.

radius allows the path to be made slightly larger or smaller.
copy(self)
Returns a shallow copy of the Path, which will share the vertices and codes with the source Path.

depthcopy(self, memo=None)
Returns a deepcopy of the Path. The Path will not be readonly, even if the source Path is.

get_extents(self, transform=None)
Returns the extents (xmin, ymin, xmax, ymax) of the path.
Unlike computing the extents on the vertices alone, this algorithm will take into account the curves and deal with control points appropriately.

has_nonfinite

hatch(hatchpattern, density=6)
Given a hatch specifier, hatchpattern, generates a Path that can be used in a repeated hatching pattern. density is the number of lines per unit square.

interpolated(self, steps)
Returns a new path resampled to length N x steps. Does not currently handle interpolating curves.

intersects_bbox(self, bbox, filled=True)
Returns True if this path intersects a given Bbox.
filled, when True, treats the path as if it was filled. That is, if the path completely encloses the bounding box, intersects_bbox() will return True.
The bounding box is always considered filled.

intersects_path(self, other, filled=True)
Returns True if this path intersects another given path.
filled, when True, treats the paths as if they were filled. That is, if one path completely encloses the other, intersects_path() will return True.

iter_segments(self, transform=None, remove_nans=True, clip=None, snap=False, stroke_width=1.0, simplify=None, curves=True, sketch=None)
Iterates over all of the curve segments in the path. Each iteration returns a 2-tuple (vertices, code), where vertices is a sequence of 1-3 coordinate pairs, and code is a Path code.
Additionally, this method can provide a number of standard cleanups and conversions to the path.

Parameters

transform [None or Transform] If not None, the given affine transformation will be applied to the path.

remove_nans [bool, optional] Whether to remove all NaNs from the path and skip over them using MOVETO commands.

clip [None or (float, float, float, float), optional] If not None, must be a four-tuple (x1, y1, x2, y2) defining a rectangle in which to clip the path.

snap [None or bool, optional] If True, snap all nodes to pixels; if False, don’t snap them. If None, perform snapping if the path contains only segments parallel to the x or y axes, and no more than 1024 of them.
stroke_width [float, optional] The width of the stroke being drawn (used for path snapping).

simplify [None or bool, optional] Whether to simplify the path by removing vertices that do not affect its appearance. If None, use the should_simplify attribute. See also rcParams["path.simplify"] (default: True) and rcParams["path.simplify_threshold"] (default: 0.1111111111111111).

curves [bool, optional] If True, curve segments will be returned as curve segments. If False, all curves will be converted to line segments.

sketch [None or sequence, optional] If not None, must be a 3-tuple of the form (scale, length, randomness), representing the sketch parameters.

classmethod make_compound_path(*args)
Make a compound path from a list of Path objects.

classmethod make_compound_path_from_polys(XY)
Make a compound path object to draw a number of polygons with equal numbers of sides XY is a (numpolys x numsides x 2) numpy array of vertices. Return object is a Path

readonly
True if the Path is read-only.
should_simplify
   True if the vertices array should be simplified.

simplify_threshold
   The fraction of a pixel difference below which vertices will be simplified out.

to_polygons(self, transform=None, width=0, height=0, closed_only=True)
   Convert this path to a list of polygons or polylines. Each polygon/polyline is an
   Nx2 array of vertices. In other words, each polygon has no \texttt{MOVETO} instructions or
   curves. This is useful for displaying in backends that do not support compound
   paths or Bezier curves.

   If \texttt{width} and \texttt{height} are both non-zero then the lines will be simplified so that vertices
   outside of \((0, 0), (width, height)\) will be clipped.

   If \texttt{closed_only} is \texttt{True} (default), only closed polygons, with the last point being the
   same as the first point, will be returned. Any unclosed polylines in the path will be
   explicitly closed. If \texttt{closed_only} is \texttt{False}, any unclosed polygons in the path will be
   returned as unclosed polygons, and the closed polygons will be returned explicitly
   closed by setting the last point to the same as the first point.

transformed(self, transform)
   Return a transformed copy of the path.

   See also:

   \texttt{matplotlib.transforms.TransformedPath} A specialized path class that will cache the
   transformed result and automatically update when the transform changes.

classmethod unit_circle()
   Return the readonly \texttt{Path} of the unit circle.

   For most cases, \texttt{Path.circle()} will be what you want.

classmethod unit_circle_righthalf()
   Return a \texttt{Path} of the right half of a unit circle.

   See \texttt{Path.circle} for the reference on the approximation used.

classmethod unit_rectangle()
   Return a \texttt{Path} instance of the unit rectangle from \((0, 0)\) to \((1, 1)\).

classmethod unit_regular_asterisk(numVertices)
   Return a \texttt{Path} for a unit regular asterisk with the given \texttt{numVertices} and radius of
   1.0, centered at \((0, 0)\).

classmethod unit_regular_polygon(numVertices)
   Return a \texttt{Path} instance for a unit regular polygon with the given \texttt{numVertices} and
   radius of 1.0, centered at \((0, 0)\).

classmethod unit_regular_star(numVertices, innerCircle=0.5)
   Return a \texttt{Path} for a unit regular star with the given \texttt{numVertices} and radius of 1.0,
   centered at \((0, 0)\).

vertices
   The list of vertices in the \texttt{Path} as an Nx2 numpy array.

classmethod wedge(theta1, theta2, n=None)
   Return the unit circle wedge from angles \texttt{theta1} to \texttt{theta2} (in degrees).
theta2 is unwrapped to produce the shortest wedge within 360 degrees. That is, if theta2 > theta1 + 360, the wedge will be from theta1 to theta2 - 360 and not a full circle plus some extra overlap.

If n is provided, it is the number of spline segments to make. If n is not provided, the number of spline segments is determined based on the delta between theta1 and theta2.

See Path.arc for the reference on the approximation used.

matplotlib.path.get_path_collection_extents(master_transform, paths, transforms, offsets, offset_transform)

Given a sequence of Paths, Transforms objects, and offsets, as found in a PathCollection, returns the bounding box that encapsulates all of them.

Parameters

- **master_transform** [Transform] Global transformation applied to all paths.
- **paths** [list of Path]
- **transform** [list of Affine2D]
- **offsets** [(N, 2) array-like]
- **offset_transform** [Affine2D] Transform applied to the offsets before offsetting the path.

Notes

The way that paths, transforms and offsets are combined follows the same method as for collections: Each is iterated over independently, so if you have 3 paths, 2 transforms and 1 offset, their combinations are as follows:

(A, A, A), (B, B, A), (C, A, A)

matplotlib.path.get_paths_extents(paths, transforms=[], offset_transform=None)

[Deprecated] Given a sequence of Path objects and optional Transform objects, returns the bounding box that encapsulates all of them.

**paths** is a sequence of Path instances.

**transforms** is an optional sequence of Affine2D instances to apply to each path.

Notes

Deprecated since version 3.1.

### 17.36 matplotlib.pathEffects

Defines classes for path effects. The path effects are supported in Text, Line2D and Patch.

class matplotlib.pathEffects.AbstractPathEffect(offset=(0.0, 0.0))

**Bases:** object

A base class for path effects.
Subclasses should override the `draw_path` method to add effect functionality.

**Parameters**
- **offset** [pair of floats] The offset to apply to the path, measured in points.

```python
def draw_path(self, renderer, gc, tpath, affine, rgbFace=None)
    Derived should override this method. The arguments are the same as `matplotlib.backend_bases.RendererBase.draw_path()` except the first argument is a renderer.
```

```python
class matplotlib.path_effects.Normal(offset=(0.0, 0.0))
Bases: matplotlib.path_effects.AbstractPathEffect
```

The “identity” PathEffect.

The Normal PathEffect’s sole purpose is to draw the original artist with no special path effect.

**Parameters**
- **offset** [pair of floats] The offset to apply to the path, measured in points.

```python
class matplotlib.path_effects.PathEffectRenderer(path_effects, renderer)
Bases: matplotlib.backend_bases.RendererBase
```

Implements a Renderer which contains another renderer.

This proxy then intercepts draw calls, calling the appropriate `AbstractPathEffect` `draw` method.

---

**Note:** Not all methods have been overridden on this RendererBase subclass. It may be necessary to add further methods to extend the PathEffects capabilities further.

**Parameters**
- **path_effects** [iterable of `AbstractPathEffect`] The path effects which this renderer represents.
- **renderer** [`matplotlib.backend_bases.RendererBase` instance]

```python
def copy_with_path_effect(self, path_effects)
```

```python
def draw_markers(self, gc, marker_path, marker_trans, path, *args, **kwargs)
    Draws a marker at each of the vertices in path. This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.
```

This provides a fallback implementation of `draw_markers` that makes multiple calls to `draw_path()`. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

**Parameters**
- **gc** [`GraphicsContextBase`] The graphics context
- **marker_trans** [`matplotlib.transforms.Transform`] An affine transform applied to the marker.
- **trans** [`matplotlib.transforms.Transform`] An affine transform applied to the path.
draw_path(self, gc, tpath, affine, rgbFace=None)
Draws a Path instance using the given affine transform.

draw_path_collection(self, gc, master_transform, paths, *args, **kwargs)
Draws a collection of paths selecting drawing properties from the lists facecolors, edgecolors, linewidths, linestyles and antialiaseds. offsets is a list of offsets to apply to each of the paths. The offsets in offsets are first transformed by offsetTrans before being applied. offset_position may be either “screen” or “data” depending on the space that the offsets are in.

This provides a fallback implementation of draw_path_collection() that makes multiple calls to draw_path(). Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods _iter_collection_raw_paths() and _iter_collection() are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of draw_path_collection() can be made globally.

new_gc(self)
Return an instance of a GraphicsContextBase.

points_to_pixels(self, points)
Convert points to display units.
You need to override this function (unless your backend doesn’t have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

\[
\text{points to pixels} = \text{points} \times \frac{\text{pixels per inch}}{72.0} \times \frac{\text{dpi}}{72.0}
\]

Parameters

points [scalar or array_like] a float or a numpy array of float

Returns

Points converted to pixels

class matplotlib.path_effects.PathPatchEffect(offset=(0, 0), **kwargs)
Bases: matplotlib.path_effects.AbstractPathEffect

Draws a PathPatch instance whose Path comes from the original PathEffect artist.

Parameters

offset [pair of floats] The offset to apply to the path, in points.

**kwargs All keyword arguments are passed through to the PathPatch constructor. The properties which cannot be overridden are “path”, “clip_box” “transform” and “clip_path”.

draw_path(self, renderer, gc, tpath, affine, rgbFace)
Derived should override this method. The arguments are the same as matplotlib.backend_bases.RendererBase.draw_path() except the first argument is a renderer.

class matplotlib.path_effects.SimpleLineShadow(offset=(2, -2), shadow_color='k', alpha=0.3, rho=0.3, **kwargs)
Bases: matplotlib.path_effects.AbstractPathEffect

A simple shadow via a line.

Parameters
offset [pair of floats] The offset to apply to the path, in points.

shadow_color [color] The shadow color. Default is black. A value of None takes the original artist’s color with a scale factor of rho.

alpha [float] The alpha transparency of the created shadow patch. Default is 0.3.

rho [float] A scale factor to apply to the rgbFace color if shadow_rgbFace is None. Default is 0.3.

**kwargs Extra keywords are stored and passed through to AbstractPathEffect._update_gc().

draw_path(self, renderer, gc, tpath, affine, rgbFace)
Overrides the standard draw_path to add the shadow offset and necessary color changes for the shadow.

class matplotlib.patheffects.SimplePatchShadow(offset=(2, -2), shadow_rgbFace=None, alpha=None, rho=0.3, **kwargs)
Bases: matplotlib.patheffects.AbstractPathEffect

A simple shadow via a filled patch.

Parameters

offset [pair of floats] The offset of the shadow in points.

shadow_rgbFace [color] The shadow color.

alpha [float] The alpha transparency of the created shadow patch. Default is 0.3. http://matplotlib.1069221.n5.nabble.com/path-effects-question-td27630.html

rho [float] A scale factor to apply to the rgbFace color if shadow_rgbFace is not specified. Default is 0.3.

**kwargs Extra keywords are stored and passed through to AbstractPathEffect._update_gc().

draw_path(self, renderer, gc, tpath, affine, rgbFace)
Overrides the standard draw_path to add the shadow offset and necessary color changes for the shadow.

class matplotlib.patheffects.Stroke(offset=(0, 0), **kwargs)
Bases: matplotlib.patheffects.AbstractPathEffect

A line based PathEffect which re-draws a stroke.

The path will be stroked with its gc updated with the given keyword arguments, i.e., the keyword arguments should be valid gc parameter values.

draw_path(self, renderer, gc, tpath, affine, rgbFace)
draw the path with updated gc.

class matplotlib.patheffects.withSimplePatchShadow(offset=(2, -2), shadow_rgbFace=None, alpha=None, rho=0.3, **kwargs)
Bases: matplotlib.patheffects.SimplePatchShadow

Adds a simple SimplePatchShadow and then draws the original Artist to avoid needing to call Normal.

Parameters
**offset** [pair of floats] The offset of the shadow in points.

**shadow_rgbFace** [color] The shadow color.

**alpha** [float] The alpha transparency of the created shadow patch. Default is 0.3. [link](http://matplotlib.1069221.n5.nabble.com/path-effects-question-td27630.html)

**rho** [float] A scale factor to apply to the rgbFace color if shadow_rgbFace is not specified. Default is 0.3.

****kwargs** Extra keywords are stored and passed through to AbstractPathEffect._update_gc().

**draw_path**(self, renderer, gc, tpath, affine, rgbFace)
Overrides the standard draw_path to add the shadow offset and necessary color changes for the shadow.

```python
class matplotlib.patheffects.withStroke(offset=(0, 0), **kwargs)
    Bases: matplotlib.patheffects.Stroke

    Adds a simple Stroke and then draws the original Artist to avoid needing to call Normal.
    The path will be stroked with its gc updated with the given keyword arguments, i.e., the keyword arguments should be valid gc parameter values.
    **draw_path**(self, renderer, gc, tpath, affine, rgbFace)
    draw the path with updated gc.
```

### 17.37 matplotlib.pyplot

#### 17.37.1 Pyplot function overview

```python
import numpy as np
import matplotlib.pyplot as plt

x = np.arange(0, 5, 0.1)
y = np.sin(x)
plt.plot(x, y)
```

The object-oriented API is recommended for more complex plots.
**Functions**

- `acorr(x, [y, data])`: Plot the autocorrelation of `x`.
- `angle_spectrum(x, Fs, Fc, window, pad_to, ...)`: Plot the angle spectrum.
- `annotate(s, xy, [args, kwags])`: Annotate the point `xy` with text `text`.
- `arrow(x, y, dx, dy, [args, kwags])`: Add an arrow to the axes.
- `autoscale([enable, axis, tight])`: Autoscale the axis view to the data (toggle).
- `autumn()`: Set the colormap to “autumn”.
- `axes([arg])`: Add an axes to the current figure and make it the current axes.
- `axhline([y, xmin, xmax])`: Add a horizontal line across the axis.
- `axhspan(ymin, ymax[, xmin, xmax])`: Add a horizontal span (rectangle) across the axis.
- `axis([args, kwags])`: Convenience method to get or set some axis properties.
- `axvline([x, ymin, ymax])`: Make a vertical line across the axes.
- `axvspan(xmin, xmax[, ymin, ymax])`: Add a vertical span (rectangle) across the axes.
- `bar(x, height[, width, bottom, align, data])`: Make a bar plot.
- `barbs([args, data])`: Plot a 2D field of barbs.
- `barh(y, width[, height, left, align])`: Make a horizontal bar plot.
- `bone()`: Set the colormap to “bone”.
- `box([on])`: Turn the axes box on or off on the current axes.
- `boxplot(x[, notch, sym, vert, whis, ...])`: Make a box and whisker plot.
- `broken_barh(xranges, yrange, [args, kwags])`: Plot a horizontal sequence of rectangles.
- `cla()`: Clear the current axes.
- `clabel(CS, [args, kwags])`: Label a contour plot.
- `clf()`: Clear the current figure.
- `clim([vmin, vmax])`: Set the color limits of the current image.
- `close(fig)`: Close a figure window.
- `cohere(x, y[, NFFT, Fs, Fc, detrend, ...])`: Plot the coherence between `x` and `y`.
- `colorbar([mappable, cax, ax])`: Add a colorbar to a plot.
- `connect(s, func)`: Connect event with string `s` to `func`.
- `contour([args, data])`: Plot contours.
- `contourf([args, data])`: Plot contours.
- `cool()`: Set the colormap to “cool”.
- `copper()`: Set the colormap to “copper”.
- `csd(x, y[, NFFT, Fs, Fc, detrend, window, ...])`: Plot the cross-spectral density.
- `delaxes([ax])`: Remove the `Axes ax` (defaulting to the current axes) from its figure.
- `disconnect(cid)`: Disconnect callback id `cid`.
- `draw()`: Redraw the current figure.
- `errorbar(x, y[, yerr, xerr, fmt, ecolor, ...])`: Plot y versus x as lines and/or markers with attached errorbars.
- `eventplot(positions[, orientation, ...])`: Plot identical parallel lines at the given positions.
- `figimage([args, kwags])`: Add a non-resampled image to the figure.
- `figlegend([args, kwags])`: Place a legend on the figure.

matplotlib.pyplot.acorr

matplotlib.pyplot.acorr(x, *, data=None, **kwargs)
   Plot the autocorrelation of x.

Parameters

x [array-like]
   detrend [callable, optional, default: mlab.detrend_none] x is detrended by
   the detrend callable. This must be a function x = detrend(x) accepting
   and returning an numpy.array. Default is no normalization.

normed [bool, optional, default: True] If True, input vectors are nor-
   malised to unit length.

usevlines [bool, optional, default: True] Determines the plot style.
   If True, vertical lines are plotted from 0 to the acorr value using Axes.
   vlines. Additionally, a horizontal line is plotted at y=0 using Axes.
   axhline.
   If False, markers are plotted at the acorr values using Axes.plot.

maxlags [int, optional, default: 10] Number of lags to show. If None, will
   return all 2 * len(x) - 1 lags.

Returns

lags [array (length 2*maxlags+1)] The lag vector.
   c [array (length 2*maxlags+1)] The auto correlation vector.
   line [LineCollection or Line2D] Artist added to the axes of the correlation:
      • LineCollection if usevlines is True.
      • Line2D if usevlines is False.
   b [Line2D or None] Horizontal line at 0 if usevlines is True None usevlines
      is False.

Other Parameters

linestyle [Line2D property, optional] The linestyle for plotting the data
   points. Only used if usevlines is False.

marker [str, optional, default: ‘o’] The marker for plotting the data points.
   Only used if usevlines is False.

Notes

The cross correlation is performed with numpy.correlate() with mode = "full".

Note: In addition to the above described arguments, this function can take a data key-
word argument. If such a data argument is given, the following arguments are replaced
by data[<arg>]:
   • All arguments with the following names: ‘x’.
Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg> in data`).

**Examples using `matplotlib.pyplot.acorr`**

- `sphx_glr_gallery_lines_bars_and_markers_xcorr_acorr_demo.py`

**`matplotlib.pyplot.angle_spectrum`**

```python
matplotlib.pyplot.angle_spectrum(x, Fs=None, Fc=None, window=None, pad_to=None, sides=None, *, data=None, **kwargs)
```

Plot the angle spectrum.

Compute the angle spectrum (wrapped phase spectrum) of `x`. Data is padded to a length of `pad_to` and the windowing function `window` is applied to the signal.

**Parameters**

- `x` [1-D array or sequence] Array or sequence containing the data.
- `Fs` [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, `freqs`, in cycles per time unit. The default value is 2.
- `window` [callable or ndarray] A function or a vector of length `NFFT`. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. The default is `window_hanning`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.
- `sides` [{`default`, `onesided`, `twosided`}]] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. `onesided` forces the return of a one-sided spectrum, while `twosided` forces two-sided.
- `pad_to` [int] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the `n` parameter in the call to `fft()`. The default is None, which sets `pad_to` equal to the length of the input signal (i.e. no padding).
- `Fc` [int] The center frequency of `x` (defaults to 0), which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsamped to baseband.

**Returns**

- `spectrum` [1-D array] The values for the angle spectrum in radians (real valued).
- `freqs` [1-D array] The frequencies corresponding to the elements in `spectrum`.
- `line` [a `Line2D` instance] The line created by this function.
## Other Parameters

**kwargs Keyword arguments control the Line2D properties:

<table>

**See also:**

- `magnitude_spectrum()` angle_spectrum() plots the magnitudes of the corresponding frequencies.
- `phase_spectrum()` phase_spectrum() plots the unwrapped version of this function.
`specgram()` can plot the angle spectrum of segments within the signal in a colormap.

Notes

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments are replaced by `data[<arg>]`:

- All arguments with the following names: ‘x’.

Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg> in data`).

```
matplotlib.pyplot.annotate
```

```
matplotlib.pyplot.annotate(s, xy, *args, **kwargs)
```

Annotate the point `xy` with text `text`.

In the simplest form, the text is placed at `xy`.

Optionally, the text can be displayed in another position `xytext`. An arrow pointing from the text to the annotated point `xy` can then be added by defining `arrowprops`.

**Parameters**

- **text** [str] The text of the annotation. `s` is a deprecated synonym for this parameter.
- **xy** [(float, float)] The point `(x,y)` to annotate.
- **xytext** [(float, float), optional] The position `(x,y)` to place the text at. If `None`, defaults to `xy`.
- **xycoords** [str, `Artist`, `Transform`, callable or tuple, optional] The coordinate system that `xy` is given in. The following types of values are supported:
  - One of the following strings:
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'figure points'</td>
<td>Points from the lower left of the figure</td>
</tr>
<tr>
<td>'figure pixels'</td>
<td>Pixels from the lower left of the figure</td>
</tr>
<tr>
<td>'figure fraction'</td>
<td>Fraction of figure from lower left</td>
</tr>
<tr>
<td>'axes points'</td>
<td>Points from lower left corner of axes</td>
</tr>
<tr>
<td>'axes pixels'</td>
<td>Pixels from lower left corner of axes</td>
</tr>
<tr>
<td>'axes fraction'</td>
<td>Fraction of axes from lower left</td>
</tr>
<tr>
<td>'data'</td>
<td>Use the coordinate system of the object being anno-</td>
</tr>
<tr>
<td></td>
<td>notated (default)</td>
</tr>
<tr>
<td>'polar'</td>
<td>(theta,r) if not native 'data' coordinates</td>
</tr>
</tbody>
</table>

- An **Artist**: xy is interpreted as a fraction of the artists Bbox. E.g. (0, 0) would be the lower left corner of the bounding box and (0.5, 1) would be the center top of the bounding box.

- A **Transform** to transform xy to screen coordinates.

- A function with one of the following signatures:

```
def transform(renderer) -> Bbox
def transform(renderer) -> Transform
```

  where renderer is a RendererBase subclass.

  The result of the function is interpreted like the Artist and Transform cases above.

- A tuple (xcoords, ycoords) specifying separate coordinate systems for x and y. xcoords and ycoords must each be of one of the above described types.

See Advanced Annotation for more details.

Defaults to 'data'.

textcoords [str, Artist, Transform, callable or tuple, optional] The coordinate system that xytext is given in.

All xycoords values are valid as well as the following strings:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'offset points'</td>
<td>Offset (in points) from the xy value</td>
</tr>
<tr>
<td>'offset pixels'</td>
<td>Offset (in pixels) from the xy value</td>
</tr>
</tbody>
</table>

Defaults to the value of xycoords, i.e. use the same coordinate system for annotation point and text position.

arrowprops [dict, optional] The properties used to draw a FancyArrowPatch arrow between the positions xy and xytext.

If arrowprops does not contain the key 'arrowstyle' the allowed keys are:
### Key

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>The width of the arrow in points</td>
</tr>
<tr>
<td>headwidth</td>
<td>The width of the base of the arrow head in points</td>
</tr>
<tr>
<td>headlength</td>
<td>The length of the arrow head in points</td>
</tr>
<tr>
<td>shrink</td>
<td>Fraction of total length to shrink from both ends</td>
</tr>
<tr>
<td>?</td>
<td>Any key to :class:<code>matplotlib.patches.FancyArrowPatch</code></td>
</tr>
</tbody>
</table>

If `arrowprops` contains the key `arrowstyle` the above keys are forbidden. The allowed values of `arrowstyle` are:

<table>
<thead>
<tr>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-'</td>
<td>None</td>
</tr>
<tr>
<td>'-&gt;'</td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>'[-]'</td>
<td>widthB=1.0,lengthB=0.2,angleB=None</td>
</tr>
<tr>
<td>'[-&gt;]'</td>
<td>widthA=1.0,widthB=1.0</td>
</tr>
<tr>
<td>'&lt;-&gt;'</td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>'&lt;-'</td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>'&lt;-&gt;'</td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>'&lt;</td>
<td>--&gt;'</td>
</tr>
<tr>
<td>'&lt;</td>
<td>--&gt;'</td>
</tr>
<tr>
<td>'&lt;</td>
<td>--&gt;'</td>
</tr>
<tr>
<td>'fancy'</td>
<td>head_length=0.4,head_width=0.4,tail_width=0.4</td>
</tr>
<tr>
<td>'simple'</td>
<td>head_length=0.5,head_width=0.5,tail_width=0.2</td>
</tr>
<tr>
<td>'wedge'</td>
<td>tail_width=0.3,shrink_factor=0.5</td>
</tr>
</tbody>
</table>

Valid keys for :class:`FancyArrowPatch` are:

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arrowstyle</td>
<td>the arrow style</td>
</tr>
<tr>
<td>connectionstyle</td>
<td>the connection style</td>
</tr>
<tr>
<td>relpos</td>
<td>default is (0.5, 0.5)</td>
</tr>
<tr>
<td>patchA</td>
<td>default is bounding box of the text</td>
</tr>
<tr>
<td>patchB</td>
<td>default is None</td>
</tr>
<tr>
<td>shrinkA</td>
<td>default is 2 points</td>
</tr>
<tr>
<td>shrinkB</td>
<td>default is 2 points</td>
</tr>
<tr>
<td>mutation_scale</td>
<td>default is text size (in points)</td>
</tr>
<tr>
<td>mutation_aspect</td>
<td>default is 1.</td>
</tr>
<tr>
<td>?</td>
<td>any key for :class:<code>matplotlib.patches.PathPatch</code></td>
</tr>
</tbody>
</table>

Defaults to None, i.e. no arrow is drawn.

**annotation_clip** [bool or None, optional] Whether to draw the annotation when the annotation point `xy` is outside the axes area.

- If `True`, the annotation will only be drawn when `xy` is within the axes.
- If `False`, the annotation will always be drawn.
- If `None`, the annotation will only be drawn when `xy` is within the axes and `xycoords` is ‘data’.

Defaults to `None`.

**kwargs** Additional kwargs are passed to :class:`Text`. 

17.37. matplotlib.pyplot 1745
Returns

annotation [Annotation]

matplotlib.pyplot.arrow

matplotlib.pyplot.arrow(x, y, dx, dy, **kwargs)
Add an arrow to the axes.
This draws an arrow from (x, y) to (x+dx, y+dy).

Parameters

x, y [float] The x and y coordinates of the arrow base.
dx, dy [float] The length of the arrow along x and y direction.

Returns

arrow [FancyArrow] The created FancyArrow object.

Other Parameters

**kwargs Optional kwargs (inherited from FancyArrow patch) control the arrow construction and properties:

Constructor arguments

width: float (default: 0.001) width of full arrow tail
length_includes_head: bool (default: False) True if head is to be counted in calculating the length.
head_width: float or None (default: 3*width) total width of the full arrow head
head_length: float or None (default: 1.5 * head_width) length of arrow head
shape: ['full', 'left', 'right'] (default: 'full') draw the left-half, right-half, or full arrow
overhang: float (default: 0)  fraction that the arrow is swept back (0 overhang means triangular shape). Can be negative or greater than one.

head_starts_at_zero: bool (default: False)  if True, the head starts being drawn at coordinate 0 instead of ending at coordinate 0.

Other valid kwargs (inherited from :class:`Patch`) are:

</tbody>
</table>

Notes

The resulting arrow is affected by the axes aspect ratio and limits. This may produce an arrow whose head is not square with its stem. To create an arrow whose head is square with its stem, use annotate() for example:

```python
>>> ax.annotate("", xy=(0.5, 0.5), xytext=(0, 0),
...    arrowprops=dict(arrowstyle="->"))
```
Examples using matplotlib.pyplot.arrow

- sphx_glr_gallery_text_labels_and_annotations_arrow_demo.py

matplotlib.pyplot.autoscale

matplotlib.pyplot.autoscale(enable=True, axis='both', tight=None)

Autoscale the axis view to the data (toggle).

Convenience method for simple axis view autoscaling. It turns autoscaling on or off, and then, if autoscaling for either axis is on, it performs the autoscaling on the specified axis or axes.

Parameters

- **enable** [bool or None, optional] True (default) turns autoscaling on, False turns it off. None leaves the autoscaling state unchanged.
- **axis** [‘both’, ‘x’, ‘y’, optional] which axis to operate on; default is ‘both’
- **tight** [bool or None, optional] If True, set view limits to data limits; if False, let the locator and margins expand the view limits; if None, use tight scaling if the only artist is an image, otherwise treat tight as False. The tight setting is retained for future autoscaling until it is explicitly changed.

matplotlib.pyplot.autumn

matplotlib.pyplot.autumn()

Set the colormap to ”autumn”.

This changes the default colormap as well as the colormap of the current image if there is one. See help(colormaps) for more information.

matplotlib.pyplot.axes

matplotlib.pyplot.axes(arg=None, **kwargs)

Add an axes to the current figure and make it the current axes.

Call signatures:

```
plt.axes()
plt.axes(rect, projection=None, polar=False, **kwargs)
plt.axes(ax)
```

Parameters

- **arg** [None or 4-tuple] The exact behavior of this function depends on the type:
  - None: A new full window axes is added using subplot(111, **kwargs)
• 4-tuple of floats $\text{rect} = [\text{left}, \text{bottom}, \text{width}, \text{height}]$. A new axes is added with dimensions $\text{rect}$ in normalized (0, 1) units using $\text{add}\_\text{axes}$ on the current figure.

**projection** [{None, ‘aitoff’, ‘hammer’, ‘lambert’, ‘mollweide’, ‘polar’, ‘rectilinear’, str}, optional] The projection type of the $\text{Axes}$. str is the name of a custom projection, see $\text{projections}$. The default None results in a ‘rectilinear’ projection.

**polar** [boolean, optional] If True, equivalent to projection=’polar’.

**sharex, sharey** [Axes, optional] Share the x or y axis with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

**label** [str] A label for the returned axes.

**Returns**

**axes** [Axes (or a subclass of $\text{Axes}$)] The returned axes class depends on the projection used. It is $\text{Axes}$ if rectilinear projection are used and $\text{projections.polar.PolarAxes}$ if polar projection are used.

**Other Parameters**

****kwargs** This method also takes the keyword arguments for the returned axes class. The keyword arguments for the rectilinear axes class $\text{Axes}$ can be found in the following table but there might also be other keyword arguments if another projection is used, see the actual axes class.

**See also:**

- `Figure.add_axes`
- `pyplot.subplot`
- `Figure.add_subplot`
- `Figure.subplots`
- `pyplot.subplots`

**Notes**

If the figure already has a axes with key `(args, kwargs)` then it will simply make that axes current and return it. This behavior is deprecated. Meanwhile, if you do not want this behavior (i.e., you want to force the creation of a new axes), you must use a unique set of args and kwargs. The axes `label` attribute has been exposed for this purpose: if you want two axes that are otherwise identical to be added to the figure, make sure you give them unique labels.
Examples

```python
# Creating a new full window axes
plt.axes()

# Creating a new axes with specified dimensions and some kwargs
plt.axes((left, bottom, width, height), facecolor='w')
```

- `sphx_glr_gallery_widgets_textbox.py`

`matplotlib.pyplot.axhline`

```python
matplotlib.pyplot.axhline(y=0, xmin=0, xmax=1, **kwargs)
```

Add a horizontal line across the axis.

**Parameters**

- `y` [scalar, optional, default: 0] y position in data coordinates of the horizontal line.
- `xmin` [scalar, optional, default: 0] Should be between 0 and 1, 0 being the far left of the plot, 1 the far right of the plot.
- `xmax` [scalar, optional, default: 1] Should be between 0 and 1, 0 being the far left of the plot, 1 the far right of the plot.

**Returns**

- `line` [Line2D]

**Other Parameters**

- `**kwargs` Valid kwargs are `Line2D` properties, with the exception of ‘transform’:

**See also:**

* hlines Add add horizontal lines in data coordinates.
* axhspan Add a horizontal span (rectangle) across the axis.

**Examples**

- draw a thick red hline at 'y' = 0 that spans the xrange:
Matplotlib, Release 3.1.3

```python
>>> axhline(linewidth=4, color='r')
```

- draw a default hline at 'y' = 1 that spans the xrange:
  ```python
  >>> axhline(y=1)
  ```

- draw a default hline at 'y' = .5 that spans the middle half of the xrange:
  ```python
  >>> axhline(y=.5, xmin=0.25, xmax=0.75)
  ```

**Examples using matplotlib.pyplot.axhline**

- sphx_glr_gallery_subplots_axes_and_figures_axhspan_demo.py
- sphx_glr_gallery_text_labels_and_annotations_multiline.py
- sphx_glr_gallery_color_color_cycle_default.py
- sphx_glr_gallery_misc_zorder_demo.py

**matplotlib.pyplot.axhspan**

```python
matplotlib.pyplot.axhspan(ymin, ymax, xmin=0, xmax=1, **kwargs)
```

Add a horizontal span (rectangle) across the axis.

Draw a horizontal span (rectangle) from `ymin` to `ymax`. With the default values of `xmin` = 0 and `xmax` = 1, this always spans the xrange, regardless of the xlim settings, even if you change them, e.g., with the `set_xlim()` command. That is, the horizontal extent is in axes coords: 0=left, 0.5=middle, 1.0=right but the `y` location is in data coordinates.

**Parameters**

- `ymin` [float] Lower limit of the horizontal span in data units.
- `ymax` [float] Upper limit of the horizontal span in data units.
- `xmin` [float, optional, default: 0] Lower limit of the vertical span in axes (relative 0-1) units.
- `xmax` [float, optional, default: 1] Upper limit of the vertical span in axes (relative 0-1) units.

**Returns**

- **Polygon** [Polygon]

**Other Parameters**

- **kwargs [Polygon properties.]

**axvspan** Add a vertical span across the axes.

Examples using matplotlib.pyplot.axhspan

- sphx_glr_gallery_subplots_axes_and_figures_axhspan_demo.py

**matplotlib.pyplot.axis**

```
matplotlib.pyplot.axis(*args, **kwargs)
```

Convenience method to get or set some axis properties.

Call signatures:

- `xmin, xmax, ymin, ymax = axis()`
- `xmin, xmax, ymin, ymax = axis([xmin, xmax, ymin, ymax])`
- `xmin, xmax, ymin, ymax = axis(option)`
- `xmin, xmax, ymin, ymax = axis(**kwargs)`

Parameters
**xmin, xmax, ymin, ymax** [float, optional] The axis limits to be set. Either none or all of the limits must be given. This can also be achieved using

```python
ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))
```

**option** [bool or str] If a bool, turns axis lines and labels on or off. If a string, possible values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'on'</td>
<td>Turn on axis lines and labels. Same as <code>True</code>.</td>
</tr>
<tr>
<td>'off'</td>
<td>Turn off axis lines and labels. Same as <code>False</code>.</td>
</tr>
<tr>
<td>'equal'</td>
<td>Set equal scaling (i.e., make circles circular) by changing axis limits.</td>
</tr>
<tr>
<td>'scaled'</td>
<td>Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box.</td>
</tr>
<tr>
<td>'tight'</td>
<td>Set limits just large enough to show all data.</td>
</tr>
<tr>
<td>'auto'</td>
<td>Automatic scaling (fill plot box with data).</td>
</tr>
<tr>
<td>'normal'</td>
<td>Same as 'auto'; deprecated.</td>
</tr>
<tr>
<td>'image'</td>
<td>'scaled' with axis limits equal to data limits.</td>
</tr>
<tr>
<td>'square'</td>
<td>Square plot; similar to 'scaled', but initially forcing <code>xmax-xmin = ymax-ymin</code>.</td>
</tr>
</tbody>
</table>

**emit** [bool, optional, default `True`] Whether observers are notified of the axis limit change. This option is passed on to `set_xlim` and `set_ylim`.

**Returns**

**xmin, xmax, ymin, ymax** [float] The axis limits.

**See also:**

- `matplotlib.axes.Axes.set_xlim`
- `matplotlib.axes.Axes.set_ylim`

**Examples using matplotlib.pyplot.axis**

- **Pyplot tutorial**

**matplotlib.pyplot.axvline**

```python
matplotlib.pyplot.axvline(x=0, ymin=0, ymax=1, **kwargs)
```

Add a vertical line across the axes.

**Parameters**
x [scalar, optional, default: 0] x position in data coordinates of the vertical line.

ymin [scalar, optional, default: 0] Should be between 0 and 1, 0 being the bottom of the plot, 1 the top of the plot.

ymax [scalar, optional, default: 1] Should be between 0 and 1, 0 being the bottom of the plot, 1 the top of the plot.

Returns

line [Line2D]

Other Parameters

**kwargs Valid kwargs are Line2D properties, with the exception of ‘transform’:

vlines Add vertical lines in data coordinates.

axvspan Add a vertical span (rectangle) across the axis.

Examples

• draw a thick red vline at x = 0 that spans the yrange:

  >>> axvline(linewidth=4, color='r')

• draw a default vline at x = 1 that spans the yrange:

  >>> axvline(x=1)

• draw a default vline at x = 0.5 that spans the middle half of the yrange:

  >>> axvline(x=0.5, ymin=0.25, ymax=0.75)

Examples using matplotlib.pyplot.axvline

• sphx_glr_gallery_subplots_axes_and_figures_axhspan_demo.py
• sphx_glr_gallery_color_color_cycle_default.py

matplotlib.pyplot.axvspan

matplotlib.pyplot.axvspan(xmin, xmax, ymin=0, ymax=1, **kwargs)
Add a vertical span (rectangle) across the axes.

Draw a vertical span (rectangle) from xmin to xmax. With the default values of ymin = 0 and ymax = 1. This always spans the yrange, regardless of the ylim settings, even if you change them, e.g., with the set_ylim() command. That is, the vertical extent is in axes coords: 0=bottom, 0.5=middle, 1.0=top but the x location is in data coordinates.

Parameters

  xmin [scalar] Number indicating the first X-axis coordinate of the vertical span rectangle in data units.
  xmax [scalar] Number indicating the second X-axis coordinate of the vertical span rectangle in data units.
**ymin** [scalar, optional] Number indicating the first Y-axis coordinate of the vertical span rectangle in relative Y-axis units (0-1). Default to 0.

**ymax** [scalar, optional] Number indicating the second Y-axis coordinate of the vertical span rectangle in relative Y-axis units (0-1). Default to 1.

**Returns**

**rectangle** [Polygon] Vertical span (rectangle) from (xmin, ymin) to (xmax, ymax).

**Other Parameters**

**kwargs** Optional parameters are properties of the class Polygon.

**See also:**

*axhspan* Add a horizontal span across the axes.

**Examples**

Draw a vertical, green, translucent rectangle from x = 1.25 to x = 1.55 that spans the yrange of the axes.

```python
>>> axvspan(1.25, 1.55, facecolor='g', alpha=0.5)
```

**Examples using matplotlib.pyplot.axvspan**

- sphx_glr_gallery_subplots_axes_and_figures_axhspan_demo.py

**matplotlib.pyplot.bar**

```python
matplotlib.pyplot.bar(x, height, width=0.8, bottom=None, *, align='center', data=None, **kwargs)
```

Make a bar plot.

The bars are positioned at x with the given alignment. Their dimensions are given by width and height. The vertical baseline is bottom (default 0).

Each of x, height, width, and bottom may either be a scalar applying to all bars, or it may be a sequence of length N providing a separate value for each bar.

**Parameters**

- **x** [sequence of scalars] The x coordinates of the bars. See also align for the alignment of the bars to the coordinates.

- **height** [scalar or sequence of scalars] The height(s) of the bars.

- **width** [scalar or array-like, optional] The width(s) of the bars (default: 0.8).

- **bottom** [scalar or array-like, optional] The y coordinate(s) of the bars bases (default: 0).
align: [‘center’, ‘edge’], optional, default: ‘center’) Alignment of the bars to the x coordinates:

• ‘center’: Center the base on the x positions.
• ‘edge’: Align the left edges of the bars with the x positions.

To align the bars on the right edge pass a negative width and align='edge'.

Returns

container: [BarContainer] Container with all the bars and optionally errorbars.

Other Parameters

color: [scalar or array-like, optional] The colors of the bar faces.
edgewidth: [scalar or array-like, optional] The colors of the bar edges.
linewidth: [scalar or array-like, optional] Width of the bar edge(s). If 0, don’t draw edges.
tick_label: [string or array-like, optional] The tick labels of the bars. Default: None (Use default numeric labels.)
xerr, yerr: [scalar or array-like of shape(N,) or shape(2,N), optional] If not None, add horizontal / vertical errorbars to the bar tips. The values are +/- sizes relative to the data:

• scalar: symmetric +/- values for all bars
• shape(N,): symmetric +/- values for each bar
• shape(2,N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
• None: No errorbar. (Default)

See /gallery/statistics/errorbar_features for an example on the usage of xerr and yerr.

ecolor: [scalar or array-like, optional, default: ‘black’] The line color of the errorbars.
capsize: [scalar, optional] The length of the error bar caps in points. Default: None, which will take the value from rcParams[“errorbar.capsize”] (default: 0.0).
error_kw: [dict, optional] Dictionary of kwargs to be passed to the errorbar method. Values of ecolor or capsize defined here take precedence over the independent kwargs.

log: [bool, optional, default: False] If True, set the y-axis to be log scale.

orientation: [{‘vertical’, ‘horizontal’}, optional] This is for internal use only. Please use barh for horizontal bar plots. Default: ‘vertical’.

See also:

barh Plot a horizontal bar plot.
## Notes

The optional arguments `color`, `edgecolor`, `linewidth`, `xerr`, and `yerr` can be either scalars or sequences of length equal to the number of bars. This enables you to use bar as the basis for stacked bar charts, or candlestick plots. Detail: `xerr` and `yerr` are passed directly to `errorbar()`, so they can also have shape 2xN for independent specification of lower and upper errors.

Pyplot tutorial

matplotlib.pyplot.barbs

matplotlib.pyplot.barbs(*args, data=None, **kw)

Plot a 2D field of barbs.

Call signature:

```
barbs([X, Y], U, V, [C], **kw)
```

Where X, Y define the barb locations, U, V define the barb directions, and C optionally sets the color.

All arguments may be 1D or 2D. U, V, C may be masked arrays, but masked X, Y are not supported at present.

Barbs are traditionally used in meteorology as a way to plot the speed and direction of wind observations, but can technically be used to plot any two dimensional vector quantity. As opposed to arrows, which give vector magnitude by the length of the arrow, the barbs give more quantitative information about the vector magnitude by putting slanted lines or a triangle for various increments in magnitude, as show schematically below:

```
:\       / \\  
:\      /  \ 
:\    /   \ \  
:\  /    \  \  
:\--------------------------
```

The largest increment is given by a triangle (or “flag”). After those come full lines (barbs). The smallest increment is a half line. There is only, of course, ever at most 1 half line. If the magnitude is small and only needs a single half-line and no full lines or triangles, the half-line is offset from the end of the barb so that it can be easily distinguished from barbs with a single full line. The magnitude for the barb shown above would nominally be 65, using the standard increments of 50, 10, and 5.

See also https://en.wikipedia.org/wiki/Wind_barb.

Parameters
X, Y [1D or 2D array-like, optional] The x and y coordinates of the barb locations. See *pivot* for how the barbs are drawn to the x, y positions. If not given, they will be generated as a uniform integer meshgrid based on the dimensions of U and V.

If X and Y are 1D but U, V are 2D, X, Y are expanded to 2D using x, y = np.meshgrid(X, Y). In this case len(X) and len(Y) must match the column and row dimensions of U and V.

U, V [1D or 2D array-like] The x and y components of the barb shaft.

C [1D or 2D array-like, optional] Numeric data that defines the barb colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *barbcolor* instead.

**length** [float, default: 7] Length of the barb in points; the other parts of the barb are scaled against this.

**pivot** [‘tip’, ‘middle’] or float, default: ‘tip’] The part of the arrow that is anchored to the X, Y grid. The barb rotates about this point. This can also be a number, which shifts the start of the barb that many points away from grid point.

**barbcolor** [color or color sequence] Specifies the color of all parts of the barb except for the flags. This parameter is analogous to the *edgecolor* parameter for polygons, which can be used instead. However, this parameter will override facecolor.

**flagcolor** [color or color sequence] Specifies the color of any flags on the barb. This parameter is analogous to the *facecolor* parameter for polygons, which can be used instead. However, this parameter will override facecolor. If this is not set (and C has not either) then *flagcolor* will be set to match *barbcolor* so that the barb has a uniform color. If C has been set, *flagcolor* has no effect.

sizes [dict, optional] A dictionary of coefficients specifying the ratio of a given feature to the length of the barb. Only those values one wishes to override need to be included. These features include:

- ‘spacing’ - space between features (flags, full/half barbs)
- ‘height’ - height (distance from shaft to top) of a flag or full barb
- ‘width’ - width of a flag, twice the width of a full barb
- ‘emptybarb’ - radius of the circle used for low magnitudes

**fill_empty** [bool, default: False] Whether the empty barbs (circles) that are drawn should be filled with the flag color. If they are not filled, the center is transparent.

**rounding** [bool, default: True] Whether the vector magnitude should be rounded when allocating barb components. If True, the magnitude is rounded to the nearest multiple of the half-barb increment. If False, the magnitude is simply truncated to the next lowest multiple.

**barb_increments** [dict, optional] A dictionary of increments specifying values to associate with different parts of the barb. Only those values one wishes to override need to be included.
- 'half' - half barbs (Default is 5)
- 'full' - full barbs (Default is 10)
- 'flag' - flags (default is 50)

**flip_barb** [bool or array-like of bool, default: False] Whether the lines and flags should point opposite to normal. Normal behavior is for the barbs and lines to point right (comes from wind barbs having these features point towards low pressure in the Northern Hemisphere).

A single value is applied to all barbs. Individual barbs can be flipped by passing a bool array of the same size as $U$ and $V$.

**Returns**

**barbs** [Barbs]

**Other Parameters**

**kwargs** The barbs can further be customized using `PolyCollection` keyword arguments:

Notes

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments are replaced by `data[<arg>]`:

- All positional and all keyword arguments.

Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg> in data`).

Examples using `matplotlib.pyplot.barbs`

- `sphx_glr_gallery_images_contours_and_fields_barb_demo.py`

`matplotlib.pyplot.pyplot.barh`

`matplotlib.pyplot.pyplot.barh(y, width, height=0.8, left=None, *, align='center', **kwargs)`

Make a horizontal bar plot.

The bars are positioned at `y` with the given `alignment`. Their dimensions are given by `width` and `height`. The horizontal baseline is `left` (default 0).

Each of `y`, `width`, `height`, and `left` may either be a scalar applying to all bars, or it may be a sequence of length N providing a separate value for each bar.

**Parameters**

- `y` [scalar or array-like] The y coordinates of the bars. See also `align` for the alignment of the bars to the coordinates.
- `width` [scalar or array-like] The width(s) of the bars.
- `height` [sequence of scalars, optional, default: 0.8] The heights of the bars.
- `left` [sequence of scalars] The x coordinates of the left sides of the bars (default: 0).
- `align` [{'center', 'edge'}, optional, default: 'center'] Alignment of the base to the y coordinates*:
  - 'center': Center the bars on the y positions.
  - 'edge': Align the bottom edges of the bars with the y positions.
To align the bars on the top edge pass a negative height and align='edge'.

Returns

container [BarContainer] Container with all the bars and optionally errorbars.

Other Parameters

color [scalar or array-like, optional] The colors of the bar faces.
edgecolor [scalar or array-like, optional] The colors of the bar edges.
linewidth [scalar or array-like, optional] Width of the bar edge(s). If 0, don’t draw edges.
tick_label [string or array-like, optional] The tick labels of the bars. Default: None (Use default numeric labels.)
xerr, yerr [scalar or array-like of shape(N,) or shape(2,N), optional] If not None, add horizontal / vertical errorbars to the bar tips. The values are +/- sizes relative to the data:
  • scalar: symmetric +/- values for all bars
  • shape(N,): symmetric +/- values for each bar
  • shape(2,N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
  • None: No errorbar. (default)

See /gallery/statistics/errorbar_features for an example on the usage of xerr and yerr.

ecolor [scalar or array-like, optional, default: ‘black’] The line color of the errorbars.
capsize [scalar, optional] The length of the error bar caps in points. Default: None, which will take the value from rcParams["errorbar.capsize"] (default: 0.0).

error_kw [dict, optional] Dictionary of kwargs to be passed to the errorbar method. Values of ecolor or capsizer defined here take precedence over the independent kwargs.

log [bool, optional, default: False] If True, set the x-axis to be log scale.

See also:

bar Plot a vertical bar plot.

Notes

The optional arguments color, edgecolor, linewidth, xerr, and yerr can be either scalars or sequences of length equal to the number of bars. This enables you to use bar as the basis for stacked bar charts, or candlestick plots. Detail: xerr and yerr are passed directly to errorbar(), so they can also have shape 2xN for independent specification of lower and upper errors.

Examples using matplotlib.pyplot.barh

- sphx_glr_gallery_lines_bars_and_markers_horizontal_barchart_distribution.py

matplotlib.pyplot.bone

matplotlib.pyplot.bone()

Set the colormap to “bone”.

This changes the default colormap as well as the colormap of the current image if there is one. See help(colormaps) for more information.
matplotlib.pyplot.box

matplotlib.pyplot.box(on=None)
   Turn the axes box on or off on the current axes.

   Parameters
   
   on [bool or None] The new Axes box state. If None, toggle the state.

   See also:

   matplotlib.axes.Axes.set_frame_on()
   matplotlib.axes.Axes.get_frame_on()

matplotlib.pyplot.boxplot

matplotlib.pyplot.boxplot(x, notch=None, sym=None, vert=None, whis=None, positions=None, widths=None, patch_artist=None, bootstrap=None, usermedians=None, conf_intervals=None, meanline=None, showmeans=None, showcaps=None, showbox=None, showfliers=None, boxprops=None, labels=None, flierprops=None, medianprops=None, meanprops=None, capprops=None, whiskerprops=None, manage_ticks=True, autorange=False, zorder=None, *, data=None)

Make a box and whisker plot.

Make a box and whisker plot for each column of x or each vector in sequence x. The box extends from the lower to upper quartile values of the data, with a line at the median. The whiskers extend from the box to show the range of the data. Flier points are those past the end of the whiskers.

Parameters

x [Array or a sequence of vectors.] The input data.

notch [bool, optional (False)] If True, will produce a notched box plot. Otherwise, a rectangular boxplot is produced. The notches represent the confidence interval (CI) around the median. See the entry for the bootstrap parameter for information regarding how the locations of the notches are computed.

Note: In cases where the values of the CI are less than the lower quartile or greater than the upper quartile, the notches will extend beyond the box, giving it a distinctive “flipped” appearance. This is expected behavior and consistent with other statistical visualization packages.

sym [str, optional] The default symbol for flier points. Enter an empty string ("") if you don’t want to show fliers. If None, then the fliers default to ‘b+’ If you want more control use the flierprops kwarg.

vert [bool, optional (True)] If True (default), makes the boxes vertical. If False, everything is drawn horizontally.
whis [float, sequence, or string (default = 1.5)] As a float, determines the reach of the whiskers to the beyond the first and third quartiles. In other words, where IQR is the interquartile range (Q3-Q1), the upper whisker will extend to last datum less than Q3 + whis*IQR. Similarly, the lower whisker will extend to the first datum greater than Q1 - whis*IQR. Beyond the whiskers, data are considered outliers and are plotted as individual points. Set this to an unreasonably high value to force the whiskers to show the min and max values. Alternatively, set this to an ascending sequence of percentile (e.g., [5, 95]) to set the whiskers at specific percentiles of the data. Finally, whis can be the string 'range' to force the whiskers to the min and max of the data.

bootstrap [int, optional] Specifies whether to bootstrap the confidence intervals around the median for notched boxplots. If bootstrap is None, no bootstrapping is performed, and notches are calculated using a Gaussian-based asymptotic approximation (see McGill, R., Tukey, J.W., and Larsen, W.A., 1978, and Kendall and Stuart, 1967). Otherwise, bootstrap specifies the number of times to bootstrap the median to determine its 95% confidence intervals. Values between 1000 and 10000 are recommended.

usermedians [array-like, optional] An array or sequence whose first dimension (or length) is compatible with x. This overrides the medians computed by matplotlib for each element of usermedians that is not None. When an element of usermedians is None, the median will be computed by matplotlib as normal.

conf_intervals [array-like, optional] Array or sequence whose first dimension (or length) is compatible with x and whose second dimension is 2. When the an element of conf_intervals is not None, the notch locations computed by matplotlib are overridden (provided notch is True). When an element of conf_intervals is None, the notches are computed by the method specified by the other kwargs (e.g., bootstrap).

positions [array-like, optional] Sets the positions of the boxes. The ticks and limits are automatically set to match the positions. Defaults to range(1, N+1) where N is the number of boxes to be drawn.

widths [scalar or array-like] Sets the width of each box either with a scalar or a sequence. The default is 0.5, or 0.15*(distance between extreme positions), if that is smaller.

patch_artist [bool, optional (False)] If False produces boxes with the Line2D artist. Otherwise, boxes and drawn with Patch artists.

labels [sequence, optional] Labels for each dataset. Length must be compatible with dimensions of x.

manage_ticks [bool, optional (True)] If True, the tick locations and labels will be adjusted to match the boxplot positions.

autorange [bool, optional (False)] When True and the data are distributed such that the 25th and 75th percentiles are equal, whis is set to 'range' such that the whisker ends are at the minimum and maximum of the data.

meanline [bool, optional (False)] If True (and showmeans is True), will try to render the mean as a line spanning the full width of the box according
to meanprops (see below). Not recommended if shownotches is also True. Otherwise, means will be shown as points.

**zorder** [scalar, optional (None)] Sets the zorder of the boxplot.

**Returns**

**result** [dict] A dictionary mapping each component of the boxplot to a list of the `matplotlib.lines.Line2D` instances created. That dictionary has the following keys (assuming vertical boxplots):

- **boxes**: the main body of the boxplot showing the quartiles and the median’s confidence intervals if enabled.
- **medians**: horizontal lines at the median of each box.
- **whiskers**: the vertical lines extending to the most extreme, non-outlier data points.
- **caps**: the horizontal lines at the ends of the whiskers.
- **fliers**: points representing data that extend beyond the whiskers (fliers).
- **means**: points or lines representing the means.

**Other Parameters**

- **showcaps** [bool, optional (True)] Show the caps on the ends of whiskers.
- **showbox** [bool, optional (True)] Show the central box.
- **showfliers** [bool, optional (True)] Show the outliers beyond the caps.
- **showmeans** [bool, optional (False)] Show the arithmetic means.
- **capprops** [dict, optional (None)] Specifies the style of the caps.
- **boxprops** [dict, optional (None)] Specifies the style of the box.
- **whiskerprops** [dict, optional (None)] Specifies the style of the whiskers.
- **flierprops** [dict, optional (None)] Specifies the style of the fliers.
- **medianprops** [dict, optional (None)] Specifies the style of the median.
- **meanprops** [dict, optional (None)] Specifies the style of the mean.

**Notes**

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments are replaced by `data[<arg>]`:

- All positional and all keyword arguments.

Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg> in data`).
Examples using `matplotlib.pyplot.boxplot`

- `sphx_glr_gallery_pyplots_boxplot_demo_pyplot.py`

`matplotlib.pyplot.broken_barh`

`matplotlib.pyplot.broken_barh(xranges, yrange, *, data=None, **kwargs)`

Plot a horizontal sequence of rectangles.

A rectangle is drawn for each element of `xranges`. All rectangles have the same vertical position and size defined by `yrange`.

This is a convenience function for instantiating a `BrokenBarHCollection`, adding it to the axes and autoscaling the view.

**Parameters**

- `xranges` [sequence of tuples `(xmin, xwidth)`] The x-positions and extends of the rectangles. For each tuple `(xmin, xwidth)` a rectangle is drawn from `xmin` to `xmin + xwidth`.

- `yranges` [(`ymin`, `ymax`)] The y-position and extend for all the rectangles.

**Returns**

- `collection` [A `BrokenBarHCollection`]

**Other Parameters**

- `**kwargs` [`BrokenBarHCollection` properties] Each `kwarg` can be either a single argument applying to all rectangles, e.g.:

  ```python
  facecolors='black'
  ```

  or a sequence of arguments over which is cycled, e.g.:

  ```python
  facecolors=('black', 'blue')
  ```

  would create interleaving black and blue rectangles.

Supported keywords:

#### Notes

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments are replaced by `data[<arg>]:`

- All positional and all keyword arguments.

Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg> in data`).

```python
matplotlib.pyplot.cla()
```

Clear the current axes.

```python
matplotlib.pyplot.clabel(CS, *args, **kwargs)
```

Label a contour plot.

Call signature:
clabel(cs, [levels], **kwargs)

Adds labels to line contours in cs, where cs is a `ContourSet` object returned by `contour()`.

**Parameters**

- **cs** (*ContourSet*) The ContourSet to label.
- **levels** (array-like, optional) A list of level values, that should be labeled. The list must be a subset of cs.levels. If not given, all levels are labeled.
- **fontsize** (string or float, optional) Size in points or relative size e.g., ‘smaller’, ‘x-large’. See `Text.set_size` for accepted string values.
- **colors** (color-spec, optional) The label colors:
  - If `None`, the color of each label matches the color of the corresponding contour.
  - If one string color, e.g., `colors = 'r'` or `colors = 'red'`, all labels will be plotted in this color.
  - If a tuple of matplotlib color args (string, float, rgb, etc), different labels will be plotted in different colors in the order specified.
- **inline** (bool, optional) If `True` the underlying contour is removed where the label is placed. Default is `True`.
- **inline_spacing** (float, optional) Space in pixels to leave on each side of label when placing inline. Defaults to 5.
  This spacing will be exact for labels at locations where the contour is straight, less so for labels on curved contours.
- **fmt** (string or dict, optional) A format string for the label. Default is `'%1.3f'`
  Alternatively, this can be a dictionary matching contour levels with arbitrary strings to use for each contour level (i.e., fmt[level]=string), or it can be any callable, such as a `Formatter` instance, that returns a string when called with a numeric contour level.
- **manual** (bool or iterable, optional) If `True`, contour labels will be placed manually using mouse clicks. Click the first button near a contour to add a label, click the second button (or potentially both mouse buttons at once) to finish adding labels. The third button can be used to remove the last label added, but only if labels are not inline. Alternatively, the keyboard can be used to select label locations (enter to end label placement, delete or backspace act like the third mouse button, and any other key will select a label location).
  `manual` can also be an iterable object of x,y tuples. Contour labels will be created as if mouse is clicked at each x,y positions.
- **rightside_up** (bool, optional) If `True`, label rotations will always be plus or minus 90 degrees from level. Default is `True`.
- **use_clabeltext** (bool, optional) If `True`, `ClabelText` class (instead of `Text`) is used to create labels. `ClabelText` recalculates rotation angles of texts during the drawing time, therefore this can be used if aspect of the axes changes. Default is `False`.
Returns

**labels** A list of *Text* instances for the labels.

Examples using `matplotlib.pyplot.clabel`

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

`matplotlib.pyplot.clf`

`matplotlib.pyplot.clf()`

Clear the current figure.

Examples using `matplotlib.pyplot.clf`

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

`matplotlib.pyplot.clim`

`matplotlib.pyplot.clim(vmin=None, vmax=None)`

Set the color limits of the current image.

If either `vmin` or `vmax` is None, the image min/max respectively will be used for color scaling.

If you want to set the clim of multiple images, use `set_clim` on every image, for example:

```python
for im in gca().get_images():
    im.set_clim(0, 0.5)
```

`matplotlib.pyplot.close`

`matplotlib.pyplot.close(fig=None)`

Close a figure window.

**Parameters**

- **fig** [None or int or str or *Figure*] The figure to close. There are a number of ways to specify this:
  - `None`: the current figure
  - *Figure*: the given *Figure* instance
  - int: a figure number
  - str: a figure name
  - 'all': all figures
Examples using matplotlib.pyplot.close

- sphx_glr_gallery_misc_multiprocess_sgskip.py

**matplotlib.pyplot.cohere**

```python
matplotlib.pyplot.cohere(x, y, NFFT=256, Fs=2, Fc=0, detrend=<function detrend_none at 0x7f0f90419700>, window=<function window_hanning at 0x7f0f904193a0>, noverlap=0, pad_to=None, sides='default', scale_by_freq=None, *, data=None, **kwargs)
```

Plot the coherence between x and y.

Plot the coherence between x and y. Coherence is the normalized cross spectral density:

$$C_{xy} = \frac{|P_{xy}|^2}{P_{xx}P_{yy}}$$

**Parameters**

- **Fs** [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.

- **window** [callable or ndarray] A function or a vector of length NFFT. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. The default is `window_hanning`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

- **sides** [{‘default’, ‘onesided’, ‘twosided’}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.

- **pad_to** [int] The number of points to which the data segment is padded when performing the FFT. This can be different from NFFT, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the n parameter in the call to fft(). The default is None, which sets pad_to equal to NFFT.

- **NFFT** [int] The number of data points used in each block for the FFT. A power 2 is most efficient. The default value is 256. This should NOT be used to get zero padding, or the scaling of the result will be incorrect. Use pad_to for this instead.

- **detrend** [{‘none’, ‘mean’, ‘linear’} or callable, default ‘none’] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the detrend parameter is a vector, in Matplotlib it is a function. The `mlab` module defines `detrend_none`, `detrend_mean`, and `detrend_linear`, but you can use a custom function as well. You can also use a string to choose one of the functions: ‘none’ calls `detrend_none`. ‘mean’ calls `detrend_mean`. ‘linear’ calls `detrend_linear`. 

1774 Chapter 17. Modules
scale_by_freq [bool, optional] Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

nooverlap [int] The number of points of overlap between blocks. The default value is 0 (no overlap).

Fc [int] The center frequency of x (defaults to 0), which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

Returns

Cxy [1-D array] The coherence vector.

freqs [1-D array] The frequencies for the elements in Cxy.

Other Parameters

**kwargs Keyword arguments control the Line2D properties:

#### Notes

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments are replaced by `data[<arg>]`:

- All arguments with the following names: ‘x’, ‘y’.

Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg> in data`).

#### References

**matplotlib.pyplot.colorbar**

```python
matplotlib.pyplot.colorbar(mappable=None, cax=None, ax=None, **kw)
```

Add a colorbar to a plot.

Function signatures for the `pyplot` interface; all but the first are also method signatures for the `colorbar()` method:

- `colorbar(**kwargs)`
- `colorbar(mappable, **kwargs)`
- `colorbar(mappable, cax=cax, **kwargs)`
- `colorbar(mappable, ax=ax, **kwargs)`

**Parameters**

`mappable` The `matplotlib.cm.ScalarMappable` (i.e., `Image`, `ContourSet`, etc.) described by this colorbar. This argument is mandatory for the `Figure.colorbar` method but optional for the `pyplot.colorbar` function, which sets the default to the current image.

Note that one can create a `ScalarMappable` “on-the-fly” to generate colorbars not attached to a previously drawn artist, e.g.
fig.colorbar(cm.ScalarMappable(norm=norm, cmap=cmap), ax=ax)

cax [Axes object, optional] Axes into which the colorbar will be drawn.

ax [Axes, list of Axes, optional] Parent axes from which space for a new colorbar axes will be stolen. If a list of axes is given they will all be resized to make room for the colorbar axes.

use_gridspec [bool, optional] If cax is None, a new cax is created as an instance of Axes. If ax is an instance of Subplot and use_gridspec is True, cax is created as an instance of Subplot using the gridspec module.

Returns

colorbar [Colorbar] See also its base class, ColorbarBase. Use set_label to label the colorbar.

Notes

Additional keyword arguments are of two kinds:

axes properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>orientation</td>
<td>vertical or horizontal</td>
</tr>
<tr>
<td>fraction</td>
<td>0.15; fraction of original axes to use for colorbar</td>
</tr>
<tr>
<td>pad</td>
<td>0.05 if vertical, 0.15 if horizontal; fraction of original axes between colorbar and new image axes</td>
</tr>
<tr>
<td>shrink</td>
<td>1.0; fraction by which to multiply the size of the colorbar</td>
</tr>
<tr>
<td>aspect</td>
<td>20; ratio of long to short dimensions</td>
</tr>
<tr>
<td>anchor</td>
<td>(0.0, 0.5) if vertical; (0.5, 1.0) if horizontal; the anchor point of the colorbar axes</td>
</tr>
<tr>
<td>panchor</td>
<td>(1.0, 0.5) if vertical; (0.5, 0.0) if horizontal; the anchor point of the colorbar parent axes. If False, the parent axes’ anchor will be unchanged</td>
</tr>
</tbody>
</table>

colorbar properties:
### Property Description

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>extend</code></td>
<td>[ ‘neither’</td>
</tr>
<tr>
<td><code>extendfrac</code></td>
<td>[ None</td>
</tr>
<tr>
<td><code>extendrect</code></td>
<td>bool If False the minimum and maximum colorbar extensions will be triangular (the default). If True the extensions will be rectangular.</td>
</tr>
<tr>
<td><code>spacing</code></td>
<td>[ ‘uniform’</td>
</tr>
<tr>
<td><code>ticks</code></td>
<td>[ None</td>
</tr>
<tr>
<td><code>format</code></td>
<td>[ None</td>
</tr>
<tr>
<td><code>drawedges</code></td>
<td>Whether to draw lines at color boundaries.</td>
</tr>
</tbody>
</table>

The following will probably be useful only in the context of indexed colors (that is, when the mappable has norm=NoNorm()), or other unusual circumstances.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>boundaries</code></td>
<td>None or a sequence</td>
</tr>
<tr>
<td><code>values</code></td>
<td>None or a sequence which must be of length 1 less than the sequence of <code>boundaries</code>. For each region delimited by adjacent entries in <code>boundaries</code>, the color mapped to the corresponding value in <code>values</code> will be used.</td>
</tr>
</tbody>
</table>

If `mappable` is a `ContourSet`, its `extend` kwarg is included automatically.

The `shrink` kwarg provides a simple way to scale the colorbar with respect to the axes. Note that if `cax` is specified, it determines the size of the colorbar and `shrink` and `aspect` kwargs are ignored.

For more precise control, you can manually specify the positions of the axes objects in...
which the mappable and the colorbar are drawn. In this case, do not use any of the axes properties kwargs.

It is known that some vector graphics viewers (svg and pdf) renders white gaps between segments of the colorbar. This is due to bugs in the viewers, not Matplotlib. As a workaround, the colorbar can be rendered with overlapping segments:

```python
cbar = colorbar()
cbar.solids.set_edgecolor("face")
draw()
```

However this has negative consequences in other circumstances, e.g. with semi-transparent images (alpha < 1) and colorbar extensions; therefore, this workaround is not used by default (see issue #1188).

- `sphx_glr_gallery_axes_grid1_simple_colorbar.py`

- *Image tutorial*
- *Tight Layout guide*

**`matplotlib.pyplot.connect`**

`matplotlib.pyplot.connect(s, func)`

Connect event with string `s` to `func`. The signature of `func` is:
def func(event)

where event is a matplotlib.backend_bases.Event. The following events are recognized

- 'button_press_event'
- 'button_release_event'
- 'draw_event'
- 'key_press_event'
- 'key_release_event'
- 'motion_notify_event'
- 'pick_event'
- 'resize_event'
- 'scroll_event'
- 'figure_enter_event,'
- 'figure_leave_event',
- 'axes_enter_event',
- 'axes_leave_event'
- 'close_event'

For the location events (button and key press/release), if the mouse is over the axes, the
variable event.inaxes will be set to the Axes the event occurs is over, and additionally, the
variables event.xdata and event.ydata will be defined. This is the mouse location in data
coords. See KeyEvent and MouseEvent for more info.

Return value is a connection id that can be used with mpl_disconnect().

Examples

Usage:

def on_press(event):
    print('you pressed', event.button, event.xdata, event.ydata)

cid = canvas.mpl_connect('button_press_event', on_press)

Examples using matplotlib.pyplot.connect

- sphx_glr_gallery_event_handling_coords_demo.py
- sphx_glr_gallery_widgets_rectangle_selector.py
matplotlib.pyplot.contour

`matplotlib.pyplot.contour(*args, data=None, **kwargs)`

Plot contours.

Call signature:

```python
contour([X, Y], Z, [levels], **kwargs)
```

`contour` and `contourf` draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

**Parameters**

- **X, Y** [array-like, optional] The coordinates of the values in Z.
  - X and Y must both be 2-D with the same shape as Z (e.g. created via `numpy.meshgrid`), or they must both be 1-D such that `len(X) == M` is the number of columns in Z and `len(Y) == N` is the number of rows in Z.
  - If not given, they are assumed to be integer indices, i.e. `X = range(M)`, `Y = range(N)`.
- **Z** [array-like(N, M)] The height values over which the contour is drawn.
- **levels** [int or array-like, optional] Determines the number and positions of the contour lines / regions.
  - If an int n, use n data intervals; i.e. draw `n+1` contour lines. The level heights are automatically chosen.
  - If array-like, draw contour lines at the specified levels. The values must be in increasing order.

**Returns**

- **c** [QuadContourSet]

**Other Parameters**

- **corner_mask** [bool, optional] Enable/disable corner masking, which only has an effect if Z is a masked array. If False, any quad touching a masked point is masked out. If True, only the triangular corners of quads nearest those points are always masked out, other triangular corners comprising three unmasked points are contoured as usual.
  - Defaults to `rcParams["contour.corner_mask"]` (default: True), which defaults to True.
- **colors** [color string or sequence of colors, optional] The colors of the levels, i.e. the lines for `contour` and the areas for `contourf`.
  - The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it’s repeated.
  - As a shortcut, single color strings may be used in place of one-element lists, i.e. `'red'` instead of `['red']` to color all levels with the same color.
  - This shortcut does only work for color strings, not for other ways of specifying colors.
  - By default (value `None`), the colormap specified by `cmap` will be used.
**alpha** [float, optional] The alpha blending value, between 0 (transparent) and 1 (opaque).

**cmap** [str or *Colormap*, optional] A *Colormap* instance or registered colormap name. The colormap maps the level values to colors. Defaults to `rcParams["image.cmap"]` (default: ’viridis’).

If both `colors` and `cmap` are given, an error is raised.

**norm** [*Normalize*, optional] If a colormap is used, the *Normalize* instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

**vmin, vmax** [float, optional] If not None, either or both of these values will be supplied to the *Normalize* instance, overriding the default color scaling based on *levels*.

**origin** [{None, ‘upper’, ‘lower’, ‘image’}, optional] Determines the orientation and exact position of Z by specifying the position of Z[0, 0]. This is only relevant, if X, Y are not given.

- **None**: Z[0, 0] is at X=0, Y=0 in the lower left corner.
- **’lower’**: Z[0, 0] is at X=0.5, Y=0.5 in the lower left corner.
- **’upper’**: Z[0, 0] is at X=N+0.5, Y=0.5 in the upper left corner.
- **’image’**: Use the value from `rcParams["image.origin"]` (default: ’upper’).

**extent** [(x0, x1, y0, y1), optional] If `origin` is not None, then `extent` is interpreted as in `imshow`: it gives the outer pixel boundaries. In this case, the position of Z[0,0] is the center of the pixel, not a corner. If `origin` is None, then (x0, y0) is the position of Z[0,0], and (x1, y1) is the position of Z[-1,-1].

This argument is ignored if X and Y are specified in the call to contour.

**locator** [ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to `MaxNLocator`.

**extend** [{’both’, ’min’, ’max’}, optional, default: ’neither’] Determines the `contourf`-coloring of values that are outside the *levels* range.

If ‘neither’, values outside the *levels* range are not colored. If ‘min’, ‘max’ or ‘both’, color the values below, above or below and above the *levels* range.

Values below min(*levels*) and above max(*levels*) are mapped to the under/over values of the *Colormap*. Note, that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using *Colormap.set_under* and *Colormap.set_over*.

**Note:** An existing *QuadContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call *QuadContourSet.changed()* is needed after modifying the colormap. The explicit call
can be left out, if a colorbar is assigned to the \texttt{QuadContourSet} because it internally calls \texttt{QuadContourSet.changed()}.

Example:

```python
x = np.arange(1, 10)
y = x.reshape(-1, 1)
h = x * y

cs = plt.contourf(h, levels=[10, 30, 50],
                colors=['#808080', '#A0A0A0', '#C0C0C0'], extend='both')

xunits, yunits [registered units, optional] Override axis units by specifying an instance of a \texttt{matplotlib.units.ConversionInterface}.

antialiased [bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is \texttt{True}. For line contours, it is taken from \texttt{rcParams["lines.antialiased"]} (default: True).

Nchunk [int \(\geq 0\), optional] If 0, no subdivision of the domain. Specify a positive integer to divide the domain into subdomains of \texttt{nchunk} by \texttt{nchunk} quads. Chunking reduces the maximum length of polygons generated by the contouring algorithm which reduces the rendering workload passed on to the backend and also requires slightly less RAM. It can however introduce rendering artifacts at chunk boundaries depending on the backend, the \texttt{antialiased} flag and value of \texttt{alpha}.

linewidths [float or sequence of float, optional] \textit{Only applies to \texttt{contour}}.

The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

Defaults to \texttt{rcParams["lines.linewidth"]} (default: 1.5).

linestyles [{\texttt{None}, \texttt{"solid"}, \texttt{"dashed"}, \texttt{"dashdot"}, \texttt{"dotted"}}, optional] \textit{Only applies to \texttt{contour}}.

If \texttt{linestyles} is \texttt{None}, the default is \texttt{"solid"} unless the lines are monochrome. In that case, negative contours will take their linestyle from \texttt{rcParams["contour.negative_linestyle"]} (default: \texttt{"dashed"}) setting.

\texttt{linestyles} can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

hatches [List[str], optional] \textit{Only applies to \texttt{contour}}.

A list of cross hatch patterns to use on the filled areas. If None, no hatching will be added to the contour. Hatching is supported in the PostScript, PDF, SVG and Agg backends only.
Notes

1. `contourf` differs from the MATLAB version in that it does not draw the polygon edges. To draw edges, add line contours with calls to `contour`.

2. `contourf` fills intervals that are closed at the top; that is, for boundaries $z_1$ and $z_2$, the filled region is:

$$z_1 < Z \leq z_2$$

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

Examples using `matplotlib.pyplot.contour`

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

`matplotlib.pyplot.contourf`

```python
matplotlib.pyplot.contourf(*args, data=None, **kwargs)
```

Plot contours.

Call signature:

```python
contourf([X, Y,] Z, [levels, **kwargs])
```

`contour` and `contourf` draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

Parameters

- **X, Y** [array-like, optional] The coordinates of the values in $Z$.
  - $X$ and $Y$ must both be 2-D with the same shape as $Z$ (e.g. created via `numpy.meshgrid`), or they must both be 1-D such that `len(X) == M` is the number of columns in $Z$ and `len(Y) == N` is the number of rows in $Z`.
  - If not given, they are assumed to be integer indices, i.e. $X = \text{range}(M)$, $Y = \text{range}(N)$.

- **Z** [array-like(N, M)] The height values over which the contour is drawn.

- **levels** [int or array-like, optional] Determines the number and positions of the contour lines / regions.
  - If an int $n$, use $n$ data intervals; i.e. draw $n+1$ contour lines. The level heights are automatically chosen.
  - If array-like, draw contour lines at the specified levels. The values must be in increasing order.

Returns

- **c** `[QuadContourSet]`

Other Parameters
corner_mask [bool, optional] Enable/disable corner masking, which only has an effect if Z is a masked array. If False, any quad touching a masked point is masked out. If True, only the triangular corners of quads nearest those points are always masked out, other triangular corners comprising three unmasked points are contoured as usual.

Defaults to rcpams["contour.corner_mask"] (default: True), which defaults to True.

colors [color string or sequence of colors, optional] The colors of the levels, i.e. the lines for contour and the areas for contourf.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it’s repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. 'red' instead of ['red'] to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value None), the colormap specified by cmap will be used.

alpha [float, optional] The alpha blending value, between 0 (transparent) and 1 (opaque).

cmap [str or Colormap, optional] A Colormap instance or registered colormap name. The colormap maps the level values to colors. Defaults to rcpams["image.cmap"] (default: 'viridis').

If both colors and cmap are given, an error is raised.

norm [Normalize, optional] If a colormap is used, the Normalize instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

vmin, vmax [float, optional] If not None, either or both of these values will be supplied to the Normalize instance, overriding the default color scaling based on levels.

origin [{None, 'upper', 'lower', 'image'}, optional] Determines the orientation and exact position of Z by specifying the position of Z[0, 0]. This is only relevant, if X, Y are not given.

- None: Z[0, 0] is at X=0, Y=0 in the lower left corner.
- 'lower': Z[0, 0] is at X=0.5, Y=0.5 in the lower left corner.
- 'upper': Z[0, 0] is at X=N+0.5, Y=0.5 in the upper left corner.
- 'image': Use the value from rcpams["image.origin"] (default: 'upper').

extent [(x0, x1, y0, y1), optional] If origin is not None, then extent is interpreted as in imshow: it gives the outer pixel boundaries. In this case, the position of Z[0,0] is the center of the pixel, not a corner. If origin is None, then (x0, y0) is the position of Z[0,0], and (x1, y1) is the position of Z[-1,-1].

This argument is ignored if X and Y are specified in the call to contour.

locator [ticker Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via levels. Defaults to MaxNLocator.
**extend** [{’neither’, ’both’, ’min’, ’max’}, optional, default: ’neither’] Determines the `contourf`-coloring of values that are outside the `levels` range.

If ’neither’, values outside the `levels` range are not colored. If ’min’, ’max’ or ’both’, color the values below, above or below and above the `levels` range.

Values below $\min(levels)$ and above $\max(levels)$ are mapped to the under/over values of the `Colormap`. Note, that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using `Colormap.set_under` and `Colormap.set_over`.

**Note:** An existing `QuadContourSet` does not get notified if properties of its colormap are changed. Therefore, an explicit call `QuadContourSet.changed()` is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the `QuadContourSet` because it internally calls `QuadContourSet.changed()`.

Example:

```python
x = np.arange(1, 10)
y = x.reshape(-1, 1)
h = x * y

cs = plt.contourf(h, levels=[10, 30, 50],
    colors=['#B08080', '#A0A0A0', '#C0C0C0'], extend='both')
cs.cmap.set_over('red')
cs.cmap.set_under('blue')
cs.changed()
```

**xunits, yunits** [registered units, optional] Override axis units by specifying an instance of a `matplotlib.units.ConversionInterface`.

**antialiased** [bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is True. For line contours, it is taken from `rcParams["lines.antialiased"]` (default: True).

**Nchunk** [int >= 0, optional] If 0, no subdivision of the domain. Specify a positive integer to divide the domain into subdomains of `nchunk` by `nchunk` quads. Chunking reduces the maximum length of polygons generated by the contouring algorithm which reduces the rendering workload passed on to the backend and also requires slightly less RAM. It can however introduce rendering artifacts at chunk boundaries depending on the backend, the antialiased flag and value of alpha.

**linestyles** [float or sequence of float, optional] Only applies to `contour`. The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

Defaults to `rcParams["lines.linewidth"]` (default: 1.5).
linestyles [{None, 'solid', 'dashed', 'dashdot', 'dotted'}, optional] Only applies to contour.

If linestyles is None, the default is 'solid' unless the lines are monochrome. In that case, negative contours will take their linestyle from rcParams["contour.negative_linestyle"] (default: 'dashed') setting.

linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

hatches [List[str], optional] Only applies to contourf.

A list of cross hatch patterns to use on the filled areas. If None, no hatching will be added to the contour. Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Notes

1. contourf differs from the MATLAB version in that it does not draw the polygon edges. To draw edges, add line contours with calls to contour.

2. contourf fills intervals that are closed at the top; that is, for boundaries z1 and z2, the filled region is:

\[ z1 < Z \leq z2 \]

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

Examples using matplotlib.pyplot.contourf

- sphx_glr_gallery_images_contours_and_fields_triinterp_demo.py

matplotlib.pyplot.cool

matplotlib.pyplot.cool()

    Set the colormap to "cool".

    This changes the default colormap as well as the colormap of the current image if there is one. See help(colormaps) for more information.
matplotlib.pyplot.copper

```python
matplotlib.pyplot.copper()
```

Set the colormap to “copper”.

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

matplotlib.pyplot.csd

```python
matplotlib.pyplot.csd(x, y, NFFT=None, Fs=None, Fc=None, detrend=None, window=None, noverlap=None, pad_to=None, sides=None, scale_by_freq=None, return_line=None, *, data=None, **kwargs)
```

Plot the cross-spectral density.

The cross spectral density $P_{xy}$ by Welch’s average periodogram method. The vectors $x$ and $y$ are divided into $NFFT$ length segments. Each segment is detrended by function `detrend` and windowed by function `window`. `noverlap` gives the length of the overlap between segments. The product of the direct FFTs of $x$ and $y$ are averaged over each segment to compute $P_{xy}$, with a scaling to correct for power loss due to windowing.

If `len(x) < NFFT` or `len(y) < NFFT`, they will be zero padded to $NFFT$.

**Parameters**

- `x, y` [1-D arrays or sequences] Arrays or sequences containing the data.
- `Fs` [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.
- `window` [callable or ndarray] A function or a vector of length $NFFT$. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. The default is `window_hanning`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.
- `sides` [{‘default’, ‘onesided’, ‘twosided’}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.
- `pad_to` [int] The number of points to which the data segment is padded when performing the FFT. This can be different from $NFFT$, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the $n$ parameter in the call to `fft()`. The default is None, which sets `pad_to` equal to $NFFT$.
- `NFFT` [int] The number of data points used in each block for the FFT. A power 2 is most efficient. The default value is 256. This should NOT be used to get zero padding, or the scaling of the result will be incorrect. Use `pad_to` for this instead.
detrend [{‘none’, ‘mean’, ‘linear’} or callable, default ‘none’] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the detrend parameter is a vector, in Matplotlib is it a function. The mlab module defines detrend_none, detrend_mean, and detrend_linear, but you can use a custom function as well. You can also use a string to choose one of the functions: ‘none’ calls detrend_none. ‘mean’ calls detrend_mean. ‘linear’ calls detrend_linear.

scale_by_freq [bool, optional] Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap [int] The number of points of overlap between segments. The default value is 0 (no overlap).

Fc [int] The center frequency of x (defaults to 0), which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

return_line [bool] Whether to include the line object plotted in the returned values. Default is False.

Returns

Pxy [1-D array] The values for the cross spectrum \( P_{xy} \) before scaling (complex valued).

dfreqs [1-D array] The frequencies corresponding to the elements in Pxy.

dline [a Line2D instance] The line created by this function. Only returned if return_line is True.

Other Parameters

**kwargs Keyword arguments control the Line2D properties:

See also:

`psd()` is the equivalent to setting y=x.

Notes

For plotting, the power is plotted as $10 \log_{10}(P_{xy})$ for decibels, though $P_{xy}$ itself is returned.

References

Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

- All arguments with the following names: ‘x’, ‘y’.

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).
matplotlib.pyplot.delaxes

matplotlib.pyplot.delaxes(ax=None)
    Remove the Axes ax (defaulting to the current axes) from its figure.
    A KeyError is raised if the axes doesn’t exist.

matplotlib.pyplot.disconnect

matplotlib.pyplot.disconnect(cid)
    Disconnect callback id cid

**Examples**

**Usage:**

```python
cid = canvas.mpl_connect('button_press_event', on_press)
#...later
canvas.mpl_disconnect(cid)
```

**Examples using matplotlib.pyplot.disconnect**

- sphx_glr_gallery_event_handling_coords_demo.py

matplotlib.pyplot.draw

matplotlib.pyplot.draw()
    Redraw the current figure.
    This is used to update a figure that has been altered, but not automatically re-drawn. If interactive mode is on (ion()), this should be only rarely needed, but there may be ways to modify the state of a figure without marking it as stale. Please report these cases as bugs.
    A more object-oriented alternative, given any Figure instance, fig, that was created using a pyplot function, is:

```python
fig.canvas.draw_idle()
```

**Examples using matplotlib.pyplot.draw**

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py
- sphx_glr_gallery_mplot3d_rotate_axes3d_sgskip.py
Plot y versus x as lines and/or markers with attached errorbars. x, y define the data locations, xerr, yerr define the errorbar sizes. By default, this draws the data markers/lines as well as the errorbars. Use fmt='none' to draw errorbars without any data markers.

Parameters

x, y [scalar or array-like] The data positions.

xerr, yerr [scalar or array-like, shape(N,) or shape(2,N), optional] The errorbar sizes:

- scalar: Symmetric +/- values for all data points.
- shape(N,): Symmetric +/-values for each data point.
- shape(2,N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- None: No errorbar.

Note that all error arrays should have positive values.

See /gallery/statistics/errorbar_features for an example on the usage of xerr and yerr.

fmt [plot format string, optional, default: "] The format for the data points / data lines. See plot for details.

Use ‘none’ (case insensitive) to plot errorbars without any data markers.

ecolor [mpl color, optional, default: None] A matplotlib color arg which gives the color the errorbar lines. If None, use the color of the line connecting the markers.

elinewidth [scalar, optional, default: None] The linewidth of the errorbar lines. If None, the linewidth of the current style is used.

capsize [scalar, optional, default: None] The length of the error bar caps in points. If None, it will take the value from rcParams["errorbar. capsize"] (default: 0.0).

capthick [scalar, optional, default: None] An alias to the keyword argument markeredgewidth (a.k.a. mew). This setting is a more sensible name for the property that controls the thickness of the error bar cap in points. For backwards compatibility, if mew or markeredgewidth are given, then they will over-ride capthick. This may change in future releases.

barsabove [bool, optional, default: False] If True, will plot the errorbars above the plot symbols. Default is below.

lolims, uplims, xlolims, xuplims [bool, optional, default: False] These arguments can be used to indicate that a value gives only upper/lower
limits. In that case a caret symbol is used to indicate this. *lims*-arguments may be of the same type as *xerr* and *yerr*. To use limits with inverted axes, *set_xlim()* or *set_ylim()* must be called before *errorbar()*.

**errorevery** [positive integer, optional, default: 1] Subsamples the errorbars. e.g., if errorevery=5, errorbars for every 5-th datapoint will be plotted. The data plot itself still shows all data points.

**Returns**

*container* [ErrorbarContainer] The container contains:

- plotline: *Line2D* instance of x, y plot markers and/or line.
- caplines: A tuple of *Line2D* instances of the error bar caps.
- barlinecols: A tuple of *LineCollection* with the horizontal and vertical error ranges.

**Other Parameters**

****kwargs** All other keyword arguments are passed on to the plot command for the markers. For example, this code makes big red squares with thick green edges:

```python
x, y, yerr = np.random.rand(3, 10)
errorbar(x, y, yerr, marker='s', mfc='red', mec='green', ms=20, mew=4)
```

where *mfc*, *mec*, *ms* and *mew* are aliases for the longer property names, *markerfacecolor*, *markeredgecolor*, *markersize* and *markeredgewidth*.

Valid kwargs for the marker properties are *Line2D properties*:

**Notes**

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments are replaced by `data[<arg>]`:

- All arguments with the following names: `x`, `xerr`, `y`, `yerr`.

Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg> in data`).

**Examples using `matplotlib.pyplot.errorbar`**

- sphx_glr_gallery_lines_bars_and_markers_errorbar_limits_simple.py

**`matplotlib.pyplot.eventplot`**

```python
matplotlib.pyplot.eventplot(positions, orientation='horizontal', lineoffsets=1, line lengths=1, linewidths=None, colors=None, linestyles='solid', *, data=None, **kwargs)
```

Plot identical parallel lines at the given positions.

`positions` should be a 1D or 2D array-like object, with each row corresponding to a row or column of lines.
This type of plot is commonly used in neuroscience for representing neural events, where it is usually called a spike raster, dot raster, or raster plot.

However, it is useful in any situation where you wish to show the timing or position of multiple sets of discrete events, such as the arrival times of people to a business on each day of the month or the date of hurricanes each year of the last century.

**Parameters**

- **positions** [1D or 2D array-like object] Each value is an event. If positions is a 2D array-like, each row corresponds to a row or a column of lines (depending on the orientation parameter).

- **orientation** [{‘horizontal’, ‘vertical’}, optional] Controls the direction of the event collections:
  - ‘horizontal’ : the lines are arranged horizontally in rows, and are vertical.
  - ‘vertical’ : the lines are arranged vertically in columns, and are horizontal.

- **lineoffsets** [scalar or sequence of scalars, optional, default: 1] The offset of the center of the lines from the origin, in the direction orthogonal to orientation.

- **linelengths** [scalar or sequence of scalars, optional, default: 1] The total height of the lines (i.e. the lines stretches from lineoffset - linelength/2 to lineoffset + linelength/2).

- **linewidths** [scalar, scalar sequence or None, optional, default: None] The line width(s) of the event lines, in points. If it is None, defaults to its rcParams setting.

- **colors** [color, sequence of colors or None, optional, default: None] The color(s) of the event lines. If it is None, defaults to its rcParams setting.

- **linestyles** [str or tuple or a sequence of such values, optional] Default is ‘solid’. Valid strings are [‘solid’, ‘dashed’, ‘dashdot’, ‘dotted’, ‘-’, ‘–’, ‘-’, ‘-’, ‘:‘]. Dash tuples should be of the form:

  

  (offset, onoffseq),

  

  where onoffseq is an even length tuple of on and off ink in points.

**kwargs [optional] Other keyword arguments are line collection properties. See LineCollection for a list of the valid properties.

**Returns**

- **list** [A list of EventCollection objects.] Contains the EventCollection that were added.

**Notes**

For linelengths, linewidths, colors, and linestyles, if only a single value is given, that value is applied to all lines. If an array-like is given, it must have the same length as positions, and each value will be applied to the corresponding row of the array.
Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).

matplotlib.pyplot.figimage

matplotlib.pyplot.figimage(*args, **kwargs)
Add a non-resampled image to the figure.

The image is attached to the lower or upper left corner depending on origin.

Parameters

X The image data. This is an array of one of the following shapes:
  - MxN: luminance (grayscale) values
  - MxNx3: RGB values
Matplotlib, Release 3.1.3

- MxNx4: RGBA values

**xo, yo** [int] The x/y image offset in pixels.

**alpha** [None or float] The alpha blending value.

**norm** [*matplotlib.colors.Normalize*] A Normalize instance to map the luminance to the interval [0, 1].

**cmap** [str or *matplotlib.colors.Colormap*] The colormap to use. Default: `rcParams["image.cmap"]` (default: 'viridis').

**vmin, vmax** [scalar] If `norm` is not given, these values set the data limits for the colormap.

**origin** [{'upper', 'lower'}] Indicates where the [0, 0] index of the array is in the upper left or lower left corner of the axes. Defaults to `rcParams["image.origin"]` (default: 'upper').

**resize** [bool] If True, resize the figure to match the given image size.

**Returns**

*matplotlib.image.FigureImage*

**Other Parameters**

****kwargs** Additional kwargs are *Artist* kwargs passed on to *FigureImage*.

**Notes**

figimage complements the axes image (*imshow*) which will be resampled to fit the current axes. If you want a resampled image to fill the entire figure, you can define an *Axes* with extent [0,0,1,1].

**Examples:**

```python
f = plt.figure()
nx = int(f.get_figwidth() * f.dpi)
ny = int(f.get_fighight() * f.dpi)
data = np.random.random((ny, nx))
f.figimage(data)
plt.show()
```

**Examples using matplotlib.pyplot.figimage**

- sphx_glr_gallery_images_contours_and_fields_figimage_demo.py

**matplotlib.pyplot.figlegend**

```python
matplotlib.pyplot.figlegend(*args, **kwargs)
```

Place a legend on the figure.

To make a legend from existing artists on every axes:

```python
figlegend()
```
To make a legend for a list of lines and labels:

```python
figlegend(
    (line1, line2, line3),
    ('label1', 'label2', 'label3'),
    loc='upper right')
```

These can also be specified by keyword:

```python
figlegend(
    handles=(line1, line2, line3),
    labels=('label1', 'label2', 'label3'),
    loc='upper right')
```

**Parameters**

- **handles** [sequence of Artist, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with labels, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

  The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

- **labels** [sequence of strings, optional] A list of labels to show next to the artists. Use this together with handles, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

**Returns**

`matplotlib.legend.Legend instance`

**Other Parameters**

- **loc** [str or pair of floats, default: `rcParams["legend.loc"]` (default: ‘best’) (‘best’ for axes, ‘upper right’ for figures)] The location of the legend.

  The strings 'upper left', 'upper right', 'lower left', 'lower right' place the legend at the corresponding corner of the axes/figure.

  The strings 'upper center', 'lower center', 'center left', 'center right' place the legend at the center of the corresponding edge of the axes/figure.

  The string 'center' places the legend at the center of the axes/figure.

  The string 'best' places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

  The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case `bbox_to_anchor` will be ignored).

  For back-compatibility, 'center right' (but no other location) can also be spelled 'right', and each "string" locations can also be given as a numeric value:
<table>
<thead>
<tr>
<th>Location String</th>
<th>Location Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>'best'</td>
<td>0</td>
</tr>
<tr>
<td>'upper right'</td>
<td>1</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4</td>
</tr>
<tr>
<td>'right'</td>
<td>5</td>
</tr>
<tr>
<td>'center left'</td>
<td>6</td>
</tr>
<tr>
<td>'center right'</td>
<td>7</td>
</tr>
<tr>
<td>'lower center'</td>
<td>8</td>
</tr>
<tr>
<td>'upper center'</td>
<td>9</td>
</tr>
<tr>
<td>'center'</td>
<td>10</td>
</tr>
</tbody>
</table>

**bbox_to_anchor** ([`BboxBase`, 2-tuple, or 4-tuple of floats]) Box that is used to position the legend in conjunction with `loc`. Defaults to `axes.bbox` (if called as a method to `Axes.legend`) or `figure.bbox` (if `Figure.legend`). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by `bbox_transform`, with the default transform `Axes` or `Figure` coordinates, depending on which `legend` is called.

If a 4-tuple or `BboxBase` is given, then it specifies the bbox `(x, y, width, height)` that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```python
loc='best', bbox_to_anchor=(0.5, 0.5, 0.5, 0.5)
```

A 2-tuple `(x, y)` places the corner of the legend specified by `loc` at `x, y`. For example, to put the legend’s upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```python
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

**ncol** [integer] The number of columns that the legend has. Default is 1.

**prop** [None or `matplotlib.font_manager.FontProperties` or dict] The font properties of the legend. If None (default), the current `matplotlib.rcParams` will be used.

**fontsize** [int or float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] Controls the font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if `prop` is not specified.

**numpoints** [None or int] The number of marker points in the legend when creating a legend entry for a `Line2D` (line). Default is None, which will take the value from `rcParams["legend.numpoints"]` (default: 1).

**scatterpoints** [None or int] The number of marker points in the legend when creating a legend entry for a `PathCollection` (scatter plot). Default is None, which will take the value from `rcParams["legend.scatterpoints"]` (default: 1).

**scatteryoffsets** [iterable of floats] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at
the base the legend text, and 1.0 is at the top. To draw all markers at
the same height, set to [0.5]. Default is [0.375, 0.5, 0.3125].

**markerscale** [None or int or float] The relative size of legend markers
compared with the originally drawn ones. Default is None, which will
take the value from `rcParams['legend.markerscale']` (default: 1.0).

**markerfirst** [bool] If True, legend marker is placed to the left of the leg-
end label. If False, legend marker is placed to the right of the legend
label. Default is True.

**frameon** [None or bool] Control whether the legend should be drawn
on a patch (frame). Default is None, which will take the value from
`rcParams['legend.frameon']` (default: True).

**fancybox** [None or bool] Control whether round edges should be enabled
around the `FancyBboxPatch` which makes up the legend’s background.
Default is None, which will take the value from `rcParams['legend.
framealpha']` (default: False).

**shadow** [None or bool] Control whether to draw a shadow behind the leg-
end. Default is None, which will take the value from `rcParams['legend.
shadow']` (default: False).

**facecolor** [None or “inherit” or a color spec] Control the legend’s back-
ground color. Default is None, which will take the value from
`rcParams['legend.facecolor']` (default: 'inherit'). If "inherit", it will
take `rcParams['axes.facecolor']` (default: 'white').

**edgecolor** [None or “inherit” or a color spec] Control the legend’s back-
ground patch edge color. Default is None, which will take the value from
`rcParams['legend.edgecolor']` (default: '0.8') If "inherit", it will
take `rcParams['axes.edgecolor']` (default: 'black').

**mode** ["expand", None)] If mode is set to "expand" the legend will be hor-
vizontally expanded to fill the axes area (or `bbox_to_anchor` if defines the
legend’s size).

**bbox_transform** [None or `matplotlib.transforms.Transform`] The trans-
form for the bounding box (`bbox_to_anchor`). For a value of None (de-
fault) the Axes’ transAxes transform will be used.

**title** [str or None] The legend’s title. Default is no title (None).

**title_fontsize** str or None The fontsize of the legend’s title. Default is
the default fontsize.

**borderpad** [float or None] The fractional whitespace inside the legend
border. Measured in font-size units. Default is None, which will take
the value from `rcParams['legend.borderpad']` (default: 0.4).

**labelspacing** [float or None] The vertical space between the legend en-
tries. Measured in font-size units. Default is None, which will take the
value from `rcParams['legend.labelspacing']` (default: 0.5).
**Handle Length** [float or None] The length of the legend handles. Measured in font-size units. Default is `None`, which will take the value from `rcParams["legend.handlelength"]` (default: 2.0).

**Handle Text Pad** [float or None] The pad between the legend handle and text. Measured in font-size units. Default is `None`, which will take the value from `rcParams["legend.handletextpad"]` (default: 0.8).

**Border Axes Pad** [float or None] The pad between the axes and legend border. Measured in font-size units. Default is `None`, which will take the value from `rcParams["legend.borderaxespad"]` (default: 0.5).

**Column Spacing** [float or None] The spacing between columns. Measured in font-size units. Default is `None`, which will take the value from `rcParams["legend.columnspacing"]` (default: 2.0).

**Handler Map** [dict or None] The custom dictionary mapping instances or types to a legend handler. This handler_map updates the default handler map found at `matplotlib.legend.Legend.get_legend_handler_map()`.

**Notes**

Not all kinds of artist are supported by the legend command. See *Legend guide* for details.

**matplotlib.pyplot.fignum_exists**

`matplotlib.pyplot.fignum_exists(num)`

Return whether the figure with the given id exists.

**matplotlib.pyplot.figtext**

`matplotlib.pyplot.figtext(x, y, s, *args, **kwargs)`

Add text to figure.

**Parameters**

- **x, y** [float] The position to place the text. By default, this is in figure coordinates, floats in [0, 1]. The coordinate system can be changed using the `transform` keyword.
- **s** [str] The text string.
- **fontdict** [dictionary, optional, default: None] A dictionary to override the default text properties. If fontdict is None, the defaults are determined by your rc parameters. A property in `kwarg` overrides the same property in fontdict.
- **withdash** [boolean, optional, default: False] Creates a `TextWithDash` instance instead of a `Text` instance.

**Returns**

- **text** [Text]

**Other Parameters**
**kwargs [Text properties] Other other miscellaneous text parameters.

Axes.text

pyplot.text
Examples using `matplotlib.pyplot.figtext`

- `sphx_glr_gallery_text_labels_and_annotations_fonts_demo.py`
- `sphx_glr_gallery_text_labels_and_annotations_fonts_demo_kw.py`

`matplotlib.pyplot.figure`

```python
matplotlib.pyplot.figure(num=None, figsize=None, dpi=None, facecolor=None, edgecolor=None, frameon=True, FigureClass=<class 'matplotlib.figure.Figure'>, clear=False, **kwargs)
```

Create a new figure.

**Parameters**

- **num** [integer or string, optional, default: None] If not provided, a new figure will be created, and the figure number will be incremented. The figure objects holds this number in a `number` attribute. If num is provided, and a figure with this id already exists, make it active, and returns a reference to it. If this figure does not exists, create it and returns it. If num is a string, the window title will be set to this figure’s num.

- **figsize** [(float, float), optional, default: None] width, height in inches. If not provided, defaults to `rcParams["figure.figsize"]` (default: [6.4, 4.8]) = [6.4, 4.8].

- **dpi** [integer, optional, default: None] resolution of the figure. If not provided, defaults to `rcParams["figure.dpi"]` (default: 100.0) = 100.

- **facecolor** [color spec] the background color. If not provided, defaults to `rcParams["figure.facecolor"]` (default: 'white') = 'w'.

- **edgecolor** [color spec] the border color. If not provided, defaults to `rcParams["figure.edgecolor"]` (default: 'white') = 'w'.

- **frameon** [bool, optional, default: True] If False, suppress drawing the figure frame.

- **FigureClass** [subclass of `Figure`] Optionally use a custom `Figure` instance.

- **clear** [bool, optional, default: False] If True and the figure already exists, then it is cleared.

**Returns**

- **figure** [Figure] The `Figure` instance returned will also be passed to `new_figure_manager` in the backends, which allows to hook custom `Figure` classes into the pyplot interface. Additional kwargs will be passed to the `Figure` init function.

**Notes**

If you are creating many figures, make sure you explicitly call `pyplot.close()` on the figures you are not using, because this will enable pyplot to properly clean up the memory. `rcParams` defines the default values, which can be modified in the matplotlibrc file.
Examples using `matplotlib.pyplot.figure`

- The double pendulum problem
- Frame grabbing
- sphx_glr_gallery_misc_hyperlinks_sgskip.py
- sphx_glr_gallery_mplot3d_rotate_axes3d_sgskip.py
- sphx_glr_gallery_mplot3d_wire3d_animation_sgskip.py
- sphx_glr_gallery_user_interfaces_svg_histogram_sgskip.py
- sphx_glr_gallery_user_interfaces_toolmanager_sgskip.py
- sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py

`matplotlib.pyplot.fill`

`matplotlib.pyplot.fill(*args, data=None, **kwargs)`
Plot filled polygons.

**Parameters**

*args [sequence of x, y, [color]] Each polygon is defined by the lists of x and y positions of its nodes, optionally followed by a color specifier. See `matplotlib.colors` for supported color specifiers. The standard color cycle is used for polygons without a color specifier.

You can plot multiple polygons by providing multiple x, y, [color] groups.

For example, each of the following is legal:

```
ax.fill(x, y)  # a polygon with default color
ax.fill(x, y, "b")  # a blue polygon
ax.fill(x, y, x2, y2)  # two polygons
ax.fill(x, y, "b", x2, y2, "r")  # a blue and a red polygon
```

data [indexable object, optional] An object with labelled data. If given, provide the label names to plot in x and y, e.g.:

```
ax.fill("time", "signal",
       data={"time": [0, 1, 2], "signal": [0, 1, 0]})
```

**Returns**

a list of `Polygon`

**Other Parameters**

**kwargs [`Polygon` properties]

**Notes**

Use `fill_between()` if you would like to fill the region between two curves.
Examples using `matplotlib.pyplot.fill`

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

`matplotlib.pyplot.fill_between`

```python
matplotlib.pyplot.fill_between(x, y1, y2=0, where=None, interpolate=False, step=None, *, data=None, **kwargs)
```

Fill the area between two horizontal curves.

The curves are defined by the points \((x, y1)\) and \((x, y2)\). This creates one or multiple polygons describing the filled area.

You may exclude some horizontal sections from filling using `where`.

By default, the edges connect the given points directly. Use `step` if the filling should be a step function, i.e. constant in between `x`.

**Parameters**
- `x` [array (length N)] The x coordinates of the nodes defining the curves.
- `y1` [array (length N) or scalar] The y coordinates of the nodes defining the first curve.
- `y2` [array (length N) or scalar, optional, default: 0] The y coordinates of the nodes defining the second curve.
- `where` [array of bool (length N), optional, default: None] Define `where` to exclude some horizontal regions from being filled. The filled regions are defined by the coordinates \(x[\text{where}]\). More precisely, fill between \(x[i]\) and \(x[i+1]\) if \(\text{where}[i]\) and \(\text{where}[i+1]\). Note that this definition implies that an isolated `True` value between two `False` values in `where` will not result in filling. Both sides of the `True` position remain unfilled due to the adjacent `False` values.
- `interpolate` [bool, optional] This option is only relevant if `where` is used and the two curves are crossing each other.

Semantically, `where` is often used for \(y1 > y2\) or similar. By default, the nodes of the polygon defining the filled region will only be placed at the positions in the `x` array. Such a polygon cannot describe the above semantics close to the intersection. The x-sections containing the intersection are simply clipped.

Setting `interpolate` to `True` will calculate the actual intersection point and extend the filled region up to this point.

- `step` [{‘pre’, ‘post’, ‘mid’}, optional] Define `step` if the filling should be a step function, i.e. constant in between `x`. The value determines where the step will occur:
  - ‘pre’: The y value is continued constantly to the left from every x position, i.e. the interval \((x[i-1], x[i])\) has the value \(y[i]\).
  - ‘post’: The y value is continued constantly to the right from every x position, i.e. the interval \([x[i], x[i+1])\) has the value \(y[i]\).
  - ‘mid’: Steps occur half-way between the x positions.
Returns

**PolyCollection** A PolyCollection containing the plotted polygons.

Other Parameters

**kwargs** All other keyword arguments are passed on to PolyCollection. They control the Polygon properties:

**fill_betweenx** Fill between two sets of x-values.
Notes

Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

- All arguments with the following names: 'where', 'x', 'y1', 'y2'.

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).

Examples using matplotlib.pyplot.fill_between

- sphx_glr_gallery_lines_bars_and_markers_fill_between_demo.py
- sphx_glr_gallery_text_labels_and_annotations_mathtext_examples.py

matplotlib.pyplot.fill_betweenx

matplotlib.pyplot.fill_betweenx(y, x1, x2=0, where=None, step=None, interpolate=False, *, data=None, **kwargs)

Fill the area between two vertical curves.

The curves are defined by the points (x1, y) and (x2, y). This creates one or multiple polygons describing the filled area.

You may exclude some vertical sections from filling using where.

By default, the edges connect the given points directly. Use step if the filling should be a step function, i.e. constant in between y.

Parameters

y [array (length N)] The y coordinates of the nodes defining the curves.

x1 [array (length N) or scalar] The x coordinates of the nodes defining the first curve.

x2 [array (length N) or scalar, optional, default: 0] The x coordinates of the nodes defining the second curve.

where [array of bool (length N), optional, default: None] Define where to exclude some vertical regions from being filled. The filled regions are defined by the coordinates y[where]. More precisely, fill between y[i] and y[i+1] if where[i] and where[i+1]. Note that this definition implies that an isolated True value between two False values in where will not result in filling. Both sides of the True position remain unfilled due to the adjacent False values.

interpolate [bool, optional] This option is only relevant if where is used and the two curves are crossing each other.

Semantically, where is often used for x1 > x2 or similar. By default, the nodes of the polygon defining the filled region will only be placed at the positions in the y array. Such a polygon cannot describe the
above semantics close to the intersection. The y-sections containing
the intersection are simply clipped.

Setting `interpolate` to `True` will calculate the actual intersection point
and extend the filled region up to this point.

**step** [{‘pre’, ‘post’, ‘mid’}, optional] Define `step` if the filling should be a
step function, i.e. constant in between y. The value determines where
the step will occur:

- ‘pre’: The y value is continued constantly to the left from every x
  position, i.e. the interval \((x[i-1], x[i])\) has the value \(y[i]\).
- ‘post’: The y value is continued constantly to the right from every x
  position, i.e. the interval \([x[i], x[i+1])\) has the value \(y[i]\).
- ‘mid’: Steps occur half-way between the x positions.

**Returns**

`PolyCollection` A `PolyCollection` containing the plotted polygons.

**Other Parameters**

**kwargs** All other keyword arguments are passed on to `PolyCollection`.
They control the `Polygon` properties:

<table>

See also:

fill_between  Fill between two sets of y-values.

Notes

Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

- All arguments with the following names: ‘where’, ‘x1’, ‘x2’, ‘y’.

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).

matplotlib.pyplot.findobj

matplotlib.pyplot.findobj(o=None, match=None, include_self=True)

Find artist objects.

Recursively find all Artist instances contained in the artist.

Parameters

match  A filter criterion for the matches. This can be

- None: Return all objects contained in artist.

- A function with signature def match(artist: Artist) -> bool. The result will only contain artists for which the function returns True.

- A class instance: e.g., Line2D. The result will only contain artists of this class or its subclasses (isinstance check).

include_self  [bool] Include self in the list to be checked for a match.

Returns

artists  [list of Artist]
**matplotlib.pyplot.flag**

`matplotlib.pyplot.flag()`  
Set the colormap to “flag”.  
This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

**matplotlib.pyplot.gca**

`matplotlib.pyplot.gca(**kwargs)`  
Get the current `Axes` instance on the current figure matching the given keyword args, or create one.  

**See also:**

`matplotlib.figure.Figure(gca)` The figure’s gca method.

**Examples**

To get the current polar axes on the current figure:

```python
plt.gca(projection='polar')
```

If the current axes doesn’t exist, or isn’t a polar one, the appropriate axes will be created and then returned.

**Examples using matplotlib.pyplot.gca**

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

**matplotlib.pyplot.gcf**

`matplotlib.pyplot.gcf()`  
Get the current figure.  
If no current figure exists, a new one is created using `figure()`.

**Examples using matplotlib.pyplot.gcf**

- sphx_glr_gallery_text_labels_and_annotations_arrow_demo.py
- sphx_glr_gallery_event_handling_trifinder_event_demo.py
- `Tight Layout guide`
matplotlib.pyplot.gci

matplotlib.pyplot.gci()
Get the current colorable artist. Specifically, returns the current *ScalarMappable* instance (image or patch collection), or *None* if no images or patch collections have been defined. The commands *imshow()* and *figimage()* create *Image* instances, and the commands *pcolor()* and *scatter()* create *Collection* instances. The current image is an attribute of the current axes, or the nearest earlier axes in the current figure that contains an image.

**Notes**

Historically, the only colorable artists were images; hence the name *gci* (get current image).

matplotlib.pyplot.get_current_fig_manager

matplotlib.pyplot.get_current_fig_manager()
Return the figure manager of the current figure.

The figure manager is a container for the actual backend-dependent window that displays the figure on screen.

If if no current figure exists, a new one is created an its figure manager is returned.

**Returns**

*manager* [*FigureManagerBase* or backend-dependent subclass thereof]

**Examples using** matplotlib.pyplot.get_current_fig_manager

- sphx_glr_gallery_misc_agg_buffer.py

matplotlib.pyplot.get_fignums

matplotlib.pyplot.get_fignums()
Return a list of existing figure numbers.

matplotlib.pyplot.get_plot_commands

matplotlib.pyplot.get_plot_commands()
Get a sorted list of all of the plotting commands.
matplotlib.pyplot.ginput

`matplotlib.pyplot.ginput(*args, **kwargs)`

Blocking call to interact with a figure.

Wait until the user clicks \( n \) times on the figure, and return the coordinates of each click in a list.

There are three possible interactions:

- Add a point.
- Remove the most recently added point.
- Stop the interaction and return the points added so far.

The actions are assigned to mouse buttons via the arguments `mouse_add`, `mouse_pop` and `mouse_stop`. Mouse buttons are defined by the numbers:

- 1: left mouse button
- 2: middle mouse button
- 3: right mouse button
- None: no mouse button

**Parameters**

- `n` [int, optional, default: 1] Number of mouse clicks to accumulate. If negative, accumulate clicks until the input is terminated manually.
- `timeout` [scalar, optional, default: 30] Number of seconds to wait before timing out. If zero or negative will never timeout.
- `show_clicks` [bool, optional, default: True] If True, show a red cross at the location of each click.
- `mouse_add` [{1, 2, 3, None}, optional, default: 1 (left click)] Mouse button used to add points.
- `mouse_pop` [{1, 2, 3, None}, optional, default: 3 (right click)] Mouse button used to remove the most recently added point.
- `mouse_stop` [{1, 2, 3, None}, optional, default: 2 (middle click)] Mouse button used to stop input.

**Returns**

- `points` [list of tuples] A list of the clicked (x, y) coordinates.

**Notes**

The keyboard can also be used to select points in case your mouse does not have one or more of the buttons. The delete and backspace keys act like right clicking (i.e., remove last point), the enter key terminates input and any other key (not already used by the window manager) selects a point.
Examples using matplotlib.pyplot.ginput

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

**matplotlib.pyplot.gray**

`matplotlib.pyplot.gray()`

Set the colormap to "gray".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

**matplotlib.pyplot.grid**

`matplotlib.pyplot.grid(b=None, which='major', axis='both', **kwargs)`

Configure the grid lines.

**Parameters**

- **b** [bool or None, optional] Whether to show the grid lines. If any `kwargs` are supplied, it is assumed you want the grid on and `b` will be set to True.
  
  If `b` is None and there are no `kwargs`, this toggles the visibility of the lines.

- **which** [{‘major’, ‘minor’, ‘both’}, optional] The grid lines to apply the changes on.

- **axis** [{‘both’, ‘x’, ‘y’}, optional] The axis to apply the changes on.

- **kwargs** [Line2D properties] Define the line properties of the grid, e.g.:

  ```python
  grid(color='r', linestyle='-', linewidth=2)
  ```

Valid `kwargs` are

Notes

The axis is drawn as a unit, so the effective zorder for drawing the grid is determined by the zorder of each axis, not by the zorder of the Line2D objects comprising the grid. Therefore, to set grid zorder, use set_axisbelow or, for more control, call the set_zorder method of each axis.

- sphx_glr_gallery_misc_customize_rc.py
- sphx_glr_gallery_misc_findobj_demo.py
- sphx_glr_gallery_scales_custom_scale.py
Make a 2D hexagonal binning plot of points x, y.

If C is None, the value of the hexagon is determined by the number of points in the hexagon. Otherwise, C specifies values at the coordinate (x[i], y[i]). For each hexagon, these values are reduced using reduce_C_function.

**Parameters**

- **x, y** [array-like] The data positions. x and y must be of the same length.
- **C** [array-like, optional] If given, these values are accumulated in the bins. Otherwise, every point has a value of 1. Must be of the same length as x and y.
- **gridsize** [int or (int, int), default: 100] If a single int, the number of hexagons in the x-direction. The number of hexagons in the y-direction is chosen such that the hexagons are approximately regular.
  
  Alternatively, if a tuple (nx, ny), the number of hexagons in the x-direction and the y-direction.
- **bins** ['log' or int or sequence, default: None] Discretization of the hexagon values.
  
  - If None, no binning is applied; the color of each hexagon directly corresponds to its count value.
  
  - If 'log', use a logarithmic scale for the color map. Internally, \( \log_{10}(i+1) \) is used to determine the hexagon color. This is equivalent to norm=LogNorm().
  
  - If an integer, divide the counts in the specified number of bins, and color the hexagons accordingly.
  
  - If a sequence of values, the values of the lower bound of the bins to be used.
- **xscale** [{‘linear’, ‘log’}, default: ‘linear'] Use a linear or log10 scale on the horizontal axis.
- **yscale** [{‘linear’, ‘log’}, default: ‘linear'] Use a linear or log10 scale on the vertical axis.
- **mincnt** [int > 0, default: None] If not None, only display cells with more than mincnt number of points in the cell.
**marginals** [bool, default: False] If marginals is True, plot the marginal density as colormapped rectangles along the bottom of the x-axis and left of the y-axis.

**extent** [float, default: None] The limits of the bins. The default assigns the limits based on `gridsize`, `x`, `y`, `xscale` and `yscale`.

If `xscale` or `yscale` is set to ‘log’, the limits are expected to be the exponent for a power of 10. E.g. for x-limits of 1 and 50 in ‘linear’ scale and y-limits of 10 and 1000 in ‘log’ scale, enter (1, 50, 1, 3).

Order of scalars is (left, right, bottom, top).

**Returns**

**polycollection** [PolyCollection] A PolyCollection defining the hexagonal bins.

- `PolyCollection.get_offset` contains a Mx2 array containing the x, y positions of the M hexagon centers.
- `PolyCollection.get_array` contains the values of the M hexagons.

If `marginals` is True, horizontal bar and vertical bar (both PolyCollections) will be attached to the return collection as attributes `hbar` and `vbar`.

**Other Parameters**

**cmap** [str or Colormap, optional] The Colormap instance or registered colormap name used to map the bin values to colors. Defaults to `rcParams["image.cmap"]` (default: ‘viridis’).

**norm** [Normalize, optional] The Normalize instance scales the bin values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

**vmin, vmax** [float, optional, default: None] The colorbar range. If `None`, suitable min/max values are automatically chosen by the `Normalize` instance (defaults to the respective min/max values of the bins in case of the default linear scaling). This is ignored if `norm` is given.

**alpha** [float between 0 and 1, optional] The alpha blending value, between 0 (transparent) and 1 (opaque).

**linewdths** [float, default: None] If `None`, defaults to 1.0.

**edgecolors** [{'face', 'none', 'None'} or color, default: ‘face’] The color of the hexagon edges. Possible values are:

- ‘face’: Draw the edges in the same color as the fill color.
- ‘none’: No edges are drawn. This can sometimes lead to unsightly unpainted pixels between the hexagons.
- `None`: Draw outlines in the default color.
- An explicit matplotlib color.

**reduce_C_function** [callable, default is `numpy.mean`] The function to aggregate `C` within the bins. It is ignored if `C` is not given. This must have the signature:
```python
def reduce_C_function(C: array) -> float
```

Commonly used functions are:

- `numpy.mean`: average of the points
- `numpy.sum`: integral of the point values
- `numpy.max`: value taken from the largest point

**kwargs `[PolyCollection properties]` All other keyword arguments are passed on to `PolyCollection`:

Notes

Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

- All arguments with the following names: ‘x’, ‘y’.

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).

matplotlib.pyplot.hist

matplotlib.pyplot.hist(x, bins=None, range=None, density=None, weights=None, cumulative=False, bottom=None, histtype='bar', align='mid', orientation='vertical', rwidth=None, log=False, color=None, label=None, stacked=False, normed=None, *, data=None, **kwargs)

Plot a histogram.

Compute and draw the histogram of x. The return value is a tuple (n, bins, patches) or ([n0, n1, ...], bins, [patches0, patches1,...]) if the input contains multiple data. See the documentation of the weights parameter to draw a histogram of already-binned data.

Multiple data can be provided via x as a list of datasets of potentially different length ([x0, x1, ...]), or as a 2-D ndarray in which each column is a dataset. Note that the ndarray form is transposed relative to the list form.

Masked arrays are not supported at present.

Parameters

x [(n,) array or sequence of (n,) arrays] Input values, this takes either a single array or a sequence of arrays which are not required to be of the same length.

bins [int or sequence or str, optional] If an integer is given, bins + 1 bin edges are calculated and returned, consistent with numpy.histogram.

If bins is a sequence, gives bin edges, including left edge of first bin and right edge of last bin. In this case, bins is returned unmodified.

All but the last (righthand-most) bin is half-open. In other words, if bins is:

[1, 2, 3, 4]

then the first bin is (1, 2) (including 1, but excluding 2) and the second [2, 3). The last bin, however, is [3, 4], which includes 4.

Unequally spaced bins are supported if bins is a sequence.

With Numpy 1.11 or newer, you can alternatively provide a string describing a binning strategy, such as ‘auto’, ‘sturges’, ‘fd’, ‘doane’, ‘scott’, ‘rice’ or ‘sqrt’, see numpy.histogram.

The default is taken from rcParams["hist.bins"] (default: 10).
range [tuple or None, optional] The lower and upper range of the bins. Lower and upper outliers are ignored. If not provided, range is \((x.\ min(), x.\ max())\). Range has no effect if bins is a sequence.

If bins is a sequence or range is specified, autoscaling is based on the specified bin range instead of the range of x.

Default is None

density [bool, optional] If True, the first element of the return tuple will be the counts normalized to form a probability density, i.e., the area (or integral) under the histogram will sum to 1. This is achieved by dividing the count by the number of observations times the bin width and not dividing by the total number of observations. If stacked is also True, the sum of the histograms is normalized to 1.

Default is None for both normed and density. If either is set, then that value will be used. If neither are set, then the args will be treated as False.

If both density and normed are set an error is raised.

weights [(n, ) array_like or None, optional] An array of weights, of the same shape as x. Each value in x only contributes its associated weight towards the bin count (instead of 1). If normed or density is True, the weights are normalized, so that the integral of the density over the range remains 1.

Default is None.

This parameter can be used to draw a histogram of data that has already been binned, e.g. using np.histogram (by treating each bin as a single point with a weight equal to its count)

counts, bins = np.histogram(data)
plt.hist(bins[:-1], bins, weights=counts)

(or you may alternatively use bar()).

cumulative [bool, optional] If True, then a histogram is computed where each bin gives the counts in that bin plus all bins for smaller values. The last bin gives the total number of datapoints. If normed or density is also True then the histogram is normalized such that the last bin equals 1. If cumulative evaluates to less than 0 (e.g., -1), the direction of accumulation is reversed. In this case, if normed and/or density is also True, then the histogram is normalized such that the first bin equals 1.

Default is False

bottom [array_like, scalar, or None] Location of the bottom baseline of each bin. If a scalar, the base line for each bin is shifted by the same amount. If an array, each bin is shifted independently and the length of bottom must match the number of bins. If None, defaults to 0.

Default is None

histtype [{'bar', 'barstacked', 'step', 'stepfilled'}, optional] The type of histogram to draw.
• ‘bar’ is a traditional bar-type histogram. If multiple data are given the bars are arranged side by side.
• ‘barstacked’ is a bar-type histogram where multiple data are stacked on top of each other.
• ‘step’ generates a lineplot that is by default unfilled.
• ‘stepfilled’ generates a lineplot that is by default filled.
Default is ‘bar’

**align** [{‘left’, ‘mid’, ‘right’}, optional] Controls how the histogram is plotted.
• ‘left’: bars are centered on the left bin edges.
• ‘mid’: bars are centered between the bin edges.
• ‘right’: bars are centered on the right bin edges.
Default is ‘mid’

**orientation** [{‘horizontal’, ‘vertical’}, optional] If ‘horizontal’, barh will be used for bar-type histograms and the bottom kwarg will be the left edges.

**rwidth** [scalar or None, optional] The relative width of the bars as a fraction of the bin width. If None, automatically compute the width.
Ignored if histtype is ‘step’ or ‘stepfilled’.
Default is None

**log** [bool, optional] If True, the histogram axis will be set to a log scale. If log is True and x is a 1D array, empty bins will be filtered out and only the non-empty (n, bins, patches) will be returned.
Default is False

**color** [color or array like of colors or None, optional] Color spec or sequence of color specs, one per dataset. Default (None) uses the standard line color sequence.
Default is None

**label** [str or None, optional] String, or sequence of strings to match multiple datasets. Bar charts yield multiple patches per dataset, but only the first gets the label, so that the legend command will work as expected.
Default is None

**stacked** [bool, optional] If True, multiple data are stacked on top of each other If False multiple data are arranged side by side if histtype is ‘bar’ or on top of each other if histtype is ‘step’
Default is False

**normed** [bool, optional] Deprecated; use the density keyword argument instead.

**Returns**
n [array or list of arrays] The values of the histogram bins. See density and weights for a description of the possible semantics. If input x is an array, then this is an array of length nbins. If input is a sequence of arrays [data1, data2, ...], then this is a list of arrays with the values of the histograms for each of the arrays in the same order. The dtype of the array n (or of its element arrays) will always be float even if no weighting or normalization is used.

bins [array] The edges of the bins. Length nbins + 1 (nbins left edges and right edge of last bin). Always a single array even when multiple data sets are passed in.

patches [list or list of lists] Silent list of individual patches used to create the histogram or list of such list if multiple input datasets.

Other Parameters
**kwargs [Patch properties]

See also:

hist2d 2D histograms

Notes

Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

- All arguments with the following names: ‘weights’, ‘x’.

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).

Examples using matplotlib.pyplot.hist

- sphx_glr_gallery_user_interfaces_svg_histogram_sgskip.py

matplotlib.pyplot.hist2d

matplotlib.pyplot.hist2d(x, y, bins=10, range=None, density=False, weights=None, cmin=None, cmax=None, *, data=None, **kwargs)

Make a 2D histogram plot.

Parameters

x, y [array_like, shape (n, )] Input values

bins [None or int or [int, int] or array_like or [array, array]] The bin specification:

- If int, the number of bins for the two dimensions (nx=ny=bins).
- If [int, int], the number of bins in each dimension (nx, ny = bins).
• If array_like, the bin edges for the two dimensions (x_edges=y_edges=bins).

• If [array, array], the bin edges in each dimension (x_edges, y_edges = bins).

The default value is 10.

range [array_like shape(2, 2), optional, default: None] The leftmost and rightmost edges of the bins along each dimension (if not specified explicitly in the bins parameters): [[xmin, xmax], [ymin, ymax]]. All values outside of this range will be considered outliers and not tallied in the histogram.

density [bool, optional, default: False] Normalize histogram. normed is a deprecated synonym for this parameter.

weights [array_like, shape (n,), optional, default: None] An array of values w_i weighing each sample (x_i, y_i).

cmin [scalar, optional, default: None] All bins that has count less than cmin will not be displayed and these count values in the return value count histogram will also be set to nan upon return.

cmax [scalar, optional, default: None] All bins that has count more than cmax will not be displayed (set to none before passing to imshow) and these count values in the return value count histogram will also be set to nan upon return.

Returns

h [2D array] The bi-dimensional histogram of samples x and y. Values in x are histogrammed along the first dimension and values in y are histogrammed along the second dimension.

xedges [1D array] The bin edges along the x axis.

yedges [1D array] The bin edges along the y axis.

image [QuadMesh]

Other Parameters

norm [Normalize, optional] A colors.Normalize instance is used to scale luminance data to [0, 1]. If not set, defaults to colors.Normalize().

vmin/vmax [None or scalar, optional] Arguments passed to the Normalize instance.

alpha [0 <= scalar <= 1 or None, optional] The alpha blending value.

See also:

hist 1D histogram plotting

Notes

• Currently hist2d calculates it’s own axis limits, and any limits previously set are ignored.
• Rendering the histogram with a logarithmic color scale is accomplished by passing a `colors.LogNorm` instance to the `norm` keyword argument. Likewise, power-law normalization (similar in effect to gamma correction) can be accomplished with `colors.PowerNorm`.

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments are replaced by `data[<arg>]`:

• All arguments with the following names: ‘weights’, ‘x’, ‘y’.

Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg> in data`).

Examples using `matplotlib.pyplot.hist2d`

• `sphx_glr_gallery_scales_power_norm.py`
Note: In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments are replaced by `data[<arg>]`:

- All arguments with the following names: `colors`, `xmax`, `xmin`, `y`.

Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg> in data`).

**Matplotlib.pyplot.hot**

```python
import matplotlib.pyplot as plt
plt.hot()
```

Set the colormap to “hot”.

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

**Matplotlib.pyplot.hsv**

```python
import matplotlib.pyplot as plt
plt.hsv()
```

Set the colormap to “hsv”.

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

**Matplotlib.pyplot.imread**

```python
import matplotlib.pyplot as plt
plt.imread(fname, format=None)
```

Read an image from a file into an array.

**Parameters**

- `fname` [str or file-like] The image file to read: a filename, a URL or a file-like object opened in read-binary mode.
- `format` [str, optional] The image file format assumed for reading the data. If not given, the format is deduced from the filename. If nothing can be deduced, PNG is tried.

**Returns**

- `imagedata` [numpy.array] The image data. The returned array has shape
  - (M, N) for grayscale images.
  - (M, N, 3) for RGB images.
  - (M, N, 4) for RGBA images.
Notes

Matplotlib can only read PNGs natively. Further image formats are supported via the optional dependency on Pillow. Note, URL strings are not compatible with Pillow. Check the Pillow documentation for more information.

Examples using matplotlib.pyplot.imread

• sphx_glr_gallery_images_contours_and_fields_image_clip_path.py
• sphx_glr_gallery_images_contours_and_fields_image_demo.py
• sphx_glr_gallery_images_contours_and_fields_watermark_image.py
• sphx_glr_gallery_text_labels_and_annotations_demo_annotation_box.py
• sphx_glr_gallery_text_labels_and_annotations_demo_text_path.py
• sphx_glr_gallery_misc_demo_ribbon_box.py

matplotlib.pyplot.imsave

matplotlib.pyplot.imsave(fname, arr, **kwargs)

Save an array as an image file.

Parameters

fname [str or PathLike or file-like] A path or a file-like object to store the image in. If format is not set, then the output format is inferred from the extension of fname, if any, and from rcParams["savefig.format"] (default: ‘png’) otherwise. If format is set, it determines the output format.

arr [array-like] The image data. The shape can be one of MxN (luminance), MxNx3 (RGB) or MxNx4 (RGBA).

vmin, vmax [scalar, optional] vmin and vmax set the color scaling for the image by fixing the values that map to the colormap color limits. If either vmin or vmax is None, that limit is determined from the arr min/max value.

cmap [str or Colormap, optional] A Colormap instance or registered colormap name. The colormap maps scalar data to colors. It is ignored for RGB(A) data. Defaults to rcParams["image.cmap"] (default: ‘viridis’) (‘viridis’).

format [str, optional] The file format, e.g. ‘png’, ‘pdf’, ‘svg’, ... The behavior when this is unset is documented under fname.

origin [{‘upper’, ‘lower’}, optional] Indicates whether the (0, 0) index of the array is in the upper left or lower left corner of the axes. Defaults to rcParams["image.origin"] (default: ‘upper’) (‘upper’).

dpi [int] The DPI to store in the metadata of the file. This does not affect the resolution of the output image.
Display an image, i.e. data on a 2D regular raster.

Parameters

X [array-like or PIL image] The image data. Supported array shapes are:

- (M, N): an image with scalar data. The data is visualized using a colormap.
- (M, N, 3): an image with RGB values (0-1 float or 0-255 int).
- (M, N, 4): an image with RGBA values (0-1 float or 0-255 int), i.e. including transparency.

The first two dimensions (M, N) define the rows and columns of the image.

Out-of-range RGB(A) values are clipped.

cmap [str or Colormap, optional] The Colormap instance or registered colormap name used to map scalar data to colors. This parameter is ignored for RGB(A) data. Defaults to rcParams["image.cmap"] (default: 'viridis').

norm [Normalize, optional] The Normalize instance used to scale scalar data to the [0, 1] range before mapping to colors using cmap. By default, a linear scaling mapping the lowest value to 0 and the highest to 1 is used. This parameter is ignored for RGB(A) data.

aspect [{‘equal’, ‘auto’} or float, optional] Controls the aspect ratio of the axes. The aspect is of particular relevance for images since it may distort the image, i.e. pixel will not be square.

This parameter is a shortcut for explicitly calling Axes.set_aspect. See there for further details.

- ‘equal’: Ensures an aspect ratio of 1. Pixels will be square (unless pixel sizes are explicitly made non-square in data coordinates using extent).
- ‘auto’: The axes is kept fixed and the aspect is adjusted so that the data fit in the axes. In general, this will result in non-square pixels.

If not given, use rcParams["image.aspect"] (default: ‘equal’) (default: ‘equal’).

interpolation [str; optional] The interpolation method used. If None rcParams["image.interpolation"] (default: ‘nearest’) is used, which defaults to ‘nearest’.

If *interpolation* is ‘none’, then no interpolation is performed on the Agg, ps, pdf and svg backends. Other backends will fall back to ‘nearest’. Note that most SVG renders perform interpolation at rendering and that the default interpolation method they implement may differ.

See /gallery/images_contours_and_fields/interpolation_methods for an overview of the supported interpolation methods.

Some interpolation methods require an additional radius parameter, which can be set by *filterrad*. Additionally, the antigrain image resize filter is controlled by the parameter *filternorm*.

**alpha** [scalar, optional] The alpha blending value, between 0 (transparent) and 1 (opaque). This parameter is ignored for RGBA input data.

**vmin, vmax** [scalar, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. *vmin, vmax* are ignored if the *norm* parameter is used.

**origin** [{‘upper’, ‘lower’}, optional] Place the [0,0] index of the array in the upper left or lower left corner of the axes. The convention ‘upper’ is typically used for matrices and images. If not given, *rcParams[‘image.origin’]* (default: ‘upper’) is used, defaulting to ‘upper’.

Note that the vertical axes points upward for ‘lower’ but downward for ‘upper’.

See the *origin and extent in imshow* tutorial for examples and a more detailed description.

**extent** [scalars (left, right, bottom, top), optional] The bounding box in data coordinates that the image will fill. The image is stretched individually along x and y to fill the box.

The default extent is determined by the following conditions. Pixels have unit size in data coordinates. Their centers are on integer coordinates, and their center coordinates range from 0 to columns-1 horizontally and from 0 to rows-1 vertically.

Note that the direction of the vertical axis and thus the default values for top and bottom depend on *origin*:

- For *origin == ‘upper’* the default is (-0.5, numcols-0.5, numrows-0.5, -0.5).
- For *origin == ‘lower’* the default is (-0.5, numcols-0.5, -0.5, numrows-0.5).

See the *origin and extent in imshow* tutorial for examples and a more detailed description.

**filternorm** [bool, optional, default: True] A parameter for the antigrain image resize filter (see the antigrain documentation). If *filternorm* is set, the filter normalizes integer values and corrects the rounding errors. It doesn’t do anything with the source floating point values, it corrects only integers according to the rule of 1.0 which means that any sum of pixel weights must be equal to 1.0. So, the filter function must produce a graph of the proper shape.
filterrad [float > 0, optional, default: 4.0] The filter radius for filters that have a radius parameter, i.e. when interpolation is one of: ‘sinc’, ‘lanczos’ or ‘blackman’.

resample [bool, optional] When True, use a full resampling method. When False, only resample when the output image is larger than the input image.

url [str, optional] Set the url of the created AxesImage. See Artist.set_url.

Returns

image [AxesImage]

Other Parameters

**kwargs [Artist properties] These parameters are passed on to the constructor of the AxesImage artist.

See also:

matshow Plot a matrix or an array as an image.

Notes

Unless extent is used, pixel centers will be located at integer coordinates. In other words: the origin will coincide with the center of pixel (0, 0).

There are two common representations for RGB images with an alpha channel:

• Straight (unassociated) alpha: R, G, and B channels represent the color of the pixel, disregarding its opacity.

• Premultiplied (associated) alpha: R, G, and B channels represent the color of the pixel, adjusted for its opacity by multiplication.

imshow expects RGB images adopting the straight (unassociated) alpha representation.

Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

• All positional and all keyword arguments.

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).

Examples using matplotlib.pyplot.imshow

• sphx_glr_gallery_misc_hyperlinks_sgskip.py

matplotlib.pyplot.inferno

matplotlib.pyplot.inferno()

Set the colormap to "inferno".
This changes the default colormap as well as the colormap of the current image if there is one. See help(colormaps) for more information.

```
matplotlib.pyplot.install_repl_displayhook
```

Install a repl display hook so that any stale figure are automatically redrawn when control is returned to the repl.

This works both with IPython and with vanilla python shells.

```
matplotlib.pyplot.ioff
```

Turn the interactive mode off.

**Examples using matplotlib.pyplot.ioff**

- *Usage Guide*

```
matplotlib.pyplot.ion
```

Turn the interactive mode on.

**Examples using matplotlib.pyplot.ion**

- *Usage Guide*

```
matplotlib.pyplot.isinteractive
```

Return the status of interactive mode.

```
matplotlib.pyplot.jet
```

Set the colormap to “jet”.

This changes the default colormap as well as the colormap of the current image if there is one. See help(colormaps) for more information.
**matplotlib.pyplot.legend**

`matplotlib.pyplot.legend(*args, **kwargs)`

Place a legend on the axes.

Call signatures:

```python
def legend()
def legend(labels)
def legend(handles, labels)
```

The call signatures correspond to three different ways how to use this method.

1. **Automatic detection of elements to be shown in the legend**

The elements to be added to the legend are automatically determined, when you do not pass in any extra arguments.

In this case, the labels are taken from the artist. You can specify them either at artist creation or by calling the `set_label()` method on the artist:

```python
line, = ax.plot([1, 2, 3], label='Inline label')
ax.legend()
```

or:

```python
line, = ax.plot([1, 2, 3])
line.set_label('Label via method')
ax.legend()
```

Specific lines can be excluded from the automatic legend element selection by defining a label starting with an underscore. This is default for all artists, so calling `Axes.legend` without any arguments and without setting the labels manually will result in no legend being drawn.

2. **Labeling existing plot elements**

To make a legend for lines which already exist on the axes (via plot for instance), simply call this function with an iterable of strings, one for each legend item. For example:

```python
ax.plot([1, 2, 3])
ax.legend(['A simple line'])
```

Note: This way of using is discouraged, because the relation between plot elements and labels is only implicit by their order and can easily be mixed up.

3. **Explicitly defining the elements in the legend**

For full control of which artists have a legend entry, it is possible to pass an iterable of legend artists followed by an iterable of legend labels respectively:

```python
legend((line1, line2, line3), ('label1', 'label2', 'label3'))
```

**Parameters**

- `handles` [sequence of `Artist`, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with `labels`, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.
The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

**labels** [sequence of strings, optional] A list of labels to show next to the artists. Use this together with **handles**, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

**Returns**

`matplotlib.legend.Legend` instance

**Other Parameters**

**loc** [str or pair of floats, default: `rcParams["legend.loc"]` (default: 'best') ('best' for axes, 'upper right' for figures)] The location of the legend.

The strings 'upper left', 'upper right', 'lower left', 'lower right' place the legend at the corresponding corner of the axes/figure.

The strings 'upper center', 'lower center', 'center left', 'center right' place the legend at the center of the corresponding edge of the axes/figure.

The string 'center' places the legend at the center of the axes/figure.

The string 'best' places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case `bbox_to_anchor` will be ignored).

For back-compatibility, 'center right' (but no other location) can also be spelled 'right', and each "string" locations can also be given as a numeric value:

<table>
<thead>
<tr>
<th>Location String</th>
<th>Location Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>'best'</td>
<td>0</td>
</tr>
<tr>
<td>'upper right'</td>
<td>1</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4</td>
</tr>
<tr>
<td>'right'</td>
<td>5</td>
</tr>
<tr>
<td>'center left'</td>
<td>6</td>
</tr>
<tr>
<td>'center right'</td>
<td>7</td>
</tr>
<tr>
<td>'lower center'</td>
<td>8</td>
</tr>
<tr>
<td>'upper center'</td>
<td>9</td>
</tr>
<tr>
<td>'center'</td>
<td>10</td>
</tr>
</tbody>
</table>

**bbox_to_anchor** [BboxBase, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with **loc**. Defaults to axes.bbox (if called as a method to `Axes.legend`) or figure.bbox (if `Figure.legend`). This argument allows arbitrary placement of the legend.
Bbox coordinates are interpreted in the coordinate system given by `bbox_transform`, with the default transform Axes or Figure coordinates, depending on which `legend` is called.

If a 4-tuple or `BboxBase` is given, then it specifies the bbox \((x, y, \text{width, height})\) that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0.5, 0.5, 0.5)
```

A 2-tuple \((x, y)\) places the corner of the legend specified by `loc` at \(x, y\). For example, to put the legend’s upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

**ncol** [integer] The number of columns that the legend has. Default is 1.

**prop** [None or `matplotlib.font_manager.FontProperties` or dict] The font properties of the legend. If None (default), the current `matplotlib.rcParams` will be used.

**fontsize** [int or float or \{‘xx-small’, ‘x-small’, ‘small’, ‘medium’, ‘large’, ‘x-large’, ‘xx-large’\}] Controls the font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if `prop` is not specified.

**numpoints** [None or int] The number of marker points in the legend when creating a legend entry for a `Line2D` (line). Default is None, which will take the value from `rcParams["legend.numpoints"]` (default: 1).

**scatterpoints** [None or int] The number of marker points in the legend when creating a legend entry for a `PathCollection` (scatter plot). Default is None, which will take the value from `rcParams["legend.scatterpoints"]` (default: 1).

**scatteryoffsets** [iterable of floats] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to \([0.5]\). Default is \([0.375, 0.5, 0.3125]\).

**markerscale** [None or int or float] The relative size of legend markers compared with the originally drawn ones. Default is None, which will take the value from `rcParams["legend.markerscale"]` (default: 1.0).

**markerfirst** [bool] If True, legend marker is placed to the left of the legend label. If False, legend marker is placed to the right of the legend label. Default is True.

**frameon** [None or bool] Control whether the legend should be drawn on a patch (frame). Default is None, which will take the value from `rcParams["legend.frameon"]` (default: True).

**fancybox** [None or bool] Control whether round edges should be enabled around the `FancyBboxPatch` which makes up the legend’s background. Default is None, which will take the value from `rcParams["legend.fancybox"]` (default: True).
shadow [None or bool] Control whether to draw a shadow behind the legend. Default is None, which will take the value from $\text{rcParams["legend.shadow"]}$ (default: False).

framealpha [None or float] Control the alpha transparency of the legend’s background. Default is None, which will take the value from $\text{rcParams["legend.framealpha"]}$ (default: 0.8). If shadow is activated and framealpha is None, the default value is ignored.

facecolor [None or “inherit” or a color spec] Control the legend’s background color. Default is None, which will take the value from $\text{rcParams["legend.facecolor"]}$ (default: ‘inherit’). If “inherit”, it will take $\text{rcParams["axes.facecolor"]}$ (default: ‘white’).

decor Color [None or “inherit” or a color spec] Control the legend’s background patch edge color. Default is None, which will take the value from $\text{rcParams["legend.decor"]}$ (default: ‘0.8’) If “inherit”, it will take $\text{rcParams["axes.decor"]}$ (default: ‘black’).

mode [{“expand”, None}] If mode is set to “expand” the legend will be horizontally expanded to fill the axes area (or bbox_to_anchor if defines the legend’s size).

bbox_transform [None or matplotlib.transforms.Transform] The transform for the bounding box (bbox_to_anchor). For a value of None (default) the Axes’ transAxes transform will be used.

title [str or None] The legend’s title. Default is no title (None).

title fontsize: str or None The fontsize of the legend’s title. Default is the default fontsize.

borderpad [float or None] The fractional whitespace inside the legend border. Measured in font-size units. Default is None, which will take the value from $\text{rcParams["legend.borderpad"]}$ (default: 0.4).

labelspsacing [float or None] The vertical space between the legend entries. Measured in font-size units. Default is None, which will take the value from $\text{rcParams["legend.labelspsacing"]}$ (default: 0.5).

handlelength [float or None] The length of the legend handles. Measured in font-size units. Default is None, which will take the value from $\text{rcParams["legend.handlelength"]}$ (default: 2.0).

handletextpad [float or None] The pad between the legend handle and text. Measured in font-size units. Default is None, which will take the value from $\text{rcParams["legend.handletextpad"]}$ (default: 0.8).

borderaxespad [float or None] The pad between the axes and legend border. Measured in font-size units. Default is None, which will take the value from $\text{rcParams["legend.borderaxespad"]}$ (default: 0.5).

columnspacing [float or None] The spacing between columns. Measured in font-size units. Default is None, which will take the value from $\text{rcParams["legend.columnspacing"]}$ (default: 2.0).

handler_map [dict or None] The custom dictionary mapping instances or types to a legend handler. This handler_map updates the default handler map found at $\text{matplotlib.legend.Legend.get_legend_handler_map()}$. 

17.37. matplotlib.pyplot 1833
Notes

Not all kinds of artist are supported by the legend command. See *Legend guide* for details.

Examples

```
Examples using matplotlib.pyplot.legend

- sphx_glr_gallery_user_interfaces_svg_histogram_sgskip.py
- sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py
```

```
matplotlib.pyplot.locator_params

matplotlib.pyplot.locator_params(axis='both', tight=None, **kwargs)

Control behavior of major tick locators.

Because the locator is involved in autoscaling, *autoscale_view* is called automatically after the parameters are changed.

Parameters
```
**axis** [{‘both’, ‘x’, ‘y’}, optional] The axis on which to operate.

**tight** [bool or None, optional] Parameter passed to autoscale_view. Default is None, for no change.

**Other Parameters**

**kwargs** Remaining keyword arguments are passed to directly to the set_params() method of the locator. Supported keywords depend on the type of the locator. See for example set_params for the ticker. MaxNLocator used by default for linear axes.

**Examples**

When plotting small subplots, one might want to reduce the maximum number of ticks and use tight bounds, for example:

```python
ax locator_params(tight=True, nbins=4)
```

**matplotlib.pyplot.loglog**

```python
matplotlib.pyplot.loglog(*args, **kwargs)
```

Make a plot with log scaling on both the x and y axis.

Call signatures:

- `loglog([x], y, [fmt], data=None, **kwargs)`
- `loglog([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)`

This is just a thin wrapper around `plot` which additionally changes both the x-axis and the y-axis to log scaling. All of the concepts and parameters of plot can be used here as well.

The additional parameters `basex/y, subsx/y and nonposx/y control the x/y-axis properties. They are just forwarded to `Axes.set_xscale and `Axes.set_yscale.**

**Parameters**

- `basex, basey` [scalar, optional, default 10] Base of the x/y logarithm.
- `subsx, subsy` [sequence, optional] The location of the minor x/y ticks. If `None`, reasonable locations are automatically chosen depending on the number of decades in the plot. See `Axes.set_xscale` / `Axes.set_yscale` for details.
- `nonposx, nonposy` [{‘mask’, ‘clip’}, optional, default ‘mask’] Non-positive values in x or y can be masked as invalid, or clipped to a very small positive number.

**Returns**

- `lines` A list of `Line2D` objects representing the plotted data.

**Other Parameters**

- `**kwargs` All parameters supported by `plot`. 17.37. `matplotlib.pyplot` 1835
tuple of color (preferably string)

set the colormap to "{}".

This changes the default colormap as well as the colormap of the current image if there is one. See help(colormaps) for more information.

matplotlib.pyplot.magnitude_spectrum

matplotlib.pyplot.magnitude_spectrum(x, Fs=None, Fc=None, window=None, pad_to=None, sides=None, scale=None, *, data=None, **kwargs)

Plot the magnitude spectrum.

Compute the magnitude spectrum of x. Data is padded to a length of pad_to and the windowing function window is applied to the signal.

Parameters

x [1-D array or sequence] Array or sequence containing the data.

Fs [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.

window [callable or ndarray] A function or a vector of length NFFT. To create window vectors see window_hanning, window_none, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. The default is window_hanning. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides [{‘default’, ‘onesided’, ‘twosided’}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.

pad_to [int] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the n parameter in the call to fft(). The default is None, which sets pad_to equal to the length of the input signal (i.e. no padding).

scale [{‘default’, ‘linear’, ‘dB’}] The scaling of the values in the spec. ‘linear’ is no scaling. ‘dB’ returns the values in dB scale, i.e., the dB amplitude (20 * log10). ‘default’ is ‘linear’.

Fc [int] The center frequency of x (defaults to 0), which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

Returns

spectrum [1-D array] The values for the magnitude spectrum before scaling (real valued).
**freqs** [1-D array] The frequencies corresponding to the elements in `spectrum`.

**line** [a `Line2D` instance] The line created by this function.

**Other Parameters**

**kwargs** Keyword arguments control the `Line2D` properties:

17.37. `matplotlib.pyplot`
psd() plots the power spectral density.

angle_spectrum() plots the angles of the corresponding frequencies.

phase_spectrum() plots the phase (unwrapped angle) of the corresponding frequencies.

specgram() can plot the magnitude spectrum of segments within the signal in a colormap.

Notes

Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

- All arguments with the following names: ‘x’.

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).

matplotlib.pyplot.margins

```python
matplotlib.pyplot.margins(*margins, x=None, y=None, tight=True)
```

Set or retrieve autoscaling margins.

The padding added to each limit of the axes is the margin times the data interval. All input parameters must be floats within the range [0, 1]. Passing both positional and keyword arguments is invalid and will raise a TypeError. If no arguments (positional or otherwise) are provided, the current margins will remain in place and simply be returned.

Specifying any margin changes only the autoscaling; for example, if xmargin is not None, then xmargin times the X data interval will be added to each end of that interval before it is used in autoscaling.

Parameters

- **margins** [float, optional] If a single positional argument is provided, it specifies both margins of the x-axis and y-axis limits. If two positional arguments are provided, they will be interpreted as xmargin, ymargin. If setting the margin on a single axis is desired, use the keyword arguments described below.

- **x, y** [float, optional] Specific margin values for the x-axis and y-axis, respectively. These cannot be used with positional arguments, but can be used individually to alter on e.g., only the y-axis.

- **tight** [bool or None, default is True] The tight parameter is passed to autoscale_view(), which is executed after a margin is changed; the default here is True, on the assumption that when margins are specified, no additional padding to match tick marks is usually desired. Set tight to None will preserve the previous setting.

Returns

- **xmargin, ymargin** [float]
Notes

If a previously used Axes method such as `pcolor()` has set `use_sticky_edges` to `True`, only the limits not set by the “sticky artists” will be modified. To force all of the margins to be set, set `use_sticky_edges` to `False` before calling `margins()`.

Examples using `matplotlib.pyplot.margins`

- `sphx_glr_gallery_subplots_axes_and_figures_axes_margins.py`
- `sphx_glr_gallery_ticks_and_spines_ticklabels_rotation.py`

`matplotlib.pyplot.matshow`

`matplotlib.pyplot.matshow(A, fignum=None, **kwargs)`

Display an array as a matrix in a new figure window.

The origin is set at the upper left hand corner and rows (first dimension of the array) are displayed horizontally. The aspect ratio of the figure window is that of the array, unless this would make an excessively short or narrow figure.

Tick labels for the xaxis are placed on top.

**Parameters**

- `A` [array-like(M, N)] The matrix to be displayed.
- `fignum` [None or int or False] If `None`, create a new figure window with automatic numbering.
  - If a nonzero integer, draw into the figure with the given number (create it if it does not exist).
  - If 0, use the current axes (or create one if it does not exist).

**Note:** Because of how `Axes.matshow` tries to set the figure aspect ratio to be the one of the array, strange things may happen if you reuse an existing figure.

**Returns**

- `image` `[AxesImage]`

**Other Parameters**

- `**kwargs` [`imshow` arguments]

Examples using `matplotlib.pyplot.matshow`

- `sphx_glr_gallery_images_contours_and_fields_matshow.py`
matplotlib.pyplot.minorticks_off

matplotlib.pyplot.minorticks_off()
    Remove minor ticks from the axes.

matplotlib.pyplot.minorticks_on

matplotlib.pyplot.minorticks_on()
    Display minor ticks on the axes.
    Displaying minor ticks may reduce performance; you may turn them off using
    minorticks_off() if drawing speed is a problem.

matplotlib.pyplot.nipy_spectral

matplotlib.pyplot.nipy_spectral()
    Set the colormap to "nipy_spectral".
    This changes the default colormap as well as the colormap of the current image if there
    is one. See help(colormaps) for more information.

matplotlib.pyplot.pause

matplotlib.pyplot.pause(interval)
    Pause for interval seconds.
    If there is an active figure, it will be updated and displayed before the pause, and the
    GUI event loop (if any) will run during the pause.
    This can be used for crude animation. For more complex animation, see matplotlib.
    animation.

Notes

This function is experimental; its behavior may be changed or extended in a future re-
lease.

Examples using matplotlib.pyplot.pause

• sphx_glr_gallery_mplot3d_rotate_axes3d_sgskip.py
• sphx_glr_gallery_mplot3d_wire3d_animation_sgskip.py

matplotlib.pyplot.pcolor

matplotlib.pyplot.pcolor(*args, alpha=None, norm=None, cmap=None, vmin=None,
    vmax=None, data=None, **kwargs)
    Create a pseudocolor plot with a non-regular rectangular grid.
    Call signature:
pcolor([X, Y], C, **kwargs)

X and Y can be used to specify the corners of the quadrilaterals.

**Hint:** pcolor() can be very slow for large arrays. In most cases you should use the similar but much faster pcolormesh instead. See there for a discussion of the differences.

**Parameters**

- **C** [array_like] A scalar 2-D array. The values will be color-mapped.
- **X, Y** [array_like, optional] The coordinates of the quadrilateral corners. The quadrilateral for C[i,j] has corners at:

```
(X[i+1, j], Y[i+1, j])  (X[i+1, j+1], Y[i+1, j+1])
+-------+  +-------+
| C[i,j] |  | C[i,j] |
+-------+  +-------+
(X[i, j], Y[i, j])  (X[i, j+1], Y[i, j+1])
```

Note that the column index corresponds to the x-coordinate, and the row index corresponds to y. For details, see the Notes section below.

The dimensions of X and Y should be one greater than those of C. Alternatively, X, Y and C may have equal dimensions, in which case the last row and column of C will be ignored.

If X and/or Y are 1-D arrays or column vectors they will be expanded as needed into the appropriate 2-D arrays, making a rectangular grid.

- **cmap** [str or Colormap, optional] A Colormap instance or registered colormap name. The colormap maps the C values to colors. Defaults to rcParams["image.cmap"] (default: 'viridis').
- **norm** [Normalize, optional] The Normalize instance scales the data values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.
- **vmin, vmax** [scalar, optional, default: None] The colorbar range. If None, suitable min/max values are automatically chosen by the Normalize instance (defaults to the respective min/max values of C in case of the default linear scaling).
- **edgecolors** [{‘none’, None, ‘face’, color, color sequence}, optional] The color of the edges. Defaults to ‘none’. Possible values:
  - ‘none’ or None: No edge.
  - None: rcParams["patch.edgecolor"] (default: ‘black’) will be used. Note that currently rcParams["patch.force_edgecolor"] (default: False) has to be True for this to work.
  - ‘face’: Use the adjacent face color.
  - An mpl color or sequence of colors will set the edge color.

The singular form edgecolor works as an alias.
alpha [scalar, optional, default: None] The alpha blending value of the face color, between 0 (transparent) and 1 (opaque). Note: The edge-color is currently not affected by this.

snap [bool, optional, default: False] Whether to snap the mesh to pixel boundaries.

Returns

collection [matplotlib.collections.Collection]

Other Parameters

antialiaseds [bool, optional, default: False] The default antialiaseds is False if the default edgecolors="none" is used. This eliminates artificial lines at patch boundaries, and works regardless of the value of alpha. If edgecolors is not "none", then the default antialiaseds is taken from rcParams["patch.antialiased"] (default: True), which defaults to True. Stroking the edges may be preferred if alpha is 1, but will cause artifacts otherwise.

**kwargs Additionally, the following arguments are allowed. They are passed along to the PolyCollection constructor:

<table>

pcolormesh for an explanation of the differences between pcolor and pcolormesh.
imshow If X and Y are each equidistant, imshow can be a faster alternative.

Notes

Masked arrays

X, Y and C may be masked arrays. If either C[i, j], or one of the vertices surrounding C[i,j] (X or Y at [i, j], [i+1, j], [i, j+1], [i+1, j+1]) is masked, nothing is plotted.

Grid orientation

The grid orientation follows the standard matrix convention: An array C with shape (nrows, ncolumns) is plotted with the column number as X and the row number as Y.

Handling of pcolor() end-cases

pcolor() displays all columns of C if X and Y are not specified, or if X and Y have one more column than C. If X and Y have the same number of columns as C then the last column of C is dropped. Similarly for the rows.

Note: This behavior is different from MATLAB’s pcolor(), which always discards the last row and column of C.

Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

• All positional and all keyword arguments.

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).

Examples using matplotlib.pyplot.pcolor

• sphx_glr_gallery_images_contours_and_fields_pcolor_demo.py
• sphx_glr_gallery_subplots_axes_and_figures_axes_margins.py
Create a pseudocolor plot with a non-regular rectangular grid.

**Call signature:**

```python
color([X, Y,] C, **kwargs)
```

`X` and `Y` can be used to specify the corners of the quadrilaterals.

**Note:** `pcolormesh()` is similar to `pcolor()`. It’s much faster and preferred in most cases. For a detailed discussion on the differences see *Differences between pcolor() and pcolormesh()*.

**Parameters**

- **C** [array_like] A scalar 2-D array. The values will be color-mapped.
- **X, Y** [array_like, optional] The coordinates of the quadrilateral corners. The quadrilateral for `C[i,j]` has corners at:

  \[
  (X[i+1, j], Y[i+1, j]) \quad (X[i+1, j+1], Y[i+1, j+1]) \\
  (X[i+1, j+1], Y[i+1, j+1]) \quad (X[i, j], Y[i, j])
  \]

  Note that the column index corresponds to the x-coordinate, and the row index corresponds to y. For details, see the *Notes* section below.

  The dimensions of `X` and `Y` should be one greater than those of `C`. Alternatively, `X`, `Y` and `C` may have equal dimensions, in which case the last row and column of `C` will be ignored.

  If `X` and/or `Y` are 1-D arrays or column vectors they will be expanded as needed into the appropriate 2-D arrays, making a rectangular grid.

- **cmap** [str or Colormap, optional] A Colormap instance or registered colormap name. The colormap maps the `C` values to colors. Defaults to `rcParams["image.cmap"]` (default: ‘viridis’).

- **norm** [Normalize, optional] The Normalize instance scales the data values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

- **vmin, vmax** [scalar, optional, default: None] The colorbar range. If `None`, suitable min/max values are automatically chosen by the `Normalize` instance (defaults to the respective min/max values of `C` in case of the default linear scaling).

- **edgecolors** [{‘none’, None, ‘face’, color, color sequence}, optional] The color of the edges. Defaults to ‘none’. Possible values:
  - ‘none’ or “: No edge.
• **None**: `rcParams["patch.edgecolor"]` (default: 'black') will be used. Note that currently `rcParams["patch.force_edgecolor"]` (default: False) has to be True for this to work.

• ‘face’: Use the adjacent face color.

• An mpl color or sequence of colors will set the edge color.

The singular form `edgecolor` works as an alias.

**alpha** [scalar, optional, default: None] The alpha blending value, between 0 (transparent) and 1 (opaque).

**shading** [{'flat', 'gouraud'}, optional] The fill style, Possible values:

• ‘flat’: A solid color is used for each quad. The color of the quad (i, j), (i+1, j), (i, j+1), (i+1, j+1) is given by `C[i, j]`.

• ‘gouraud’: Each quad will be Gouraud shaded: The color of the corners (i’, j’) are given by `C[i’, j’]`. The color values of the area in between is interpolated from the corner values. When Gouraud shading is used, `edgecolors` is ignored.

**snap** [bool, optional, default: False] Whether to snap the mesh to pixel boundaries.

**Returns**

mesh [matplotlib.collections.QuadMesh]

**Other Parameters**

**kwargs** Additionally, the following arguments are allowed. They are passed along to the `QuadMesh` constructor:

<table>
<thead>

</tbody>
</table>

**See also:**

- `pcolor` An alternative implementation with slightly different features. For a detailed discussion on the differences see [Differences between pcolor() and pcolormesh()](#).
- `imshow` If X and Y are each equidistant, `imshow` can be a faster alternative.

**Notes**

**Masked arrays**

C may be a masked array. If C[i, j] is masked, the corresponding quadrilateral will be transparent. Masking of X and Y is not supported. Use `pcolor` if you need this functionality.

**Grid orientation**

The grid orientation follows the standard matrix convention: An array C with shape (nrows, ncolumns) is plotted with the column number as X and the row number as Y.

**Differences between pcolor() and pcolormesh()**

Both methods are used to create a pseudocolor plot of a 2-D array using quadrilaterals.

The main difference lies in the created object and internal data handling: While `pcolor` returns a `PolyCollection`, `pcolormesh` returns a `QuadMesh`. The latter is more specialized for the given purpose and thus is faster. It should almost always be preferred.

There is also a slight difference in the handling of masked arrays. Both `pcolor` and `pcolormesh` support masked arrays for C. However, only `pcolor` supports masked arrays for X and Y. The reason lies in the internal handling of the masked values. `pcolor` leaves out the respective polygons from the PolyCollection. `pcolormesh` sets the facecolor of the masked elements to transparent. You can see the difference when using edgecolors. While all edges are drawn irrespective of masking in a QuadMesh, the edge between two adjacent masked quadrilaterals in `pcolor` is not drawn as the corresponding polygons do not exist in the PolyCollection.

Another difference is the support of Gouraud shading in `pcolormesh`, which is not available with `pcolor`. 
**Note:** In addition to the above described arguments, this function can take a `data` key-
word argument. If such a `data` argument is given, the following arguments are replaced by `data[<arg>]`:

- All positional and all keyword arguments.

Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg> in data`).

Examples using `matplotlib.pyplot.pcolormesh`

- sphx_glr_gallery_images_contours_and_fields_pcolor_demo.py
- sphx_glr_gallery_images_contours_and_fields_pcolormesh_levels.py
- sphx_glr_gallery_images_contours_and_fields_quadmesh_demo.py

`matplotlib.pyplot.phase_spectrum`

`matplotlib.pyplot.phase_spectrum(x, Fs=None, Fc=None, window=None, pad_to=None, sides=None, *, data=None, **kwargs)`

Plot the phase spectrum.

Compute the phase spectrum (unwrapped angle spectrum) of `x`. Data is padded to a length of `pad_to` and the windowing function `window` is applied to the signal.

**Parameters**

- `x` [1-D array or sequence] Array or sequence containing the data
- `Fs` [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.
- `window` [callable or ndarray] A function or a vector of length `NFFT`. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. The default is `window_hanning`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.
- `sides` [{‘default’, ‘onesided’, ‘twosided’}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.
- `pad_to` [int] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the `n` parameter in the call to `fft()`. The default is `None`, which sets `pad_to` equal to the length of the input signal (i.e. no padding).
- `Fc` [int] The center frequency of `x` (defaults to 0), which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.
**Returns**

-spectrum [1-D array] The values for the phase spectrum in radians (real valued).

-freqs [1-D array] The frequencies corresponding to the elements in spectrum.

-line [a Line2D instance] The line created by this function.

**Other Parameters**

**kwargs Keyword arguments control the Line2D properties:

Notes

**Note:** In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by `data[<arg>]:`

- All arguments with the following names: ‘x’.

Objects passed as data must support item access (`data[<arg>]`) and membership test (`<arg> in data`).

**matplotlib.pyplot.pie**

`matplotlib.pyplot.pie(x, explode=None, labels=None, colors=None, autopct=None, pctdistance=0.6, shadow=False, labeldistance=1.1, startangle=None, radius=None, counterclock=True, wedgeprops=None, textprops=None, center=(0, 0), frame=False, rotatelabels=False, *, data=None)`

Plot a pie chart.

Make a pie chart of array x. The fractional area of each wedge is given by x/sum(x). If sum(x) < 1, then the values of x give the fractional area directly and the array will not be normalized. The resulting pie will have an empty wedge of size 1 - sum(x).

The wedges are plotted counterclockwise, by default starting from the x-axis.

**Parameters**

- **x** [array-like] The wedge sizes.
- **explode** [array-like, optional, default: None] If not None, is a len(x) array which specifies the fraction of the radius with which to offset each wedge.
- **labels** [list, optional, default: None] A sequence of strings providing the labels for each wedge.
- **colors** [array-like, optional, default: None] A sequence of matplotlib color args through which the pie chart will cycle. If None, will use the colors in the currently active cycle.
autopct [None (default), string, or function, optional] If not None, is a string or function used to label the wedges with their numeric value. The label will be placed inside the wedge. If it is a format string, the label will be fmt % pct. If it is a function, it will be called.

pctdistance [float, optional, default: 0.6] The ratio between the center of each pie slice and the start of the text generated by autopct. Ignored if autopct is None.

shadow [bool, optional, default: False] Draw a shadow beneath the pie.

labeldistance [float or None, optional, default: 1.1] The radial distance at which the pie labels are drawn. If set to None, labels are not drawn, but are stored for use in legend().

startangle [float, optional, default: None] If not None, rotates the start of the pie chart by angle degrees counterclockwise from the x-axis.

radius [float, optional, default: None] The radius of the pie, if radius is None it will be set to 1.

counterclock [bool, optional, default: True] Specify fractions direction, clockwise or counterclockwise.

wedgeprops [dict, optional, default: None] Dict of arguments passed to the wedge objects making the pie. For example, you can pass in wedgeprops = {'linewidth': 3} to set the width of the wedge border lines equal to 3. For more details, look at the doc/arguments of the wedge object. By default clip_on=False.

textprops [dict, optional, default: None] Dict of arguments to pass to the text objects.

center [list of float, optional, default: (0, 0)] Center position of the chart. Takes value (0, 0) or is a sequence of 2 scalars.

frame [bool, optional, default: False] Plot axes frame with the chart if true.

rotatelabels [bool, optional, default: False] Rotate each label to the angle of the corresponding slice if true.

Returns

patches [list] A sequence of matplotlib.patches.Wedge instances

texts [list] A list of the label matplotlib.text.Text instances.

autotexts [list] A list of Text instances for the numeric labels. This will only be returned if the parameter autopct is not None.

Notes

The pie chart will probably look best if the figure and axes are square, or the Axes aspect is equal. This method sets the aspect ratio of the axis to “equal”. The axes aspect ratio can be controlled with Axes.set_aspect.

Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

• All arguments with the following names: 'colors', 'explode', 'labels', 'x'.

Objects passed as **data** must support item access (data[<arg>]) and membership test (<arg> in data).

**Examples using matplotlib.pyplot.pie**

- sphx_glr_gallery_pie_and_polarCharts_pie_features.py
- sphx_glr_gallery_pie_and_polarCharts_pie_demo2.py
- sphx_glr_gallery_pie_and_polarCharts_nested_pie.py
- sphx_glr_gallery_pie_and_polarCharts_pie_and_donut_labels.py

**matplotlib.pyplot.pink**

```
matplotlib.pyplot.pink()
```

Set the colormap to "pink".

This changes the default colormap as well as the colormap of the current image if there is one. See help(colormaps) for more information.

**matplotlib.pyplot.plasma**

```
matplotlib.pyplot.plasma()
```

Set the colormap to "plasma".

This changes the default colormap as well as the colormap of the current image if there is one. See help(colormaps) for more information.

**matplotlib.pyplot.plot**

```
matplotlib.pyplot.plot(*args, scalex=True, scaley=True, data=None, **kwargs)
```

Plot y versus x as lines and/or markers.

Call signatures:

```
plot([x], y, [fmt], *, data=None, **kwargs)
plot([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

The coordinates of the points or line nodes are given by x, y.

The optional parameter **fmt** is a convenient way for defining basic formatting like color, marker and linestyle. It's a shortcut string notation described in the Notes section below.

```
>>> plot(x, y)  # plot x and y using default line style and color
>>> plot(x, y, 'bo')  # plot x and y using blue circle markers
>>> plot(y)     # plot y using x as index array 0..N-1
>>> plot(y, 'r+')  # ditto, but with red plusses
```

You can use Line2D properties as keyword arguments for more control on the appearance. Line properties and **fmt** can be mixed. The following two calls yield identical results:
>>> plot(x, y, 'go--', linewidth=2, markersize=12)
>>> plot(x, y, color='green', marker='o', linestyle='dashed',
... linewidth=2, markersize=12)

When conflicting with fmt, keyword arguments take precedence.

**Plotting labelled data**

There’s a convenient way for plotting objects with labelled data (i.e. data that can be accessed by index obj['y']). Instead of giving the data in x and y, you can provide the object in the data parameter and just give the labels for x and y:

```python
>>> plot('xlabel', 'ylabel', data=obj)
```

All indexable objects are supported. This could e.g. be a dict, a pandas.DataFrame or a structured numpy array.

**Plotting multiple sets of data**

There are various ways to plot multiple sets of data.

- The most straight forward way is just to call `plot` multiple times. Example:

  ```python
  >>> plot(x1, y1, 'bo')
  >>> plot(x2, y2, 'go')
  ```

- Alternatively, if your data is already a 2d array, you can pass it directly to x, y. A separate data set will be drawn for every column.

  Example: an array `a` where the first column represents the x values and the other columns are the y columns:

  ```python
  >>> plot(a[0], a[:,1])
  ```

- The third way is to specify multiple sets of [x, y, fmt] groups:

  ```python
  >>> plot(x1, y1, 'g^', x2, y2, 'g-')
  ```

  In this case, any additional keyword argument applies to all datasets. Also this syntax cannot be combined with the data parameter.

By default, each line is assigned a different style specified by a ‘style cycle’. The fmt and line property parameters are only necessary if you want explicit deviations from these defaults. Alternatively, you can also change the style cycle using the ‘axes.prop_cycle’ rcParam.

**Parameters**

- **x, y** [array-like or scalar] The horizontal / vertical coordinates of the data points. x values are optional and default to `range(len(y))`.
  
  Commonly, these parameters are 1D arrays.

  They can also be scalars, or two-dimensional (in that case, the columns represent separate data sets).

  These arguments cannot be passed as keywords.

- **fmt** [str, optional] A format string, e.g. ‘ro’ for red circles. See the Notes section for a full description of the format strings.
Format strings are just an abbreviation for quickly setting basic line properties. All of these and more can also be controlled by keyword arguments.

This argument cannot be passed as keyword.

**data** [indexable object, optional] An object with labelled data. If given, provide the label names to plot in x and y.

**Note:** Technically there’s a slight ambiguity in calls where the second label is a valid fmt. `plot('n', 'o', data=obj)` could be `plot(x, y)` or `plot(y, fmt)`. In such cases, the former interpretation is chosen, but a warning is issued. You may suppress the warning by adding an empty format string `plot('n', 'o', '', data=obj)`.

**Returns**

- **lines** A list of `Line2D` objects representing the plotted data.

**Other Parameters**

- **scalex, scaley** [bool, optional, default: True] These parameters determined if the view limits are adapted to the data limits. The values are passed on to `autoscale_view`.

- ****kwargs** [Line2D properties, optional]** `kwargs` are used to specify properties like a line label (for auto legends), linewidth, antialiasing, marker face color. Example:

```
>>> plot([1, 2, 3], [1, 2, 3], 'go-', label='line 1', linewidth=2)
>>> plot([1, 2, 3], [1, 4, 9], 'rs', label='line 2')
```

If you make multiple lines with one plot command, the kwargs apply to all those lines.

Here is a list of available `Line2D` properties:

<table>

**See also:**

*scatter* XY scatter plot with markers of varying size and/or color (sometimes also called bubble chart).

**Notes**

**Format Strings**

A format string consists of a part for color, marker and line:

```python
fmt = '[marker][line][color]'  
```

Each of them is optional. If not provided, the value from the style cycle is used. Exception: If line is given, but no marker, the data will be a line without markers.

Other combinations such as [color][marker][line] are also supported, but note that their parsing may be ambiguous.

**Markers**
### Marker Characters

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>'.'</code></td>
<td>point marker</td>
</tr>
<tr>
<td><code>', '</code></td>
<td>pixel marker</td>

</tr>
<tr>
<td><code>'H'</code></td>
<td>hexagon2 marker</td>
</tr>
<tr>
<td><code>'+ '</code></td>
<td>plus marker</td>
</tr>
<tr>
<td><code>'x'</code></td>
<td>x marker</td>
</tr>
<tr>
<td><code>'D'</code></td>
<td>diamond marker</td>
</tr>
<tr>
<td><code>'d'</code></td>
<td>thin_diamond marker</td>
</tr>
<tr>
<td>`'</td>
<td>'`</td>
</tr>
<tr>
<td><code>'_ '</code></td>
<td>hline marker</td>
</tr>
</tbody>
</table>

### Line Styles

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>'-'</code></td>
<td>solid line style</td>
</tr>
<tr>
<td><code>'-='</code></td>
<td>dashed line style</td>
</tr>
<tr>
<td><code>'-.-'</code></td>
<td>dash-dot line style</td>
</tr>
<tr>
<td><code>'.'</code></td>
<td>dotted line style</td>
</tr>
</tbody>
</table>

#### Example format strings:

```
'b'  # blue markers with default shape
'or' # red circles
'g'  # green solid line
'g-' # dashed line with default color
'k:' # black triangle_up markers connected by a dotted line
```

### Colors

The supported color abbreviations are the single letter codes:
and the 'Cn' colors that index into the default property cycle.

If the color is the only part of the format string, you can additionally use any `matplotlib.colors` spec, e.g. full names ('green') or hex strings ('#008000').

**Examples using `matplotlib.pyplot.plot`**

- `Frame grabbing`
- `sphx_glr_gallery_misc_print_stdout_sgskip.py`
- `sphx_glr_gallery_user_interfaces_toolmanager_sgskip.py`
- `sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py`

**`matplotlib.pyplot.plot_date`**

```python
matplotlib.pyplot.plot_date(x, y, fmt='o', tz=None, xdate=True, ydate=False, *, data=None, **kwargs)
```

Plot data that contains dates.

Similar to `plot`, this plots `y` vs. `x` as lines or markers. However, the axis labels are formatted as dates depending on `xdate` and `ydate`.

**Parameters**

- `x, y` [array-like] The coordinates of the data points. If `xdate` or `ydate` is `True`, the respective values `x` or `y` are interpreted as Matplotlib dates.
- `fmt` [str, optional] The plot format string. For details, see the corresponding parameter in `plot`.
- `tz` [None | timezone string | tzinfo instance] The time zone to use in labeling dates. If `None`, defaults to rcParam `timezone`.
- `xdate` [bool, optional, default: True] If `True`, the x-axis will be interpreted as Matplotlib dates.
- `ydate` [bool, optional, default: False] If `True`, the y-axis will be interpreted as Matplotlib dates.

**Returns**

- `lines` A list of `Line2D` objects representing the plotted data.

**Other Parameters**
**kwargs** Keyword arguments control the Line2D properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>

</tbody>
</table>

**See also:**

- [matplotlib.dates](https://matplotlib.org/3.1.3/api/dates_api.html) Helper functions on dates.
- [matplotlib.dates.date2num](https://matplotlib.org/3.1.3/api/dates_api.html) Convert dates to num.
- [matplotlib.dates.num2date](https://matplotlib.org/3.1.3/api/dates_api.html) Convert num to dates.
**matplotlib.dates.drange** Create an equally spaced sequence of dates.

**Notes**

If you are using custom date tickers and formatters, it may be necessary to set the formatters/locators after the call to `plot_date`. `plot_date` will set the default tick locator to `AutoDateLocator` (if the tick locator is not already set to a `DateLocator` instance) and the default tick formatter to `AutoDateFormatter` (if the tick formatter is not already set to a `DateFormatter` instance).

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments are replaced by `data[<arg>]`:

- All arguments with the following names: 'x', 'y'.

Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg> in data`).

**Examples using matplotlib.pyplot.plot_date**

- `sphx_glr_gallery_ticks_and_spines_date_demo_rrule.py`

```python
cmplib.pyplot.plotfile

```python
matplotlib.pyplot.plotfile(fname, cols=(0, ), plotfuncs=None, comments='#', skiprows=0, checkrows=5, delimiter=', ', names=None, subplots=True, newfig=True, **kwargs)

Plot the data in a file.

`cols` is a sequence of column identifiers to plot. An identifier is either an int or a string. If it is an int, it indicates the column number. If it is a string, it indicates the column header. `matplotlib` will make column headers lower case, replace spaces with underscores, and remove all illegal characters; so 'Adj Close*' will have name 'adj_close'.

- If `len(cols) == 1`, only that column will be plotted on the y axis.
- If `len(cols) > 1`, the first element will be an identifier for data for the x axis and the remaining elements will be the column indexes for multiple subplots if `subplots` is `True` (the default), or for lines in a single subplot if `subplots` is `False`.

`plotfuncs`, if not `None`, is a dictionary mapping identifier to an `Axes` plotting function as a string. Default is 'plot', other choices are 'semilogy', 'fill', 'bar', etc. You must use the same type of identifier in the `cols` vector as you use in the `plotfuncs` dictionary, e.g., integer column numbers in both or column names in both. If `subplots` is `False`, then including any function such as 'semilogy' that changes the axis scaling will set the scaling for all columns.

- `comments`: the character used to indicate the start of a comment in the file, or `None` to switch off the removal of comments
- `skiprows`: is the number of rows from the top to skip
• **checkrows**: is the number of rows to check to validate the column data type. When set to zero all rows are validated.

• **delimiter**: is the character(s) separating row items

• **names**: if not None, is a list of header names. In this case, no header will be read from the file

If `newfig` is `True`, the plot always will be made in a new figure; if `False`, it will be made in the current figure if one exists, else in a new figure.

kwargs are passed on to plotting functions.

Example usage:

```python
# plot the 2nd and 4th column against the 1st in two subplots
plotfile(fname, (0,1,3))

# plot using column names; specify an alternate plot type for volume
plotfile(fname, ('date', 'volume', 'adj_close'),
        plotfuncs={'volume': 'semilogy'})
```

Note: plotfile is intended as a convenience for quickly plotting data from flat files; it is not intended as an alternative interface to general plotting with pyplot or matplotlib.

**Examples using matplotlib.pyplot.plotfile**

• sphx_glr_gallery_misc_plotfile_demo.py

**matplotlib.pyplot.polar**

```python
matplotlib.pyplot.polar(*args, **kwargs)
```

Make a polar plot.

call signature:

```python
polar(theta, r, **kwargs)
```

Multiple `theta`, `r` arguments are supported, with format strings, as in `plot()`.

**Examples using matplotlib.pyplot.polar**

• sphx_glr_gallery_misc_transoffset.py

**matplotlib.pyplot.prism**

```python
matplotlib.pyplot.prism()
```

Set the colormap to “prism”.

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.
matplotlib.pyplot.psd

matplotlib.pyplot.psd(x, NFFT=None, Fs=None, Fc=None, detrend=None, window=None, noverlap=None, pad_to=None, sides=None, scale_by_freq=None, return_line=None, *, data=None, **kwargs)

Plot the power spectral density.

The power spectral density $P_{xx}$ by Welch’s average periodogram method. The vector $x$ is divided into NFFT length segments. Each segment is detrended by function detrend and windowed by function window. noverlap gives the length of the overlap between segments. The $|\text{fft}(i)|^2$ of each segment $i$ are averaged to compute $P_{xx}$, with a scaling to correct for power loss due to windowing.

If len(x) < NFFT, it will be zero padded to NFFT.

Parameters

- **x** [1-D array or sequence] Array or sequence containing the data
- **Fs** [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.
- **window** [callable or ndarray] A function or a vector of length NFFT. To create window vectors see window_hanning, window_none, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. The default is window_hanning. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.
- **sides** [{‘default’, ‘onesided’, ‘twosided’}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.
- **pad_to** [int] The number of points to which the data segment is padded when performing the FFT. This can be different from NFFT, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the $n$ parameter in the call to fft(). The default is None, which sets pad_to equal to NFFT.
- **NFFT** [int] The number of data points used in each block for the FFT. A power 2 is most efficient. The default value is 256. This should NOT be used to get zero padding, or the scaling of the result will be incorrect. Use pad_to for this instead.
- **detrend** [{‘none’, ‘mean’, ‘linear’} or callable, default ‘none’] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the detrend parameter is a vector, in Matplotlib is it a function. The mlab module defines detrend_none, detrend_mean, and detrend_linear, but you can use a custom function as well. You can also use a string to choose one of the functions: ‘none’ calls detrend_none. ‘mean’ calls detrend_mean. ‘linear’ calls detrend_linear.
scale_by_freq [bool, optional] Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

nooverlap [int] The number of points of overlap between segments. The default value is 0 (no overlap).

Fc [int] The center frequency of x (defaults to 0), which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

return_line [bool] Whether to include the line object plotted in the returned values. Default is False.

Returns

Pxx [1-D array] The values for the power spectrum $P_{xx}$ before scaling (real valued).

freqs [1-D array] The frequencies corresponding to the elements in Pxx.

line [a Line2D instance] The line created by this function. Only returned if return_line is True.

Other Parameters

**kwargs Keyword arguments control the Line2D properties:

See also:

specgram() specgram() differs in the default overlap; in not returning the mean of the segment periodograms; in returning the times of the segments; and in plotting a colormap instead of a line.

magnitude_spectrum() magnitude_spectrum() plots the magnitude spectrum.

csd() csd() plots the spectral density between two signals.

Notes

For plotting, the power is plotted as $10 \log_{10}(P_{xx})$ for decibels, though $P_{xx}$ itself is returned.

References

Note:  In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: ‘x’.

Objects passed as **data** must support item access (**data[<arg>]**) and membership test (**<arg> in data**).

Examples using matplotlib.pyplot.psd

- sphx_glr_gallery_lines_bars_and_markers_psd_demo.py
matplotlib.pyplot.quiver

matplotlib.pyplot.quiver(*args, data=None, **kw)

Plot a 2D field of arrows.

Call signature:

    quiver([X, Y], U, V, [C], **kw)

Where X, Y define the arrow locations, U, V define the arrow directions, and C optionally sets the color.

**Arrow size**

The default settings auto-scales the length of the arrows to a reasonable size. To change this behavior see the `scale` and `scale_units` parameters.

**Arrow shape**

The defaults give a slightly swept-back arrow; to make the head a triangle, make `headaxislength` the same as `headlength`. To make the arrow more pointed, reduce `headwidth` or increase `headlength` and `headaxislength`. To make the head smaller relative to the shaft, scale down all the head parameters. You will probably do best to leave `minshaft` alone.

**Arrow outline**

`linewidtshs` and `edgecolors` can be used to customize the arrow outlines.

**Parameters**

- **X, Y** [1D or 2D array-like, optional] The x and y coordinates of the arrow locations.
  
  If not given, they will be generated as a uniform integer meshgrid based on the dimensions of U and V.
  
  If X and Y are 1D but U, V are 2D, X, Y are expanded to 2D using X, Y = np.meshgrid(X, Y). In this case len(X) and len(Y) must match the column and row dimensions of U and V.

- **U, V** [1D or 2D array-like] The x and y direction components of the arrow vectors.

- **C** [1D or 2D array-like, optional] Numeric data that defines the arrow colors by colormapping via `norm` and `cmap`.
  
  This does not support explicit colors. If you want to set colors directly, use `color` instead.

- **units** [{‘width’, ‘height’, ‘dots’, ‘inches’, ‘x’, ‘y’ ‘xy’}, default: ‘width’] The arrow dimensions (except for `length`) are measured in multiples of this unit.
  
  The following values are supported:
  
  - ‘width’, ‘height’: The width or height of the axis.
  - ‘dots’, ‘inches’: Pixels or inches based on the figure dpi.
  - ‘x’, ‘y’, ‘xy’: X, Y or \(\sqrt{x^2 + y^2}\) in data units.

  The arrows scale differently depending on the units. For ‘x’ or ‘y’, the arrows get larger as one zooms in; for other units, the arrow size is independent of the zoom state. For ‘width’ or ‘height’, the arrow size
increases with the width and height of the axes, respectively, when the
window is resized; for ‘dots’ or ‘inches’, resizing does not change the
arrows.

angles [{‘uv’, ‘xy’} or array-like, optional, default: ‘uv’] Method for de-
termining the angle of the arrows.

- ‘uv’: The arrow axis aspect ratio is 1 so that if $U == V$ the orienta-
tion of the arrow on the plot is 45 degrees counter-clockwise from
the horizontal axis (positive to the right).

  Use this if the arrows symbolize a quantity that is not based on X,
  Y data coordinates.

- ‘xy’: Arrows point from (x,y) to (x+u, y+v). Use this for plotting a
  gradient field, for example.

  Alternatively, arbitrary angles may be specified explicitly as an ar-
  ray of values in degrees, counter-clockwise from the horizontal
  axis.

  In this case $U$, $V$ is only used to determine the length of the arrows.

  Note: inverting a data axis will correspondingly invert the arrows only
  with angles=’xy’.

scale [float, optional] Number of data units per arrow length unit, e.g.,
m/s per plot width; a smaller scale parameter makes the arrow longer.
Default is None.

  If None, a simple autoscaling algorithm is used, based on the average
  vector length and the number of vectors. The arrow length unit is
  given by the scale_units parameter.

the scale kwarg is None, the arrow length unit. Default is None.

e.g. scale_units is ‘inches’, scale is 2.0, and $(u,v) = (1,0)$, then the
vector will be 0.5 inches long.

  If scale_units is ‘width’ or ‘height’, then the vector will be half the
  width/height of the axes.

  If scale_units is ‘x’ then the vector will be 0.5 x-axis units. To plot
  vectors in the x-y plane, with u and v having the same units as x and y,
  use angles=’xy’, scale_units=’xy’, scale=1.

width [float, optional] Shaft width in arrow units; default depends on
choice of units, above, and number of vectors; a typical starting value
is about 0.005 times the width of the plot.

headwidth [float, optional, default: 3] Head width as multiple of shaft
width.

headlength [float, optional, default: 5] Head length as multiple of shaft
width.

headaxislength [float, optional, default: 4.5] Head length at shaft inter-
section.

minshaft [float, optional, default: 1] Length below which arrow scales,
in units of head length. Do not set this to less than 1, or small arrows
will look terrible!
minlength [float, optional, default: 1] Minimum length as a multiple of shaft width; if an arrow length is less than this, plot a dot (hexagon) of this diameter instead.

pivot [{‘tail’, ‘mid’, ‘middle’, ‘tip’}, optional, default: ‘tail’] The part of the arrow that is anchored to the X, Y grid. The arrow rotates about this point.

‘mid’ is a synonym for ‘middle’.

color [color or color sequence, optional] Explicit color(s) for the arrows.

If C has been set, color has no effect.

This is a synonym for the PolyCollection facecolor parameter.

**Other Parameters**

**kwargs [PolyCollection properties, optional] All other keyword arguments are passed on to PolyCollection:

**See also:**

*quiverkey* Add a key to a quiver plot.

**Examples using matplotlib.pyplot.quiver**

- sphx_glr_gallery_images_contours_and_fields_quiver_demo.py
- sphx_glr_gallery_images_contours_and_fields_quiver_simple_demo.py
- sphx_glr_gallery_images_contours_and_fields_trigradient_demo.py

**matplotlib.pyplot.quiverkey**

matplotlib.pyplot.quiverkey(Q, X, Y, U, label, **kw)
Add a key to a quiver plot.

Call signature:

```python
quiverkey(Q, X, Y, U, label, **kw)
```

Arguments:

- **Q**: The Quiver instance returned by a call to quiver.
- **X, Y**: The location of the key; additional explanation follows.
- **U**: The length of the key
- **label**: A string with the length and units of the key

Keyword arguments:

- **angle** = 0 The angle of the key arrow. Measured in degrees anti-clockwise from the x-axis.
- **coordinates** = [‘axes’ | ‘figure’ | ‘data’ | ‘inches’] Coordinate system and units for X, Y: ‘axes’ and ‘figure’ are normalized coordinate systems with 0,0 in the lower left and 1,1 in the upper right; ‘data’ are the axes data coordinates (used for the locations of the vectors in the quiver plot itself); ‘inches’ is position in the figure in inches, with 0,0 at the lower left corner.
- **color**: overrides face and edge colors from Q.
- **labelpos** = [‘N’ | ‘S’ | ‘E’ | ‘W’] Position the label above, below, to the right, to the left of the arrow, respectively.
- **labelsep**: Distance in inches between the arrow and the label. Default is 0.1
- **labelcolor**: defaults to default *Text* color.
**fontproperties**: A dictionary with keyword arguments accepted by the `FontProperties` initializer: `family`, `style`, `variant`, `size`, `weight` Any additional keyword arguments are used to override vector properties taken from `Q`. The positioning of the key depends on `X`, `Y`, `coordinates`, and `labelpos`. If `labelpos` is ‘N’ or ‘S’, `X`, `Y` give the position of the middle of the key arrow. If `labelpos` is ‘E’, `X`, `Y` positions the head, and if `labelpos` is ‘W’, `X`, `Y` positions the tail; in either of these two cases, `X`, `Y` is somewhere in the middle of the arrow+label key object.

**Examples using matplotlib.pyplot.quiverkey**

- sphx_glr_gallery_images_contours_and_fields_quiver_demo.py
- sphx_glr_gallery_images_contours_and_fields_quiver_simple_demo.py

**matplotlib.pyplot.rc**

```python
matplotlib.pyplot.rc(group, **kwargs)
```

Set the current rc params. `group` is the grouping for the rc, e.g., for `lines.linewidth` the group is `lines`, for `axes.facecolor`, the group is `axes`, and so on. Group may also be a list or tuple of group names, e.g., `(xtick, ytick)`. `kwargs` is a dictionary attribute name/value pairs, e.g.,:

```python
rc('lines', linewidth=2, color='r')
```

sets the current rc params and is equivalent to:

```python
rcParams['lines.linewidth'] = 2
rcParams['lines.color'] = 'r'
```

The following aliases are available to save typing for interactive users:

<table>
<thead>
<tr>
<th>Alias</th>
<th>Property</th>
</tr>
</thead>
<tbody>
<tr>
<td>'lw'</td>
<td>'linewidth'</td>
</tr>
<tr>
<td>'ls'</td>
<td>'linestyle'</td>
</tr>
<tr>
<td>'c'</td>
<td>'color'</td>
</tr>
<tr>
<td>'fc'</td>
<td>'facecolor'</td>
</tr>
<tr>
<td>'ec'</td>
<td>'edgecolor'</td>
</tr>
<tr>
<td>'mew'</td>
<td>'markeredgewidth'</td>
</tr>
<tr>
<td>'aa'</td>
<td>'antialiased'</td>
</tr>
</tbody>
</table>

Thus you could abbreviate the above rc command as:

```python
rc('lines', lw=2, c='r')
```

Note you can use python’s `kwargs` dictionary facility to store dictionaries of default parameters. e.g., you can customize the font rc as follows:

```python
font = {
    'family': 'monospace',
    'weight': 'bold',
    'size': 'larger'}
```

(continues on next page)
This enables you to easily switch between several configurations. Use \texttt{matplotlib.style.use('default')} or \texttt{rcdefaults()} to restore the default rc params after changes.

Examples using \texttt{matplotlib.pyplot.rc}

- \texttt{sphx\_glr\_gallery\_pie\_and\_polar\_charts\_polar\_legend.py}
- \texttt{sphx\_glr\_gallery\_text\_labels\_and\_annotations\_usetex\_demo.py}
- \texttt{sphx\_glr\_gallery\_color\_color\_cycler.py}
- \texttt{sphx\_glr\_gallery\_misc\_customize\_rc.py}
- \texttt{sphx\_glr\_gallery\_misc\_multipage\_pdf.py}
- \textit{Styling with cycler}

\texttt{matplotlib.pyplot.rc\_context}

\texttt{matplotlib.pyplot.rc\_context(rc=\texttt{None}, f\texttt{name}=\texttt{None})}

Return a context manager for managing rc settings.

This allows one to do:

```python
with mpl.rc_context(fname='screen.rc'):
    plt.plot(x, a)
with mpl.rc_context(fname='print.rc'):
    plt.plot(x, b)
    plt.plot(x, c)
```

The ‘a’ vs ‘x’ and ‘c’ vs ‘x’ plots would have settings from ‘screen.rc’, while the ‘b’ vs ‘x’ plot would have settings from ‘print.rc’.

A dictionary can also be passed to the context manager:

```python
with mpl.rc_context(rc={\texttt{\textit{text.usetex}}: \texttt{True}}, f\texttt{name}=\texttt{\textit{screen.rc}}):
    plt.plot(x, a)
```

The ‘rc’ dictionary takes precedence over the settings loaded from ‘fname’. Passing a dictionary only is also valid. For example a common usage is:

```python
with mpl.rc_context(rc={\texttt{\textit{interactive}}: \texttt{False}}):
    fig, ax = plt.subplots()
    ax.plot(range(3), range(3))
    fig.savefig('A.png', format='png')
    plt.close(fig)
```

Examples using \texttt{matplotlib.pyplot.rc\_context}

- \texttt{sphx\_glr\_gallery\_text\_labels\_and\_annotations\_usetex\_baseline\_test.py}
• sphx_glr_gallery_misc_logos2.py
• sphx_glr_gallery_ticks_and_spines_auto_ticks.py

matplotlib.pyplot.rcdefaults

matplotlib.pyplot.rcdefaults()
    Restore the rc params from Matplotlib’s internal default style.
    Style-blacklisted rc params (defined in matplotlib.style.core.STYLE_BLACKLIST) are not updated.

    **See also:**
    rc_file_defaults  Restore the rc params from the rc file originally loaded by Matplotlib.
    matplotlib.style.use  Use a specific style file. Call style.use('default') to restore the default style.

Examples using matplotlib.pyplot.rcdefaults

• sphx_glr_gallery_lines_bars_and_markers_barh.py
• sphx_glr_gallery_misc_customize_rc.py

matplotlib.pyplot.rgrids

matplotlib.pyplot.rgrids(*args, **kwargs)
    Get or set the radial gridlines on the current polar plot.
    Call signatures:
    
    lines, labels = rgrids()
    lines, labels = rgrids(radii, labels=None, angle=22.5, fmt=None, **kwargs)

    When called with no arguments, *rgrids* simply returns the tuple (lines, labels). When called with arguments, the labels will appear at the specified radial distances and angle.

    **Parameters**
    
    radii  [tuple with floats] The radii for the radial gridlines
    labels  [tuple with strings or None] The labels to use at each radial gridline. The matplotlib.ticker.ScalarFormatter will be used if None.
    angle  [float] The angular position of the radius labels in degrees.
    fmt  [str or None] Format string used in matplotlib.ticker.FormatStrFormatter. For example ‘%f’.

    **Returns**
    
    lines, labels  [list of lines.Line2D, list of text.Text] lines are the radial gridlines and labels are the tick labels.

    **Other Parameters**
    
    **kwargs  kwargs are optional Text properties for the labels.
See also:

- `pyplot.thetagrids`
- `projections.polar.PolarAxes.set_rgrids`
- `Axis.get_gridlines`
- `Axis.get_ticklabels`

Examples

```python
# set the locations of the radial gridlines
lines, labels = rgrids( (0.25, 0.5, 1.0) )

# set the locations and labels of the radial gridlines
lines, labels = rgrids( (0.25, 0.5, 1.0), ('Tom', 'Dick', 'Harry') )
```

`matplotlib.pyplot.savefig`

`matplotlib.pyplot.savefig(*args, **kwargs)`

Save the current figure.

Call signature:

```python
savefig(fname, dpi=None, facecolor='w', edgecolor='w',
        orientation='portrait', papertype=None, format=None,
        transparent=False, bbox_inches=None, pad_inches=0.1,
        frameon=None, metadata=None)
```

The output formats available depend on the backend being used.

Parameters

- `fname` [str or PathLike or file-like object] A path, or a Python file-like object, or possibly some backend-dependent object such as `matplotlib.backends.backend_pdf.PdfPages`.

  If `format` is not set, then the output format is inferred from the extension of `fname`, if any, and from `rcParams["savefig.format"]` (default: 'png') otherwise. If `format` is set, it determines the output format.

  Hence, if `fname` is not a path or has no extension, remember to specify `format` to ensure that the correct backend is used.

Other Parameters

- `dpi` [[None | scalar > 0 | 'figure']] The resolution in dots per inch. If `None`, defaults to `rcParams["savefig.dpi"]` (default: 'figure'). If 'figure', uses the figure’s dpi value.

- `quality` [[None | 1 <= scalar <= 100]] The image quality, on a scale from 1 (worst) to 95 (best). Applicable only if `format` is jpg or jpeg, ignored otherwise. If `None`, defaults to `rcParams["savefig.jpeg_quality"]` (default: 95) (95 by default). Values above 95 should be avoided; 100 completely disables the JPEG quantization stage.
**optimize** [bool] If True, indicates that the JPEG encoder should make an extra pass over the image in order to select optimal encoder settings. Applicable only if format is jpg or jpeg, ignored otherwise. Is False by default.

**progressive** [bool] If True, indicates that this image should be stored as a progressive JPEG file. Applicable only if format is jpg or jpeg, ignored otherwise. Is False by default.

**facecolor** [color spec or None, optional] The facecolor of the figure; if None, defaults to rcParams["savefig.facecolor"] (default: ‘white’).

**edgecolor** [color spec or None, optional] The edgecolor of the figure; if None, defaults to rcParams["savefig.edgecolor"] (default: ‘white’)

**orientation** [{‘landscape’, ‘portrait’}] Currently only supported by the postscript backend.

**format** [str] The file format, e.g. ‘png’, ‘pdf’, ‘svg’, ... The behavior when this is unset is documented under fname.

**transparent** [bool] If True, the axes patches will all be transparent; the figure patch will also be transparent unless facecolor and/or edgecolor are specified via kwargs. This is useful, for example, for displaying a plot on top of a colored background on a web page. The transparency of these patches will be restored to their original values upon exit of this function.

**bbox_inches** [str or Bbox, optional] Bbox in inches. Only the given portion of the figure is saved. If ‘tight’, try to figure out the tight bbox of the figure. If None, use savefig.bbox

**pad_inches** [scalar, optional] Amount of padding around the figure when bbox_inches is ‘tight’. If None, use savefig.pad_inches

**bbox_extra_artists** [list of Artist, optional] A list of extra artists that will be considered when the tight bbox is calculated.

**metadata** [dict, optional] Key/value pairs to store in the image metadata. The supported keys and defaults depend on the image format and backend:

- ‘png’ with Agg backend: See the parameter metadata of print_png.
- ‘pdf’ with pdf backend: See the parameter metadata of PdfPages.
- ‘eps’ and ‘ps’ with PS backend: Only ‘Creator’ is supported.

**pil_kwargs** [dict, optional] Additional keyword arguments that are passed to PIL.Image.save when saving the figure. Only applicable for formats that are saved using Pillow, i.e. JPEG, TIFF, and (if the keyword is set to a non-None value) PNG.

**Examples using matplotlib.pyplot.savefig**

- sphx_glr_gallery_misc_print_stdout_sgskip.py
- sphx_glr_gallery_user_interfaces_svg_histogram_sgskip.py
matplotlib.pyplot.sca

```python
matplotlib.pyplot.sca(ax)
```

Set the current Axes instance to `ax`.

The current Figure is updated to the parent of `ax`.

matplotlib.pyplot.scatter

```python
matplotlib.pyplot.scatter(x, y, s=None, c=None, marker=None, cmap=None,
                          norm=None, vmin=None, vmax=None, alpha=None,
                          linewidths=None, verts=None, edgecolors=None,
                          **kwargs)
```

A scatter plot of `y` vs `x` with varying marker size and/or color.

**Parameters**

- `x, y` [array_like, shape (n, )] The data positions.
- `s` [scalar or array_like, shape (n, ), optional] The marker size in points**2. Default is `rcParams['lines.markersize'] ** 2`.
- `c` [color, sequence, or sequence of color, optional] The marker color. Possible values:
  - A single color format string.
  - A sequence of color specifications of length n.
  - A sequence of n numbers to be mapped to colors using `cmap` and `norm`.
  - A 2-D array in which the rows are RGB or RGBA.

Note that `c` should not be a single numeric RGB or RGBA sequence because that is indistinguishable from an array of values to be color-mapped. If you want to specify the same RGB or RGBA value for all points, use a 2-D array with a single row. Otherwise, value-matching will have precedence in case of a size matching with `x` and `y`.

Defaults to `None`. In that case the marker color is determined by the value of `color`, `facecolor` or `facecolors`. In case those are not specified or `None`, the marker color is determined by the next color of the `Axes` current “shape and fill” color cycle. This cycle defaults to `rcParams["axes.prop_cycle"]` (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`).

- `marker` [MarkerStyle, optional] The marker style. `marker` can be either an instance of the class or the text shorthand for a particular marker. Defaults to `None`, in which case it takes the value of `rcParams["scatter.marker"]` (default: `'o'`) = `'o'`. See `markers` for more information about marker styles.
**cmap** [Colormap, optional, default: None] A Colormap instance or registered colormap name. *cmap* is only used if *c* is an array of floats. If *None*, defaults to rc image.cmap.

**norm** [Normalize, optional, default: None] A Normalize instance is used to scale luminance data to 0, 1. *norm* is only used if *c* is an array of floats. If *None*, use the default colors.Normalize.

**vmin, vmax** [scalar, optional, default: None] *vmin* and *vmax* are used in conjunction with *norm* to normalize luminance data. If *None*, the respective min and max of the color array is used. *vmin* and *vmax* are ignored if you pass a *norm* instance.

**alpha** [scalar, optional, default: None] The alpha blending value, between 0 (transparent) and 1 (opaque).

**linewidths** [scalar or array_like, optional, default: None] The linewidth of the marker edges. Note: The default *edgecolors* is ‘face’. You may want to change this as well. If *None*, defaults to rcParams lines.linewidth.

**edgecolors** [{'face', 'none', None} or color or sequence of color, optional.] The edge color of the marker. Possible values:
- ‘face’: The edge color will always be the same as the face color.
- ‘none’: No patch boundary will be drawn.
- A Matplotlib color or sequence of color.

Defaults to *None*, in which case it takes the value of rcParams "scatter.edgecolors" (default: ‘face’) = ‘face’.

For non-filled markers, the *edgecolors* kwarg is ignored and forced to ‘face’ internally.

**plotnonfinite** [boolean, optional, default: False] Set to plot points with nonfinite *c*, in conjunction with set_bad.

**Returns**

**paths** [PathCollection]

**Other Parameters**

****kwargs** [Collection properties]

**See also:**

**plot** To plot scatter plots when markers are identical in size and color.

**Notes**

- The *plot* function will be faster for scatterplots where markers don’t vary in size or color.
- Any or all of *x*, *y*, *s*, and *c* may be masked arrays, in which case all masks will be combined and only unmasked points will be plotted.
- Fundamentally, scatter works with 1-D arrays; *x*, *y*, *s*, and *c* may be input as 2-D arrays, but within scatter they will be flattened. The exception is *c*, which will be flattened only if its size matches the size of *x* and *y*.
**Note:** In addition to the above described arguments, this function can take a data key-word argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).

**Examples using** matplotlib.pyplot.scatter

- sphx_glr_gallery_misc_hyperlinks_sgskip.py

**matplotlib.pyplot.sci**

`matplotlib.pyplot.sci(im)`

Set the current image.

This image will be the target of colormap functions like *viridis*, and other functions such as *clim*. The current image is an attribute of the current axes.

**Examples using** matplotlib.pyplot.sci

- sphx_glr_gallery_shapes_and_collections_line_collection.py

**matplotlib.pyplot.semilogx**

`matplotlib.pyplot.semilogx(*args, **kwargs)`

Make a plot with log scaling on the x axis.

Call signatures:

```python
semilogx([x], y, [fmt], data=None, **kwargs)
semilogx([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around *plot* which additionally changes the x-axis to log scaling. All of the concepts and parameters of plot can be used here as well.

The additional parameters *base*, *subx* and *nonposx* control the x-axis properties. They are just forwarded to *Axes.set_xscale*.

**Parameters**

- **base** [scalar, optional, default 10] Base of the x logarithm.
- **subx** [array_like, optional] The location of the minor xticks. If None, reasonable locations are automatically chosen depending on the number of decades in the plot. See *Axes.set_xscale* for details.
- **nonposx** [{'mask', 'clip'}, optional, default ‘mask’] Non-positive values in x can be masked as invalid, or clipped to a very small positive number.
Returns

**lines** A list of :class:`Line2D` objects representing the plotted data.

Other Parameters

**kwargs** All parameters supported by :func:`plot`.

.. _semilogy:

.. currentmodule:: matplotlib.pyplot

``semilogy(*args, **kwargs)`

Make a plot with log scaling on the y axis.

Call signatures:

``semilogy([x], y, [fmt], data=None, **kwargs)`
``semilogy([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)`

This is just a thin wrapper around :func:`plot` which additionally changes the y-axis to log scaling. All of the concepts and parameters of plot can be used here as well.

The additional parameters :paramref:`basey`, :paramref:`subsy` and :paramref:`nonposy` control the y-axis properties. They are just forwarded to :meth:`Axes.set_yscale`.

Parameters

**basey** [scalar, optional, default 10] Base of the y logarithm.

**subsy** [array_like, optional] The location of the minor yticks. If None, reasonable locations are automatically chosen depending on the number of decades in the plot. See :meth:`Axes.set_yscale` for details.

**nonposy** [{'mask', 'clip'}, optional, default 'mask'] Non-positive values in y can be masked as invalid, or clipped to a very small positive number.

Returns

**lines** A list of :class:`Line2D` objects representing the plotted data.

Other Parameters

**kwargs** All parameters supported by :func:`plot`.

.. _set_cmap:

.. currentmodule:: matplotlib.pyplot

``set_cmap(cmap)`

Set the default colormap. Applies to the current image if any. See help(colormaps) for more information.

**cmap** must be a :class:`Colormap` instance, or the name of a registered colormap.

.. _setp:

.. currentmodule:: matplotlib.pyplot

``setp(obj, *args, **kwargs)`

Set a property on an artist object.
matplotlib supports the use of `setp()` ("set property") and `getp()` to set and get object properties, as well as to do introspection on the object. For example, to set the linestyle of a line to be dashed, you can do:

```python
>>> line, = plot([1,2,3])
>>> setp(line, linestyle='--')
```

If you want to know the valid types of arguments, you can provide the name of the property you want to set without a value:

```python
>>> setp(line, 'linestyle')
linestyle: ['-' | '--' | '-.' | ':' | 'steps' | 'None']
```

If you want to see all the properties that can be set, and their possible values, you can do:

```python
>>> setp(line)
... long output listing omitted
```

You may specify another output file to `setp` if `sys.stdout` is not acceptable for some reason using the `file` keyword-only argument:

```python
>>> with fopen('output.log') as f:
...   setp(line, file=f)
```

`setp()` operates on a single instance or a iterable of instances. If you are in query mode introspecting the possible values, only the first instance in the sequence is used. When actually setting values, all the instances will be set. e.g., suppose you have a list of two lines, the following will make both lines thicker and red:

```python
>>> x = arange(0,1.0,0.01)
>>> y1 = sin(2*pi*x)
>>> y2 = sin(4*pi*x)
>>> lines = plot(x, y1, x, y2)
>>> setp(lines, linewidth=2, color='r')
```

`setp()` works with the MATLAB style string/value pairs or with python kwargs. For example, the following are equivalent:

```python
>>> setp(lines, 'linewidth', 2, 'color', 'r')  # MATLAB style
>>> setp(lines, linewidth=2, color='r')       # python style
```

**Examples using matplotlib.pyplot.setp**

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

**matplotlib.pyplot.show**

`matplotlib.pyplot.show(*args, **kw)`

Display a figure.

When running in ipython with its pylab mode, display all figures and return to the ipython prompt.
In non-interactive mode, display all figures and block until the figures have been closed; in interactive mode it has no effect unless figures were created prior to a change from non-interactive to interactive mode (not recommended). In that case it displays the figures but does not block.

A single experimental keyword argument, `block`, may be set to True or False to override the blocking behavior described above.

**Examples using `matplotlib.pyplot.show`**

- sphx_glr_gallery_text_labels_and_annotations_font_family_rc_sgskip.py
- *The double pendulum problem*
- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py
- sphx_glr_gallery_event_handling_pong_sgskip.py
- sphx_glr_gallery_misc_cursor_demo_sgskip.py
- sphx_glr_gallery_misc_multiprocess_sgskip.py
- sphx_glr_gallery_user_interfaces_pylab_with_gtk_sgskip.py
- sphx_glr_gallery_user_interfaces_toolmanager_sgskip.py
- sphx_glr_gallery_widgets_lasso_selector_demo_sgskip.py

`matplotlib.pyplot.specgram`

`matplotlib.pyplot.specgram(x, NFFT=None, Fs=None, Fc=None, detrend=None, window=None, noverlap=None, cmap=None, xextent=None, pad_to=None, sides=None, scale_by_freq=None, mode=None, scale=None, vmin=None, vmax=None, *, data=None, **kwargs)`

Plot a spectrogram.

Compute and plot a spectrogram of data in `x`. Data are split into `NFFT` length segments and the spectrum of each section is computed. The windowing function `window` is applied to each segment, and the amount of overlap of each segment is specified with `noverlap`. The spectrogram is plotted as a colormap (using imshow).

**Parameters**

- `x` [1-D array or sequence] Array or sequence containing the data.
- `Fs` [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.
- `window` [callable or ndarray] A function or a vector of length `NFFT`. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. The default is `window_hanning`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.
sides [{‘default’, ‘onesided’, ‘twosided’}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.

pad_to [int] The number of points to which the data segment is padded when performing the FFT. This can be different from NFFT, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the n parameter in the call to fft(). The default is None, which sets pad_to equal to NFFT.

NFFT [int] The number of data points used in each block for the FFT. A power 2 is most efficient. The default value is 256. This should NOT be used to get zero padding, or the scaling of the result will be incorrect. Use pad_to for this instead.

detrend [{‘none’, ‘mean’, ‘linear’} or callable, default ‘none’] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the detrend parameter is a vector, in Matplotlib it is a function. The mlab module defines detrend_none, detrend_mean, and detrend_linear, but you can use a custom function as well. You can also use a string to choose one of the functions: ‘none’ calls detrend_none. ‘mean’ calls detrend_mean. ‘linear’ calls detrend_linear.

scale_by_freq [bool, optional] Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

mode [{‘default’, ‘psd’, ‘magnitude’, ‘angle’, ‘phase’}] What sort of spectrum to use. Default is ‘psd’, which takes the power spectral density. ‘magnitude’ returns the magnitude spectrum. ‘angle’ returns the phase spectrum with unwrapping. ‘phase’ returns the phase spectrum with unwrapping.

noverlap [int] The number of points of overlap between blocks. The default value is 128.

scale [{‘default’, ‘linear’, ‘dB’}] The scaling of the values in the spec. ‘linear’ is no scaling. ‘dB’ returns the values in dB scale. When mode is ‘psd’, this is dB power (10 * log10). Otherwise this is dB amplitude (20 * log10). ‘default’ is ‘dB’ if mode is ‘psd’ or ‘magnitude’ and ‘linear’ otherwise. This must be ‘linear’ if mode is ‘angle’ or ‘phase’.

Fc [int] The center frequency of x (defaults to 0), which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

cmap A matplotlib.colors.Colormap instance; if None, use default determined by rc

xextent [None or (xmin, xmax)] The image extent along the x-axis. The default sets xmin to the left border of the first bin (spectrum column) and xmax to the right border of the last bin. Note that for noverlap>0 the width of the bins is smaller than those of the segments.
**kwargs Additional kwargs are passed on to imshow which makes the specgram image.

**Returns**

- **spectrum** [2-D array] Columns are the periodograms of successive segments.
- **freqs** [1-D array] The frequencies corresponding to the rows in spectrum.
- **t** [1-D array] The times corresponding to midpoints of segments (i.e., the columns in spectrum).
- **im** [instance of class AxesImage] The image created by imshow containing the spectrogram

**See also:**

- **psd** differs in the default overlap; in returning the mean of the segment periodograms; in not returning times; and in generating a line plot instead of colormap.
- **magnitude_spectrum** A single spectrum, similar to having a single segment when mode is 'magnitude'. Plots a line instead of a colormap.
- **angle_spectrum** A single spectrum, similar to having a single segment when mode is 'angle'. Plots a line instead of a colormap.
- **phase_spectrum** A single spectrum, similar to having a single segment when mode is 'phase'. Plots a line instead of a colormap.

**Notes**

The parameters detrend and scale_by_freq do only apply when mode is set to 'psd'.

---

**Note:** In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

- All arguments with the following names: ‘x’.

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).

---

**Examples using matplotlib.pyplot.specgram**

- sphx_glr_gallery_images_contours_and_fields_specgram_demo.py

**matplotlib.pyplot.spring**

```python
matplotlib.pyplot.spring()
```

Set the colormap to “spring”.

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.
matplotlib.pyplot.spy

matplotlib.pyplot.spy(Z, precision=0, marker=None, markersize=None, aspect='equal', origin='upper', **kwargs)

Plot the sparsity pattern of a 2D array.
This visualizes the non-zero values of the array.

Two plotting styles are available: image and marker. Both are available for full arrays, but only the marker style works for scipy.sparse.spmatrix instances.

Image style
If marker and markersize are None, imshow is used. Any extra remaining kwargs are passed to this method.

Marker style
If Z is a scipy.sparse.spmatrix or marker or markersize are None, a Line2D object will be returned with the value of marker determining the marker type, and any remaining kwargs passed to plot.

Parameters

Z [array-like (M, N)] The array to be plotted.

precision [float or ‘present’, optional, default: 0] If precision is 0, any non-zero value will be plotted. Otherwise, values of |Z| > precision will be plotted.

For scipy.sparse.spmatrix instances, you can also pass ‘present’. In this case any value present in the array will be plotted, even if it is identically zero.

origin [{‘upper’, ‘lower’}, optional] Place the [0,0] index of the array in the upper left or lower left corner of the axes. The convention ‘upper’ is typically used for matrices and images. If not given, rcParams["image.origin"] (default: ‘upper’) is used, defaulting to ‘upper’.

aspect [{‘equal’, ‘auto’, None} or float, optional] Controls the aspect ratio of the axes. The aspect is of particular relevance for images since it may distort the image, i.e. pixel will not be square.
This parameter is a shortcut for explicitly calling Axes.set_aspect. See there for further details.

• ‘equal’: Ensures an aspect ratio of 1. Pixels will be square.
• ‘auto’: The axes is kept fixed and the aspect is adjusted so that the data fit in the axes. In general, this will result in non-square pixels.
• None: Use rcParams["image.aspect"] (default: ‘equal’) (default: ‘equal’).

Default: ‘equal’

Returns

ret [AxesImage or Line2D] The return type depends on the plotting style (see above).

Other Parameters
**kwargs The supported additional parameters depend on the plotting style.

For the image style, you can pass the following additional parameters of `imshow`:

- `cmap`
- `alpha`
- `url`
- any `Artist` properties (passed on to the `AxesImage`)

For the marker style, you can pass any `Line2D` property except for `linestyle`:

Examples using `matplotlib.pyplot.spy`

- sphx_glr_gallery_images_contours_and_fields_spy_demos.py

`matplotlib.pyplot.stackplot`

`matplotlib.pyplot.stackplot(x, *args, labels=(), colors=None, baseline='zero', data=None, **kwargs)`

Draw a stacked area plot.

**Parameters**

- `x` [1d array of dimension N]
- `y` [2d array (dimension MxN), or sequence of 1d arrays (each dimension 1xN)] The data is assumed to be unstacked. Each of the following calls is legal:

  | stackplot(x, y) | # where y is MxN |
  | stackplot(x, y1, y2, y3, y4) | # where y1, y2, y3, y4, are all 1xNm |

- `baseline` [{'zero', 'sym', 'wiggle', 'weighted_wiggle'}] Method used to calculate the baseline:
  - 'zero': Constant zero baseline, i.e. a simple stacked plot.
  - 'sym': Symmetric around zero and is sometimes called 'ThemRiver'.
  - 'wiggle': Minimizes the sum of the squared slopes.
  - 'weighted_wiggle': Does the same but weights to account for size of each layer. It is also called 'Streamgraph'-layout. More details can be found at http://leebyron.com/streamgraph/.

- `labels` [Length N sequence of strings] Labels to assign to each data series.

- `colors` [Length N sequence of colors] A list or tuple of colors. These will be cycled through and used to colour the stacked areas.

- `**kwargs` All other keyword arguments are passed to `Axes.fill_between()`.

**Returns**

- `list` [list of `PolyCollection`] A list of `PolyCollection` instances, one for each element in the stacked area plot.
Notes

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments are replaced by `data[<arg>]`:

- All positional and all keyword arguments.

Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg>` in `data`).

```python
matplotlib.pyplot.stem
```

Create a stem plot.

A stem plot plots vertical lines at each x location from the baseline to y, and places a marker there.

Call signature:

```python
stem([x,] y, linefmt=None, markerfmt=None, basefmt=None, bottom=0, label=None, use_line_collection=False, data=None)
```

The x-positions are optional. The formats may be provided either as positional or as keyword-arguments.

**Parameters**

- `x` [array-like, optional] The x-positions of the stems. Default: `(0, 1, ..., len(y) - 1)`.
- `y` [array-like] The y-values of the stem heads.
- `linefmt` [str; optional] A string defining the properties of the vertical lines. Usually, this will be a color or a color and a linestyle:

```
<table>
<thead>
<tr>
<th>Character</th>
<th>Line Style</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-.'</td>
<td>dash-dot line</td>
</tr>
<tr>
<td>':'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>
```

Default: `'C0-'`, i.e. solid line with the first color of the color cycle.

Note: While it is technically possible to specify valid formats other than color or color and linestyle (e.g. `‘rx’` or `‘.-’`), this is beyond the intention of the method and will most likely not result in a reasonable plot.

- `markerfmt` [str; optional] A string defining the properties of the markers at the stem heads. Default: `'C0o'`, i.e. filled circles with the first color of the color cycle.
**basefmt** [str, optional] A format string defining the properties of the baseline.

Default: ‘C3-’ (‘C2-‘ in classic mode).

**bottom** [float, optional, default: 0] The y-position of the baseline.

**label** [str, optional, default: None] The label to use for the stems in legends.

**use_line_collection** [bool, optional, default: False] If True, store and plot the stem lines as a LineCollection instead of individual lines. This significantly improves performance, and will become the default option in Matplotlib 3.3. If False, defaults to the old behavior of using a list of Line2D objects.

**Returns**

**container** [StemContainer] The container may be treated like a tuple

(markerline, stemlines, baseline)

**Notes**

**See also:**
The MATLAB function stem which inspired this method.

**Note:** In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

- All positional and all keyword arguments.

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).

**Examples using matplotlib.pyplot.stem**

- sphx_glr_gallery_lines_bars_and_markers_stem_plot.py

**matplotlib.pyplot.step**

matplotlib.pyplot.step(x, y, *args, where='pre', data=None, **kwargs)

Make a step plot.

Call signatures:

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>step(x, y, [fmt], *, data=None, where='pre', **kwargs)</td>
<td>Make a step plot.</td>
</tr>
<tr>
<td>step(x, y, [fmt], x2, y2, [fmt2], ..., *, where='pre', **kwargs)</td>
<td>Add another line to the plot.</td>
</tr>
</tbody>
</table>

This is just a thin wrapper around plot which changes some formatting options. Most of the concepts and parameters of plot can be used here as well.

**Parameters**
x [array_like] 1-D sequence of x positions. It is assumed, but not checked, that it is uniformly increasing.

y [array_like] 1-D sequence of y levels.

fmt [str, optional] A format string, e.g. ‘g’ for a green line. See plot for a more detailed description.

Note: While full format strings are accepted, it is recommended to only specify the color. Line styles are currently ignored (use the keyword argument linestyle instead). Markers are accepted and plotted on the given positions, however, this is a rarely needed feature for step plots.

data [indexable object, optional] An object with labelled data. If given, provide the label names to plot in x and y.

where [‘pre’, ‘post’, ‘mid’], optional, default ‘pre’] Define where the steps should be placed:

- ‘pre’: The y value is continued constantly to the left from every x position, i.e. the interval \((x[i-1], x[i])\) has the value \(y[i]\).
- ‘post’: The y value is continued constantly to the right from every x position, i.e. the interval \([x[i], x[i+1])\) has the value \(y[i]\).
- ‘mid’: Steps occur half-way between the x positions.

Returns

lines A list of Line2D objects representing the plotted data.

Other Parameters

**kwargs Additional parameters are the same as those for plot.

Notes

Examples using matplotlib.pyplot.step

- sphx_glr_gallery_lines_bars_and_markers_step_demo.py

matplotlib.pyplot.streamplot

matplotlib.pyplot.streamplot(x, y, u, v, density=1, linewidth=None, color=None, cmap=None, norm=None, arrowstyle='-', minlength=0.1, transform=None, zorder=None, start_points=None, maxlength=4.0, integration_direction='both', *, data=None)

Draw streamlines of a vector flow.

Parameters

x, y [1D arrays] An evenly spaced grid.

u, v [2D arrays] x and y-velocities. The number of rows and columns must match the length of y and x, respectively.
**density** [float or (float, float)] Controls the closeness of streamlines. When `density = 1`, the domain is divided into a 30x30 grid. `density` linearly scales this grid. Each cell in the grid can have, at most, one traversing streamline. For different densities in each direction, use a tuple `(density_x, density_y)`.

**linewidth** [float or 2D array] The width of the stream lines. With a 2D array the line width can be varied across the grid. The array must have the same shape as `u` and `v`.

**color** [matplotlib color code, or 2D array] The streamline color. If given an array, its values are converted to colors using `cmap` and `norm`. The array must have the same shape as `u` and `v`.

**cmap** [Colormap] Colormap used to plot streamlines and arrows. This is only used if `color` is an array.

**norm** [Normalize] Normalize object used to scale luminance data to 0, 1. If `None`, stretch (min, max) to (0, 1). This is only used if `color` is an array.

**arrowsize** [float] Scaling factor for the arrow size.

**minlength** [float] Minimum length of streamline in axes coordinates.

**start_points** [Nx2 array] Coordinates of starting points for the streamlines in data coordinates (the same coordinates as the `x` and `y` arrays).

**zorder** [int] The zorder of the stream lines and arrows. Artists with lower zorder values are drawn first.

**maxlength** [float] Maximum length of streamline in axes coordinates.

**integration_direction** [{‘forward’, ‘backward’, ‘both’}] Integrate the streamline in forward, backward or both directions. default is ‘both’.

**Returns**

**stream_container** [StreamplotSet] Container object with attributes

- `lines`: `LineCollection` of streamlines
- `arrows`: `PatchCollection` containing `FancyArrowPatch` objects representing the arrows half-way along stream lines.

This container will probably change in the future to allow changes to the colormap, alpha, etc. for both lines and arrows, but these changes should be backward compatible.

**Notes**

**Note:** In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: ‘start_points’, ‘u’, ‘v’, ‘x’, ‘y’.
Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg> in data`).

**Examples using `matplotlib.pyplot.streamplot`**

- `sphx_glr_gallery_images_contours_and_fields_plot_streamplot.py`

`matplotlib.pyplot.subplot`

```python
matplotlib.pyplot.subplot(*args, **kwargs)
```

Add a subplot to the current figure.

Wrapper of `Figure.add_subplot` with a difference in behavior explained in the notes section.

Call signatures:

- `subplot(nrows, ncols, index, **kwargs)`
- `subplot(pos, **kwargs)`
- `subplot(ax)`

**Parameters**

- `*args` Either a 3-digit integer or three separate integers describing the position of the subplot. If the three integers are `nrows`, `ncols`, and `index` in order, the subplot will take the `index` position on a grid with `nrows` rows and `ncols` columns. `index` starts at 1 in the upper left corner and increases to the right.

  `pos` is a three digit integer, where the first digit is the number of rows, the second the number of columns, and the third the index of the subplot. i.e. `fig.add_subplot(235)` is the same as `fig.add_subplot(2, 3, 5)`. Note that all integers must be less than 10 for this form to work.

- `projection [{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional]` The projection type of the subplot (`Axes`). `str` is the name of a custom projection, see `projections`. The default `None` results in a 'rectilinear' projection.

- `polar` [boolean, optional] If True, equivalent to `projection='polar'`.

- `sharex, sharey` [Axes, optional] Share the x or y axis with `sharex` and/or `sharey`. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

- `label` [str] A label for the returned axes.

**Returns**

- `axes` [an `axes.SubplotBase` subclass of `Axes` (or a subclass of `Axes`)] The axes of the subplot. The returned axes base class depends on the projection used. It is `Axes` if rectilinear projection are used and `projections.polar.PolarAxes` if polar projection are used. The returned axes is then a subplot subclass of the base class.

**Other Parameters**
This method also takes the keyword arguments for the returned axes base class. The keyword arguments for the rectilinear base class `Axes` can be found in the following table but there might also be other keyword arguments if another projection is used.

**See also:**

*Figure.add_subplot*

*pyplot.subplots*

*pyplot.axes*

*Figure.subplots*

**Notes**

Creating a subplot will delete any pre-existing subplot that overlaps with it beyond sharing a boundary:

```python
import matplotlib.pyplot as plt
# plot a line, implicitly creating a subplot(111)
plt.plot([1,2,3])
# now create a subplot which represents the top plot of a grid
# with 2 rows and 1 column. Since this subplot will overlap the
# first, the plot (and its axes) previously created, will be removed
plt.subplot(211)
```

If you do not want this behavior, use the *Figure.add_subplot* method or the *pyplot.axes* function instead.

If the figure already has a subplot with key (*args, **kwargs*) then it will simply make that subplot current and return it. This behavior is deprecated. Meanwhile, if you do not want this behavior (i.e., you want to force the creation of a new subplot), you must use a unique set of args and kwargs. The axes *label* attribute has been exposed for this purpose: if you want two subplots that are otherwise identical to be added to the figure, make sure you give them unique labels.

In rare circumstances, *add_subplot* may be called with a single argument, a subplot axes instance already created in the present figure but not in the figure’s list of axes.

**Examples**

```python
plt.subplot(221)
# equivalent but more general
ax1=plt.subplot(2, 2, 1)
# add a subplot with no frame
ax2=plt.subplot(222, frameon=False)
```

(continues on next page)
# add a polar subplot
plt.subplot(223, projection='polar')

# add a red subplot that shares the x-axis with ax1
plt.subplot(224, sharex=ax1, facecolor='red')

# delete ax2 from the figure
plt.delaxes(ax2)

# add ax2 to the figure again
plt.subplot(ax2)

matplotlib.pyplot.subplot2grid

matplotlib.pyplot.subplot2grid(shape, loc, rowspan=1, colspan=1, fig=None, **kwargs)
Create an axis at specific location inside a regular grid.

Parameters

- **shape** [sequence of 2 ints] Shape of grid in which to place axis. First entry is number of rows, second entry is number of columns.
- **loc** [sequence of 2 ints] Location to place axis within grid. First entry is row number, second entry is column number.
- **rowspan** [int] Number of rows for the axis to span to the right.
- **colspan** [int] Number of columns for the axis to span downwards.
- **fig** [Figure, optional] Figure to place axis in. Defaults to current figure.
- ****kwargs** Additional keyword arguments are handed to add_subplot.

Notes

The following call

```python
subplot2grid(shape, loc, rowspan=1, colspan=1)
```

is identical to

```python
gs=GridSpec(shape[0], shape[1])
sps=gs.new_subplotspec(loc, rowspan, colspan)
subplots(sps)
```
Examples using `matplotlib.pyplot.subplot2grid`

- `sphx_glr_gallery_subplots_axes_and_figures_demo_tight_layout.py`
- `sphx_glr_gallery_userdemo_demo_gridspec01.py`
- `Constrained Layout Guide`
- `Tight Layout guide`

`matplotlib.pyplot.subplot_tool`

`matplotlib.pyplot.subplot_tool(targetfig=None)`
Launch a subplot tool window for a figure.
A `matplotlib.widgets.SubplotTool` instance is returned.

Examples using `matplotlib.pyplot.subplot_tool`

- `sphx_glr_gallery_subplots_axes_and_figures_subplot_toolbar.py`

`matplotlib.pyplot.subplots`

`matplotlib.pyplot.subplots(nrows=1, ncols=1, sharex=False, sharey=False, squeeze=True, subplot_kw=None, gridspec_kw=None, **fig_kw)`
Create a figure and a set of subplots.
This utility wrapper makes it convenient to create common layouts of subplots, including the enclosing figure object, in a single call.

**Parameters**

- `nrows, ncols` [int, optional, default: 1] Number of rows/columns of the subplot grid.
- `sharex, sharey` [bool or {'none', 'all', 'row', 'col'}, default: False] Controls sharing of properties among x (sharex) or y (sharey) axes:
  - True or 'all': x- or y-axis will be shared among all subplots.
  - False or 'none': each subplot x- or y-axis will be independent.
  - 'row': each subplot row will share an x- or y-axis.
  - 'col': each subplot column will share an x- or y-axis.
When subplots have a shared x-axis along a column, only the x tick labels of the bottom subplot are created. Similarly, when subplots have a shared y-axis along a row, only the y tick labels of the first column subplot are created. To later turn other subplots’ ticklabels on, use `tick_params`.
- `squeeze` [bool, optional, default: True]
  - If True, extra dimensions are squeezed out from the returned array of `Axes`:
- if only one subplot is constructed (nrows=ncols=1), the resulting single Axes object is returned as a scalar.
- for Nx1 or 1xM subplots, the returned object is a 1D numpy object array of Axes objects.
- for NxM, subplots with N>1 and M>1 are returned as a 2D array.

- If False, no squeezing at all is done: the returned Axes object is always a 2D array containing Axes instances, even if it ends up being 1x1.

`num` [integer or string, optional, default: None] A `pyplot.figure` keyword that sets the figure number or label.

`subplot_kw` [dict, optional] Dict with keywords passed to the `add_subplot` call used to create each subplot.

`gridspec_kw` [dict, optional] Dict with keywords passed to the `GridSpec` constructor used to create the grid the subplots are placed on.

**`fig_kw`** All additional keyword arguments are passed to the `pyplot.figure` call.

Returns

- `fig` [Figure]  
- `ax` [Axes object or array of Axes objects.] `ax` can be either a single `Axes` object or an array of `Axes` objects if more than one subplot was created. The dimensions of the resulting array can be controlled with the `squeeze` keyword, see above.

See also:

- `pyplot.figure`
- `pyplot.subplot`
- `pyplot.axes`
- `Figure.subplots`
- `Figure.add_subplot`

Examples

```python
# First create some toy data:
x = np.linspace(0, 2*np.pi, 400)
y = np.sin(x**2)

# Creates just a figure and only one subplot
fig, ax = plt.subplots()
ax.plot(x, y)
ax.set_title('Simple plot')

# Creates two subplots and unpacks the output array immediately
f, (ax1, ax2) = plt.subplots(1, 2, sharey=True)
ax1.plot(x, y)
```
ax1.set_title('Sharing Y axis')
ax2.scatter(x, y)

# Creates four polar axes, and accesses them through the returned array
fig, axes = plt.subplots(2, 2, subplot_kw=dict(polar=True))
axes[0, 0].plot(x, y)
axes[1, 1].scatter(x, y)

# Share a X axis with each column of subplots
plt.subplots(2, 2, sharex='col')

# Share a Y axis with each row of subplots
plt.subplots(2, 2, sharey='row')

# Share both X and Y axes with all subplots
plt.subplots(2, 2, sharex='all', sharey='all')

# Note that this is the same as
plt.subplots(2, 2, sharex=True, sharey=True)

# Creates figure number 10 with a single subplot
# and clears it if it already exists.
fig, ax=plt.subplots(num=10, clear=True)

Examples using matplotlib.pyplot.subplots

- sphx_glr_gallery_text_labels_and_annotations_font_family_rc_sgskip.py
- sphx_glr_gallery_event_handling_pong_sgskip.py
- sphx_glr_gallery_misc_cursor_demo_sgskip.py
- sphx_glr_gallery_misc_multiprocess_sgskip.py
- sphx_glr_gallery_user_interfaces_pylab_with_gtk_sgskip.py
- sphx_glr_gallery_user_interfaces_svg_tooltip_sgskip.py
- sphx_glr_gallery_widgets_lasso_selector_demo_sgskip.py

matplotlib.pyplot.subplots_adjust

matplotlib.pyplot.subplots_adjust(left=None, bottom=None, right=None, top=None,
                                  wspace=None, hspace=None)

Tune the subplot layout.

The parameter meanings (and suggested defaults) are:

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>left</td>
<td>the left side of the subplots of the figure</td>
</tr>
<tr>
<td>right</td>
<td>the right side of the subplots of the figure</td>
</tr>
<tr>
<td>bottom</td>
<td>the bottom of the subplots of the figure</td>
</tr>
<tr>
<td>top</td>
<td>the top of the subplots of the figure</td>
</tr>
<tr>
<td>wspace</td>
<td>the amount of width reserved for space between subplots</td>
</tr>
<tr>
<td>hspace</td>
<td>the amount of space reserved for vertical spacing between subplots</td>
</tr>
</tbody>
</table>
The actual defaults are controlled by the rc file

**`matplotlib.pyplot.summer`**

```python
matlab.pyplot.summer()
```

Set the colormap to "summer".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

**`matplotlib.pyplot.suptitle`**

```python
matlab.pyplot.suptitle(t, **kwargs)
```

Add a centered title to the figure.

**Parameters**

- `t` [str] The title text.
x [float, default 0.5] The x location of the text in figure coordinates.

y [float, default 0.98] The y location of the text in figure coordinates.

**horizontalalignment, ha** [{‘center’, ‘left’, ‘right’}, default: ‘center’] The horizontal alignment of the text relative to (x, y).

**verticalalignment, va** [{‘top’, ‘center’, ‘bottom’, ‘baseline’}, default: ‘top’] The vertical alignment of the text relative to (x, y).

**fontsize, size** [default: :rcParams["figure.titlesize"] (default: ‘large’)] The font size of the text. See :meth:`Text.set_size` for possible values.

**Returns**

- **text** The :class:`Text` instance of the title.

**Other Parameters**

**fontproperties** [None or dict, optional] A dict of font properties. If fontproperties is given the default values for font size and weight are taken from the :class:`FontProperties` defaults. :rcParams["figure.titlesize"] (default: ‘large’) and :rcParams["figure.titleweight"] (default: ‘normal’) are ignored in this case.

****kwargs** Additional kwarg is :class:`matplotlib.text.Text` properties.

**Examples**

```python
>>> fig.suptitle('This is the figure title', fontsize=12)
```

**Examples using matplotlib.pyplot.suptitle**

- sphx_glr_gallery_subplots_axes_and_figures_gridspec_nested.py
- Pyplot tutorial

**matplotlib.pyplot.switch_backend**

```python
matplotlib.pyplot.switch_backend(newbackend)
```

Close all open figures and set the Matplotlib backend.

The argument is case-insensitive. Switching to an interactive backend is possible only if no event loop for another interactive backend has started. Switching to and from non-interactive backends is always possible.

**Parameters**

- **newbackend** [str] The name of the backend to use.
matplotlib.pyplot.table

```python
matplotlib.pyplot.table(cellText=None, cellColours=None, cellLoc='right', colWidths=None, rowLabels=None, rowColours=None, rowLoc='left', colLabels=None, colColours=None, colLoc='center', loc='bottom', bbox=None, edges='closed', **kwargs)
```

Add a table to an `Axes`.

At least one of `cellText` or `cellColours` must be specified. These parameters must be 2D lists, in which the outer lists define the rows and the inner list define the column values per row. Each row must have the same number of elements.

The table can optionally have row and column headers, which are configured using `rowLabels`, `rowColours`, `rowLoc` and `colLabels`, `colColours`, `colLoc` respectively.

For finer grained control over tables, use the `Table` class and add it to the axes with `Axes.add_table`.

**Parameters**

- **cellText** [2D list of str, optional] The texts to place into the table cells.
  
  *Note:* Line breaks in the strings are currently not accounted for and will result in the text exceeding the cell boundaries.

- **cellColours** [2D list of matplotlib color specs, optional] The background colors of the cells.

- **cellLoc** [{‘left’, ‘center’, ‘right’}, default: ‘right’] The alignment of the text within the cells.

- **colWidths** [list of float, optional] The column widths in units of the axes.
  
  If not given, all columns will have a width of $1 / ncols$.

- **rowLabels** [list of str, optional] The text of the row header cells.

- **rowColours** [list of matplotlib color specs, optional] The colors of the row header cells.

- **rowLoc** [{‘left’, ‘center’, ‘right’}, optional, default: ‘left’] The text alignment of the row header cells.

- **colLabels** [list of str, optional] The text of the column header cells.

- **colColours** [list of matplotlib color specs, optional] The colors of the column header cells.

- **colLoc** [{‘left’, ‘center’, ‘right’}, optional, default: ‘left’] The text alignment of the column header cells.

- **loc** [str, optional] The position of the cell with respect to `ax`. This must be one of the `codes`.

- **bbox** [Bbox, optional] A bounding box to draw the table into. If this is not `None`, this overrides `loc`.

- **edges** [substring of ‘BRTL’ or {‘open’, ‘closed’, ‘horizontal’, ‘vertical’}] The cell edges to be drawn with a line. See also `visible_edges`.

**Returns**

- **table** [Table] The created table.
Other Parameters

**kwargs Table properties.

Examples using matplotlib.pyplot.table

- sphx_glr_gallery_misc_table_demo.py

matplotlib.pyplot.text

matplotlib.pyplot.text(x, y, s, fontdict=None, withdash=<deprecated parameter>, **kwargs)

Add text to the axes.

Add the text s to the axes at location x, y in data coordinates.

Parameters

x, y [scalars] The position to place the text. By default, this is in data coordinates. The coordinate system can be changed using the transform parameter.

s [str] The text.

fontdict [dictionary, optional, default: None] A dictionary to override the default text properties. If fontdict is None, the defaults are determined by your rc parameters.

Returns

**text** [Text] The created Text instance.

Other Parameters

**kwargs [Text properties.]** Other miscellaneous text parameters.

Examples

Individual keyword arguments can be used to override any given parameter:

```python
>>> text(x, y, s, fontsize=12)
```

The default transform specifies that text is in data coords, alternatively, you can specify text in axis coords (0,0 is lower-left and 1,1 is upper-right). The example below places text in the center of the axes:

```python
>>> text(0.5, 0.5, 'matplotlib', horizontalalignment='center', ...
    verticalalignment='center', transform=ax.transAxes)
```

You can put a rectangular box around the text instance (e.g., to set a background color) by using the keyword `bbox`. `bbox` is a dictionary of `Rectangle` properties. For example:

```python
>>> text(x, y, s, bbox=dict(facecolor='red', alpha=0.5))
```

Examples using `matplotlib.pyplot.text`

- sphx_glr_gallery_userdemo_pgf_texsystem.py
matplotlib.pyplot.thetagrids

matplotlib.pyplot.thetagrids(*args, **kwargs)

Get or set the theta gridlines on the current polar plot.

Call signatures:

```python
lines, labels = thetagrids()
lines, labels = thetagrids(angles, labels=None, fmt=None, **kwargs)
```

When called with no arguments, `thetagrids` simply returns the tuple `(lines, labels)`. When called with arguments, the labels will appear at the specified angles.

**Parameters**

- `angles` [tuple with floats, degrees] The angles of the theta gridlines.
- `labels` [tuple with strings or None] The labels to use at each radial gridline. The `projections.polar.ThetaFormatter` will be used if None.
- `fmt` [str or None] Format string used in `matplotlib.ticker.FormatStrFormatter`. For example '%f'. Note that the angle in radians will be used.

**Returns**

- `lines, labels` [list of `lines.Line2D`, list of `text.Text`] `lines` are the theta gridlines and `labels` are the tick labels.

**Other Parameters**

- `**kwargs` `kwars` are optional `Text` properties for the labels.

**See also:**

- `pyplot.rgrids`
- `projections.polar.PolarAxes.set_thetagrids`
- `Axis.get_gridlines`
- `Axis.get_ticklabels`

**Examples**

```
# set the locations of the angular gridlines
lines, labels = thetagrids( range(45,360,90) )

# set the locations and labels of the angular gridlines
lines, labels = thetagrids( range(45,360,90), ('NE', 'NW', 'SW','SE') )
```
matplotlib.pyplot.tick_params

matplotlib.pyplot.tick_params(axis='both', **kwargs)
Change the appearance of ticks, tick labels, and gridlines.

Parameters

axis [{'x', 'y', 'both'}, optional] Which axis to apply the parameters to.

Other Parameters

axis [{'x', 'y', 'both'}] Axis on which to operate; default is 'both'.
reset [bool] If True, set all parameters to defaults before processing other keyword arguments. Default is False.
which [{'major', 'minor', 'both'}] Default is 'major'; apply arguments to which ticks.
direction [{'in', 'out', 'inout'}] Puts ticks inside the axes, outside the axes, or both.
length [float] Tick length in points.
width [float] Tick width in points.
color [color] Tick color; accepts any mpl color spec.
pad [float] Distance in points between tick and label.
labelszie [float or str] Tick label font size in points or as a string (e.g., 'large').
labelcolor [color] Tick label color; mpl color spec.
colors [color] Changes the tick color and the label color to the same value: mpl color spec.
zorder [float] Tick and label zorder.
bottom, top, left, right [bool] Whether to draw the respective ticks.
labelbottom, labeltop, labelleft, labelright [bool] Whether to draw the respective tick labels.
labelrotation [float] Tick label rotation
grid_color [color] Changes the gridline color to the given mpl color spec.
grid_alpha [float] Transparency of gridlines: 0 (transparent) to 1 (opaque).
grid_linewidth [float] Width of gridlines in points.
grid_linestyle [string] Any valid Line2D line style spec.

Examples

Usage

```
ax.tick_params(direction='out', length=6, width=2, colors='r',
               grid_color='r', grid_alpha=0.5)
```
This will make all major ticks be red, pointing out of the box, and with dimensions 6 points by 2 points. Tick labels will also be red. Gridlines will be red and translucent.

```
plt.ticklabel_format(
    axis='both',
    style='plain',
    scilimits=None,
    useOffset=None,
    useLocale=None,
    useMathText=None
)
```

Change the `ScalarFormatter` used by default for linear axes.

Optional keyword arguments:

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>axis</code></td>
<td>['x', 'y', 'both']</td>
</tr>
<tr>
<td><code>style</code></td>
<td>['sci' (or 'scientific')</td>
</tr>
<tr>
<td><code>scilimits</code></td>
<td>(m, n), pair of integers; if <code>style</code> is 'sci', scientific notation will be used for numbers outside the range $10^m$ to $10^n$. Use (0,0) to include all numbers. Use (m,m) where m &lt;&gt; 0 to fix the order of magnitude to $10^m$.</td>
</tr>
<tr>
<td><code>useOffset</code></td>
<td>[bool</td>
</tr>
<tr>
<td><code>useLocale</code></td>
<td>If True, format the number according to the current locale. This affects things such as the character used for the decimal separator. If False, use C-style (English) formatting. The default setting is controlled by the axes.formatter.use_locale rcparam.</td>
</tr>
<tr>
<td><code>useMathText</code></td>
<td>If True, render the offset and scientific notation in mathtext</td>
</tr>
</tbody>
</table>

Only the major ticks are affected. If the method is called when the `ScalarFormatter` is not the `Formatter` being used, an `AttributeError` will be raised.

```
plt.tight_layout()
```

Automatically adjust subplot parameters to give specified padding.

**Parameters**

- `pad` [float] Padding between the figure edge and the edges of subplots, as a fraction of the font size.
- `h_pad, w_pad` [float, optional] Padding (height/width) between edges of adjacent subplots, as a fraction of the font size. Defaults to `pad`.
- `rect` [tuple (left, bottom, right, top), optional] A rectangle (left, bottom, right, top) in the normalized figure coordinate that the whole subplots area (including labels) will fit into. Default is (0, 0, 1, 1).

**Examples using `plt.tight_layout()`**

- sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py
**matplotlib.pyplot.title**

`matplotlib.pyplot.title(label, fontdict=None, loc='center', pad=None, **kwargs)`

Set a title for the axes.

Set one of the three available axes titles. The available titles are positioned above the axes in the center, flush with the left edge, and flush with the right edge.

**Parameters**

- **label** [str] Text to use for the title
- **fontdict** [dict] A dictionary controlling the appearance of the title text, the default `fontdict` is:
  ```python
default_fontdict = {'fontsize': rcParams['axes.titlesize'],
                     'fontweight': rcParams['axes.titleweight'],
                     'verticalalignment': 'baseline',
                     'horizontalalignment': 'center'}
```
  - `loc` ([‘center’, ‘left’, ‘right’], str, optional) Which title to set, defaults to ‘center’
  - `pad` [float] The offset of the title from the top of the axes, in points. Default is `None` to use `rcParams['axes.titlepad']`.

**Returns**

- **text** [Text] The matplotlib text instance representing the title

**Other Parameters**

- **kwargs** [Text properties] Other keyword arguments are text properties, see `Text` for a list of valid text properties.

**Examples using matplotlib.pyplot.title**

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py
- sphx_glr_gallery_user_interfaces_svg_histogram_sgskip.py

**matplotlib.pyplot.tricontour**

`matplotlib.pyplot.tricontour(*args, **kwargs)`

Draw contours on an unstructured triangular grid.

`tricontour` and `tricontourf` draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

The triangulation can be specified in one of two ways; either

```
tricontour(triangulation, ...)
```

where `triangulation` is a `matplotlib.tri.Triangulation` object, or
in which case a `Triangulation` object will be created. See that class’ docstring for an explanation of these cases.

The remaining arguments may be:

```python
tricontour(..., Z)
```

where `Z` is the array of values to contour, one per point in the triangulation. The level values are chosen automatically.

```python
tricontour(..., Z, N)
```

contour up to `N+1` automatically chosen contour levels (`N` intervals).

```python
tricontour(..., Z, V)
```

draw contour lines at the values specified in sequence `V`, which must be in increasing order.

```python
tricontourf(..., Z, V)
```

fill the (len(`V`)-1) regions between the values in `V`, which must be in increasing order.

```python
tricontour(Z, **kwargs)
```

Use keyword args to control colors, linewidth, origin, cmap ... see below for more details.

`tricontour(...)` returns a TriContourSet object.

Optional keyword arguments:

```python
colors: [None | string | (mpl_colors)] If None, the colormap specified by cmap will be used.

If a string, like ‘r’ or ‘red’, all levels will be plotted in this color.

If a tuple of matplotlib color args (string, float, rgb, etc), different levels will be plotted in different colors in the order specified.
```

```python
alpha: float The alpha blending value
```

```python
cmap: [None | Colormap] A cm Colormap instance or None. If cmap is None and colors is None, a default Colormap is used.
```

```python
norm: [None | Normalize] A matplotlib.colors.Normalize instance for scaling data values to colors. If norm is None and colors is None, the default linear scaling is used.
```

```python
levels [level0, level1, ..., leveln] A list of floating point numbers indicating the level curves to draw, in increasing order; e.g., to draw just the zero contour pass levels=[0]
```
**origin**: [None | 'upper' | 'lower' | 'image'] If None, the first value of Z will correspond to the lower left corner, location (0,0). If 'image', the rc value for image.origin will be used.

This keyword is not active if X and Y are specified in the call to contour.

**extent**: [None | (x0,x1,y0,y1)]

If origin is not None, then extent is interpreted as in `matplotlib.pyplot.imshow()`: it gives the outer pixel boundaries. In this case, the position of Z[0,0] is the center of the pixel, not a corner. If origin is None, then (x0, y0) is the position of Z[0,0], and (x1, y1) is the position of Z[-1,-1].

This keyword is not active if X and Y are specified in the call to contour.

**locator**: [None | ticker.Locator subclass] If locator is None, the default MaxNLocator is used. The locator is used to determine the contour levels if they are not given explicitly via the V argument.

**extend**: ['neither' | 'both' | 'min' | 'max'] Unless this is ‘neither’, contour levels are automatically added to one or both ends of the range so that all data are included. These added ranges are then mapped to the special colormap values which default to the ends of the colormap range, but can be set via `matplotlib.colors.Colormap.set_under()` and `matplotlib.colors.Colormap.set_over()` methods.

**xunits**, **yunits**: [None | registered units] Override axis units by specifying an instance of a `matplotlib.units.ConversionInterface`.

**tricontour-only keyword arguments:**

* **linewidths**: [None | number | tuple of numbers] If linewidths is None, defaults to `rc:lines.linewidth`. If a number, all levels will be plotted with this linewidth.

If a tuple, different levels will be plotted with different linewidths in the order specified.

* **linestyles**: [None | 'solid' | 'dashed' | 'dashdot' | 'dotted'] If linestyles is None, the 'solid' is used.

* **tricontourf-only keyword arguments:**

* **antialiased**: bool enable antialiasing

Note: tricontourf fills intervals that are closed at the top; that is, for boundaries z1 and z2, the filled region is:

```
z1 < Z <= z2
```

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).
Examples using `matplotlib.pyplot.tricontour`

- sphx_glr_gallery_images_contours_and_fields_irregulardatagrid.py
- sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_delaunay.py
- sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_user.py
- sphx_glr_gallery_images_contours_and_fields_trigradient_demo.py

`matplotlib.pyplot.tricontourf`

`matplotlib.pyplot.tricontourf(*args, **kwargs)`

Draw contours on an unstructured triangular grid.

`tricontour` and `tricontourf` draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

The triangulation can be specified in one of two ways; either

```
tricontour(triangulation, ...)
```

where `triangulation` is a `matplotlib.tri.Triangulation` object, or

```
tricontour(x, y, ...)  
tricontour(x, y, triangles, ...)  
tricontour(x, y, triangles=triangles, ...)  
tricontour(x, y, mask=mask, ...)  
tricontour(x, y, triangles, mask=mask, ...)
```

in which case a `Triangulation` object will be created. See that class’ docstring for an explanation of these cases.

The remaining arguments may be:

```
tricontour(..., Z)
```

where `Z` is the array of values to contour, one per point in the triangulation. The level values are chosen automatically.

```
tricontour(..., Z, N)
```

contour up to $N+1$ automatically chosen contour levels ($N$ intervals).

```
tricontour(..., Z, V)
```

draw contour lines at the values specified in sequence `V`, which must be in increasing order.

```
tricontourf(..., Z, V)
```

fill the (len(`V`)−1) regions between the values in `V`, which must be in increasing order.

```
tricontour(Z, **kwargs)
```
Use keyword args to control colors, linewidth, origin, cmap ... see below for more details.

tricontour(...) returns a TriContourSet object.

Optional keyword arguments:

colors: [None | string | (mpl_colors)] If None, the colormap specified by cmap will be used.

If a string, like 'r' or 'red', all levels will be plotted in this color.

If a tuple of matplotlib color args (string, float, rgb, etc), different levels will be plotted in different colors in the order specified.

alpha: float The alpha blending value

cmap: [None | Colormap] A cm Colormap instance or None. If cmap is None and colors is None, a default Colormap is used.

norm: [None | Normalize] A matplotlib.colors.Normalize instance for scaling data values to colors. If norm is None and colors is None, the default linear scaling is used.

levels [level0, level1, ..., leveln] A list of floating point numbers indicating the level curves to draw, in increasing order; e.g., to draw just the zero contour pass levels=[0]

origin: [None | ‘upper’ | ‘lower’ | ‘image’] If None, the first value of Z will correspond to the lower left corner, location (0,0). If ‘image’, the rc value for image.origin will be used.

This keyword is not active if X and Y are specified in the call to contour.

extent: [None | (x0,x1,y0,y1)]

If origin is not None, then extent is interpreted as in matplotlib.pyplot.imshow(): it gives the outer pixel boundaries. In this case, the position of Z[0,0] is the center of the pixel, not a corner. If origin is None, then (x0, y0) is the position of Z[0,0], and (x1, y1) is the position of Z[-1,-1].

This keyword is not active if X and Y are specified in the call to contour.

locator: [None | ticker.Locator subclass] If locator is None, the default MaxNLocator is used. The locator is used to determine the contour levels if they are not given explicitly via the V argument.

extend: [‘neither’ | ‘both’ | ‘min’ | ‘max’] Unless this is ‘neither’, contour levels are automatically added to one or both ends of the range so that all data are included. These added ranges are then mapped to the special colormap values which default to the ends of the colormap range, but can be set via matplotlib.colors.Colormap.set_under() and matplotlib.colors.Colormap.set_over() methods.

xunits, yunits: [None | registered units] Override axis units by specifying an instance of a matplotlib.units.ConversionInterface.

tricontour-only keyword arguments:

linewidths: [None | number | tuple of numbers] If linewidths is None, defaults to rc:lines.linewidth.

If a number, all levels will be plotted with this linewidth.
If a tuple, different levels will be plotted with different linewidths in the order specified.

**linestyles**: [ *None* | ‘solid’ | ‘dashed’ | ‘dashdot’ | ‘dotted’ ] If *linestyles* is *None*, the ‘solid’ is used.

*linestyles* can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

If contour is using a monochrome colormap and the contour level is less than 0, then the linestyle specified in *rcParams*["contour.negative_linestyle"] (default: ‘dashed’) will be used.

**tricontourf-only keyword arguments:**

- **antialiased**: bool enable antialiasing

Note: *tricontourf* fills intervals that are closed at the top; that is, for boundaries *z1* and *z2*, the filled region is:

\[ z1 < Z \leq z2 \]

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

**Examples using matplotlib.pyplot.tricontourf**

- sphx_glr_gallery_images_contours_and_fields_irregulardatagrid.py
- sphx_glr_gallery_images_contours_and_fields_tricontour_demo.py
- sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_delaunay.py
- sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_user.py
- sphx_glr_gallery_images_contours_and_fields_triinterp_demo.py

**matplotlib.pyplot.tripcolor**

```
matplotlib.pyplot.tripcolor(*args, alpha=1.0, norm=None, cmap=None, vmin=None, vmax=None, shading='flat', facecolors=None, **kwargs)
```

Create a pseudocolor plot of an unstructured triangular grid.

The triangulation can be specified in one of two ways; either:

```
tripcolor(triangulation, ...)
```

where triangulation is a *matplotlib.tri.Triangulation* object, or

```
tripcolor(x, y, ...)
tripcolor(x, y, triangles, ...)
tripcolor(x, y, triangles=triangles, ...)
tripcolor(x, y, mask=mask, ...)
tripcolor(x, y, triangles, mask=mask, ...)
```
in which case a Triangulation object will be created. See *Triangulation* for a explanation of these possibilities.

The next argument must be \( C \), the array of color values, either one per point in the triangulation if color values are defined at points, or one per triangle in the triangulation if color values are defined at triangles. If there are the same number of points and triangles in the triangulation it is assumed that color values are defined at points; to force the use of color values at triangles use the kwarg `facecolors=C` instead of just `C`.

`shading` may be ‘flat’ (the default) or ‘gouraud’. If `shading` is ‘flat’ and \( C \) values are defined at points, the color values used for each triangle are from the mean \( C \) of the triangle’s three points. If `shading` is ‘gouraud’ then color values must be defined at points.

The remaining kwargs are the same as for `pcolor()`.

**Examples using `matplotlib.pyplot.tripcolor`**

- `sphx_glr_gallery_images_contours_and_fields_tripcolor_demo.py`

**`matplotlib.pyplot.triplot`**

```python
matplotlib.pyplot.triplot(*args, **kwargs)
```

Draw a unstructured triangular grid as lines and/or markers.

The triangulation to plot can be specified in one of two ways; either:

```python
triplot(triangulation, ...)
```

where triangulation is a *matplotlib.tri.Triangulation* object, or

```python
triplot(x, y, ...)
triplot(x, y, triangles, ...)
triplot(x, y, triangles=triangles, ...)
triplot(x, y, mask=mask, ...)
triplot(x, y, triangles, mask=mask, ...)
```

in which case a Triangulation object will be created. See *Triangulation* for a explanation of these possibilities.

The remaining args and kwargs are the same as for `plot()`.

Return a list of 2 `Line2D` containing respectively:

- the lines plotted for triangles edges
- the markers plotted for triangles nodes

**Examples using `matplotlib.pyplot.triplot`**

- `sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_delaunay.py`
- `sphx_glr_gallery_images_contours_and_fields_trigradient_demo.py`
- `sphx_glr_gallery_images_contours_and_fields_triinterp_demo.py`
• sphx_glr_gallery_images_contours_and_fields_triplot_demo.py
• sphx_glr_gallery_event_handling_trifinder_event_demo.py

matplotlib.pyplot.twinx

matplotlib.pyplot.twinx(ax=None)
Make and return a second axes that shares the x-axis. The new axes will overlay ax (or the current axes if ax is None), and its ticks will be on the right.

Examples
/gallery/subplots_axes_and_figures/two_scales

matplotlib.pyplot.twiny

matplotlib.pyplot.twiny(ax=None)
Make and return a second axes that shares the y-axis. The new axes will overlay ax (or the current axes if ax is None), and its ticks will be on the top.

Examples
/gallery/subplots_axes_and_figures/two_scales

matplotlib.pyplot.uninstall_repl_displayhook

matplotlib.pyplot.uninstall_repl_displayhook()
Uninstall the matplotlib display hook.

matplotlib.pyplot.violinplot

matplotlib.pyplot.violinplot(dataset, positions=None, vert=True, widths=0.5, showmeans=False, showextrema=True, showmedians=False, points=100, bw_method=None, *, data=None)
Make a violin plot.

Make a violin plot for each column of dataset or each vector in sequence dataset. Each filled area extends to represent the entire data range, with optional lines at the mean, the median, the minimum, and the maximum.

Parameters

- **dataset** [Array or a sequence of vectors.] The input data.
- **positions** [array-like, default = [1, 2, ..., n]] Sets the positions of the violins. The ticks and limits are automatically set to match the positions.
- **vert** [bool, default = True.] If true, creates a vertical violin plot. Otherwise, creates a horizontal violin plot.
**widths** [array-like, default = 0.5] Either a scalar or a vector that sets the maximal width of each violin. The default is 0.5, which uses about half of the available horizontal space.

**showmeans** [bool, default = False] If True, will toggle rendering of the means.

**showextrema** [bool, default = True] If True, will toggle rendering of the extrema.

**showmedians** [bool, default = False] If True, will toggle rendering of the medians.

**points** [scalar, default = 100] Defines the number of points to evaluate each of the gaussian kernel density estimations at.

**bw_method** [str, scalar or callable, optional] The method used to calculate the estimator bandwidth. This can be ‘scott’, ‘silverman’, a scalar constant or a callable. If a scalar, this will be used directly as \( kde \). If a callable, it should take a GaussianKDE instance as its only parameter and return a scalar. If None (default), ‘scott’ is used.

**Returns**

**result** [dict] A dictionary mapping each component of the violinplot to a list of the corresponding collection instances created. The dictionary has the following keys:

- **bodies**: A list of the matplotlib.collections.PolyCollection instances containing the filled area of each violin.
- **cmeans**: A matplotlib.collections.LineCollection instance created to identify the mean values of each of the violin’s distribution.
- **cmins**: A matplotlib.collections.LineCollection instance created to identify the bottom of each violin’s distribution.
- **cmaxes**: A matplotlib.collections.LineCollection instance created to identify the top of each violin’s distribution.
- **cbars**: A matplotlib.collections.LineCollection instance created to identify the centers of each violin’s distribution.
- **cmedians**: A matplotlib.collections.LineCollection instance created to identify the median values of each of the violin’s distribution.

**Notes**

**Note:** In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

- All arguments with the following names: ‘dataset’.

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).
**matplotlib.pyplot.viridis**

```python
matplotlib.pyplot.viridis()
```

Set the colormap to "viridis".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

**matplotlib.pyplot.vlines**

```python
matplotlib.pyplot.vlines(x, ymin, ymax, colors='k', linestyles='solid', label='', *,
                         data=None, **kwargs)
```

Plot vertical lines.

Plot vertical lines at each `x` from `ymin` to `ymax`.

**Parameters**

- `x` [scalar or 1D array_like] x-indexes where to plot the lines.
- `ymin, ymax` [scalar or 1D array_like] Respective beginning and end of each line. If scalars are provided, all lines will have same length.
- `colors` [array_like of colors, optional, default: 'k']
- `linestyles` [{‘solid’, ‘dashed’, ‘dashdot’, ‘dotted’}, optional]
- `label` [string, optional, default: '']

**Returns**

- `lines` [LineCollection]

**Other Parameters**

- `**kwargs` [LineCollection properties.]

**See also:**

- `hlines` horizontal lines
- `axvline` vertical line across the axes

**Notes**

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments are replaced by `data[<arg>]`:

- All arguments with the following names: ‘colors’, ‘x’, ‘ymax’, ‘ymin’.

Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg> in data`).
matplotlib.pyplot.waitforbuttonpress

matplotlib.pyplot.waitforbuttonpress(*args, **kwargs)
   Blocking call to interact with the figure.
   This will return True is a key was pressed, False if a mouse button was pressed and None
   if timeout was reached without either being pressed.
   If timeout is negative, does not timeout.

Examples using matplotlib.pyplot.waitforbuttonpress

• sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

matplotlib.pyplot.winter

matplotlib.pyplot.winter()
   Set the colormap to “winter”.
   This changes the default colormap as well as the colormap of the current image if there
   is one. See help(colormaps) for more information.

matplotlib.pyplot.xcorr

matplotlib.pyplot.xcorr(x, y, normed=True, detrend=<function detrend_none
   at 0x7f0f90419700>, usevlines=True, maxlags=10, *,
   data=None, **kwargs)
   Plot the cross correlation between x and y.
   The correlation with lag k is defined as \( \sum_n x[n+k] \cdot y^*[n] \), where \( y^* \) is the complex conjugate
   of \( y \).

Parameters

  x [array-like of length n]
  y [array-like of length n]

  detrend [callable, optional, default: mlab.detrend_none] x and y are de-
  trended by the detrend callable. This must be a function \( x = \text{detrend}(x) \)
  accepting and returning an numpy.array. Default is no normalization.

  normed [bool, optional, default: True] If True, input vectors are nor-
  malised to unit length.

  usevlines [bool, optional, default: True] Determines the plot style.
  If True, vertical lines are plotted from 0 to the xcorr value using Axes.
  vlines. Additionally, a horizontal line is plotted at \( y=0 \) using Axes.
  axhline.
  If False, markers are plotted at the xcorr values using Axes.plot.

  maxlags [int, optional, default: 10] Number of lags to show. If None, will
  return all \( 2 \cdot \text{len}(x) - 1 \) lags.

Returns
lags [array (length 2*maxlags+1)] The lag vector.
c [array (length 2*maxlags+1)] The auto correlation vector.
line [LineCollection or Line2D] Artist added to the axes of the correlation:

• LineCollection if usevlines is True.
• Line2D if usevlines is False.
b [Line2D or None] Horizontal line at 0 if usevlines is True None usevlines is False.

Other Parameters

linestyle [Line2D property, optional] The linestyle for plotting the data points. Only used if usevlines is False.
marker [str, optional, default: 'o'] The marker for plotting the data points. Only used if usevlines is False.

Notes

The cross correlation is performed with numpy.correlate() with mode = "full".

Note: In addition to the above described arguments, this function can take a data key-word argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

• All arguments with the following names: ‘x’, ‘y’.

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).

Examples using matplotlib.pyplot.xcorr

• sphx_glr_gallery_lines_bars_and_markers_xcorr_acorr_demo.py

matplotlib.pyplot.xkcd

matplotlib.pyplot.xkcd(scale=1, length=100, randomness=2)

Turn on xkcd sketch-style drawing mode. This will only have effect on things drawn after this function is called.

For best results, the “Humor Sans” font should be installed: it is not included with matplotlib.

Parameters

scale [float, optional] The amplitude of the wiggle perpendicular to the source line.
length [float, optional] The length of the wiggle along the line.
randomness [float, optional] The scale factor by which the length is shrunken or expanded.
Notes

This function works by a number of rcParams, so it will probably override others you have set before.

If you want the effects of this function to be temporary, it can be used as a context manager, for example:

```python
with plt.xkcd():
    # This figure will be in XKCD-style
    fig1 = plt.figure()
    # ...

# This figure will be in regular style
fig2 = plt.figure()
```

Examples using `matplotlib.pyplot.xkcd`

- `sphx_glr_gallery_showcase_xkcd.py`

`matplotlib.pyplot.xlabel`

```python
matplotlib.pyplot.xlabel(xlabel, fontdict=None, labelpad=None, **kwargs)
```

Set the label for the x-axis.

**Parameters**

- `xlabel` [str] The label text.
- `labelpad` [scalar, optional, default: None] Spacing in points from the axes bounding box including ticks and tick labels.

**Other Parameters**

- `**kwargs` [Text properties] Text properties control the appearance of the label.

**See also:**

`text` for information on how override and the optional args work

Examples using `matplotlib.pyplot.xlabel`

- `sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py`

`matplotlib.pyplot.xlim`

```python
matplotlib.pyplot.xlim(*args, **kwargs)
```

Get or set the x limits of the current axes.

Call signatures:
left, right = xlim()  # return the current xlim
xlim((left, right))  # set the xlim to left, right
xlim(left, right)   # set the xlim to left, right

If you do not specify args, you can pass left or right as kwargs, i.e.:

xlim(right=3)  # adjust the right leaving left unchanged
xlim(left=1)   # adjust the left leaving right unchanged

Setting limits turns autoscaling off for the x-axis.

**Returns**

left, right A tuple of the new x-axis limits.

**Notes**

Calling this function with no arguments (e.g. xlim()) is the pyplot equivalent of calling get_xlim on the current axes. Calling this function with arguments is the pyplot equivalent of calling set_xlim on the current axes. All arguments are passed though.

**Examples using matplotlib.pyplot.xlim**

- Frame grabbing
- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

**matplotlib.pyplot.xscale**

matplotlib.pyplot.xscale(value, **kwargs)

Set the x-axis scale.

**Parameters**

value [{“linear”, “log”, “symlog”, “logit”, ...}] The axis scale type to apply.

**kwargs** Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- matplotlib.scale.LinearScale
- matplotlib.scale.LogScale
- matplotlib.scale.SymmetricalLogScale
- matplotlib.scale.LogitScale

**Notes**

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using matplotlib.scale.register_scale. These scales can then also be used here.
Examples using `matplotlib.pyplot.xscale`

- `sphx_glr_gallery_scales_symlog_demo.py`

`matplotlib.pyplot.xticks`

`matplotlib.pyplot.xticks(ticks=None, labels=None, **kwargs)`

Get or set the current tick locations and labels of the x-axis.

Call signatures:

```
locs, labels = xticks()          # Get locations and labels
xticks(ticks, [labels], **kwargs)  # Set locations and labels
```

**Parameters**

- `ticks` [array_like] A list of positions at which ticks should be placed. You can pass an empty list to disable xticks.
- `labels` [array_like, optional] A list of explicit labels to place at the given `locs`.
- `**kwargs` Text properties can be used to control the appearance of the labels.

**Returns**

- `locs` An array of label locations.
- `labels` A list of `Text` objects.

**Notes**

Calling this function with no arguments (e.g. `xticks()`) is the pyplot equivalent of calling `get_xticks` and `get_xticklabels` on the current axes. Calling this function with arguments is the pyplot equivalent of calling `set_xticks` and `set_xticklabels` on the current axes.

**Examples**

Get the current locations and labels:

```
>>> locs, labels = xticks()
```

Set label locations:

```
>>> xticks(np.arange(0, 1, step=0.2))
```

Set text labels:

```
>>> xticks(np.arange(5), ('Tom', 'Dick', 'Harry', 'Sally', 'Sue'))
```

Set text labels and properties:
>>> xticks(np.arange(12), calendar.month_name[1:13], rotation=20)

Disable xticks:

>>> xticks([])

Examples using matplotlib.pyplot.xticks

- sphx_glr_gallery_lines_bars_and_markers_bar_stacked.py
- sphx_glr_gallery_subplots_axes_and_figures_secondary_axis.py
- sphx_glr_gallery_text_labels_and_annotations_arrow_demo.py
- sphx_glr_gallery_text_labels_and_annotations_multiline.py
- sphx_glr_gallery_text_labels_and_annotations_usetex_demo.py
- sphx_glr_gallery_axes_grid1_demo_colorbar_of_inset_axes.py
- sphx_glr_gallery_misc_table_demo.py
- sphx_glr_gallery_ticks_and_spines_custom_ticker1.py
- sphx_glr_gallery_ticks_and_spines_ticklabels_rotation.py

matplotlib.pyplot.ylabel

matplotlib.pyplot.ylabel(ylabel, fontdict=None, labelpad=None, **kwargs)

Set the label for the y-axis.

**Parameters**

- **ylabel** [str] The label text.
- **labelpad** [scalar, optional, default: None] Spacing in points from the axes bounding box including ticks and tick labels.

**Other Parameters**

- **kwargs** [Text properties] Text properties control the appearance of the label.

**See also:**

- **text** for information on how override and the optional args work

Examples using matplotlib.pyplot.ylabel

- sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py
matplotlib.pyplot.ylim

matplotlib.pyplot.ylim(*args, **kwargs)
Get or set the y-limits of the current axes.

Call signatures:

```python
bottom, top = ylim()  # return the current ylim
ylim((bottom, top))  # set the ylim to bottom, top
ylim(bottom, top)    # set the ylim to bottom, top
```

If you do not specify args, you can alternatively pass bottom or top as kwargs, i.e.:

```python
ylim(top=3)  # adjust the top leaving bottom unchanged
ylim(bottom=1)  # adjust the bottom leaving top unchanged
```

Setting limits turns autoscaling off for the y-axis.

**Returns**

bottom, top A tuple of the new y-axis limits.

**Notes**

Calling this function with no arguments (e.g. ylim()) is the pyplot equivalent of calling get_ylim on the current axes. Calling this function with arguments is the pyplot equivalent of calling set_ylim on the current axes. All arguments are passed through.

**Examples using matplotlib.pyplot.ylim**

- Frame grabbing
- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

matplotlib.pyplot.yscale

matplotlib.pyplot.yscale(value, **kwargs)
Set the y-axis scale.

**Parameters**

value [{“linear”, “log”, “symlog”, “logit”, ...}] The axis scale type to apply.

**kwargs** Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- matplotlib.scale.LinearScale
- matplotlib.scale.LogScale
- matplotlib.scale.SymmetricalLogScale
- matplotlib.scale.LogitScale
Notes

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using `matplotlib.scale.register_scale`. These scales can then also be used here.

Examples using `matplotlib.pyplot.yscale`

- `sphx_glr_gallery_pyplots_pyplot_scales.py`
- `sphx_glr_gallery_scales_symlog_demo.py`
- Pyplot tutorial

`matplotlib.pyplot.yticks`

`matplotlib.pyplot.yticks(ticks=None, labels=None, **kwargs)`

Get or set the current tick locations and labels of the y-axis.

Call signatures:

```python
locs, labels = yticks()          # Get locations and labels
yticks(ticks, [labels], **kwargs) # Set locations and labels
```

Parameters

- `ticks [array_like]` A list of positions at which ticks should be placed. You can pass an empty list to disable yticks.
- `labels [array_like, optional]` A list of explicit labels to place at the given `locs`.
- `**kwargs` `Text` properties can be used to control the appearance of the labels.

Returns

- `locs` An array of label locations.
- `labels` A list of `Text` objects.

Notes

Calling this function with no arguments (e.g. `yticks()`) is the pyplot equivalent of calling `get_yticks` and `get_yticklabels` on the current axes. Calling this function with arguments is the pyplot equivalent of calling `set_yticks` and `set_yticklabels` on the current axes.

Examples

Get the current locations and labels:

```python
>>> locs, labels = yticks()
```

Set label locations:
>>> yticks(np.arange(0, 1, step=0.2))

Set text labels:
>>> yticks(np.arange(5), ('Tom', 'Dick', 'Harry', 'Sally', 'Sue'))

Set text labels and properties:
>>> yticks(np.arange(12), calendar.month_name[1:13], rotation=45)

Disable yticks:
>>> yticks([])

Examples using matplotlib.pyplot.yticks

- sphx_glr_gallery_lines_bars_and_markers_bar_stacked.py
- sphx_glr_gallery_text_labels_and_annotations_arrow_demo.py
- sphx_glr_gallery_text_labels_and_annotations_usetex_demo.py
- sphx_glr_gallery_axes_grid1_demo_colorbar_of_inset_axes.py
- sphx_glr_gallery_misc_table_demo.py

```
Function         Description
acorr            Plot the autocorrelation of x.
angle_spectrum   Plot the angle spectrum.
anotate          Annotate the point xy with text text.
arrow            Add an arrow to the axes.
autoscale        Autoscale the axis view to the data (toggle).
axes             Add an axes to the current figure and make it the current axes.
axhline          Add a horizontal line across the axis.
axhspan          Add a horizontal span (rectangle) across the axis.
axis             Convenience method to get or set some axis properties.
axvline          Add a vertical line across the axes.
axvspan          Add a vertical span (rectangle) across the axes.
bar              Make a bar plot.
barbs            Plot a 2D field of barbs.
barh             Make a horizontal bar plot.
box              Turn the axes box on or off on the current axes.
boxplot          Make a box and whisker plot.
broken_barh      Plot a horizontal sequence of rectangles.
cla              Clear the current axes.
clabel           Label a contour plot.
cif              Clear the current figure.
clim             Set the color limits of the current image.
close            Close a figure window.
cohere           Plot the coherence between x and y.

</tr>
</tbody>
</table>
### 17.37.2 Colors in Matplotlib

There are many colormaps you can use to map data onto color values. Below we list several ways in which color can be utilized in Matplotlib.

For a more in-depth look at colormaps, see the *Choosing Colormaps in Matplotlib* tutorial.

Matplotlib provides a number of colormaps, and others can be added using `register_cmap()`. This function documents the built-in colormaps, and will also return a list of all registered colormaps if called.

You can set the colormap for an image, pcolor, scatter, etc, using a keyword argument:

```python
imshow(X, cmap=cm.hot)
```

or using the `set_cmap()` function:

```python
imshow(X)
pplot.set_cmap('hot')
pplot.set_cmap('jet')
```

In interactive mode, `set_cmap()` will update the colormap post-hoc, allowing you to see which one works best for your data.

All built-in colormaps can be reversed by appending `_r`: For instance, `gray_r` is the reverse of `gray`.

There are several common color schemes used in visualization:

- **Sequential schemes** for unipolar data that progresses from low to high
- **Diverging schemes** for bipolar data that emphasizes positive or negative deviations from a central value
- **Cyclic schemes** for plotting values that wrap around at the endpoints, such as phase angle, wind direction, or time of day
- **Qualitative schemes** for nominal data that has no inherent ordering, where color is used only to distinguish categories

Matplotlib ships with 4 perceptually uniform color maps which are the recommended color maps for sequential data:
<table>
<thead>
<tr>
<th>Colormap</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inferno</td>
<td>perceptually uniform shades of black-red-yellow</td>
</tr>
<tr>
<td>magma</td>
<td>perceptually uniform shades of black-red-white</td>
</tr>
<tr>
<td>plasma</td>
<td>perceptually uniform shades of blue-red-yellow</td>
</tr>
<tr>
<td>viridis</td>
<td>perceptually uniform shades of blue-green-yellow</td>
</tr>
</tbody>
</table>

The following colormaps are based on the ColorBrewer color specifications and designs developed by Cynthia Brewer:

ColorBrewer Diverging (luminance is highest at the midpoint, and decreases towards differently-colored endpoints):

<table>
<thead>
<tr>
<th>Colormap</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BrBG</td>
<td>brown, white, blue-green</td>
</tr>
<tr>
<td>PiYG</td>
<td>pink, white, yellow-green</td>
</tr>
<tr>
<td>PRGn</td>
<td>purple, white, green</td>
</tr>
<tr>
<td>PuOr</td>
<td>orange, white, purple</td>
</tr>
<tr>
<td>RdBu</td>
<td>red, white, blue</td>
</tr>
<tr>
<td>RdGy</td>
<td>red, white, gray</td>
</tr>
<tr>
<td>RdYlBu</td>
<td>red, yellow, blue</td>
</tr>
<tr>
<td>RdYlGn</td>
<td>red, yellow, green</td>
</tr>
<tr>
<td>Spectral</td>
<td>red, orange, yellow, green, blue</td>
</tr>
</tbody>
</table>

ColorBrewer Sequential (luminance decreases monotonically):

<table>
<thead>
<tr>
<th>Colormap</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blues</td>
<td>white to dark blue</td>
</tr>
<tr>
<td>BuGn</td>
<td>white, light blue, dark green</td>
</tr>
<tr>
<td>BuPu</td>
<td>white, light blue, dark purple</td>
</tr>
<tr>
<td>GnBu</td>
<td>white, light green, dark blue</td>
</tr>
<tr>
<td>Greens</td>
<td>white to dark green</td>
</tr>
<tr>
<td>Greys</td>
<td>white to black (not linear)</td>
</tr>
<tr>
<td>OrRd</td>
<td>white, orange, dark red</td>
</tr>
<tr>
<td>PuBu</td>
<td>white, light purple, dark blue</td>
</tr>
<tr>
<td>PuBuGn</td>
<td>white, light purple, dark green</td>
</tr>
<tr>
<td>PuRd</td>
<td>white, light purple, dark red</td>
</tr>
<tr>
<td>Purples</td>
<td>white to dark purple</td>
</tr>
<tr>
<td>RdPu</td>
<td>white, pink, dark purple</td>
</tr>
<tr>
<td>Reds</td>
<td>white to dark red</td>
</tr>
<tr>
<td>YlGn</td>
<td>light yellow, dark green</td>
</tr>
<tr>
<td>YlGnBu</td>
<td>light yellow, light green, dark blue</td>
</tr>
<tr>
<td>YlOrBr</td>
<td>light yellow, orange, dark brown</td>
</tr>
<tr>
<td>YlOrRd</td>
<td>light yellow, orange, dark red</td>
</tr>
</tbody>
</table>

ColorBrewer Qualitative:
(For plotting nominal data, ListedColormap is used, not LinearSegmentedColormap. Different sets of colors are recommended for different numbers of categories.)

- Accent
- Dark2

17.37. matplotlib.pyplot 1925
• Paired
• Pastel1
• Pastel2
• Set1
• Set2
• Set3

A set of colormaps derived from those of the same name provided with Matlab are also included:

<table>
<thead>
<tr>
<th>Colormap</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>autumn</td>
<td>sequential linearly-increasing shades of red-orange-yellow</td>
</tr>
<tr>
<td>bone</td>
<td>sequential increasing black-white color map with a tinge of blue, to emulate X-ray film</td>
</tr>
<tr>
<td>cool</td>
<td>linearly-decreasing shades of cyan-magenta</td>
</tr>
<tr>
<td>copper</td>
<td>sequential increasing shades of black-copper</td>
</tr>
<tr>
<td>flag</td>
<td>repetitive red-white-blue-black pattern (not cyclic at endpoints)</td>
</tr>
<tr>
<td>gray</td>
<td>sequential linearly-increasing black-to-white grayscale</td>
</tr>
<tr>
<td>hot</td>
<td>sequential black-red-yellow-white, to emulate blackbody radiation from an object at increasing temperatures</td>
</tr>
<tr>
<td>jet</td>
<td>a spectral map with dark endpoints, blue-cyan-yellow-red; based on a fluid-jet simulation by NCSA¹</td>
</tr>
<tr>
<td>pink</td>

A set of palettes from the Yorick scientific visualisation package, an evolution of the GIST package, both by David H. Munro are included:

¹ Rainbow colormaps, jet in particular, are considered a poor choice for scientific visualization by many researchers: Rainbow Color Map (Still) Considered Harmful
## Matplotlib, Release 3.1.3

### Colormap Description

<table>
<thead>
<tr>
<th>Colormap</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gist_earth</td>
<td>mapmaker’s colors from dark blue deep ocean to green lowlands to brown highlands to white mountains</td>
</tr>
<tr>
<td>gist_heat</td>
<td>sequential increasing black-red-orange-white, to emulate black-body radiation from an iron bar as it grows hotter</td>
</tr>
<tr>
<td>gist_ncar</td>
<td>pseudo-spectral black-blue-green-yellow-red-purple-white colormap from National Center for Atmospheric Research²</td>
</tr>
<tr>
<td>gist_rainbow</td>
<td>runs through the colors in spectral order from red to violet at full saturation (like hsv but not cyclic)</td>
</tr>
<tr>
<td>gist_stern</td>
<td>“Stern special” color table from Interactive Data Language software</td>
</tr>
</tbody>
</table>

A set of cyclic color maps:

<table>
<thead>
<tr>
<th>Colormap</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hsv</td>
<td>red-yellow-green-cyan-blue-magenta-red, formed by changing the hue component in the HSV color space</td>
</tr>
<tr>
<td>twilight</td>
<td>perceptually uniform shades of white-blue-black-red-white</td>
</tr>
<tr>
<td>twilight_shifted</td>
<td>perceptually uniform shades of black-blue-white-red-black</td>
</tr>
</tbody>
</table>

Other miscellaneous schemes:

<td>blue-red-green</td>
</tr>
<tr>
<td>bwr</td>
<td>diverging blue-white-red</td>
</tr>
<tr>
<td>coolwarm</td>
<td>diverging blue-gray-red, meant to avoid issues with 3D shading, color blindness, and ordering of colors</td>
</tr>
<tr>
<td>CM-Rmap</td>
<td>&quot;Default colormaps on color images often reproduce to confusing grayscale images. The proposed colormap maintains an aesthetically pleasing color image that automatically reproduces to a monotonic grayscale with discrete, quantifiable saturation levels.&quot;</td>
</tr>
<tr>
<td>cubehelix</td>
<td>Unlike most other color schemes cubehelix was designed by D.A. Green to be monotonically increasing in terms of perceived brightness. Also, when printed on a black and white postscript printer, the scheme results in a greyscale with monotonically increasing brightness. This color scheme is named cubehelix because the r,g,b values produced can be visualised as a squashed helix around the diagonal in the r,g,b color cube.</td>
</tr>
<tr>
<td>gnuplot</td>
<td>gnuplot’s traditional pm3d scheme (black-blue-red-yellow)</td>
</tr>
<tr>
<td>gnuplot2</td>
<td>sequential color printable as gray (black-blue-violet-yellow-white)</td>
</tr>
<tr>
<td>ocean</td>
<td>green-blue-white</td>
</tr>
<tr>
<td>rainbow</td>
<td>spectral purple-blue-green-yellow-orange-red colormap with diverging luminance</td>
</tr>
<tr>
<td>seismic</td>
<td>diverging blue-white-red</td>
</tr>
<tr>
<td>nipy</td>
<td>spartak purple-blue-green-yellow-red-white spectrum, originally from the Neuroimaging in Python project</td>
</tr>
<tr>
<td>terrain</td>
<td>mapmaker’s colors, blue-green-yellow-brown-white, originally from IGOR Pro</td>
</tr>
</tbody>
</table>

The following colormaps are redundant and may be removed in future versions. It’s recommended to use the names in the descriptions instead, which produce identical output:

<table>
<thead>
<tr>
<th>Colormap</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gist_gray</td>
<td>identical to gray</td>
</tr>
<tr>
<td>gist_yarg</td>
<td>identical to gray_r</td>
</tr>
<tr>
<td>binary</td>
<td>identical to gray_r</td>
</tr>
</tbody>
</table>

### 17.38 matplotlib.projections

`class matplotlib.projections.ProjectionRegistry`  
`Bases: object`  
Manages the set of projections available to the system.

---

3 See Diverging Color Maps for Scientific Visualization by Kenneth Moreland.  
4 See A Color Map for Effective Black-and-White Rendering of Color-Scale Images by Carey Rappaport
get_projection_class(self, name)
    Get a projection class from its name.

get_projection_names(self)
    Get a list of the names of all projections currently registered.

register(self, *projections)
    Register a new set of projections.

matplotlib.projections.get_projection_class(projection=None)
    Get a projection class from its name.
    If projection is None, a standard rectilinear projection is returned.

matplotlib.projections.get_projection_names()
    Get a list of acceptable projection names.

matplotlib.projections.process_projection_requirements(figure, *args, **kwargs)
    [Deprecated]

Notes

Deprecated since version 3.1:

matplotlib.projections.register_projection(cls)

17.39 matplotlib.projections.polar

class matplotlib.projections.polar.InvertedPolarTransform(axis=None, use_rmin=True, _apply_theta_transforms=True)
    Bases: matplotlib.transforms.Transform

    The inverse of the polar transform, mapping Cartesian coordinate space x and y back to theta and r.

    input_dims = 2

    inverted(self)
        Return the corresponding inverse transformation.
        The return value of this method should be treated as temporary. An update to self does not cause a corresponding update to its inverted copy.

        x === self.inverted().transform(self.transform(x))

        is_separable = False

    output_dims = 2

    transform_non_affine(self, xy)
        Performs only the non-affine part of the transformation.
        transform(values) is always equivalent to transform_affine(transform_non_affine(values)).
        In non-affine transformations, this is generally equivalent to transform(values). In affine transformations, this is always a no-op.

        Accepts a numpy array of shape (N x input_dims) and returns a numpy array of shape (N x output_dims).
Alternatively, accepts a numpy array of length $input_dims$ and returns a numpy array of length $output_dims$.

class matplotlib.projections.polar.PolarAffine(scale_transform, limits)
Bases: matplotlib.transforms.Affine2DBase

The affine part of the polar projection. Scales the output so that maximum radius rests on the edge of the axes circle.

$limits$ is the view limit of the data. The only part of its bounds that is used is the y limits (for the radius limits). The theta range is handled by the non-affine transform.

get_matrix(self)
Get the Affine transformation array for the affine part of this transform.

class matplotlib.projections.polar.PolarAxes(*args, theta_offset=0, theta_direction=1, rlabel_position=22.5, **kwargs)
Bases: matplotlib.axes._axes.Axes

A polar graph projection, where the input dimensions are $theta$, $r$.
Theta starts pointing east and goes anti-clockwise.

class InvertedPolarTransform(axis=None, use_rmin=True, _apply_theta_transforms=True)
Bases: matplotlib.transforms.Transform

The inverse of the polar transform, mapping Cartesian coordinate space $x$ and $y$ back to $theta$ and $r$.

input_dims = 2
inverted(self)
Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to self does not cause a corresponding update to its inverted copy.

x === self.inverted().transform(self.transform(x))

is_separable = False
output_dims = 2

transform_non_affine(self, xy)
Performs only the non-affine part of the transformation.

transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

In non-affine transformations, this is generally equivalent to transform(values).
In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x $input_dims$) and returns a numpy array of shape (N x $output_dims$).

Alternatively, accepts a numpy array of length $input_dims$ and returns a numpy array of length $output_dims$.

class PolarAffine(scale_transform, limits)
Bases: matplotlib.transforms.Affine2DBase

The affine part of the polar projection. Scales the output so that maximum radius rests on the edge of the axes circle.
limits is the view limit of the data. The only part of its bounds that is used is the y
limits (for the radius limits). The theta range is handled by the non-affine transform.

get_matrix(self)
Get the Affine transformation array for the affine part of this transform.

class PolarTransform(axis=None, use_rmin=True, _apply_theta_transforms=True)
Bases: matplotlib.transforms.Transform

The base polar transform. This handles projection theta and r into Cartesian coor-
dinate space x and y, but does not perform the ultimate affine transformation into
the correct position.

input_dims = 2

inverted(self)
Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to
self does not cause a corresponding update to its inverted copy.

x == self.inverted().transform(self.transform(x))

is_separable = False

output_dims = 2

transform_non_affine(self, tr)
Performs only the non-affine part of the transformation.

transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

In non-affine transformations, this is generally equivalent to transform(values).
In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x input_dims) and returns a numpy array of
shape (N x output_dims).

Alternatively, accepts a numpy array of length input_dims and returns a numpy
array of length output_dims.

transform_path_non_affine(self, path)
Returns a path, transformed only by the non-affine part of this transform.

path: a Path instance.

transform_path(path) is equivalent to transform_path_affine(transform_path_non_affine(values))

class RadialLocator(base, axes=None)
Bases: matplotlib.ticker.Locator

Used to locate radius ticks.

Ensures that all ticks are strictly positive. For all other tasks, it delegates to the
base Locator (which may be different depending on the scale of the r-axis.

autoscale(self)
autoscale the view limits

pan(self, numsteps)
Pan numticks (can be positive or negative)

refresh(self)
refresh internal information based on current lim
view_limits(self, vmin, vmax)
Select a scale for the range from vmin to vmax.
Subclasses should override this method to change locator behaviour.

zoom(self, direction)
Zoom in/out on axis; if direction is >0 zoom in, else zoom out

class ThetaFormatter
Bases: matplotlib.ticker.Formatter
Used to format the theta tick labels. Converts the native unit of radians into degrees
and adds a degree symbol.

class ThetaLocator(base)
Bases: matplotlib.ticker.Locator
Used to locate theta ticks.
This will work the same as the base locator except in the case that the view spans
the entire circle. In such cases, the previously used default locations of every 45
degrees are returned.

autoscale(self)
autoscale the view limits

pan(self, numsteps)
Pan numticks (can be positive or negative)

refresh(self)
refresh internal information based on current lim

set_axis(self, axis)

view_limits(self, vmin, vmax)
Select a scale for the range from vmin to vmax.
Subclasses should override this method to change locator behaviour.

zoom(self, direction)
Zoom in/out on axis; if direction is >0 zoom in, else zoom out

can_pan(self)
Return True if this axes supports the pan/zoom button functionality.
For polar axes, this is slightly misleading. Both panning and zooming are performed
by the same button. Panning is performed in azimuth while zooming is done along
the radial.

can_zoom(self)
Return True if this axes supports the zoom box button functionality.
Polar axes do not support zoom boxes.

cla(self)
Clear the current axes.

drag_pan(self, button, key, x, y)
Called when the mouse moves during a pan operation.

button is the mouse button number:

• 1: LEFT
• 2: MIDDLE
• 3: RIGHT

key is a "shift" key
x, y are the mouse coordinates in display coords.

**Note:** Intended to be overridden by new projection types.

draw(self, *args, **kwargs)

Draw everything (plot lines, axes, labels)

draw_pan(self)

Called when a pan operation completes (when the mouse button is up.)

**Note:** Intended to be overridden by new projection types.

format_coord(self, theta, r)

Return a format string formatting the coordinate using Unicode characters.

get_data_ratio(self)

Return the aspect ratio of the data itself. For a polar plot, this should always be 1.0

get_rlabel_position(self)

**Returns**

    float The theta position of the radius labels in degrees.

get_rmax(self)

**Returns**

    float Outer radial limit.

get_rmin(self)

**Returns**

    float The inner radial limit.

get_rorigin(self)

**Returns**

    float

get_rsign(self)

get_theta_direction(self)

Get the direction in which theta increases.

-1: Theta increases in the clockwise direction

1: Theta increases in the counterclockwise direction

get_theta_offset(self)

Get the offset for the location of 0 in radians.

get_thetamax(self)

get_thetamin(self)

get_xaxis_text1_transform(self, pad)
Returns

transform [Transform] The transform used for drawing x-axis labels, which will add pad_points of padding (in points) between the axes and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates.

halign [‘center’, ‘left’, ‘right’] The text horizontal alignment.

Notes

This transformation is primarily used by the Axis class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

get_xaxis_text2_transform(self, pad)

Returns

transform [Transform] The transform used for drawing secondary x-axis labels, which will add pad_points of padding (in points) between the axes and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates.

halign [‘center’, ‘left’, ‘right’] The text horizontal alignment.

Notes

This transformation is primarily used by the Axis class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

get_xaxis_transform(self, which=’grid’)

Get the transformation used for drawing x-axis labels, ticks and gridlines. The x-direction is in data coordinates and the y-direction is in axis coordinates.

Note: This transformation is primarily used by the Axis class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

get_yaxis_text1_transform(self, pad)

Returns

transform [Transform] The transform used for drawing y-axis labels, which will add pad_points of padding (in points) between the axes and the label. The x-direction is in axis coordinates and the y-direction is in data coordinates.

**halign** [{’center’, ’left’, ’right’}] The text horizontal alignment.

**Notes**

This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

```python
get_yaxis_text2_transform(self, pad)
```

**Returns**

- **transform** [Transform] The transform used for drawing secondart y-axis labels, which will add *pad_points* of padding (in points) between the axes and the label. The x-direction is in axis coordinates and the y-direction is in data coordinates

- **valign** [{’center’, ’top’, ’bottom’, ’baseline’, ’center_baseline’}] The text vertical alignment.

- **halign** [{’center’, ’left’, ’right’}] The text horizontal alignment.

**Notes**

This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

```python
get_yaxis_transform(self, which=’grid’)
```

Get the transformation used for drawing y-axis labels, ticks and gridlines. The x-direction is in axis coordinates and the y-direction is in data coordinates.

---

```python
def set_rgrids(self, radii, labels=None, angle=None, fmt=None, **kwargs):
```

Set the radial gridlines on a polar plot.

**Parameters**

- **radii** [tuple with floats] The radii for the radial gridlines

- **labels** [tuple with strings or None] The labels to use at each radial gridline. The *matplotlib.ticker.ScalarFormatter* will be used if None.

- **angle** [float] The angular position of the radius labels in degrees.

- **fmt** [str or None] Format string used in *matplotlib.ticker.FormatStrFormatter*. For example ‘%f’.

**Returns**

- **lines, labels** [list of *lines.Line2D*, list of *text.Text*] *lines* are the radial gridlines and *labels* are the tick labels.
**Other Parameters**

**kwargs are optional Text properties for the labels.

*See also:*

- `PolarAxes.set_thetagrids`
- `Axis.get_gridlines`
- `Axis.get_ticklabels`

`set_rlabel_position(self, value)`

Updates the theta position of the radius labels.

**Parameters**

- `value` [number] The angular position of the radius labels in degrees.

`set_rlim(self, bottom=None, top=None, emit=True, auto=False, **kwargs)`

See `set_rlim`.

`set_rmax(self, rmax)`

Set the outer radial limit.

**Parameters**

- `rmax` [float]

`set_rmin(self, rmin)`

Set the inner radial limit.

**Parameters**

- `rmin` [float]

`set_rorigin(self, rorigin)`

Update the radial origin.

**Parameters**

- `rorigin` [float]

`set_rscale(self, *args, **kwargs)`

`set_rticks(self, *args, **kwargs)`

`set_theta_direction(self, direction)`

Set the direction in which theta increases.

- `clockwise, -1`: Theta increases in the clockwise direction
- `counterclockwise, anticlockwise, 1`: Theta increases in the counterclockwise direction

`set_theta_offset(self, offset)`

Set the offset for the location of 0 in radians.

`set_theta_zero_location(self, loc, offset=0.0)`

Sets the location of theta’s zero. (Calls `set_theta_offset` with the correct value in radians under the hood.)

- `loc` [str] May be one of “N”, “NW”, “W”, “SW”, “S”, “SE”, “E”, or “NE”.

---

1936 Chapter 17. Modules
offset [float, optional] An offset in degrees to apply from the specified loc. Note: this offset is always applied counter-clockwise regardless of the direction setting.

set_thetagrids(self, angles, labels=None, fmt=None, **kwargs)
Set the theta gridlines in a polar plot.

Parameters

angles [tuple with floats, degrees] The angles of the theta gridlines.

labels [tuple with strings or None] The labels to use at each theta gridline. The projections.polar.ThetaFormatter will be used if None.

fmt [str or None] Format string used in matplotlib.ticker.FormatStrFormatter. For example '%f'. Note that the angle that is used is in radians.

Returns

lines, labels [list of lines.Line2D, list of text.Text] lines are the theta gridlines and labels are the tick labels.

Other Parameters

**kwargs kwargs are optional Text properties for the labels.

See also:

PolarAxes.set_rgrids
Axis.get_gridlines
Axis.get_ticklabels

set_thetalim(self, *args, **kwargs)
Set the minimum and maximum theta values.

Parameters

thetamax [float] Maximum value in degrees.

set_thetamax(self, thetamax)
set_thetamin(self, thetamin)

set_xscale(self, scale, *args, **kwargs)
Set the x-axis scale.

Parameters

value [{"linear", "log", "symlog", "logit", ...}] The axis scale type to apply.

**kwargs Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- matplotlib.scale.LinearScale
- matplotlib.scale.LogScale
- matplotlib.scale.SymmetricalLogScale
- matplotlib.scale.LogitScale
Notes

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using `matplotlib.scale.register_scale`. These scales can then also be used here.

```python
set_ylim(self, bottom=None, top=None, emit=True, auto=False, *, ymin=None, ymax=None)
```
Set the data limits for the radial axis.

**Parameters**

- `bottom` [scalar, optional] The bottom limit (default: None, which leaves the bottom limit unchanged). The bottom and top ylims may be passed as the tuple (`bottom`, `top`) as the first positional argument (or as the `bottom` keyword argument).
- `top` [scalar, optional] The top limit (default: None, which leaves the top limit unchanged).
- `emit` [bool, optional] Whether to notify observers of limit change (default: True).
- `auto` [bool or None, optional] Whether to turn on autoscaling of the y-axis. True turns on, False turns off (default action), None leaves unchanged.
- `ymin`, `ymax` [scalar, optional] These arguments are deprecated and will be removed in a future version. They are equivalent to `bottom` and `top` respectively, and it is an error to pass both `ymin` and `bottom` or `ymax` and `top`.

**Returns**

- `bottom`, `top` [(float, float)] The new y-axis limits in data coordinates.

```python
set_yscale(self, *args, **kwargs)
```
Set the y-axis scale.

**Parameters**

- `value` [{"linear", "log", "symlog", "logit", ...}] The axis scale type to apply.
- **kwargs Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:
  - `matplotlib.scale.LinearScale`
  - `matplotlib.scale.LogScale`
  - `matplotlib.scale.SymmetricalLogScale`
  - `matplotlib.scale.LogitScale`
start_pan(self, x, y, button)
Called when a pan operation has started.

x, y are the mouse coordinates in display coords. button is the mouse button number:
- 1: LEFT
- 2: MIDDLE
- 3: RIGHT

**Note:** Intended to be overridden by new projection types.

class matplotlib.projections.polar.PolarTransform(axis=None, use_rmin=True, _apply_theta_transforms=True)
Bases: matplotlib.transforms.Transform

The base polar transform. This handles projection theta and r into Cartesian coordinate space x and y, but does not perform the ultimate affine transformation into the correct position.

input_dims = 2

inverted(self)
Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to self does not cause a corresponding update to its inverted copy.

x === self.inverted().transform(self.transform(x))

is_separable = False

output_dims = 2

transform_non_affine(self, tr)
Performs only the non-affine part of the transformation.

transform(values) is always equivalent to transform_affine(transform_non_affine(values)).
In non-affine transformations, this is generally equivalent to transform(values). In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x input_dims) and returns a numpy array of shape (N x output_dims).

Alternatively, accepts a numpy array of length input_dims and returns a numpy array of length output_dims.

transform_path_non_affine(self, path)
Returns a path, transformed only by the non-affine part of this transform.

path: a Path instance.
transform_path(path) is equivalent to transform_path_affine(transform_path_non_affine(values)).

class matplotlib.projections.polar.RadialAxis(*args, **kwargs)
Bases: matplotlib.axis.YAxis

A radial Axis.

This overrides certain properties of a YAxis to provide special-casing for a radial axis.
```
axis_name = 'radius'

cla(self)
    clear the current axis

class matplotlib.projections.polar.RadialLocator(base, axes=None)
    Bases: matplotlib.ticker.Locator

    Used to locate radius ticks.

    Ensures that all ticks are strictly positive. For all other tasks, it delegates to the base Locator (which may be different depending on the scale of the r-axis).

    autoscale(self)
        autoscale the view limits

    pan(self, numsteps)
        Pan numticks (can be positive or negative)

    refresh(self)
        refresh internal information based on current lim

    view_limits(self, vmin, vmax)
        Select a scale for the range from vmin to vmax.

        Subclasses should override this method to change locator behaviour.

    zoom(self, direction)
        Zoom in/out on axis; if direction is >0 zoom in, else zoom out
```

```
class matplotlib.projections.polar.RadialTick(axes, loc, label, size=None, width=None, color=None, tickdir=None, pad=None, labelsize=None, labelcolor=None, zorder=None, gridOn=None, tick1On=True, tick2On=True, label1On=True, label2On=False, major=True, labelrotation=0, grid_color=None, grid_linestyle=None, grid_linewidth=None, grid_alpha=None, **kw)

    Bases: matplotlib.axis.YTick

    A radial-axis tick.

    This subclass of YTick provides radial ticks with some small modification to their repositioning such that ticks are rotated based on axes limits. This results in ticks that are correctly perpendicular to the spine. Labels are also rotated to be perpendicular to the spine, when 'auto' rotation is enabled.

    bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

    update_position(self, loc)
        Set the location of tick in data coords with scalar loc.
```

```
class matplotlib.projections.polar.ThetaAxis(axes, pickradius=15)
    Bases: matplotlib.axis.XAxis

    A theta Axis.

    This overrides certain properties of an XAxis to provide special-casing for an angular axis.
```
Parameters

pickradius [float] The acceptance radius for containment tests. See also Axis.contains.

axis_name = 'theta'

cla(self)
    clear the current axis

class matplotlib.projections.polar.ThetaFormatter
    Bases: matplotlib.ticker.Formatter
    Used to format the theta tick labels. Converts the native unit of radians into degrees and adds a degree symbol.

class matplotlib.projections.polar.ThetaLocator(base)
    Bases: matplotlib.ticker.Locator
    Used to locate theta ticks.
    This will work the same as the base locator except in the case that the view spans the entire circle. In such cases, the previously used default locations of every 45 degrees are returned.

    autoscale(self)
        autoscale the view limits

    pan(self, numsteps)
        Pan numticks (can be positive or negative)

    refresh(self)
        refresh internal information based on current lim

    set_axis(self, axis)

    view_limits(self, vmin, vmax)
        Select a scale for the range from vmin to vmax.
        Subclasses should override this method to change locator behaviour.

    zoom(self, direction)
        Zoom in/out on axis; if direction is >0 zoom in, else zoom out

class matplotlib.projections.polar.ThetaTick(axes, *args, **kwargs)
    Bases: matplotlib.axis.XTick
    A theta-axis tick.
    This subclass of XTick provides angular ticks with some small modification to their repositioning such that ticks are rotated based on tick location. This results in ticks that are correctly perpendicular to the arc spine.
    When 'auto' rotation is enabled, labels are also rotated to be parallel to the spine. The label padding is also applied here since it's not possible to use a generic axes transform to produce tick-specific padding.

    update_position(self, loc)
        Set the location of tick in data coords with scalar loc.
17.40 matplotlib.rcsetup

The rcsetup module contains the default values and the validation code for customization using matplotlib’s rc settings.

Each rc setting is assigned a default value and a function used to validate any attempted changes to that setting. The default values and validation functions are defined in the rcsetup module, and are used to construct the rcParams global object which stores the settings and is referenced throughout matplotlib.

These default values should be consistent with the default matplotlibrc file that actually reflects the values given here. Any additions or deletions to the parameter set listed here should also be visited to the matplotlibrc.template in matplotlib’s root source directory.

class matplotlib.rcsetup.ValidateInStrings(key, valid, ignorecase=False)
    Bases: object
    valid is a list of legal strings

class matplotlib.rcsetup.ValidateInterval(vmin, vmax, closedmin=True, closedmax=True)
    Bases: object
    Value must be in interval

matplotlib.rcsetup.cycler(*args, **kwargs)
    Creates a Cycler object much like cycler.cycler(), but includes input validation.
    Call signatures:
    cycler(cycler)
    cycler(label=values[, label2=values2[, ...]])
    cycler(label, values)

Form 1 copies a given Cycler object.
Form 2 creates a Cycler which cycles over one or more properties simultaneously. If multiple properties are given, their value lists must have the same length.
Form 3 creates a Cycler for a single property. This form exists for compatibility with the original cycler. Its use is discouraged in favor of the kwarg form, i.e. cycler(label=values).

Parameters
   cycler [Cycler] Copy constructor for Cycler.
   label [str] The property key. Must be a valid Artist property. For example, 'color' or 'linestyle'. Aliases are allowed, such as 'c' for 'color' and 'lw' for 'linewidth'.
   values [iterable] Finite-length iterable of the property values. These values are validated and will raise a ValueError if invalid.

Returns
   cycler [Cycler] A new Cycler for the given properties.

Examples

Creating a cycler for a single property:
Creating a cycler for simultaneously cycling over multiple properties (e.g. red circle, green plus, blue cross):

```python
>>> c = cycler(color=['red', 'green', 'blue'], marker=['o', '+', 'x'])
```

```
matplotlib.rcsetup.update_savefig_format(value)

matplotlib.rcsetup.validate_anylist(s)
matplotlib.rcsetup.validate_aspect(s)
matplotlib.rcsetup.validate_axisbelow(s)
matplotlib.rcsetup.validate_backend(s)
matplotlib.rcsetup.validate_bbox(s)
matplotlib.rcsetup.validate_bool(b)
    Convert b to a boolean or raise.
matplotlib.rcsetup.validate_bool_maybe_none(b)
    Convert b to a boolean or raise.
matplotlib.rcsetup.validate_capstylelist(s)
matplotlib.rcsetup.validate_color(s)
    Return a valid color arg.
matplotlib.rcsetup.validate_color_for_prop_cycle(s)
matplotlib.rcsetup.validate_color_or_auto(s)
matplotlib.rcsetup.validate_color_or_inherit(s)
    Return a valid color arg.
matplotlib.rcsetup.validate_colorlist(s)
    return a list of colorspecs
matplotlib.rcsetup.validate_cycler(s)
    Return a Cycler object from a string repr or the object itself.
matplotlib.rcsetup.validate_dashlist(s)
matplotlib.rcsetup.validate_dpi(s)
    Confirm s is string ‘figure’ or convert s to float or raise.
matplotlib.rcsetup.validate_fillstylelist(s)
matplotlib.rcsetup.validate_float(s)
    Convert s to float or raise.
matplotlib.rcsetup.validate_float_or_None(s)
    Convert s to float, None or raise.
matplotlib.rcsetup.validate_floatlist(s)
    Convert s to float or raise.
matplotlib.rcsetup.validate_font_properties(s)
```
matplotlib.rcsetup.validate_fontsize(s)
matplotlib.rcsetup.validate_fontsize_None(s)
matplotlib.rcsetup.validate_fontsizeitelist(s)
matplotlib.rcsetup.validate_fonttype(s)
    Confirm that this is a Postscript or PDF font type that we know how to convert to.
matplotlib.rcsetup.validate_fontweight(s)
matplotlib.rcsetup.validate_hatch(s)
    Validate a hatch pattern. A hatch pattern string can have any sequence of the following
    characters: \ / | - + * . x o O.
matplotlib.rcsetup.validate_hatchlist(s)
    Validate a hatch pattern. A hatch pattern string can have any sequence of the following
    characters: \ / | - + * . x o O.
matplotlib.rcsetup.validate_hinting(s)
matplotlib.rcsetup.validate_hist_bins(s)
matplotlib.rcsetup.validate_int(s)
    Convert s to int or raise.
matplotlib.rcsetup.validate_int_or_None(s)
    Return None if s is None or return int(s), otherwise raise.
matplotlib.rcsetup.validate_joinstylelist(s)
matplotlib.rcsetup.validate_markevery(s)
    Validate the markevery property of a Line2D object.

Parameters

    s [None, int, float, slice, length-2 tuple of ints,] length-2 tuple of floats,
    list of ints

Returns

    s [None, int, float, slice, length-2 tuple of ints,] length-2 tuple of floats,
    list of ints

matplotlib.rcsetup.validate_markeverylist(s)
    Validate the markevery property of a Line2D object.

Parameters

    s [None, int, float, slice, length-2 tuple of ints,] length-2 tuple of floats,
    list of ints

Returns

    s [None, int, float, slice, length-2 tuple of ints,] length-2 tuple of floats,
    list of ints

matplotlib.rcsetup.validate_mathtext_default(s)

class matplotlib.rcsetup.validate_nseq_float(n=None, allow_none=False)
    Bases: object

class matplotlib.rcsetup.validate_nseq_int(n=None)
    Bases: object

17.41 matplotlib.sankey

Module for creating Sankey diagrams using Matplotlib.

class matplotlib.sankey.Sankey(ax=None, scale=1.0, unit="", format='%G',
gap=0.25, radius=0.1, shoulder=0.03, offset=0.15,
head_angle=100, margin=0.4, tolerance=1e-06,
**kwargs)

    Bases: object
    Sankey diagram.
Sankey diagrams are a specific type of flow diagram, in which the width of the arrows is shown proportionally to the flow quantity. They are typically used to visualize energy or material or cost transfers between processes. [Wikipedia (6/1/2011)]

Create a new Sankey instance.

Optional keyword arguments:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ax</td>
<td>axes onto which the data should be plotted. If <code>ax</code> isn’t provided, new axes will be created.</td>
</tr>
<tr>
<td>scale</td>
<td>scaling factor for the flows. <code>scale</code> sizes the width of the paths in order to maintain proper layout. The same scale is applied to all subdiagrams. The value should be chosen such that the product of the scale and the sum of the inputs is approximately 1.0 (and the product of the scale and the sum of the outputs is approximately -1.0).</td>
</tr>
<tr>
<td>unit</td>
<td>string representing the physical unit associated with the flow quantities. If <code>unit</code> is None, then none of the quantities are labeled.</td>
</tr>
<tr>
<td>format</td>
<td>a Python number formatting string to be used in labeling the flow as a quantity (i.e., a number times a unit, where the unit is given)</td>
</tr>
<tr>
<td>gap</td>
<td>space between paths that break in/break away to/from the top or bottom</td>
</tr>
<tr>
<td>radius</td>
<td>inner radius of the vertical paths</td>
</tr>
<tr>
<td>shoulder</td>
<td>size of the shoulders of output arrows</td>
</tr>
<tr>
<td>offset</td>
<td>text offset (from the dip or tip of the arrow)</td>
</tr>
<tr>
<td>head</td>
<td>angle of the arrow heads (and negative of the angle of the tails) [deg]</td>
</tr>
<tr>
<td>margin</td>
<td>minimum space between Sankey outlines and the edge of the plot area</td>
</tr>
<tr>
<td>tolerance</td>
<td>acceptable maximum of the magnitude of the sum of flows. The magnitude of the sum of connected flows cannot be greater than <code>tolerance</code>.</td>
</tr>
</tbody>
</table>

The optional arguments listed above are applied to all subdiagrams so that there is consistent alignment and formatting.

If `Sankey` is instantiated with any keyword arguments other than those explicitly listed above (**kwargs), they will be passed to `add()`, which will create the first subdiagram.

In order to draw a complex Sankey diagram, create an instance of `Sankey` by calling it without any kwargs:

```python
sankey = Sankey()
```

Then add simple Sankey sub-diagrams:

```python
sankey.add()  # 1
sankey.add()  # 2
...            # ...
sankey.add()  # n
```

Finally, create the full diagram:
sankey.finish()

Or, instead, simply daisy-chain those calls:

Sankey().add().add... .add().finish()

See also:

Sankey.add
Sankey.finish

Examples

The default settings produce a diagram like this.

```
add(self, patchlabel='', flows=None, orientations=None, labels='', trunk-length=1.0, pathlengths=0.25, prior=None, connect=(0, 0), rotation=0, **kwargs)
```

Add a simple Sankey diagram with flows at the same hierarchical level.

Parameters

**patchlabel** [str] Label to be placed at the center of the diagram. Note that *label* (not *patchlabel*) can be passed as keyword argument to create an entry in the legend.
Flow Diagram of a Widget

flows [list of float] Array of flow values. By convention, inputs are positive and outputs are negative.

Flows are placed along the top of the diagram from the inside out in order of their index within flows. They are placed along the sides of the diagram from the top down and along the bottom from the outside in.

If the sum of the inputs and outputs is nonzero, the discrepancy will appear as a cubic Bezier curve along the top and bottom edges of the trunk.

orientations [list of {-1, 0, 1}] List of orientations of the flows (or a single orientation to be used for all flows). Valid values are 0 (inputs from the left, outputs to the right), 1 (from and to the top) or -1 (from and to the bottom).

labels [list of (str or None)] List of labels for the flows (or a single label to be used for all flows). Each label may be None (no label), or a labeling string. If an entry is a (possibly empty) string, then the quantity for the corresponding flow will be shown below the string. However, if the unit of the main diagram is None, then quantities are never shown, regardless of the value of this argument.

trunklength [float] Length between the bases of the input and output groups (in data-space units).

pathlengths [list of float] List of lengths of the vertical arrows before
break-in or after break-away. If a single value is given, then it will be applied to the first (inside) paths on the top and bottom, and the length of all other arrows will be justified accordingly. The path-lengths are not applied to the horizontal inputs and outputs.

**prior** [int] Index of the prior diagram to which this diagram should be connected.

**connect** [(int, int)] A (prior, this) tuple indexing the flow of the prior diagram and the flow of this diagram which should be connected. If this is the first diagram or prior is None, connect will be ignored.

**rotation** [float] Angle of rotation of the diagram in degrees. The interpretation of the orientations argument will be rotated accordingly (e.g., if rotation == 90, an orientations entry of 1 means to/from the left). rotation is ignored if this diagram is connected to an existing one (using prior and connect).

**Returns**

**Sankey** The current Sankey instance.

**Other Parameters**

**kwargs** Additional keyword arguments set matplotlib.patches.PathPatch properties, listed below. For example, one may want to use fill=False or label="A legend entry".
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agg_filter</td>
<td>a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array.</td>

**See also:**

Sankey.finish

finish(self)

Adjust the axes and return a list of information about the Sankey subdiagram(s).

Return value is a list of subdiagrams represented with the following fields:
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>patch</td>
<td>Sankey outline (an instance of <code>PathPatch</code>)</td>
</tr>
<tr>
<td>flows</td>
<td>values of the flows (positive for input, negative for output)</td>
</tr>
<tr>
<td>angles</td>
<td>list of angles of the arrows [deg/90] For example, if the diagram</td>
</tr>
<tr>
<td></td>
<td>has not been rotated, an input to the top side will have an angle of</td>
</tr>
<tr>
<td></td>
<td>3 (DOWN), and an output from the top side will have an angle of</td>
</tr>
<tr>
<td></td>
<td>1 (UP). If a flow has been skipped (because its magnitude is less</td>
</tr>
<tr>
<td></td>
<td>than <code>tolerance</code>), then its angle will be <code>None</code>.</td>
</tr>
<tr>
<td>tips</td>
<td>array in which each row is an [x, y] pair indicating the positions</td>
</tr>
<tr>
<td></td>
<td>of the tips (or &quot;dips&quot;) of the flow paths If the magnitude of a flow</td>
</tr>
<tr>
<td></td>
<td>is less the <code>tolerance</code> for the instance of <code>Sankey</code>, the flow is skipped</td>
</tr>
<tr>
<td></td>
<td>and its tip will be at the center of the diagram.</td>
</tr>
<tr>
<td>text</td>
<td><code>Text</code> instance for the label of the diagram</td>
</tr>
<tr>
<td>texts</td>
<td>list of <code>Text</code> instances for the labels of flows</td>
</tr>
</tbody>
</table>

`Sankey.add`

## 17.42 matplotlib.scale

class matplotlib.scale.FuncScale(axis, functions)
Bases: `matplotlib.scale.ScaleBase`

Provide an arbitrary scale with user-supplied function for the axis.

**Parameters**

- **axis**: the axis for the scale
- **functions** [(callable, callable)] two-tuple of the forward and inverse functions for the scale. The forward function must be monotonic.

Both functions must have the signature:

```python
def forward(values: array-like) -> array-like
```

get_transform(self)
The transform for arbitrary scaling

name = 'function'

set_default_locators_and_formatters(self, axis)
Set the locators and formatters to the same defaults as the linear scale.

class matplotlib.scale.FuncScaleLog(axis, functions, base=10)
Bases: `matplotlib.scale.LogScale`

Provide an arbitrary scale with user-supplied function for the axis and then put on a logarithmic axes.

**Parameters**

- **axis**: the axis for the scale
functions [(callable, callable)] two-tuple of the forward and inverse functions for the scale. The forward function must be monotonic.

Both functions must have the signature:

```python
def forward(values: array-like) -> array-like
```

base [float] logarithmic base of the scale (default = 10)

def get_transform(self)
    The transform for arbitrary scaling

name = 'functionlog'

class matplotlib.scale.FuncTransform(forward, inverse)
    Bases: matplotlib.transforms.Transform

A simple transform that takes and arbitrary function for the forward and inverse transform.

Parameters

forward [callable] The forward function for the transform. This function must have an inverse and, for best behavior, be monotonic. It must have the signature:

```python
def forward(values: array-like) -> array-like
```

inverse [callable] The inverse of the forward function. Signature as forward.

has_inverse = True

input_dims = 1

inverted(self)
    Return the corresponding inverse transformation.

    The return value of this method should be treated as temporary. An update to self does not cause a corresponding update to its inverted copy.

    x == self.inverted().transform(self.transform(x))

is_separable = True

output_dims = 1

transform_non_affine(self, values)
    Performs only the non-affine part of the transformation.

    transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

    In non-affine transformations, this is generally equivalent to transform(values). In affine transformations, this is always a no-op.

    Accepts a numpy array of shape (N x input_dims) and returns a numpy array of shape (N x output_dims).

    Alternatively, accepts a numpy array of length input_dims and returns a numpy array of length output_dims.
class matplotlib.scale.InvertedLog10Transform(**kwargs)
    Bases: matplotlib.scale.InvertedLogTransformBase

[Deprecated]

Notes

Deprecated since version 3.1:

base = 10.0

inverted(self)
    Return the corresponding inverse transformation.
    The return value of this method should be treated as temporary. An update to self
does not cause a corresponding update to its inverted copy.
    x === self.inverted().transform(self.transform(x))

class matplotlib.scale.InvertedLog2Transform(**kwargs)
    Bases: matplotlib.scale.InvertedLogTransformBase

[Deprecated]

Notes

Deprecated since version 3.1:

base = 2.0

inverted(self)
    Return the corresponding inverse transformation.
    The return value of this method should be treated as temporary. An update to self
does not cause a corresponding update to its inverted copy.
    x === self.inverted().transform(self.transform(x))

class matplotlib.scale.InvertedLogTransform(base)
    Bases: matplotlib.scale.InvertedLogTransformBase

has_inverse = True
input_dims = 1

inverted(self)
    Return the corresponding inverse transformation.
    The return value of this method should be treated as temporary. An update to self
does not cause a corresponding update to its inverted copy.
    x === self.inverted().transform(self.transform(x))
is_separable = True
output_dims = 1

transform_non_affine(self, a)
    Performs only the non-affine part of the transformation.
    transform(values) is always equivalent to transform_affine(transform_non_affine(values)).
In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x `input_dims`) and returns a numpy array of shape (N x `output_dims`).

Alternatively, accepts a numpy array of length `input_dims` and returns a numpy array of length `output_dims`.

```python
class matplotlib.scale.InvertedLogTransformBase(**kwargs)
    Bases: matplotlib.transforms.Transform

    [Deprecated]
```

**Notes**

Deprecated since version 3.1:

- `has_inverse = True`
- `input_dims = 1`
- `is_separable = True`
- `output_dims = 1`

`transform_non_affine(self, a)`

Performs only the non-affine part of the transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x `input_dims`) and returns a numpy array of shape (N x `output_dims`).

Alternatively, accepts a numpy array of length `input_dims` and returns a numpy array of length `output_dims`.

```python
class matplotlib.scale.InvertedNaturalLogTransform(**kwargs)
    Bases: matplotlib.scale.InvertedLogTransformBase

    [Deprecated]
```

**Notes**

Deprecated since version 3.1:

- `base = 2.718281828459045`

`inverted(self)`

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to `self` does not cause a corresponding update to its inverted copy.

```
x === self.inverted().transform(self.transform(x))
```

```python
class matplotlib.scale.InvertedSymmetricalLogTransform(base, linthresh, linscale)
    Bases: matplotlib.transforms.Transform
```

**Notes**
has_inverse = True
input_dims = 1

inverted(self)
    Return the corresponding inverse transformation.
    The return value of this method should be treated as temporary. An update to self
does not cause a corresponding update to its inverted copy.
    x == self.inverted().transform(self.transform(x))

is_separable = True
output_dims = 1

transform_non_affine(self, a)
    Performs only the non-affine part of the transformation.
    transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

    In non-affine transformations, this is generally equivalent to transform(values). In
    affine transformations, this is always a no-op.
    Accepts a numpy array of shape (N x input_dims) and returns a numpy array of shape
    (N x output_dims).
    Alternatively, accepts a numpy array of length input_dims and returns a numpy array
    of length output_dims.

class matplotlib.scale.LinearScale(axis, **kwargs)
    Bases: matplotlib.scale.ScaleBase

    The default linear scale.

    get_transform(self)
        The transform for linear scaling is just the IdentityTransform.

    name = 'linear'

    set_default_locators_and_formatters(self, axis)
        Set the locators and formatters to reasonable defaults for linear scaling.

class matplotlib.scale.Log10Transform(**kwargs)
    Bases: matplotlib.scale.LogTransformBase

    [Deprecated]

    Notes

    Deprecated since version 3.1:

    base = 10.0

    inverted(self)
        Return the corresponding inverse transformation.
        The return value of this method should be treated as temporary. An update to self
does not cause a corresponding update to its inverted copy.
        x == self.inverted().transform(self.transform(x))
class matplotlib.scale.Log2Transform(**kwargs)
    Bases: matplotlib.scale.LogTransformBase

[Deprecated]

Notes

Deprecated since version 3.1:

base = 2.0

inverted(self)
    Return the corresponding inverse transformation.
    The return value of this method should be treated as temporary. An update to self
does not cause a corresponding update to its inverted copy.
    
x === self.inverted().transform(self.transform(x))

class matplotlib.scale.LogScale(axis, **kwargs)
    Bases: matplotlib.scale.ScaleBase

A standard logarithmic scale. Care is taken to only plot positive values.

baseX/baseY: The base of the logarithm

nonposX/nonposY: {'mask', 'clip'} non-positive values in x or y can be masked as in-
valid, or clipped to a very small positive number

subsx/subsy: Where to place the subticks between each major tick. Should be a se-
quence of integers. For example, in a log10 scale: [2, 3, 4, 5, 6, 7, 8, 9]
will place 8 logarithmically spaced minor ticks between each major tick.

class InvertedLog10Transform(**kwargs)
    Bases: matplotlib.scale.InvertedLogTransformBase

[Deprecated]

Notes

Deprecated since version 3.1:

base = 10.0

inverted(self)
    Return the corresponding inverse transformation.
    The return value of this method should be treated as temporary. An update to self
does not cause a corresponding update to its inverted copy.
    
x === self.inverted().transform(self.transform(x))

class InvertedLog2Transform(**kwargs)
    Bases: matplotlib.scale.InvertedLogTransformBase

[Deprecated]
Notes

Deprecated since version 3.1:

base = 2.0

inverted(self)
    Return the corresponding inverse transformation.

    The return value of this method should be treated as temporary. An update to self does not cause a corresponding update to its inverted copy.

    \[ x == self.inverted().transform(self.transform(x)) \]

class InvertedLogTransform(base)
    Bases: matplotlib.scale.InvertedLogTransformBase

    has_inverse = True
    input_dims = 1

    inverted(self)
        Return the corresponding inverse transformation.

        The return value of this method should be treated as temporary. An update to self does not cause a corresponding update to its inverted copy.

        \[ x == self.inverted().transform(self.transform(x)) \]

    is_separable = True
    output_dims = 1

    transform_non_affine(self, a)
        Performs only the non-affine part of the transformation.

        transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

        In non-affine transformations, this is generally equivalent to transform(values).

        In affine transformations, this is always a no-op.

        Accepts a numpy array of shape (N x input_dims) and returns a numpy array of
        shape (N x output_dims).

        Alternatively, accepts a numpy array of length input_dims and returns a numpy
        array of length output_dims.

class InvertedNaturalLogTransform(**kwargs)
    Bases: matplotlib.scale.InvertedLogTransformBase

    [Deprecated]

Notes

Deprecated since version 3.1:

base = 2.718281828459045

inverted(self)
    Return the corresponding inverse transformation.

    The return value of this method should be treated as temporary. An update to self does not cause a corresponding update to its inverted copy.
Matplotlib, Release 3.1.3

```python
x = self.inverted().transform(self.transform(x))
```

```python
class Log10Transform(**kwargs)
    Bases: matplotlib.scale.LogTransformBase

[Deprecation]

Notes

Deprecated since version 3.1:

```python
base = 10.0
```

```python
inverted(self)
    Return the corresponding inverse transformation.
    The return value of this method should be treated as temporary. An update to
    self does not cause a corresponding update to its inverted copy.
```

```python
x = self.inverted().transform(self.transform(x))
```

```python
class Log2Transform(**kwargs)
    Bases: matplotlib.scale.LogTransformBase

[Deprecation]

Notes

Deprecated since version 3.1:

```python
base = 2.0
```

```python
inverted(self)
    Return the corresponding inverse transformation.
    The return value of this method should be treated as temporary. An update to
    self does not cause a corresponding update to its inverted copy.
```

```python
x = self.inverted().transform(self.transform(x))
```

```python
class LogTransform(base, nonpos='clip')
    Bases: matplotlib.transforms.Transform

has_inverse = True
input_dims = 1
```

```python
inverted(self)
    Return the corresponding inverse transformation.
    The return value of this method should be treated as temporary. An update to
    self does not cause a corresponding update to its inverted copy.
```

```python
x = self.inverted().transform(self.transform(x))
```

```python
is_separable = True
output_dims = 1
```

```python
transform_non_affine(self, a)
    Performs only the non-affine part of the transformation.
    transform(values) is always equivalent to transform_affine(transform_non_affine(values)).
```
In non-affine transformations, this is generally equivalent to \texttt{transform(values)}. In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x \texttt{input_dims}) and returns a numpy array of shape (N x \texttt{output_dims}).

Alternatively, accepts a numpy array of length \texttt{input_dims} and returns a numpy array of length \texttt{output_dims}.

\begin{verbatim}

    [Deprecated]

    Notes

    Deprecated since version 3.1:
    base = 2.718281828459045

    inverted(self)
        Return the corresponding inverse transformation.
        The return value of this method should be treated as temporary. An update to \texttt{self} does not cause a corresponding update to its inverted copy.
        \[ x == self.inverted().transform(self.transform(x)) \]

    base
\end{verbatim}
get_transform(self)
    Return a Transform instance appropriate for the given logarithm base.

limit_range_for_scale(self, vmin, vmax, minpos)
    Limit the domain to positive values.

ame = 'log'

set_default_locators_and_formatters(self, axis)
    Set the locators and formatters to specialized versions for log scaling.

class matplotlib.scale.LogTransform(base, nonpos='clip')
    Bases: matplotlib.transforms.Transform

    has_inverse = True
    input_dims = 1

    inverted(self)
        Return the corresponding inverse transformation.
        The return value of this method should be treated as temporary. An update to self
does not cause a corresponding update to its inverted copy.
        x === self.inverted().transform(self.transform(x))

    is_separable = True
    output_dims = 1

    transform_non_affine(self, a)
        Performs only the non-affine part of the transformation.
        transform(values) is always equivalent to transform_affine(transform_non_affine(values)).
        In non-affine transformations, this is generally equivalent to transform(values). In
affine transformations, this is always a no-op.

        Accepts a numpy array of shape (N x input_dims) and returns a numpy array of shape
(N x output_dims).

        Alternatively, accepts a numpy array of length input_dims and returns a numpy array
of length output_dims.

class matplotlib.scale.LogTransformBase(**kwargs)
    Bases: matplotlib.transforms.Transform

    [Deprecated]

    Notes

    Deprecated since version 3.1:

    has_inverse = True
    input_dims = 1
    is_separable = True
    output_dims = 1

    transform_non_affine(self, a)
        Performs only the non-affine part of the transformation.
        transform(values) is always equivalent to transform_affine(transform_non_affine(values)).
In non-affine transformations, this is generally equivalent to \( \text{transform(values)} \). In affine transformations, this is always a no-op.

Accepts a numpy array of shape \((N \times \text{input_dims})\) and returns a numpy array of shape \((N \times \text{output_dims})\).

Alternatively, accepts a numpy array of length \(\text{input_dims}\) and returns a numpy array of length \(\text{output_dims}\).

```python
class matplotlib.scale.LogisticTransform(nonpos='mask')

Bases: matplotlib.transforms.Transform

has_inverse = True
input_dims = 1
inverted(self)
    Return the corresponding inverse transformation.
    The return value of this method should be treated as temporary. An update to self
does not cause a corresponding update to its inverted copy.

x === self.inverted().transform(self.transform(x))

is_separable = True
output_dims = 1
transform_non_affine(self, a)
    logistic transform (base 10)

class matplotlib.scale.LogitScale(axis, nonpos='mask')

Bases: matplotlib.scale.ScaleBase

Logit scale for data between zero and one, both excluded.
This scale is similar to a log scale close to zero and to one, and almost linear around 0.5.
It maps the interval \((0, 1)\) onto \((-\infty, +\infty)\).

nonpos: \{'mask', 'clip'\} values beyond \((0, 1)\) can be masked as invalid, or clipped to
a number very close to 0 or 1

get_transform(self)
    Return a LogitTransform instance.

limit_range_for_scale(self, vmin, vmax, minpos)
    Limit the domain to values between 0 and 1 (excluded).

name = 'logit'
set_default_locators_and_formatters(self, axis)
    Set the Locator and Formatter objects on the given axis to match this scale.
```

```python
class matplotlib.scale.LogisticTransform(nonpos='mask')

Bases: matplotlib.transforms.Transform

has_inverse = True
input_dims = 1
inverted(self)
    Return the corresponding inverse transformation.
    The return value of this method should be treated as temporary. An update to self
does not cause a corresponding update to its inverted copy.
```
x === self.inverted().transform(self.transform(x))

is_separable = True
output_dims = 1

transform_non_affine(self, a)
    logit transform (base 10), masked or clipped

class matplotlib.scale.NaturalLogTransform(**kwargs)
    Bases: matplotlib.scale.LogTransformBase

    [Deprecated]

    Notes

    Deprecated since version 3.1:

    base = 2.718281828459045

    inverted(self)
        Return the corresponding inverse transformation.

        The return value of this method should be treated as temporary. An update to self
does not cause a corresponding update to its inverted copy.

        x === self.inverted().transform(self.transform(x))

class matplotlib.scale.ScaleBase(axis, **kwargs)
    Bases: object

    The base class for all scales.

    Scales are separable transformations, working on a single dimension.

    Any subclasses will want to override:

    • name
    • get_transform()
    • set_default_locators_and_formatters()

    And optionally:

    • limit_range_for_scale()

    Construct a new scale.

    Notes

    The following note is for scale implementors.

    For back-compatibility reasons, scales take an Axis object as first argument. However,
this argument should not be used: a single scale object should be usable by multiple
Axes at the same time.

    get_transform(self)
        Return the Transform object associated with this scale.
limit_range_for_scale(self, vmin, vmax, minpos)

Returns the range vmin, vmax, possibly limited to the domain supported by this scale.

**minpos should be the minimum positive value in the data.** This is used by log scales to determine a minimum value.

set_default_locators_and_formatters(self, axis)

Set the Locator and Formatter objects on the given axis to match this scale.

class matplotlib.scale.SymmetricalLogScale(axis, **kwargs)

Bases: matplotlib.scale.ScaleBase

The symmetrical logarithmic scale is logarithmic in both the positive and negative directions from the origin.

Since the values close to zero tend toward infinity, there is a need to have a range around zero that is linear. The parameter linthresh allows the user to specify the size of this range (-linthresh, linthresh).

**Parameters**

- **basex, basey** [float] The base of the logarithm. Defaults to 10.
- **linthreshx, linthreshy** [float] Defines the range (-x, x), within which the plot is linear. This avoids having the plot go to infinity around zero. Defaults to 2.
- **subsx, subsy** [sequence of int] Where to place the subticks between each major tick. For example, in a log10 scale: [2, 3, 4, 5, 6, 7, 8, 9] will place 8 logarithmically spaced minor ticks between each major tick.
- **linscalex, linscaley** [float, optional] This allows the linear range (-linthresh, linthresh) to be stretched relative to the logarithmic range. Its value is the number of decades to use for each half of the linear range. For example, when linscale == 1.0 (the default), the space used for the positive and negative halves of the linear range will be equal to one decade in the logarithmic range.

class InvertedSymmetricalLogTransform(base, linthresh, linscale)

Bases: matplotlib.transforms.Transform

has_inverse = True

input_dims = 1

inverted(self)

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to self does not cause a corresponding update to its inverted copy.

x === self.inverted().transform(self.transform(x))

is_separable = True

output_dims = 1

transform_non_affine(self, a)

Performs only the non-affine part of the transformation.

transform(values) is always equivalent to transform_affine(transform_non_affine(values)).
In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x `input_dims`) and returns a numpy array of shape (N x `output_dims`).

Alternatively, accepts a numpy array of length `input_dims` and returns a numpy array of length `output_dims`.

class SymmetricalLogTransform(base, linthresh, linscale)

Bases: matplotlib.transforms.Transform

    has_inverse = True
    input_dims = 1

    inverted(self)

    Return the corresponding inverse transformation.

    The return value of this method should be treated as temporary. An update to `self` does not cause a corresponding update to its inverted copy.

    x === self.inverted().transform(self.transform(x))

    is_separable = True
    output_dims = 1

    transform_non_affine(self, a)

    Performs only the non-affine part of the transformation.

    transform(values) is always equivalent to `transform_affine(transform_non_affine(values))`.

    In non-affine transformations, this is generally equivalent to `transform(values)`.

    In affine transformations, this is always a no-op.

    Accepts a numpy array of shape (N x `input_dims`) and returns a numpy array of shape (N x `output_dims`).

    Alternatively, accepts a numpy array of length `input_dims` and returns a numpy array of length `output_dims`.

    get_transform(self)

    Return a SymmetricalLogTransform instance.

    name = 'symlog'

    set_default_locators_and_formatters(self, axis)

    Set the locators and formatters to specialized versions for symmetrical log scaling.

class matplotlib.scale.SymmetricalLogTransform(base, linthresh, linscale)

Bases: matplotlib.transforms.Transform

    has_inverse = True
    input_dims = 1

    inverted(self)

    Return the corresponding inverse transformation.

    The return value of this method should be treated as temporary. An update to `self` does not cause a corresponding update to its inverted copy.

    x === self.inverted().transform(self.transform(x))

    is_separable = True
output_dims = 1

transform_non_affine(self, a)
Performs only the non-affine part of the transformation.

transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

In non-affine transformations, this is generally equivalent to transform(values). In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x input_dims) and returns a numpy array of shape (N x output_dims).

Alternatively, accepts a numpy array of length input_dims and returns a numpy array of length output_dims.

matplotlib.scale.get_scale_docs()

[Deprecated] Helper function for generating docstrings related to scales.

Notes

Deprecated since version 3.1: get_scale_docs() is considered private API since 3.1 and will be removed from the public API in 3.3.

matplotlib.scale.get_scale_names()

matplotlib.scale.register_scale(scale_class)
Register a new kind of scale.

scale_class must be a subclass of ScaleBase.

matplotlib.scale.scale_factory(scale, axis, **kwargs)

Return a scale class by name.

Parameters

scale [{function, functionlog, linear, log, logit, symlog}]

axis [Axis]

17.43 matplotlib.spines

class matplotlib.spines.Spine(axes, spine_type, path, **kwargs)
Bases: matplotlib.patches.Patch

an axis spine – the line noting the data area boundaries

Spines are the lines connecting the axis tick marks and noting the boundaries of the data area. They can be placed at arbitrary positions. See function:set_position for more information.

The default position is (‘outward’,0).

Spines are subclasses of class:Patch, and inherit much of their behavior.

Spines draw a line, a circle, or an arc depending if function:set_patch_line, function:set_patch_circle, or function:set_patch_arc has been called. Line-like is the default.

* axes : the Axes instance containing the spine
* spine_type : a string specifying the spine type
- *path*: the path instance used to draw the spine

Valid kwargs are:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agg_filter</td>
<td>a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array</td>

</tbody>
</table>

classmethod `arc_spine`(*axes, spine_type, center, radius, theta1, theta2, **kwargs*)

(classmethod) Returns an arc `Spine`.

classmethod `circular_spine`(*axes, center, radius, **kwargs*)

(staticmethod) Returns a circular `Spine`.

def `cla`(self):
    Clear the current spine.

def `draw`(self, renderer):
    Draw the `Patch` to the given `renderer`.

def `get_bounds`(self):
    Get the bounds of the spine.

def `get_patch_transform`(self):
    Return the `Transform` instance which takes patch coordinates to data coordinates.
For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

```
get_path(self)
    Return the path of this patch

get_position(self)
    Return the spine position.

get_smart_bounds(self)
    Return whether the spine has smart bounds.

get_spine_transform(self)
    Return the spine transform.

get_window_extent(self, renderer=None)
    Return the window extent of the spines in display space, including padding for ticks (but not their labels)

See also:

matplotlib.axes.Axes.get_tightbbox
matplotlib.axes.Axes.get_window_extent
```

```
is_frame_like(self)
    [Deprecated] Return True if directly on axes frame.
    This is useful for determining if a spine is the edge of an old style MPL plot. If so, this function will return True.

Notes

Deprecated since version 3.1.
```

```
classmethod linear_spine(axes, spine_type, **kwargs)
    (staticmethod) Returns a linear Spine.

register_axis(self, axis)
    Register an axis.
    An axis should be registered with its corresponding spine from the Axes instance. This allows the spine to clear any axis properties when needed.

set_bounds(self, low, high)
    Set the bounds of the spine.

set_color(self, c)
    Set the edgecolor.

Parameters

c [color]

Notes

This method does not modify the facecolor (which defaults to "none"), unlike the Patch.set_color method defined in the parent class. Use Patch.set_facecolor to set
the facecolor.

```python
set_patch_arc(self, center, radius, theta1, theta2)
```
Set the spine to be arc-like.

```python
set_patch_circle(self, center, radius)
```
Set the spine to be circular.

```python
set_patch_line(self)
```
Set the spine to be linear.

```python
set_position(self, position)
```
Set the position of the spine.

Spine position is specified by a 2 tuple of (position type, amount). The position types are:
- 'outward': place the spine out from the data area by the specified number of points. (Negative values specify placing the spine inward.)
- 'axes': place the spine at the specified Axes coordinate (from 0.0-1.0).
- 'data': place the spine at the specified data coordinate.

Additionally, shorthand notations define a special positions:
- 'center' -> ('axes', 0.5)
- 'zero' -> ('data', 0.0)

```python
set_smart_bounds(self, value)
```
Set the spine and associated axis to have smart bounds.

### 17.44 matplotlib.style

```
matplotlib.style.context(style, after_reset=False)
```
Context manager for using style settings temporarily.

**Parameters**

- **style** [str, dict, or list] A style specification. Valid options are:
  
<table>
<thead>
<tr>
<th>str</th>
<th>The name of a style or a path/URL to a style file. For a list of available style names, see <code>style.available</code>.</th>
</tr>
</thead>
<tbody>
<tr>
<td>dict</td>
<td>Dictionary with valid key/value pairs for <code>matplotlib.rcParams</code>.</td>
</tr>
<tr>
<td>list</td>
<td>A list of style specifiers (str or dict) applied from first to last in the list.</td>
</tr>
</tbody>
</table>

- **after_reset** [bool] If True, apply style after resetting settings to their defaults; otherwise, apply style on top of the current settings.

```
matplotlib.style.reload_library()
```
Reload style library.

```
matplotlib.style.use(style)
```
Use matplotlib style settings from a style specification.

The style name of 'default' is reserved for reverting back to the default style settings.

**Parameters**
**style** [str, dict, or list] A style specification. Valid options are:

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>The name of a style or a path/URL to a style file. For a list of available</td>
</tr>
<tr>
<td></td>
<td>style names, see <code>matplotlib.style.available</code>.</td>
</tr>
<tr>
<td>dict</td>
<td>Dictionary with valid key/value pairs for <code>matplotlib.rcParams</code>.</td>
</tr>
<tr>
<td>list</td>
<td>A list of style specifiers (str or dict) applied from first to last</td>
</tr>
<tr>
<td></td>
<td>in the list.</td>
</tr>
</tbody>
</table>

---

**matplotlib.style.library**

Dictionary of available styles

**matplotlib.style.available**

List of available styles

---

**17.45 matplotlib.table**

This module provides functionality to add a table to a plot.

Use the factory function `table` to create a ready-made table from texts. If you need more control, use the `Table` class and its methods.

The table consists of a grid of cells, which are indexed by (row, column). The cell (0, 0) is positioned at the top left.

Thanks to John Gill for providing the class and table.

```python
class matplotlib.table.Cell(xy, width, height, edgecolor='k', facecolor='w', fill=True, text='', loc=None, fontproperties=None)
```

A cell is a `Rectangle` with some associated `Text`.

**Parameters**

- **xy** [2-tuple] The position of the bottom left corner of the cell.
- **width** [float] The cell width.
- **height** [float] The cell height.
- **edgecolor** [color spec] The color of the cell border.
- **facecolor** [color spec] The cell facecolor.
- **fill** [bool] Whether the cell background is filled.
- **text** [str] The cell text.
- **loc** [{‘left’, ‘center’, ‘right’}, default: ‘right’] The alignment of the text within the cell.
- **fontproperties** [dict] A dict defining the font properties of the text. Supported keys and values are the keyword arguments accepted by `FontProperties`.

---

**PAD = 0.1**

Padding between text and rectangle.

**auto_set_font_size(self, renderer)**

Shrink font size until the text fits into the cell width.
draw(self, renderer)
    Draw the Patch to the given renderer.

get_fontsize(self)
    Return the cell fontsize.

get_required_width(self, renderer)
    Return the minimal required width for the cell.

get_text(self)
    Return the cell Text instance.

get_text_bounds(self, renderer)
    Return the text bounds as (x, y, width, height) in table coordinates.

set_figure(self, fig)
    Set the Figure instance the artist belongs to.

Parameters
    fig [Figure]

set_fontsize(self, size)
    Set the text fontsize.

set_text_props(self, **kwargs)
    Update the text properties.
    Valid kwargs are

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agg_filter</td>
<td>a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array</td>

```python
set_transform(self, trans)
    Set the artist transform.

Parameters

    t [Transform]
```

class matplotlib.table.CustomCell(*args, visible_edges, **kwargs)
    Bases: matplotlib.table.Cell
    
    A Cell subclass with configurable edge visibility.

class matplotlib.table.Table(ax, loc=None, bbox=None, **kwargs)
    Bases: matplotlib.artist.Artist
    
    A table of cells.
    
    The table consists of a grid of cells, which are indexed by (row, column).
    
    For a simple table, you’ll have a full grid of cells with indices from (0, 0) to (num_rows-1, num_cols-1), in which the cell (0, 0) is positioned at the top left. However, you can also add cells with negative indices. You don’t have to add a cell to every grid position, so you can create tables that have holes.
    
    Note: You’ll usually not create an empty table from scratch. Instead use table to create a table from data.

Parameters
**ax** [matplotlib.axes.Axes] The Axes to plot the table into.

**loc** [str] The position of the cell with respect to ax. This must be one of the codes.

**bbox** [Bbox or None] A bounding box to draw the table into. If this is not None, this overrides loc.

**Other Parameters**

**kwargs** *Artist* properties.

**AXESPAD** = 0.02
The border between the Axes and the table edge in Axes units.

**FONTSIZE** = 10

**add_cell**(*self*, *row*, *col*, *args*, **kwargs*)
Create a cell and add it to the table.

**Parameters**

**row** [int] Row index.

**col** [int] Column index.

**args**, **kwargs** All other parameters are passed on to *Cell*.

**Returns**

**cell** [CustomCell] The created cell.

**auto_set_column_width**(*self*, *col*)
Automatically set the widths of given columns to optimal sizes.

**Parameters**

**col** [int or sequence of ints] The indices of the columns to auto-scale.

**auto_set_font_size**(*self*, *value=True*)
Automatically set font size.

**codes** = {'best': 0, 'bottom': 17, 'bottom left': 12, 'bottom right': 13, 'center': 9, 'center left': 5, 'center right': 6, 'left': 14, 'right': 15, 'top': 16, 'top left': 11, 'top right': 10, 'upper center': 8, 'upper left': 2, 'upper right': 1}
Possible values where to place the table relative to the Axes.

**contains**(*self*, *mouseevent*)
Test whether the artist contains the mouse event.

**Parameters**

**mouseevent** [matplotlib.backend_bases.MouseEvent]

**Returns**

**contains** [bool] Whether any values are within the radius.

**details** [dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

**See also:**

set_contains, get_contains
**draw**(``self, renderer``)

Draw the Artist using the given renderer.

This method will be overridden in the Artist subclasses. Typically, it is implemented to not have any effect if the Artist is not visible (``Artist.get_visible`` is False).

**Parameters**

``renderer`` [``RendererBase`` subclass.]

``edges``

The default value of ``visible_edges`` for newly added cells using ``add_cell``.

**Notes**

This setting does currently only affect newly created cells using ``add_cell``.

To change existing cells, you have to set their edges explicitly:

```python
for c in tab.get_celld().values():
    c.visible_edges = 'horizontal'
```

**get_celld**(``self``)

Return a dict of cells in the table mapping (row, column) to Cells.

**Notes**

You can also directly index into the Table object to access individual cells:

```python
cell = table[row, col]
```

**get_child_artists**(``self``)

[Deprecated] Return the Artists contained by the table.

**Notes**

Deprecated since version 3.0.

**get_children**(``self``)

Return the Artists contained by the table.

**get_window_extent**(``self, renderer``)

Return the bounding box of the table in window coords.

**scale**(``self, xscale, yscale``)

Scale column widths by ``xscale`` and row heights by ``yscale``.

**set_fontsize**(``self, size``)

Set the font size, in points, of the cell text.

**Parameters**

``size`` [float]
Notes

As long as auto font size has not been disabled, the value will be clipped such that the text fits horizontally into the cell.

You can disable this behavior using `auto_set_font_size`.

```python
>>> the_table.auto_set_font_size(False)
>>> the_table.set_fontsize(20)
```

However, there is no automatic scaling of the row height so that the text may exceed the cell boundary.

```python
matplotlib.table.table(ax, cellText=None, cellColours=None, cellLoc='right',
                       colWidths=None, rowLabels=None, rowColours=None,
                       rowLoc='left', colLabels=None, colColours=None,
                       colLoc='center', loc='bottom', bbox=None, edges='closed',
                       **kwargs)
```

Add a table to an `Axes`.

At least one of `cellText` or `cellColours` must be specified. These parameters must be 2D lists, in which the outer lists define the rows and the inner list define the column values per row. Each row must have the same number of elements.

The table can optionally have row and column headers, which are configured using `rowLabels`, `rowColours`, `rowLoc` and `colLabels`, `colColours`, `colLoc` respectively.

For finer grained control over tables, use the `Table` class and add it to the axes with `Axes.add_table`.

Parameters

- **cellText** [2D list of str, optional] The texts to place into the table cells.
  
  *Note:* Line breaks in the strings are currently not accounted for and will result in the text exceeding the cell boundaries.

- **cellColours** [2D list of matplotlib color specs, optional] The background colors of the cells.

- **cellLoc** [{‘left’, ‘center’, ‘right’}, default: ‘right’] The alignment of the text within the cells.

- **colWidths** [list of float, optional] The column widths in units of the axes. If not given, all columns will have a width of `1 / ncols`.

- **rowLabels** [list of str, optional] The text of the row header cells.

- **rowColours** [list of matplotlib color specs, optional] The colors of the row header cells.

- **rowLoc** [{‘left’, ‘center’, ‘right’}, optional, default: ‘left’] The text alignment of the row header cells.

- **colLabels** [list of str, optional] The text of the column header cells.

- **colColours** [list of matplotlib color specs, optional] The colors of the column header cells.

- **colLoc** [{‘left’, ‘center’, ‘right’}, optional, default: ‘left’] The text alignment of the column header cells.
**loc** [str, optional] The position of the cell with respect to `ax`. This must be one of the `codes`.

**bbox** [Bbox, optional] A bounding box to draw the table into. If this is not `None`, this overrides `loc`.

**edges** [substring of ‘BRTL’ or {'open’, ‘closed’, ‘horizontal’, ‘vertical’}] The cell edges to be drawn with a line. See also `visible_edges`.

**Returns**

**table** [Table] The created table.

**Other Parameters**

**kwargs** `Table` properties.

<table>

### 17.46 `matplotlib.testing`

#### 17.46.1 `matplotlib.testing`

Helper functions for testing.

`matplotlib.testing.is_called_from_pytest()`

Whether we are in a pytest run.

`matplotlib.testing.set_font_settings_for_testing()`

`matplotlib.testing.set_reproducibility_for_testing()`

`matplotlib.testing.setup()`
17.46.2 matplotlib.testing.compare

Provides a collection of utilities for comparing (image) results.

```python
matplotlib.testing.compare.compare_float(expected, actual, relTol=None, absTol=None)
```

[Deprecated] Fail if the floating point values are not close enough, with the given message.

You can specify a relative tolerance, absolute tolerance, or both.

**Notes**

Deprecated since version 3.0.

```python
matplotlib.testing.compare.compare_images(expected, actual, tol, in_decorator=False)
```

Compare two “image” files checking differences within a tolerance.

The two given filenames may point to files which are convertible to PNG via the `converter` dictionary. The underlying RMS is calculated with the `calculate_rms` function.

**Parameters**

- `expected` [str] The filename of the expected image.
- `actual` [str] The filename of the actual image.
- `tol` [float] The tolerance (a color value difference, where 255 is the maximal difference). The test fails if the average pixel difference is greater than this value.
- `in_decorator` [bool] Determines the output format. If called from `image_comparison` decorator, this should be True. (default=False)

**Returns**

- `comparison_result` [None or dict or str] Return `None` if the images are equal within the given tolerance.

If the images differ, the return value depends on `in_decorator`. If `in_decorator` is true, a dict with the following entries is returned:
  - `rms`: The RMS of the image difference.
  - `expected`: The filename of the expected image.
  - `actual`: The filename of the actual image.
  - `diff_image`: The filename of the difference image.
  - `tol`: The comparison tolerance.

Otherwise, a human-readable multi-line string representation of this information is returned.

**Examples**

```python
img1 = "./baseline/plot.png"
img2 = "./output/plot.png"
compare_images(img1, img2, 0.001)
```
matplotlib.testing.compare.comparable_formats()

Return the list of file formats that compare_images can compare on this system.

Returns

**supported_formats** [list of str] E.g. ['png', 'pdf', 'svg', 'eps'].

### 17.46.3 matplotlib.testing.decorators

class matplotlib.testing.decorators.CleanupTest(**kwargs)

Bases: object

[Deprecated]

Notes

Deprecated since version 3.0:
classmethod setup_class()
classmethod teardown_class()
test(self)

class matplotlib.testing.decorators.CleanupTestCase(methodName='runTest')

Bases: unittest.case.TestCase

A wrapper for unittest.TestCase that includes cleanup operations.
Create an instance of the class that will use the named test method when executed. Raises a ValueError if the instance does not have a method with the specified name.
classmethod setUpClass()  
    Hook method for setting up class fixture before running tests in the class.
classmethod tearDownClass()  
    Hook method for deconstructing the class fixture after running all tests in the class.

class matplotlib.testing.decorators.ImageComparisonTest(**kwargs)

Bases: matplotlib.testing.decorators.CleanupTest, matplotlib.testing.decorators._ImageComparisonBase  
[Deprecated] Nose-based image comparison class

This class generates tests for a nose-based testing framework. Ideally, this class would not be public, and the only publicly visible API would be the image_comparison() decorator. Unfortunately, there are existing downstream users of this class (e.g., pytest-mpl) so it cannot yet be removed.

Notes

Deprecated since version 3.0.
nose_runner(self)
setup(self)
teardown(self)
Decorator for test cases that generate and compare two figures.

The decorated function must take two arguments, `fig_test` and `fig_ref`, and draw the test and reference images on them. After the function returns, the figures are saved and compared.

This decorator should be preferred over `image_comparison` when possible in order to keep the size of the test suite from ballooning.

**Parameters**

- `extensions` [list, default: ["png", "pdf", "svg"]]: The extensions to test.
- `tol` [float]: The RMS threshold above which the test is considered failed.

**Examples**

Check that calling `Axes.plot` with a single argument plots it against $[0, 1, 2, ...]$:

```python
@check_figures_equal()
def test_plot(fig_test, fig_ref):
    fig_test.subplots().plot([1, 3, 5])
    fig_ref.subplots().plot([0, 1, 2], [1, 3, 5])
```

A decorator to ensure that any global state is reset before running a test.

**Parameters**

- `style` [str, optional]: The name of the style to apply.

Compare images generated by the test with those specified in `baseline_images`, which must correspond, else an `ImageComparisonFailure` exception will be raised.

**Parameters**

- `baseline_images` [list or None]: A list of strings specifying the names of the images generated by calls to `matplotlib.figure.savefig()`.
  
  If `None`, the test function must use the `baseline_images` fixture, either as a parameter or with `pytest.mark.usefixtures`. This value is only allowed when using pytest.

- `extensions` [None or list of str]: The list of extensions to test, e.g. `['png', 'pdf']`.
  
  If `None`, defaults to all supported extensions: png, pdf, and svg.

In order to keep the size of the test suite from ballooning, we only include the `svg` or `pdf` outputs if the test is explicitly exercising a feature dependent on that backend (see also the `check_figures_equal` decorator for that purpose).
tol [float, optional, default: 0] The RMS threshold above which the test is considered failed.

freetype_version [str or tuple] The expected freetype version or range of versions for this test to pass.

remove_text [bool] Remove the title and tick text from the figure before comparison. This is useful to make the baseline images independent of variations in text rendering between different versions of FreeType. This does not remove other, more deliberate, text, such as legends and annotations.

savefig_kwarg [dict] Optional arguments that are passed to the savefig method.

style [string] Optional name for the base style to apply to the image test. The test itself can also apply additional styles if desired. Defaults to the '_classic_test' style.

matplotlib.testing.decorators.remove_ticks_and_titles(figure)

matplotlib.testing.decorators.skip_if_command_unavailable(cmd)
[Deprecated] skips a test if a command is unavailable.

Parameters

cmd [list of str] must be a complete command which should not return a non zero exit code, something like ["latex", ",-version"]

Notes

Deprecated since version 3.0.

matplotlib.testing.decorators.switch_backend(backend)
[Deprecated]

Notes

Deprecated since version 3.1:

17.46.4 matplotlib.testing.disable_internet

matplotlib.testing.disable_internet.check_internet_off(original_function)
Wraps original_function, which in most cases is assumed to be a socket.socket method, to raise an IOError for any operations on non-local AF_INET sockets.

matplotlib.testing.disable_internet.no_internet(verbos=False)
Context manager to temporarily disable internet access (if not already disabled). If it was already disabled before entering the context manager (i.e. turn_off_internet was called previously) then this is a no-op and leaves internet access disabled until a manual call to turn_on_internet.

matplotlib.testing.disable_internet.turn_off_internet(verbos=False)
Disable internet access via python by preventing connections from being created using the socket module. Presumably this could be worked around by using some other means
of accessing the internet, but all default python modules (urllib, requests, etc.) use
socket [citation needed].

```python
matplotlib.testing.disable_internet.turn_on_internet(verbos=False)
```

Restore internet access. Not used, but kept in case it is needed.

### 17.46.5 matplotlib.testing.exceptions

```python
exception matplotlib.testing.exceptions.ImageComparisonFailure
    Bases: AssertionError
```

Raise this exception to mark a test as a comparison between two images.

### 17.47 matplotlib.text

Classes for including text in a figure.

```python
class matplotlib.text.Annotation(text, xy, xytext=None, xycoords='data',
    textcoords=None, arrowprops=None, annotation_clip=None, **kwargs)
```

An `Annotation` is a `Text` that can refer to a specific position `xy`. Optionally an arrow
pointing from the text to `xy` can be drawn.

#### Attributes

- `xy` The annotated position.
- `xycoords` The coordinate system for `xy`.
- `arrow_patch` A `FancyArrowPatch` to point from `xytext` to `xy`.

Annotate the point `xy` with text `text`.

In the simplest form, the text is placed at `xy`.

Optionally, the text can be displayed in another position `xytext`. An arrow pointing from
the text to the annotated point `xy` can then be added by defining `arrowprops`.

#### Parameters

- `text` [str] The text of the annotation. `s` is a deprecated synonym for this parameter.
- `xy` [(float, float)] The point `(x, y)` to annotate.
- `xytext` [(float, float), optional] The position `(x, y)` to place the text at. If `None`, defaults to `xy`.
- `xycoords` [str, `Artist`, `Transform`, callable or tuple, optional] The coordinate system that `xy` is given in. The following types of values are supported:
  - One of the following strings:
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'figure points'</td>
<td>Points from the lower left of the figure</td>
</tr>
<tr>
<td>'figure pixels'</td>
<td>Pixels from the lower left of the figure</td>
</tr>
<tr>
<td>'figure fraction'</td>
<td>Fraction of figure from lower left</td>
</tr>
<tr>
<td>'axes points'</td>
<td>Points from lower left corner of axes</td>
</tr>
<tr>
<td>'axes pixels'</td>
<td>Pixels from lower left corner of axes</td>
</tr>
<tr>
<td>'axes fraction'</td>
<td>Fraction of axes from lower left</td>
</tr>
<tr>
<td>'data'</td>
<td>Use the coordinate system of the object being annotated (default)</td>
</tr>
<tr>
<td>'polar'</td>
<td>$(\theta, r)$ if not native 'data' coordinates</td>
</tr>
</tbody>
</table>

- An *Artist*: $xy$ is interpreted as a fraction of the artists *Bbox*. E.g. $(0, 0)$ would be the lower left corner of the bounding box and $(0.5, 1)$ would be the center top of the bounding box.

- A *Transform* to transform $xy$ to screen coordinates.

- A function with one of the following signatures:

  ```python
def transform(renderer) -> Bbox
def transform(renderer) -> Transform
  ```

  where *renderer* is a *RendererBase* subclass.

  The result of the function is interpreted like the *Artist* and *Transform* cases above.

- A tuple $(xcoords, ycoords)$ specifying separate coordinate systems for $x$ and $y$. $xcoords$ and $ycoords$ must each be of one of the above described types.

See *Advanced Annotation* for more details.

Defaults to 'data'.

**textcoords** [str, *Artist*, *Transform*, callable or tuple, optional] The coordinate system that *xytext* is given in.

All *xycoords* values are valid as well as the following strings:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'offset points'</td>
<td>Offset (in points) from the <em>xy</em> value</td>
</tr>
<tr>
<td>'offset pixels'</td>
<td>Offset (in pixels) from the <em>xy</em> value</td>
</tr>
</tbody>
</table>

Defaults to the value of *xycoords*, i.e. use the same coordinate system for annotation point and text position.

**arrowprops** [dict, optional] The properties used to draw a *FancyArrowPatch* arrow between the positions *xy* and *xytext*.

If *arrowprops* does not contain the key 'arrowstyle' the allowed keys are:
Key | Description
---|---
width | The width of the arrow in points
headwidth | The width of the base of the arrow head in points
headlength | The length of the arrow head in points
shrink | Fraction of total length to shrink from both ends
? | Any key to `matplotlib.patches.FancyArrowPatch`

If `arrowprops` contains the key ‘arrowstyle’ the above keys are forbidden. The allowed values of ‘arrowstyle’ are:

<table>
<thead>
<tr>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-</code></td>
<td>None</td>
</tr>
<tr>
<td><code>-&gt;</code></td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>`-['</td>
<td>widthB=1.0,lengthB=0.2,angleB=None</td>
</tr>
<tr>
<td>`</td>
<td>-'</td>
</tr>
<tr>
<td><code>'-&gt;</code></td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td><code>&lt;-</code></td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td><code>&lt;-&gt;</code></td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>`&lt;</td>
<td>-`</td>
</tr>
<tr>
<td>`&lt;</td>
<td>-</td>
</tr>
<tr>
<td><code>'fancy'</code></td>
<td>head_length=0.4,head_width=0.4,tail_width=0.4</td>
</tr>
<tr>
<td><code>'simple'</code></td>
<td>head_length=0.5,head_width=0.5,tail_width=0.2</td>
</tr>
<tr>
<td><code>'wedge'</code></td>
<td>tail_width=0.3,shrink_factor=0.5</td>
</tr>
</tbody>
</table>

Valid keys for `FancyArrowPatch` are:

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arrowstyle</td>
<td>the arrow style</td>
</tr>
<tr>
<td>connectionstyle</td>
<td>the connection style</td>
</tr>
<tr>
<td>relpos</td>
<td>default is (0.5, 0.5)</td>
</tr>
<tr>
<td>patchA</td>
<td>default is bounding box of the text</td>
</tr>
<tr>
<td>patchB</td>
<td>default is None</td>
</tr>
<tr>
<td>shrinkA</td>
<td>default is 2 points</td>
</tr>
<tr>
<td>shrinkB</td>
<td>default is 2 points</td>
</tr>
<tr>
<td>mutation_scale</td>
<td>default is text size (in points)</td>
</tr>
<tr>
<td>mutation_aspect</td>
<td>default is 1.</td>
</tr>
<tr>
<td>?</td>
<td>any key for <code>matplotlib.patches.PathPatch</code></td>
</tr>
</tbody>
</table>

Defaults to None, i.e. no arrow is drawn.

**annotation_clip** [bool or None, optional] Whether to draw the annotation when the annotation point `xy` is outside the axes area.

- If `True`, the annotation will only be drawn when `xy` is within the axes.
- If `False`, the annotation will always be drawn.
- If `None`, the annotation will only be drawn when `xy` is within the axes and `xycoords` is ‘data’.

Defaults to `None`.

**kwargs** Additional kwargs are passed to `Text`. 
Returns

annotation [Annotation]

See also:

Advanced Annotation

anncoords
The coordinate system to use for Annotation.xyann.

arrow
[Deprecated]

Notes

Deprecated since version 3.0: arrow was deprecated in Matplotlib 3.0 and will be removed in 3.2. Use arrow_patch instead.

contains(self, event)
Test whether the mouse event occurred in the patch.
In the case of text, a hit is true anywhere in the axis-aligned bounding-box containing the text.

Returns

bool [bool]

draw(self, renderer)
Draw the Annotation object to the given renderer.

get_anncoords(self)
Return the coordinate system to use for Annotation.xyann.
See also xycoords in Annotation.

get_window_extent(self, renderer=None)
Return the Bbox bounding the text and arrow, in display units.

Parameters

renderer [Renderer, optional] A renderer is needed to compute the bounding box. If the artist has already been drawn, the renderer is cached; thus, it is only necessary to pass this argument when calling get_window_extent before the first draw. In practice, it is usually easier to trigger a draw first (e.g. by saving the figure).

set_anncoords(self, coords)
Set the coordinate system to use for Annotation.xyann.
See also xycoords in Annotation.

set_figure(self, fig)
Set the Figure instance the artist belongs to.

Parameters

fig [Figure]

update_positions(self, renderer)
Update the pixel positions of the annotated point and the text.
xyann
The text position.
See also `xytext` in `Annotation`.

class matplotlib.text.OffsetFrom(artist, ref_coord, unit='points')
Bases: object
Callable helper class for working with `Annotation`.

Parameters

- **artist** [Artist, BboxBase, or Transform] The object to compute the offset from.
- **ref_coord** [length 2 sequence] If `artist` is an `Artist` or `BboxBase`, this value is the location of the offset origin in fractions of the `artist` bounding box.
  - If `artist` is a transform, the offset origin is the transform applied to this value.
- **unit** [{'points', 'pixels'}] The screen units to use (pixels or points) for the offset input.

get_unit(self)
The unit for input to the transform used by `__call__`

set_unit(self, unit)
The unit for input to the transform used by `__call__`

Parameters

- **unit** [{'points', 'pixels'}]

class matplotlib.text.Text(x=0, y=0, text='', color=None, verticalalignment='baseline', horizontalalignment='left', multialignment=None, fontproperties=None, rotation=None, linespacing=None, rotation_mode=None, usetex=None, wrap=False, **kwargs)
Bases: `matplotlib.artist.Artist`
Handle storing and drawing of text in window or data coordinates.
Create a `Text` instance at x, y with string `text`.
Valid kwargs are

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agg_filter</td>
<td>a filter function, which takes a (m, n, 3) float array and a dpi value, and</td>

</tbody>
</table>

**contains**(*self*, *mouseevent*)

Test whether the mouse event occurred in the patch.

In the case of text, a hit is true anywhere in the axis-aligned bounding-box containing the text.

**Returns**

bool [bool]

draw(*self*, *renderer*)

Draws the Text object to the given renderer.

get_bbox_patch(*self*)

Return the bbox Patch, or None if the patches.FancyBboxPatch is not made.

get_c(*self*)

Alias for get_color.

get_color(*self*)

Return the color of the text
get_family(self)
    Alias for get_fontfamily.

get_font_properties(self)
    Alias for get_fontproperties.

get_fontfamily(self)
    Return the list of font families used for font lookup

    See also:

    font_manager.FontProperties.get_family

get_fontname(self)
    Return the font name as string

    See also:

    font_manager.FontProperties.get_name

get_fontproperties(self)
    Return the font_manager.FontProperties object

get_fontsize(self)
    Return the font size as integer

    See also:

    font_manager.FontProperties.get_size_in_points

get_fontstyle(self)
    Return the font style as string

    See also:

    font_manager.FontProperties.get_style

get_fontvariant(self)
    Return the font variant as a string

    See also:

    font_manager.FontProperties.get_variant

get_fontweight(self)
    Get the font weight as string or number

    See also:

    font_manager.FontProperties.get_weight

get_ha(self)
    Alias for get_horizontalalignment.

get_horizontalalignment(self)
    Return the horizontal alignment as string. Will be one of 'left', 'center' or 'right'.

get_name(self)
    Alias for get_fontname.
get_position(self)
    Return the position of the text as a tuple (x, y)

get_prop_tup(self, renderer=None)
    Return a hashable tuple of properties.
    Not intended to be human readable, but useful for backends who want to cache
derived information about text (e.g., layouts) and need to know if the text has changed.

get_rotation(self)
    Return the text angle as float in degrees.

get_rotation_mode(self)
    Get the text rotation mode.

get_size(self)
    Alias for get_fontsize.

get_stretch(self)
    Get the font stretch as a string or number
    See also:

        font_manager.FontProperties.get_stretch

g_get_style(self)
    Alias for get_fontstyle.

g_get_text(self)
    Get the text as string

g_get_unitless_position(self)
    Return the unitless position of the text as a tuple (x, y)

g_get_usetex(self)
    Return whether this Text object uses TeX for rendering.

g_get_va(self)
    Alias for get_verticalalignment.

g_get_variant(self)
    Alias for get_fontvariant.

g_get_verticalalignment(self)
    Return the vertical alignment as string. Will be one of ‘top’, ‘center’, ‘bottom’ or
    ‘baseline’.

g_get_weight(self)
    Alias for get_fontweight.

g_get_window_extent(self, renderer=None, dpi=None)
    Return the Bbox bounding the text, in display units.
    In addition to being used internally, this is useful for specifying clickable regions in
    a png file on a web page.

    Parameters

        renderer [Renderer, optional] A renderer is needed to compute the
        bounding box. If the artist has already been drawn, the renderer is
        cached; thus, it is only necessary to pass this argument when calling
        get_window_extent before the first draw. In practice, it is usually
easier to trigger a draw first (e.g. by saving the figure).
**dpi** [float, optional] The dpi value for computing the bbox, defaults to
self.figure.dpi (not the renderer dpi); should be set e.g. if to match
regions with a figure saved with a custom dpi value.

get_wrap(self)
Return the wrapping state for the text.

static is_math_text(s, usetex=None)
[Deprecated] Returns a cleaned string and a boolean flag. The flag indicates if
the given string s contains any mathtext, determined by counting unescaped dollar
signs. If no mathtext is present, the cleaned string has its dollar signs unescaped.
If usetex is on, the flag always has the value “TeX”.

Notes
Deprecated since version 3.1.

set_backgroundcolor(self, color)
Set the background color of the text by updating the bbox.

Parameters

color [color]

See also:

set_bbox To change the position of the bounding box

set_bbox(self, rectprops)
Draw a bounding box around self.

Parameters

rectprops [dict with properties for patches.FancyBboxPatch] The de-
default boxstyle is ‘square’. The mutation scale of the patches.
FancyBboxPatch is set to the fontsize.

Examples

t.set_bbox(dict(facecolor='red', alpha=0.5))

set_c(self, color)
Alias for set_color.

set_clip_box(self, clipbox)
Set the artist’s clip Bbox.

Parameters

clipbox [Bbox]

set_clip_on(self, b)
Set whether the artist uses clipping.
When False artists will be visible out side of the axes which can lead to unexpected
results.

Parameters
b [bool]

set_clip_path(self, path, transform=None)
    Set the artist’s clip path, which may be:
    • a Patch (or subclass) instance; or
    • a Path instance, in which case a Transform instance, which will be applied to the
      path before using it for clipping, must be provided; or
    • None, to remove a previously set clipping path.
    For efficiency, if the path happens to be an axis-aligned rectangle, this method will
    set the clipping box to the corresponding rectangle and set the clipping path to None.
    ACCEPTS: [(Path, Transform) | Patch | None]

set_color(self, color)
    Set the foreground color of the text

    Parameters
    color [color]

set_family(self, fontname)
    Alias for set_fontfamily.

set_font_properties(self, fp)
    Alias for set_fontproperties.

set_fontfamily(self, fontname)
    Set the font family. May be either a single string, or a list of strings in decreasing
    priority. Each string may be either a real font name or a generic font class name. If
    the latter, the specific font names will be looked up in the corresponding rcParams.
    If a Text instance is constructed with fontfamily=None, then the font is set
    to rcParams["font.family"] (default: [‘sans-serif’]), and the same is done when
    set_fontfamily() is called on an existing Text instance.

    Parameters
    ‘monospace’}]

    See also:

    font_manager.FontProperties.set_family

set_fontname(self, fontname)
    Alias for set_family.
    One-way alias only: the getter differs.

    Parameters
    ‘monospace’}]

    See also:

    font_manager.FontProperties.set_family

set_fontproperties(self, fp)
    Set the font properties that control the text.
Parameters

\( \text{fp} \ [\text{font_manager.FontProperties}] \)

\text{set_fontsize}(\text{self}, \text{fontsize})

Set the font size. May be either a size string, relative to the default font size, or an absolute font size in points.

Parameters

See also:

\text{font_manager.FontProperties.set_size}

\text{set_fontstretch}(\text{self}, \text{stretch})

Set the font stretch (horizontal condensation or expansion).

Parameters

See also:

\text{font_manager.FontProperties.set_stretch}

\text{set_fontstyle}(\text{self}, \text{fontstyle})

Set the font style.

Parameters

\text{fontstyle} \ {[\text{‘normal’, ‘italic’, ‘oblique’}]}

See also:

\text{font_manager.FontProperties.set_style}

\text{set_fontvariant}(\text{self}, \text{variant})

Set the font variant, either ‘normal’ or ‘small-caps’.

Parameters

\text{variant} \ {[\text{‘normal’, ‘small-caps’}]}

See also:

\text{font_manager.FontProperties.set_variant}

\text{set_fontweight}(\text{self}, \text{weight})

Set the font weight.

Parameters

See also:
```python
font_manager.FontProperties.set_weight

set_ha(self, align)
    Alias for set_horizontalalignment.

set_horizontalalignment(self, align)
    Set the horizontal alignment to one of

    Parameters
    align [{'center', 'right', 'left'}]

set_linespacing(self, spacing)
    Set the line spacing as a multiple of the font size. Default is 1.2.

    Parameters
    spacing [float (multiple of font size)]

set_ma(self, align)
    Alias for set_multialignment.

set_multialignment(self, align)
    Set the alignment for multiple lines layout. The layout of the bounding box of all the
    lines is determined by the horizontalalignment and verticalalignment properties,
    but the multiline text within that box can be

    Parameters
    align [{'left', 'right', 'center'}]

set_name(self, fontname)
    Alias for set_fontname.

set_position(self, xy)
    Set the (x, y) position of the text.

    Parameters
    xy [(float, float)]

set_rotation(self, s)
    Set the rotation of the text.

    Parameters
    s [{angle in degrees, 'vertical', 'horizontal'}]

set_rotation_mode(self, m)
    Set text rotation mode.

    Parameters
    m [{None, 'default', 'anchor'}] If None or "default", the text will be
    first rotated, then aligned according to their horizontal and vertical
    alignments. If "anchor", then alignment occurs before rotation.

set_size(self, fontsize)
    Alias for set_fontsize.

set_stretch(self, stretch)
    Alias for set_fontstretch.

set_style(self, fontstyle)
    Alias for set_fontstyle.
```
set_text(self, s)
    Set the text string s.
    It may contain newlines (\n) or math in LaTeX syntax.
    
    Parameters
    s [object] Any object gets converted to its str, except None which becomes ''.

set_usetex(self, usetex)
    Parameters
    usetex [bool or None] Whether to render using TeX, None means to use
    rcParams["text.usetex"] (default: False).

set_va(self, align)
    Alias for set_verticalalignment.

set_variant(self, variant)
    Alias for set_fontvariant.

set_verticalalignment(self, align)
    Set the vertical alignment
    
    Parameters
    align [{'center', 'top', 'bottom', 'baseline', 'center_baseline'}]

set_weight(self, weight)
    Alias for set_fontweight.

set_wrap(self, wrap)
    Set the wrapping state for the text.
    
    Parameters
    wrap [bool]

set_x(self, x)
    Set the x position of the text.
    
    Parameters
    x [float]

set_y(self, y)
    Set the y position of the text.
    
    Parameters
    y [float]

update(self, kwargs)
    Update properties from a dictionary.

update_bbox_position_size(self, renderer)
    Update the location and the size of the bbox.
    This method should be used when the position and size of the bbox needs to be
    updated before actually drawing the bbox.

update_from(self, other)
    Copy properties from other to self.

zorder = 3
class matplotlib.text.TextWithDash(**kwargs)

Bases: matplotlib.text.Text

[Deprecated] This is basically a Text with a dash (drawn with a Line2D) before/after it. It is intended to be a drop-in replacement for Text, and should behave identically to it when dashlength = 0.0.

The dash always comes between the point specified by set_position() and the text. When a dash exists, the text alignment arguments (horizontalalignment, verticalalignment) are ignored.

dashlength is the length of the dash in canvas units. (default = 0.0).
dashdirection is one of 0 or 1, where 0 draws the dash after the text and 1 before. (default = 0).
dashrotation specifies the rotation of the dash, and should generally stay None. In this case get_dashrotation() returns get_rotation(). (i.e., the dash takes its rotation from the text's rotation). Because the text center is projected onto the dash, major deviations in the rotation cause what may be considered visually unappealing results. (default = None)

dashpad is a padding length to add (or subtract) space between the text and the dash, in canvas units. (default = 3)
dashpush “pushes” the dash and text away from the point specified by set_position() by the amount in canvas units. (default = 0)

---

**Note:** The alignment of the two objects is based on the bounding box of the Text, as obtained by get_window_extent(). This, in turn, appears to depend on the font metrics as given by the rendering backend. Hence the quality of the “centering” of the label text with respect to the dash varies depending on the backend used.

---

**Note:** I’m not sure that I got the get_window_extent() right, or whether that’s sufficient for providing the object bounding box.

---

Notes

Deprecated since version 3.1.

draw(self, renderer)
   Draw the TextWithDash object to the given renderer.

get_dashdirection(self)
   Get the direction dash. 1 is before the text and 0 is after.

get_dashlength(self)
   Get the length of the dash.

get_dashpad(self)
   Get the extra spacing between the dash and the text, in canvas units.

get_dashpush(self)
   Get the extra spacing between the dash and the specified text position, in canvas units.
get_dashrotation(self)
    Get the rotation of the dash in degrees.

get_figure(self)
    Return the figure instance the artist belongs to.

get_position(self)
    Return the position of the text as a tuple (x, y)

get_prop_tup(self, renderer=None)
    Return a hashable tuple of properties.
    Not intended to be human readable, but useful for backends who want to cache der-
    rived information about text (e.g., layouts) and need to know if the text has changed.

get_unitless_position(self)
    Return the unitless position of the text as a tuple (x, y)

get_window_extent(self, renderer=None)
    Return a Bbox object bounding the text, in display units.
    In addition to being used internally, this is useful for specifying clickable regions in
    a png file on a web page.

    renderer defaults to the _renderer attribute of the text object. This is not assigned
    until the first execution of draw(), so you must use this kwarg if you want to call
    get_window_extent() prior to the first draw(). For getting web page regions, it is
    simpler to call the method after saving the figure.

set_dashdirection(self, dd)
    Set the direction of the dash following the text. 1 is before the text and 0 is after.
    The default is 0, which is what you’d want for the typical case of ticks below and on
    the left of the figure.

    Parameters
        dd [int (1 is before, 0 is after)]

set_dashlength(self, dl)
    Set the length of the dash, in canvas units.

    Parameters
        dl [float]

set_dashpad(self, dp)
    Set the “pad” of the TextWithDash, which is the extra spacing between the dash
    and the text, in canvas units.

    Parameters
        dp [float]

set_dashpush(self, dp)
    Set the “push” of the TextWithDash, which is the extra spacing between the begin-
    ning of the dash and the specified position.

    Parameters
        dp [float]

set_dashrotation(self, dr)
    Set the rotation of the dash, in degrees.

    Parameters
dr [float]

set_figure(self, fig)
    Set the figure instance the artist belongs to.

    Parameters
    fig [Figure]

set_position(self, xy)
    Set the (x, y) position of the TextWithDash.

    Parameters
    xy [(float, float)]

set_transform(self, t)
    Set the matplotlib.transforms.Transform instance used by this artist.

    Parameters
    t [Transform]

set_x(self, x)
    Set the x position of the TextWithDash.

    Parameters
    x [float]

set_y(self, y)
    Set the y position of the TextWithDash.

    Parameters
    y [float]

update_coords(self, renderer)
    Computes the actual x, y coordinates for text based on the input x, y and the dash-length. Since the rotation is with respect to the actual canvas’s coordinates we need to map back and forth.

matplotlib.text.get_rotation(rotation)
    Return the text angle as float between 0 and 360 degrees.

    rotation may be ‘horizontal’, ‘vertical’, or a numeric value in degrees.

17.48 matplotlib.textpath

class matplotlib.textpath.TextPath(xy, s, size=None, prop=None, _interpolation_steps=1, usetex=False, *args, **kwargs)

    Bases: matplotlib.path.Path

    Create a path from the text.

    Create a path from the text. Note that it simply is a path, not an artist. You need to use the PathPatch (or other artists) to draw this path onto the canvas.

    Parameters
    xy [tuple or array of two float values] Position of the text. For no offset, use xy=(0, 0).
s [str] The text to convert to a path.

size [float, optional] Font size in points. Defaults to the size specified via the font properties prop.

prop [matplotlib.font_manager.FontProperties, optional] Font property. If not provided, will use a default FontProperties with parameters from the rcParams.

_interppolation_steps [integer, optional] (Currently ignored)

usetex [bool, optional] Whether to use tex rendering. Defaults to False.

Examples

The following creates a path from the string "ABC" with Helvetica font face; and another path from the latex fraction 1/2:

```python
from matplotlib.textpath import TextPath
from matplotlib.font_manager import FontProperties

fp = FontProperties(family="Helvetica", style="italic")
path1 = TextPath((12,12), "ABC", size=12, prop=fp)
path2 = TextPath((0,0), r"\frac{1}{2}", size=12, usetex=True)
```

Also see /gallery/text_labels_and_annotations/demo_text_path.

codes

Return the codes

get_size(self)

Get the text size.

is_math_text(self, s)

[Deprecated] Returns True if the given string s contains any mathtext.

Notes

Deprecated since version 3.1.

set_size(self, size)

Set the text size.

text_get_vertices_codes(self, prop, s, usetex)

[Deprecated] Convert string s to a (vertices, codes) pair using font property prop.

Notes

Deprecated since version 3.1.

vertices

Return the cached path after updating it if necessary.

class matplotlib.textpath.TextToPath

Bases: object

A class that converts strings to paths.
DPI = 72

FONT_SCALE = 100.0

glyphs_mathtext(self, prop, s, glyph_map=None, return_new_glyphs_only=False)

Parse mathtext string s and convert it to a (vertices, codes) pair.

glyphs_tex(self, prop, s, glyph_map=None, return_new_glyphs_only=False)

Convert the string s to vertices and codes using usetex mode.

glyphs_with_font(self, font, s, glyph_map=None, return_new_glyphs_only=False)

Convert string s to vertices and codes using the provided ttf font.

texmanager(self)

Return the cached TexManager instance.

text_path(self, prop, s, ismath=False, usetex=<deprecated parameter>)

Convert text s to path (a tuple of vertices and codes for matplotlib.path.Path).

Parameters

s [str] The text to be converted.
ismath [{False, True, "TeX"}] If True, use mathtext parser. If "TeX", use tex for rendering.
usetex [bool, optional] If set, forces ismath to True. This parameter is deprecated.

Returns

verts, codes [tuple of lists] verts is a list of numpy arrays containing the x and y coordinates of the vertices. codes is a list of path codes.

Examples

Create a list of vertices and codes from a text, and create a Path from those:

```python
from matplotlib.path import Path
from matplotlib.textpath import TextToPath
from matplotlib.font_manager import FontProperties

fp = FontProperties(family="Humor Sans", style="italic")
verts, codes = TextToPath().get_text_path(fp, "ABC")
path = Path(verts, codes, closed=False)
```

Also see TextPath for a more direct way to create a path from a text.

glyph_to_path(self, font, currx=0.0)

[Deprecated] Convert the font’s current glyph to a (vertices, codes) pair.
17.49 matplotlib.ticker

17.49.1 Tick locating and formatting

This module contains classes to support completely configurable tick locating and formatting. Although the locators know nothing about major or minor ticks, they are used by the Axis class to support major and minor tick locating and formatting. Generic tick locators and formatters are provided, as well as domain specific custom ones.

Default Formatter

The default formatter identifies when the x-data being plotted is a small range on top of a large offset. To reduce the chances that the ticklabels overlap, the ticks are labeled as deltas from a fixed offset. For example:

```python
ax.plot(np.arange(2000, 2010), range(10))
```

will have tick of 0-9 with an offset of +2e3. If this is not desired turn off the use of the offset on the default formatter:

```python
ax.get_xaxis().get_major_formatter().set_useOffset(False)
```

set the rcParam `axes.formatter.useoffset=False` to turn it off globally, or set a different formatter.

Tick locating

The Locator class is the base class for all tick locators. The locators handle autoscaling of the view limits based on the data limits, and the choosing of tick locations. A useful semi-automatic tick locator is `MultipleLocator`. It is initialized with a base, e.g., 10, and it picks axis limits and ticks that are multiples of that base.

The Locator subclasses defined here are

- `AutoLocator`
- `MaxNLocator` with simple defaults. This is the default tick locator for most plotting.
- `MaxNLocator` Finds up to a max number of intervals with ticks at nice locations.
- `LinearLocator` Space ticks evenly from min to max.
- `LogLocator` Space ticks logarithmically from min to max.
**MultipleLocator**  Ticks and range are a multiple of base; either integer or float.

**FixedLocator**  Tick locations are fixed.

**IndexLocator**  Locator for index plots (e.g., where $x = \text{range}(\text{len}(y))$).

**NullLocator**  No ticks.

**SymmetricalLogLocator**  Locator for use with with the symlog norm; works like **LogLocator** for the part outside of the threshold and adds 0 if inside the limits.

**LogitLocator**  Locator for logit scaling.

**OldAutoLocator**  Choose a **MultipleLocator** and dynamically reassign it for intelligent ticking during navigation.

**AutoMinorLocator**  Locator for minor ticks when the axis is linear and the major ticks are uniformly spaced. Subdivides the major tick interval into a specified number of minor intervals, defaulting to 4 or 5 depending on the major interval.

There are a number of locators specialized for date locations - see the dates module.

You can define your own locator by deriving from Locator. You must override the `__call__` method, which returns a sequence of locations, and you will probably want to override the autoscale method to set the view limits from the data limits.

If you want to override the default locator, use one of the above or a custom locator and pass it to the `x` or `y` axis instance. The relevant methods are:

```python
ax.xaxis.set_major_locator(xmajor_locator)
ax.xaxis.set_minor_locator(xminor_locator)
ax.yaxis.set_major_locator(ymajor_locator)
ax.yaxis.set_minor_locator(ymminor_locator)
```

The default minor locator is **NullLocator**, i.e., no minor ticks on by default.

**Tick formatting**

Tick formatting is controlled by classes derived from Formatter. The formatter operates on a single tick value and returns a string to the axis.

**NullFormatter**  No labels on the ticks.

**IndexFormatter**  Set the strings from a list of labels.

**FixedFormatter**  Set the strings manually for the labels.

**FuncFormatter**  User defined function sets the labels.

**StrMethodFormatter**  Use string format method.

**FormatStrFormatter**  Use an old-style sprintf format string.

**ScalarFormatter**  Default formatter for scalars: autopick the format string.

**LogFormatter**  Formatter for log axes.

**LogFormatterExponent**  Format values for log axis using $\text{exponent} = \log_{\text{base}}(\text{value})$.

**LogFormatterMathtext**  Format values for log axis using $\text{exponent} = \log_{\text{base}}(\text{value})$ using Math text.

**LogFormatterSciNotation**  Format values for log axis using scientific notation.
LogitFormatter Probability formatter.
EngFormatter Format labels in engineering notation
PercentFormatter Format labels as a percentage

You can derive your own formatter from the Formatter base class by simply overriding the __call__ method. The formatter class has access to the axis view and data limits.

To control the major and minor tick label formats, use one of the following methods:

```
ax.xaxis.set_major_formatter(xmajor_formatter)
ax.xaxis.set_minor_formatter(xminor_formatter)
ax.yaxis.set_major_formatter(ymajor_formatter)
ax.yaxis.set_minor_formatter(ymminor_formatter)
```

See /gallery/ticks_and_spines/major_minor_demo for an example of setting major and minor ticks. See the matplotlib.dates module for more information and examples of using date locators and formatters.

class matplotlib.ticker.TickHelper
    Bases: object
    axis = None
    create_dummy_axis(self, **kwargs)
    set_axis(self, axis)
    set_bounds(self, vmin, vmax)
    set_data_interval(self, vmin, vmax)
    set_view_interval(self, vmin, vmax)

class matplotlib.ticker.Formatter
    Bases: matplotlib.ticker.TickHelper

Create a string based on a tick value and location.

fix_minus(self, s)
    Some classes may want to replace a hyphen for minus with the proper unicode symbol (U+2212) for typographical correctness. The default is to not replace it.
    Note, if you use this method, e.g., in format_data() or call, you probably don’t want to use it for format_data_short() since the toolbar uses this for interactive coord reporting and I doubt we can expect GUIs across platforms will handle the unicode correctly. So for now the classes that override fix_minus() should have an explicit format_data_short() method

format_data(self, value)
    Returns the full string representation of the value with the position unspecified.

format_data_short(self, value)
    Return a short string version of the tick value.
    Defaults to the position-independent long value.

format_ticks(self, values)
    Return the tick labels for all the ticks at once.

get_offset(self)
    locs = []
set_locs(self, locs)

class matplotlib.ticker.FixedFormatter(seq):
    Bases: matplotlib.ticker.Formatter
    Return fixed strings for tick labels based only on position, not value.
    Set the sequence of strings that will be used for labels.

    get_offset(self)
    set_offset_string(self, ofs)

class matplotlib.ticker.NullFormatter:
    Bases: matplotlib.ticker.Formatter
    Always return the empty string.

class matplotlib.ticker.FuncFormatter(func):
    Bases: matplotlib.ticker.Formatter
    Use a user-defined function for formatting.
    The function should take in two inputs (a tick value x and a position pos), and return a
    string containing the corresponding tick label.

class matplotlib.ticker.FormatStrFormatter(fmt):
    Bases: matplotlib.ticker.Formatter
    Use an old-style ('%' operator) format string to format the tick.
    The format string should have a single variable format (%) in it. It will be applied to the
    value (not the position) of the tick.

class matplotlib.ticker.StrMethodFormatter(fmt):
    Bases: matplotlib.ticker.Formatter
    Use a new-style format string (as used by str.format()) to format the tick.
    The field used for the value must be labeled x and the field used for the position must be
    labeled pos.

class matplotlib.ticker.ScalarFormatter(useOffset=None, useMathText=None, useLocale=None):
    Bases: matplotlib.ticker.Formatter
    Format tick values as a number.
    Tick value is interpreted as a plain old number. If useOffset==True and the data range is
    much smaller than the data average, then an offset will be determined such that the tick
    labels are meaningful. Scientific notation is used for data < $10^{-n}$ or data >= $10^m$, where
    n and m are the power limits set using set_powerlimits((n,m)). The defaults for these are
    controlled by the axes.formatter.limits rc parameter.

    fix_minus(self, s)
        Replace hyphens with a unicode minus.

    format_data(self, value)
        Return a formatted string representation of a number.

    format_data_short(self, value)
        Return a short formatted string representation of a number.

    get_offset(self)
        Return scientific notation, plus offset.
get_useLocale(self)
get_useMathText(self)
get_useOffset(self)
pprint_val(self, x)

[Deprecated]

Notes

Deprecated since version 3.1:

set_locs(self, locs)
Set the locations of the ticks.

set_powerlimits(self, lims)
Sets size thresholds for scientific notation.

Parameters

lims [(min_exp, max_exp)] A tuple containing the powers of 10 that
determine the switchover threshold. Numbers below 10**min_exp
and above 10**max_exp will be displayed in scientific notation.

For example, formatter.set_powerlimits((-3, 4)) sets the pre-2007
default in which scientific notation is used for numbers less than
1e-3 or greater than 1e4.

See also:

ScalarFormatter.set_scientific

set_scientific(self, b)
Turn scientific notation on or off.

See also:

ScalarFormatter.set_powerlimits

set_useLocale(self, val)
set_useMathText(self, val)
set_useOffset(self, val)
useLocale
useMathText
useOffset

class matplotlib.ticker.LogFormatter(base=10.0, labelOnlyBase=False, minor_thresholds=None, linthresh=None)

Bases: matplotlib.ticker.Formatter

Base class for formatting ticks on a log or symlog scale.
It may be instantiated directly, or subclassed.

Parameters
**base** [float, optional, default: 10.] Base of the logarithm used in all calculations.

**labelOnlyBase** [bool, optional, default: False] If True, label ticks only at integer powers of base. This is normally True for major ticks and False for minor ticks.

**minor_thresholds** [(subset, all), optional, default: (1, 0.4)] If labelOnlyBase is False, these two numbers control the labeling of ticks that are not at integer powers of base; normally these are the minor ticks. The controlling parameter is the log of the axis data range. In the typical case where base is 10 it is the number of decades spanned by the axis, so we can call it 'numdec'. If numdec <= all, all minor ticks will be labeled. If all < numdec <= subset, then only a subset of minor ticks will be labeled, so as to avoid crowding. If numdec > subset then no minor ticks will be labeled.

**linthresh** [None or float, optional, default: None] If a symmetric log scale is in use, its linthresh parameter must be supplied here.

**Notes**

The set_locs method must be called to enable the subsetting logic controlled by the minor_thresholds parameter.

In some cases such as the colorbar, there is no distinction between major and minor ticks; the tick locations might be set manually, or by a locator that puts ticks at integer powers of base and at intermediate locations. For this situation, disable the minor_thresholds logic by using minor_thresholds=(np.inf, np.inf), so that all ticks will be labeled.

To disable labeling of minor ticks when 'labelOnlyBase' is False, use minor_thresholds=(0, 0). This is the default for the "classic" style.

**Examples**

To label a subset of minor ticks when the view limits span up to 2 decades, and all of the ticks when zoomed in to 0.5 decades or less, use minor_thresholds=(2, 0.5).

To label all minor ticks when the view limits span up to 1.5 decades, use minor_thresholds=(1.5, 1.5).

**base**(self, base)

Change the base for labeling.

**Warning:** Should always match the base used for LogLocator

**format_data**(self, value)

Returns the full string representation of the value with the position unspecified.

**format_data_short**(self, value)

Return a short formatted string representation of a number.

**label_minor**(self, labelOnlyBase)

Switch minor tick labeling on or off.
Parameters

**labelOnlyBase** [bool] If True, label ticks only at integer powers of base.

```python
pprint_val(self, *args, **kwargs)
```

[Deprecated]

**Notes**

Deprecated since version 3.1:

```python
set_locs(self, locs=None)
```

Use axis view limits to control which ticks are labeled.

The `locs` parameter is ignored in the present algorithm.

```python
class matplotlib.ticker.LogFormatterExponent(base=10.0, labelOnlyBase=False, minor_thresholds=None, linthresh=None)
```

Bases: `matplotlib.ticker.LogFormatter`

Format values for log axis using exponent = log_base(value).

```python
class matplotlib.ticker.LogFormatterMathtext(base=10.0, labelOnlyBase=False, minor_thresholds=None, linthresh=None)
```

Bases: `matplotlib.ticker.LogFormatter`

Format values for log axis using exponent = log_base(value).

```python
class matplotlib.ticker.IndexFormatter(labels)
```

Bases: `matplotlib.ticker.Formatter`

Format the position x to the nearest i-th label where \(i = \text{int}(x + 0.5)\). Positions where \(i < 0\) or \(i > \text{len(list)}\) have no tick labels.

**Parameters**

**labels** [list] List of labels.

```python
class matplotlib.ticker.LogFormatterSciNotation(base=10.0, labelOnlyBase=False, minor_thresholds=None, linthresh=None)
```

Bases: `matplotlib.ticker.LogFormatterMathtext`

Format values following scientific notation in a logarithmic axis.

```python
class matplotlib.ticker.LogitFormatter
```

Bases: `matplotlib.ticker.Formatter`

Probability formatter (using Math text).

```python
format_data_short(self, value)
```

return a short formatted string representation of a number

```python
class matplotlib.ticker.EngFormatter(unit=",", places=None, sep=' ', *, useTex=None, useMathText=None)
```

Bases: `matplotlib.ticker.Formatter`

Formats axis values using engineering prefixes to represent powers of 1000, plus a specified unit, e.g., 10 MHz instead of 1e7.

**Parameters**
unit [str (default: "")]: Unit symbol to use, suitable for use with single-letter representations of powers of 1000. For example, ‘Hz’ or ‘m’.

places [int (default: None)]: Precision with which to display the number, specified in digits after the decimal point (there will be between one and three digits before the decimal point). If it is None, the formatting falls back to the floating point format ‘%g’, which displays up to 6 significant digits, i.e. the equivalent value for places varies between 0 and 5 (inclusive).

sep [str (default: " ")]: Separator used between the value and the prefix/unit. For example, one get ‘3.14 mV’ if sep is " " (default) and ‘3.14mV’ if sep is "". Besides the default behavior, some other useful options may be:
- sep="" to append directly the prefix/unit to the value;
- sep="\N{THIN SPACE}" (U+2009);
- sep="\N{NARROW NO-BREAK SPACE}" (U+202F);
- sep="\N{NO-BREAK SPACE}" (U+00A0).

usetex [bool (default: None)]: To enable/disable the use of TeX’s math mode for rendering the numbers in the formatter.

useMathText [bool (default: None)]: To enable/disable the use mathtext for rendering the numbers in the formatter.

fix_minus(self, s)
Replace hyphens with a unicode minus.

format_eng(self, num)
Formats a number in engineering notation, appending a letter representing the power of 1000 of the original number. Some examples:

```python
>>> format_eng(0)  # for self.places = 0
'0'

>>> format_eng(1000000)  # for self.places = 1
'1.0 M'

>>> format_eng("-1e-6")  # for self.places = 2
'-1.00 µ'
```

get_useMathText(self)
get_usetex(self)
set_useMathText(self, val)
set_usetex(self, val)
useMathText
usetex
class matplotlib.ticker.PercentFormatter(xmax=100, decimals=None, symbol='%', is_latex=False)
Bases: matplotlib.ticker.Formatter
Format numbers as a percentage.

**Parameters**

- **xmax** [float] Determines how the number is converted into a percentage. 
  xmax is the data value that corresponds to 100%. Percentages are computed as \(x / xmax \times 100\). So if the data is already scaled to be percentages, xmax will be 100. Another common situation is where xmax is 1.0.

- **decimals** [None or int] The number of decimal places to place after the point. If None (the default), the number will be computed automatically.

- **symbol** [string or None] A string that will be appended to the label. It may be None or empty to indicate that no symbol should be used. LaTeX special characters are escaped in symbol whenever latex mode is enabled, unless is_latex is True.

- **is_latex** [bool] If False, reserved LaTeX characters in symbol will be escaped.

**convert_to_pct**(self, x)

**format_pct**(self, x, display_range)

Formats the number as a percentage number with the correct number of decimals and adds the percent symbol, if any.

If self.decimals is None, the number of digits after the decimal point is set based on the display_range of the axis as follows:

<table>
<thead>
<tr>
<th>display_range</th>
<th>decimals</th>
<th>sample</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt;50</td>
<td>0</td>
<td>x = 34.5 =&gt; 35%</td>
</tr>
<tr>
<td>&gt;5</td>
<td>1</td>
<td>x = 34.5 =&gt; 34.5%</td>
</tr>
<tr>
<td>&gt;0.5</td>
<td>2</td>
<td>x = 34.5 =&gt; 34.50%</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
<td>...</td>
</tr>
</tbody>
</table>

This method will not be very good for tiny axis ranges or extremely large ones. It assumes that the values on the chart are percentages displayed on a reasonable scale.

**symbol**

The configured percent symbol as a string.

If LaTeX is enabled via rcParams["text.usetex"] (default: False), the special characters {'#', '$', '%', '&', '~', '_', '^', '\', '{', '}'} are automatically escaped in the string.

class matplotlib.ticker.OldScalarFormatter

**Bases:** matplotlib.ticker.Formatter

Tick location is a plain old number.

**pprint_val**(self, x, d)

[Deprecated] Formats the value x based on the size of the axis range d.

**Notes**

Deprecated since version 3.1.
class matplotlib.ticker.Locator
    Bases: matplotlib.ticker.TickHelper

Determine the tick locations;
Note that the same locator should not be used across multiple Axis because the locator stores references to the Axis data and view limits.

MAXTICKS = 1000
autoscale(self)
    autoscale the view limits
nonsingular(self, v0, v1)
    Expand a range as needed to avoid singularities.
pan(self, numsteps)
    Pan numticks (can be positive or negative)
raise_if_exceeds(self, locs)
    raise a RuntimeError if Locator attempts to create more than MAXTICKS locs
refresh(self)
    refresh internal information based on current lim
set_params(self, **kwargs)
    Do nothing, and raise a warning. Any locator class not supporting the set_params() function will call this.
tick_values(self, vmin, vmax)
    Return the values of the located ticks given vmin and vmax.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

view_limits(self, vmin, vmax)
    Select a scale for the range from vmin to vmax.
    Subclasses should override this method to change locator behaviour.
zoom(self, direction)
    Zoom in/out on axis; if direction is >0 zoom in, else zoom out

class matplotlib.ticker.IndexLocator(base, offset)
    Bases: matplotlib.ticker.Locator

Place a tick on every multiple of some base number of points plotted, e.g., on every 5th point. It is assumed that you are doing index plotting; i.e., the axis is 0, len(data). This is mainly useful for x ticks.

place ticks on the i-th data points where (i-offset)%base==0
set_params(self, base=None, offset=None)
    Set parameters within this locator
tick_values(self, vmin, vmax)
    Return the values of the located ticks given vmin and vmax.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]

class matplotlib.ticker.FixedLocator(locs, nbins=None)
    Bases: matplotlib.ticker.Locator

    Tick locations are fixed. If nbins is not None, the array of possible positions will be subsampled to keep the number of ticks <= nbins +1. The subsampling will be done so as to include the smallest absolute value; for example, if zero is included in the array of possibilities, then it is guaranteed to be one of the chosen ticks.

set_params(self, nbins=None)
    Set parameters within this locator.

tick_values(self, vmin, vmax)
    " Return the locations of the ticks.

    Note: Because the values are fixed, vmin and vmax are not used in this method.

class matplotlib.ticker.NullLocator
    Bases: matplotlib.ticker.Locator

    No ticks

tick_values(self, vmin, vmax)
    " Return the locations of the ticks.

    Note: Because the values are Null, vmin and vmax are not used in this method.

class matplotlib.ticker.LinearLocator(numticks=None, presets=None)
    Bases: matplotlib.ticker.Locator

    Determine the tick locations

    The first time this function is called it will try to set the number of ticks to make a nice tick partitioning. Thereafter the number of ticks will be fixed so that interactive navigation will be nice

    Use presets to set locs based on lom. A dict mapping vmin, vmax->locs

set_params(self, numticks=None, presets=None)
    Set parameters within this locator.

tick_values(self, vmin, vmax)
    Return the values of the located ticks given vmin and vmax.
Note: To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

```python
view_limits(self, vmin, vmax)
Try to choose the view limits intelligently
```

class matplotlib.ticker.LogLocator(base=10.0, subs=(1.0,), numdecs=4, numticks=None)
Bases: matplotlib.ticker.Locator
Determine the tick locations for log axes
Place ticks on the locations : subs[j] * base**i

Parameters

subs [None, string, or sequence of float, optional, default (1.0,)] Gives the multiples of integer powers of the base at which to place ticks. The default places ticks only at integer powers of the base. The permitted string values are 'auto' and 'all', both of which use an algorithm based on the axis view limits to determine whether and how to put ticks between integer powers of the base. With 'auto', ticks are placed only between integer powers; with 'all', the integer powers are included. A value of None is equivalent to 'auto'.

```python
base(self, base)
set the base of the log scaling (major tick every base**i, i integer)
```

```python
nonsingular(self, vmin, vmax)
Expand a range as needed to avoid singularities.
```

```python
set_params(self, base=None, subs=None, numdecs=None, numticks=None)
Set parameters within this locator.
```

```python
subs(self, subs)
set the minor ticks for the log scaling every base**i*subs[j]
```

```python
tick_values(self, vmin, vmax)
Return the values of the located ticks given vmin and vmax.
```

Note: To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

```python
view_limits(self, vmin, vmax)
Try to choose the view limits intelligently
```
class matplotlib.ticker.AutoLocator
    Bases: matplotlib.ticker.MaxNLocator

    Dynamically find major tick positions. This is actually a subclass of MaxNLocator, with parameters nbins = 'auto' and steps = [1, 2, 2.5, 5, 10]. To know the values of the non-public parameters, please have a look to the defaults of MaxNLocator.

class matplotlib.ticker.MultipleLocator(base=1.0)
    Bases: matplotlib.ticker.Locator

    Set a tick on each integer multiple of a base within the view interval.

    set_params(self, base)
        Set parameters within this locator.

    tick_values(self, vmin, vmax)
        Return the values of the located ticks given vmin and vmax.

    view_limits(self, dmin, dmax)
        Set the view limits to the nearest multiples of base that contain the data.

class matplotlib.ticker.MaxNLocator(*args, **kwargs)
    Bases: matplotlib.ticker.Locator

    Select no more than N intervals at nice locations.

    Parameters

    nbins [int or 'auto', optional, default: 10] Maximum number of intervals; one less than max number of ticks. If the string 'auto', the number of bins will be automatically determined based on the length of the axis.

    steps [array-like, optional] Sequence of nice numbers starting with 1 and ending with 10; e.g., [1, 2, 4, 5, 10], where the values are acceptable tick multiples. i.e. for the example, 20, 40, 60 would be an acceptable set of ticks, as would 0.4, 0.6, 0.8, because they are multiples of 2. However, 30, 60, 90 would not be allowed because 3 does not appear in the list of steps.

    integer [bool, optional, default: False] If True, ticks will take only integer values, provided at least min_n_ticks integers are found within the view limits.

    symmetric [bool, optional, default: False] If True, autoscaling will result in a range symmetric about zero.

    prune [{'lower', 'upper', 'both', None}, optional, default: None] Remove edge ticks - useful for stacked or ganged plots where the upper tick of one axes overlaps with the lower tick of the axes above it, primarily when rcParams["axes.autolimit_mode"] (default: 'data') is
'round_numbers'. If prune=='lower', the smallest tick will be removed. If prune == 'upper', the largest tick will be removed. If prune == 'both', the largest and smallest ticks will be removed. If prune == None, no ticks will be removed.

**min_n_ticks** [int, optional, default: 2] Relax nbins and integer constraints if necessary to obtain this minimum number of ticks.

default_params = {'integer':False, 'min_n_ticks':2, 'nbins':10, 'prune':None, 'steps':None, 'symmetric':False}

**set_params**(self,**kwargs)
Set parameters for this locator.

**Parameters**

- **nbins** [int or 'auto', optional] see *MaxNLocator*
- **steps** [array-like, optional] see *MaxNLocator*
- **integer** [bool, optional] see *MaxNLocator*
- **symmetric** [bool, optional] see *MaxNLocator*
- **prune** [{'lower', 'upper', 'both', None}, optional] see *MaxNLocator*
- **min_n_ticks** [int, optional] see *MaxNLocator*

**tick_values**(self, vmin, vmax)
Return the values of the located ticks given vmin and vmax.

**Note:** To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

**view_limits**(self, dmin, dmax)
Select a scale for the range from vmin to vmax.

Subclasses should override this method to change locator behaviour.

**class** matplotlib.ticker.AutoMinorLocator(n=None)

**Bases:** matplotlib.ticker.Locator

Dynamically find minor tick positions based on the positions of major ticks. The scale must be linear with major ticks evenly spaced.

- **n** is the number of subdivisions of the interval between major ticks; e.g., n=2 will place a single minor tick midway between major ticks.
- If n is omitted or None, it will be set to 5 or 4.

**tick_values**(self, vmin, vmax)
Return the values of the located ticks given vmin and vmax.

**Note:** To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]

class matplotlib.ticker.SymmetricalLogLocator(transform=None, subs=None, linthresh=None, base=None)
Bases: matplotlib.ticker.Locator

Determine the tick locations for symmetric log axes
place ticks on the location= base**i*subs[j]

set_params(self, subs=None, numticks=None)
Set parameters within this locator.

tick_values(self, vmin, vmax)
Return the values of the located ticks given vmin and vmax.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]

view_limits(self, vmin, vmax)
Try to choose the view limits intelligently

class matplotlib.ticker.LogitLocator(minor=False)
Bases: matplotlib.ticker.Locator

Determine the tick locations for logit axes
place ticks on the logit locations

nonsingular(self, vmin, vmax)
Expand a range as needed to avoid singularities.

set_params(self, minor=None)
Set parameters within this locator.

tick_values(self, vmin, vmax)
Return the values of the located ticks given vmin and vmax.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
class matplotlib.ticker.OldAutoLocator
Bases: matplotlib.ticker.Locator

On autoscale this class picks the best MultipleLocator to set the view limits and the tick locs.

get_locator(self, d)
    pick the best locator based on a distance

refresh(self)
    refresh internal information based on current lim

tick_values(self, vmin, vmax)
    Return the values of the located ticks given vmin and vmax.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

view_limits(self, vmin, vmax)
    Try to choose the view limits intelligently
17.50 matplotlib.tight_layout

This module provides routines to adjust subplot params so that subplots are nicely fit in the figure. In doing so, only axis labels, tick labels, axes titles and offsetboxes that are anchored to axes are currently considered.

Internally, it assumes that the margins (left_margin, etc.) which are differences between ax.get_tightbbox and ax.bbox are independent of axes position. This may fail if Axes.adjustable is datalim. Also, This will fail for some cases (for example, left or right margin
is affected by xlabel).

```python
matplotlib.tight_layout.auto_adjust_subplotpars(fig, renderer, nrows_ncols, num1num2_list, subplot_list, ax_bbox_list=None, pad=1.08, h_pad=None, w_pad=None, rect=None)
```

Return a dict of subplot parameters to adjust spacing between subplots or None if resulting axes would have zero height or width.

Note that this function ignores geometry information of subplot itself, but uses what is given by the `nrows_ncols` and `num1num2_list` parameters. Also, the results could be incorrect if some subplots have adjustable=datalim.

**Parameters**

- `nrows_ncols` [Tuple[int, int]] Number of rows and number of columns of the grid.
- `num1num2_list` [List[int]] List of numbers specifying the area occupied by the subplot
- `subplot_list` [list of subplots] List of subplots that will be used to calculate optimal subplot_params.
- `pad` [float] Padding between the figure edge and the edges of subplots, as a fraction of the font size.
- `h_pad, w_pad` [float] Padding (height/width) between edges of adjacent subplots, as a fraction of the font size. Defaults to `pad`.
- `rect` [Tuple[float, float, float, float]] [left, bottom, right, top] in normalized (0, 1) figure coordinates.

```python
matplotlib.tight_layout.get_renderer(fig)
```

```python
matplotlib.tight_layout.get_subplotspec_list(axes_list, grid_spec=None)
```

Return a list of subplotspec from the given list of axes.

For an instance of axes that does not support subplotspec, None is inserted in the list.

If grid_spec is given, None is inserted for those not from the given grid_spec.

```python
matplotlib.tight_layout.get_tight_layout_figure(fig, axes_list, subplotspec_list, renderer, pad=1.08, h_pad=None, w_pad=None, rect=None)
```

Return subplot parameters for tight-layouted-figure with specified padding.

**Parameters**

- `fig` [Figure]
- `axes_list` [list of Axes]
- `subplotspec_list` [list of SubplotSpec] The subplotspecs of each axes.
- `renderer` [renderer]
- `pad` [float] Padding between the figure edge and the edges of subplots, as a fraction of the font size.
- `h_pad, w_pad` [float] Padding (height/width) between edges of adjacent subplots. Defaults to `pad`.
**rect**  [Tuple[float, float, float, float], optional] (left, bottom, right, top) rectangle in normalized figure coordinates that the whole subplots area (including labels) will fit into. Defaults to using the entire figure.

**Returns**

**subplotspec or None** subplotspec kwargs to be passed to Figure. subplots_adjust or None if tight_layout could not be accomplished.

### 17.51 matplotlib.transforms

Matplotlib includes a framework for arbitrary geometric transformations that is used to determine the final position of all elements drawn on the canvas.

Transforms are composed into trees of TransformNode objects whose actual value depends on their children. When the contents of children change, their parents are automatically invalidated. The next time an invalidated transform is accessed, it is recomputed to reflect those changes. This invalidation/caching approach prevents unnecessary recomputations of transforms, and contributes to better interactive performance.

For example, here is a graph of the transform tree used to plot data to the graph:
The framework can be used for both affine and non-affine transformations. However, for speed, we want use the backend renderers to perform affine transformations whenever possible. Therefore, it is possible to perform just the affine or non-affine part of a transformation on a set of data. The affine is always assumed to occur after the non-affine. For any transform:

\[
\text{full transform} = \text{non-affine part} + \text{affine part}
\]

The backends are not expected to handle non-affine transformations themselves.
class matplotlib.transforms.Affine2D(matrix=None, **kwargs)
    Bases: matplotlib.transforms.Affine2DBase

A mutable 2D affine transformation.

Initialize an Affine transform from a 3x3 numpy float array:

\[
\begin{pmatrix}
a & c & e \\
b & d & f \\
0 & 0 & 1
\end{pmatrix}
\]

If `matrix` is None, initialize with the identity transform.

`clear(self)`
Reset the underlying matrix to the identity transform.

static from_values(a, b, c, d, e, f)
    (staticmethod) Create a new Affine2D instance from the given values:

\[
\begin{pmatrix}
a & c & e \\
b & d & f \\
0 & 0 & 1
\end{pmatrix}
\]

`.get_matrix(self)`
Get the underlying transformation matrix as a 3x3 numpy array:

\[
\begin{pmatrix}
a & c & e \\
b & d & f \\
0 & 0 & 1
\end{pmatrix}
\]

`.static identity()`
    (staticmethod) Return a new Affine2D object that is the identity transform.

    Unless this transform will be mutated later on, consider using the faster
    IdentityTransform class instead.

rotate(self, theta)
Add a rotation (in radians) to this transform in place.

Returns `self`, so this method can easily be chained with more calls to rotate(),
rotate_deg(), translate() and scale().

rotate_around(self, x, y, theta)
Add a rotation (in radians) around the point (x, y) in place.

Returns `self`, so this method can easily be chained with more calls to rotate(),
rotate_deg(), translate() and scale().

rotate_deg(self, degrees)
Add a rotation (in degrees) to this transform in place.

Returns `self`, so this method can easily be chained with more calls to rotate(),
rotate_deg(), translate() and scale().

rotate_deg_around(self, x, y, degrees)
Add a rotation (in degrees) around the point (x, y) in place.
Returns `self`, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

`scale(self, sx, sy=None)`

Adds a scale in place.

If `sy` is None, the same scale is applied in both the x- and y-directions.

Returns `self`, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

`set(self, other)`

Set this transformation from the frozen copy of another `Affine2DBase` object.

`set_matrix(self, mtx)`

Set the underlying transformation matrix from a 3x3 numpy array:

```
| a  c  e |
| b  d  f |
| 0  0  1 |
```

`skew(self, xShear, yShear)`

Adds a skew in place.

`xShear` and `yShear` are the shear angles along the x- and y-axes, respectively, in radians.

Returns `self`, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

`skew_deg(self, xShear, yShear)`

Adds a skew in place.

`xShear` and `yShear` are the shear angles along the x- and y-axes, respectively, in degrees.

Returns `self`, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

`translate(self, tx, ty)`

Adds a translation in place.

Returns `self`, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

```
class matplotlib.transforms.Affine2DBase(*args, **kwargs)
Bases: matplotlib.transforms.AffineBase

The base class of all 2D affine transformations.

2D affine transformations are performed using a 3x3 numpy array:

```
| a  c  e |
| b  d  f |
| 0  0  1 |
```

This class provides the read-only interface. For a mutable 2D affine transformation, use `Affine2D`.

Subclasses of this class will generally only need to override a constructor and `get_matrix()` that generates a custom 3x3 matrix.
frozen(*self)
Returns a frozen copy of this transform node. The frozen copy will not update when
its children change. Useful for storing a previously known state of a transform
where copy.deepcopy() might normally be used.

has_inverse = True
input_dims = 2
inverted(*self)
Return the corresponding inverse transformation.
The return value of this method should be treated as temporary. An update to self
does not cause a corresponding update to its inverted copy.
x == self.inverted().transform(self.transform(x))

is_separable
bool(x) -> bool
Returns True when the argument x is true, False otherwise. The builtins True and
False are the only two instances of the class bool. The class bool is a subclass of
the class int, and cannot be subclassed.

static matrix_from_values(a, b, c, d, e, f)
(staticmethod) Create a new transformation matrix as a 3x3 numpy array of the
form:

<table>
<thead>
<tr>
<th>a</th>
<th>c</th>
<th>e</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>d</td>
<td>f</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>

output_dims = 2
to_values(*self)
Return the values of the matrix as an (a, b, c, d, e, f) tuple.

transform_affine(*self, points)
Performs only the affine part of this transformation on the given array of values.
transform(values) is always equivalent to transform_affine(transform_non_affine(values)).
In non-affine transformations, this is generally a no-op. In affine transformations,
is equivalent to transform(values).
Accepts a numpy array of shape (N x input_dims) and returns a numpy array of shape
(N x output_dims).
Alternatively, accepts a numpy array of length input_dims and returns a numpy array
of length output_dims.

transform_point(*self, point)
A convenience function that returns the transformed copy of a single point.
The point is given as a sequence of length input_dims. The transformed point is
returned as a sequence of length output_dims.

class matplotlib.transforms.AffineBase(*args, **kwargs)
Bases: matplotlib.transforms.Transform
The base class of all affine transformations of any number of dimensions.

get_affine(*self)
Get the affine part of this transform.
is_affine = True

transform(self, values)
Performs the transformation on the given array of values.

Accepts a numpy array of shape (N x input_dims) and returns a numpy array of shape (N x output_dims).

Alternatively, accepts a numpy array of length input_dims and returns a numpy array of length output_dims.

transform_affine(self, values)
Performs only the affine part of this transformation on the given array of values.

transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to transform(values).

Accepts a numpy array of shape (N x input_dims) and returns a numpy array of shape (N x output_dims).

Alternatively, accepts a numpy array of length input_dims and returns a numpy array of length output_dims.

transform_non_affine(self, points)
Performs only the non-affine part of the transformation.

transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

In non-affine transformations, this is generally equivalent to transform(values). In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x input_dims) and returns a numpy array of shape (N x output_dims).

Alternatively, accepts a numpy array of length input_dims and returns a numpy array of length output_dims.

transform_path(self, path)
Returns a transformed path.

path: a Path instance.

In some cases, this transform may insert curves into the path that began as line segments.

transform_path_affine(self, path)
Returns a path, transformed only by the affine part of this transform.

path: a Path instance.

transform_path(path) is equivalent to transform_path_affine(transform_path_non_affine(values)).

transform_path_non_affine(self, path)
Returns a path, transformed only by the non-affine part of this transform.

path: a Path instance.

transform_path(path) is equivalent to transform_path_affine(transform_path_non_affine(values)).

class matplotlib.transforms.Bbox(points, **kwargs)
Bases: matplotlib.transforms.BboxBase

A mutable bounding box.
**Parameters**

*points* [ndarray] A 2x2 numpy array of the form \([x_0, y_0], [x_1, y_1]\).

**Notes**

If you need to create a *Bbox* object from another form of data, consider the static methods `unit()`, `from_bounds()` and `from_extents()`.

*bounds*

Return \((x_0, y_0, \text{width}, \text{height})\).

**static from_bounds**(x0, y0, width, height)

(staticmethod) Create a new *Bbox* from \(x_0, y_0, \text{width} \) and \(\text{height}\).

*width* and *height* may be negative.

**static from_extents**(args)

(staticmethod) Create a new Bbox from \(\text{left}, \text{bottom}, \text{right} \) and \(\text{top}\).

The \(y\)-axis increases upwards.

**get_points**(self)

Get the points of the bounding box directly as a numpy array of the form: \([x_0, y_0], [x_1, y_1]\).

**ignore**(self, value)

Set whether the existing bounds of the box should be ignored by subsequent calls to `update_from_data_xy()`.

*value* [bool]

- When True, subsequent calls to `update_from_data_xy()` will ignore the existing bounds of the *Bbox*.
- When False, subsequent calls to `update_from_data_xy()` will include the existing bounds of the *Bbox*.

**intervalx**

The pair of \(x\) coordinates that define the bounding box.

This is not guaranteed to be sorted from left to right.

**intervaly**

The pair of \(y\) coordinates that define the bounding box.

This is not guaranteed to be sorted from bottom to top.

**minpos**

**minposx**

**minposy**

**mutated**(self)

Return whether the bbox has changed since init.

**mutatedx**(self)

Return whether the x-limits have changed since init.

**mutatedy**(self)

Return whether the y-limits have changed since init.
static null()
(staticmethod) Create a new null Bbox from (inf, inf) to (-inf, -inf).

p0
The first pair of (x, y) coordinates that define the bounding box.
This is not guaranteed to be the bottom-left corner (for that, use min).

p1
The second pair of (x, y) coordinates that define the bounding box.
This is not guaranteed to be the top-right corner (for that, use max).

set(self, other)
Set this bounding box from the “frozen” bounds of another Bbox.

set_points(self, points)
Set the points of the bounding box directly from a numpy array of the form: [[x0, y0], [x1, y1]]. No error checking is performed, as this method is mainly for internal use.

static unit()
(staticmethod) Create a new unit Bbox from (0, 0) to (1, 1).

update_from_data_xy(self, xy, ignore=None, updatex=True, updatey=True)
Update the bounds of the Bbox based on the passed in data. After updating, the
bounds will have positive width and height; x0 and y0 will be the minimal values.

Parameters

xy [ndarray] A numpy array of 2D points.

ignore [bool, optional]
  • When True, ignore the existing bounds of the Bbox.
  • When False, include the existing bounds of the Bbox.
  • When None, use the last value passed to ignore().

updatex, updatey [bool, optional] When True, update the x/y values.

update_from_path(self, path, ignore=None, updatex=True, updatey=True)
Update the bounds of the Bbox based on the passed in data. After updating, the
bounds will have positive width and height; x0 and y0 will be the minimal values.

Parameters

path [Path]

ignore [bool, optional]
  • when True, ignore the existing bounds of the Bbox.
  • when False, include the existing bounds of the Bbox.
  • when None, use the last value passed to ignore().

updatex, updatey [bool, optional] When True, update the x/y values.

x0
The first of the pair of x coordinates that define the bounding box.
This is not guaranteed to be less than x1 (for that, use xmin).
The second of the pair of x coordinates that define the bounding box.
This is not guaranteed to be greater than x0 (for that, use xmax).

y0
The first of the pair of y coordinates that define the bounding box.
This is not guaranteed to be less than y1 (for that, use ymin).

y1
The second of the pair of y coordinates that define the bounding box.
This is not guaranteed to be greater than y0 (for that, use ymax).

class matplotlib.transforms.BboxBase(shorthand_name=None)

Bases: matplotlib.transforms.TransformNode

This is the base class of all bounding boxes, and provides read-only access to its data. A mutable bounding box is provided by the Bbox class.

The canonical representation is as two points, with no restrictions on their ordering. Convenience properties are provided to get the left, bottom, right and top edges and width and height, but these are not stored explicitly.

Creates a new TransformNode.

Parameters

- **shorthand_name** [str] A string representing the “name” of the transform. The name carries no significance other than to improve the readability of str(transform) when DEBUG=True.

**anchored**

Return a copy of the Bbox, shifted to position c within a container.

Parameters

- **c** [(float, float) or str] May be either:
  - A sequence (cx, cy) where cx and cy range from 0 to 1, where 0 is left or bottom and 1 is right or top
  - a string: - 'C' for centered - 'S' for bottom-center - 'SE' for bottom-left - 'E' for left - etc.

- **container** [Bbox, optional] The box within which the Bbox is positioned; it defaults to the initial Bbox.

**bounds**

Return (x0, y0, width, height).

**coefs**

Returns coefs = {'C': (0.5, 0.5), 'E': (1.0, 0.5), 'N': (0.5, 1.0), 'NE': (1.0, 1.0), 'NW': (0, 1.0), 'S': (0.5, 0), 'SE': (1.0, 0), 'SW': (0, 0), 'W': (0, 0.5)}.

**contains**

Return whether (x, y) is in the bounding box or on its edge.

**containsx**

Return whether x is in the closed (x0, x1) interval.

**containsy**

Return whether y is in the closed (y0, y1) interval.

**corners**

Return the corners of this rectangle as an array of points.
Specifically, this returns the array \([[x_0, y_0], [x_0, y_1], [x_1, y_0], [x_1, y_1]]\).

\(\text{count\_contains}(\text{self}, \text{vertices})\)

Count the number of vertices contained in the \(Bbox\). Any vertices with a non-finite \(x\) or \(y\) value are ignored.

**Parameters**

- **vertices** [Nx2 Numpy array]

\(\text{count\_overlaps}(\text{self}, \text{bboxes})\)

Count the number of bounding boxes that overlap this one.

**Parameters**

- **bboxes** [sequence of \(BboxBase\) objects]

\(\text{expanded}(\text{self}, \text{sw}, \text{sh})\)

Construct a \(Bbox\) by expanding this one around its center by the factors \(sw\) and \(sh\).

\(\text{extents}\)

Return \((x_0, y_0, x_1, y_1)\).

\(\text{frozen}(\text{self})\)

\(\text{TransformNode}\) is the base class for anything that participates in the transform tree and needs to invalidate its parents or be invalidated. This includes classes that are not really transforms, such as bounding boxes, since some transforms depend on bounding boxes to compute their values.

\(\text{fully\_contains}(\text{self}, x, y)\)

Return whether \(x, y\) is in the bounding box, but not on its edge.

\(\text{fully\_containsx}(\text{self}, x)\)

Return whether \(x\) is in the open \((x_0, x_1)\) interval.

\(\text{fully\_containsy}(\text{self}, y)\)

Return whether \(y\) is in the open \((y_0, y_1)\) interval.

\(\text{fully\_overlaps}(\text{self}, \text{other})\)

Return whether this bounding box overlaps with the other bounding box, not including the edges.

**Parameters**

- **other** [BboxBase]

\(\text{get\_points}(\text{self})\)

\(\text{height}\)

The (signed) height of the bounding box.

\(\text{static\ intersection}(\text{bbox1}, \text{bbox2})\)

Return the intersection of \(bbox1\) and \(bbox2\) if they intersect, or None if they don’t.

\(\text{intervalx}\)

The pair of \(x\) coordinates that define the bounding box.

This is not guaranteed to be sorted from left to right.

\(\text{intervaly}\)

The pair of \(y\) coordinates that define the bounding box.

This is not guaranteed to be sorted from bottom to top.
inverse_transformed(self, transform)
    Construct a Bbox by statically transforming this one by the inverse of transform.

is_affine = True
is_bbox = True
is_unit(self)
    Return whether this is the unit box (from (0, 0) to (1, 1)).

max
    The top-right corner of the bounding box.

min
    The bottom-left corner of the bounding box.

overlaps(self, other)
    Return whether this bounding box overlaps with the other bounding box.

    Parameters
        other [BboxBase]

p0
    The first pair of (x, y) coordinates that define the bounding box.
    This is not guaranteed to be the bottom-left corner (for that, use min).

p1
    The second pair of (x, y) coordinates that define the bounding box.
    This is not guaranteed to be the top-right corner (for that, use max).

padded(self, p)
    Construct a Bbox by padding this one on all four sides by p.

rotated(self, radians)
    Return a new bounding box that bounds a rotated version of this bounding box by
    the given radians. The new bounding box is still aligned with the axes, of course.

shrink(self, mx, my)
    Return a copy of the Bbox, shrunk by the factor mx in the x direction and the factor
    my in the y direction. The lower left corner of the box remains unchanged. Normally
    mx and my will be less than 1, but this is not enforced.

shrink_to_aspect(self, box_aspect, container=None, fig_aspect=1.0)
    Return a copy of the Bbox, shrunk so that it is as large as it can be while having
    the desired aspect ratio, box_aspect. If the box coordinates are relative—that is,
    fractions of a larger box such as a figure—then the physical aspect ratio of that
    figure is specified with fig_aspect, so that box_aspect can also be given as a ratio of
    the absolute dimensions, not the relative dimensions.

size
    The (signed) width and height of the bounding box.

splitx(self, *args)
    Return a list of new Bbox objects formed by splitting the original one with vertical
    lines at fractional positions given by args.

splity(self, *args)
    Return a list of new Bbox objects formed by splitting the original one with horizontal
    lines at fractional positions given by args.
transformed(self, transform)
    Construct a Bbox by statically transforming this one by transform.

translated(self, tx, ty)
    Construct a Bbox by translating this one by tx and ty.

static union(bboxes)
    Return a Bbox that contains all of the given bboxes.

width
    The (signed) width of the bounding box.

x0
    The first of the pair of x coordinates that define the bounding box.
    This is not guaranteed to be less than x1 (for that, use xmin).

x1
    The second of the pair of x coordinates that define the bounding box.
    This is not guaranteed to be greater than x0 (for that, use xmax).

xmax
    The right edge of the bounding box.

xmin
    The left edge of the bounding box.

y0
    The first of the pair of y coordinates that define the bounding box.
    This is not guaranteed to be less than y1 (for that, use ymin).

y1
    The second of the pair of y coordinates that define the bounding box.
    This is not guaranteed to be greater than y0 (for that, use ymax).

ymax
    The top edge of the bounding box.

ymin
    The bottom edge of the bounding box.

class matplotlib.transforms.BboxTransform(boxin, boxout, **kwargs)
    Bases: matplotlib.transforms.Affine2DBase

    BboxTransform linearly transforms points from one Bbox to another Bbox.
    Create a new BboxTransform that linearly transforms points from boxin to boxout.

    get_matrix(self)
        Get the Affine transformation array for the affine part of this transform.

        is_separable = True

class matplotlib.transforms.BboxTransformFrom(boxin, **kwargs)
    Bases: matplotlib.transforms.Affine2DBase

    BboxTransformFrom linearly transforms points from a given Bbox to the unit bounding box.

    get_matrix(self)
        Get the Affine transformation array for the affine part of this transform.

        is_separable = True
class matplotlib.transforms.BboxTransformTo(boxout, **kwargs)
    BboxTransformTo is a transformation that linearly transforms points from the unit bounding box to a given Bbox.
    Create a new BboxTransformTo that linearly transforms points from the unit bounding box to boxout.

    get_matrix(self)
        Get the Affine transformation array for the affine part of this transform.

    is_separable = True

class matplotlib.transforms.BboxTransformToMaxOnly(boxout, **kwargs)
    BboxTransformTo is a transformation that linearly transforms points from the unit bounding box to a given Bbox with a fixed upper left of (0, 0).
    Create a new BboxTransformTo that linearly transforms points from the unit bounding box to boxout.

    get_matrix(self)
        Get the Affine transformation array for the affine part of this transform.

class matplotlib.transforms.BlendedAffine2D(x_transform, y_transform, **kwargs)
    A “blended” transform uses one transform for the x-direction, and another transform for the y-direction.
    This version is an optimization for the case where both child transforms are of type Affine2DBase.
    Create a new “blended” transform using x_transform to transform the x-axis and y_transform to transform the y-axis.
    Both x_transform and y_transform must be 2D affine transforms.
    You will generally not call this constructor directly but use the blended_transform_factory() function instead, which can determine automatically which kind of blended transform to create.

    contains_branch_seperately(self, transform)
        Returns whether the given branch is a sub-tree of this transform on each separate dimension.
        A common use for this method is to identify if a transform is a blended transform containing an axes’ data transform. e.g.:

        x_isdata, y_isdata = trans.contains_branch_seperately(ax.transData)

    get_matrix(self)
        Get the Affine transformation array for the affine part of this transform.

    is_separable = True

class matplotlib.transforms.BlendedGenericTransform(x_transform, y_transform, **kwargs)
    A “blended” transform uses one transform for the x-direction, and another transform for the y-direction.
This “generic” version can handle any given child transform in the x- and y-directions.

Create a new “blended” transform using `x_transform` to transform the x-axis and `y_transform` to transform the y-axis.

You will generally not call this constructor directly but use the `blended_transform_factory()` function instead, which can determine automatically which kind of blended transform to create.

```
def contains_branch(self, other):
    """Return whether the given transform is a sub-tree of this transform."
    This routine uses transform equality to identify sub-trees, therefore in many situations it is object id which will be used.
    For the case where the given transform represents the whole of this transform, returns True.
```

```
def contains_branch_seperately(self, transform):
    """Returns whether the given branch is a sub-tree of this transform on each separate dimension."
    A common use for this method is to identify if a transform is a blended transform containing an axes’ data transform. e.g.:
    ```
x_isdata, y_isdata = trans.contains_branch_seperately(ax.transData)
    ```
```

```
def depth(self):
    """Returns the number of transforms which have been chained together to form this Transform instance."
```

Note: For the special case of a Composite transform, the maximum depth of the two is returned.

```
def frozen(self):
    """Returns a frozen copy of this transform node. The frozen copy will not update when its children change. Useful for storing a previously known state of a transform where copy.deepcopy() might normally be used.
```

```
def get_affine(self):
    """Get the affine part of this transform."
```

```
def has_inverse(self):
    """Return the corresponding inverse transformation."
    The return value of this method should be treated as temporary. An update to self does not cause a corresponding update to its inverted copy.
    ```
x == self.inverted().transform(self.transform(x))
    ```
```

```
def is_affine(self):
    """is_separable = True
    output_dims = 2
    pass_through = True
```

17.51. matplotlib.transforms
transform_non_affine(self, points)
Performs only the non-affine part of the transformation.

transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

In non-affine transformations, this is generally equivalent to transform(values). In
affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x input_dims) and returns a numpy array of shape
(N x output_dims).

Alternatively, accepts a numpy array of length input_dims and returns a numpy array
of length output_dims.

class matplotlib.transforms.CompositeAffine2D(a, b, **kwargs)
    Bases: matplotlib.transforms.Affine2DBase

A composite transform formed by applying transform a then transform b.
This version is an optimization that handles the case where both a and b are 2D affines.
Create a new composite transform that is the result of applying transform a then trans-
form b.

Both a and b must be instances of Affine2DBase.

You will generally not call this constructor directly but use the
composite_transform_factory() function instead, which can automatically choose the
best kind of composite transform instance to create.

depth
    Returns the number of transforms which have been chained together to form this
    Transform instance.

    Note: For the special case of a Composite transform, the maximum depth of the
two is returned.

get_matrix(self)
    Get the Affine transformation array for the affine part of this transform.

class matplotlib.transforms.CompositeGenericTransform(a, b, **kwargs)
    Bases: matplotlib.transforms.Transform

A composite transform formed by applying transform a then transform b.
This “generic” version can handle any two arbitrary transformations.
Create a new composite transform that is the result of applying transform a then trans-
form b.

You will generally not call this constructor directly but use the
composite_transform_factory() function instead, which can automatically choose the
best kind of composite transform instance to create.

depth

frozen(self)
    Returns a frozen copy of this transform node. The frozen copy will not update when
its children change. Useful for storing a previously known state of a transform
where copy.deepcopy() might normally be used.
get_affine(self)
     Get the affine part of this transform.

has_inverse

inverted(self)
     Return the corresponding inverse transformation.
     The return value of this method should be treated as temporary. An update to self
does not cause a corresponding update to its inverted copy.
     
     \[ x \equiv \text{self.inverted().transform(self.transform(x))} \]

is_affine

is_separable

pass_through = True

transform_affine(self, points)
     Performs only the affine part of this transformation on the given array of values.
     \[ \text{transform(values)} \text{ is always equivalent to transform_affine(transform_non_affine(values))}. \]
     In non-affine transformations, this is generally a no-op. In affine transformations,
this is equivalent to transform(values).
     Accepts a numpy array of shape (N x input_dims) and returns a numpy array of shape
(N x output_dims).
     Alternatively, accepts a numpy array of length input_dims and returns a numpy array
of length output_dims.

transform_non_affine(self, points)
     Performs only the non-affine part of the transformation.
     \[ \text{transform(values)} \text{ is always equivalent to transform_affine(transform_non_affine(values))}. \]
     In non-affine transformations, this is generally equivalent to transform(values). In
affine transformations, this is always a no-op.
     Accepts a numpy array of shape (N x input_dims) and returns a numpy array of shape
(N x output_dims).
     Alternatively, accepts a numpy array of length input_dims and returns a numpy array
of length output_dims.

transform_path_non_affine(self, path)
     Returns a path, transformed only by the non-affine part of this transform.
     path: a Path instance.
     \[ \text{transform_path(path)} \text{ is equivalent to transform_path_affine(transform_path_non_affine(values))}. \]

class matplotlib.transforms.IdentityTransform(*args, **kwargs)
     Bases: matplotlib.transforms.Affine2DBase

     A special class that does one thing, the identity transform, in a fast way.

frozen(self)
     Returns a frozen copy of this transform node. The frozen copy will not update when
its children change. Useful for storing a previously known state of a transform
where copy.deepcopy() might normally be used.

get_affine(self)
     Get the affine part of this transform.
get_matrix(self)
Get the Affine transformation array for the affine part of this transform.

inverted(self)
Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to self
does not cause a corresponding update to its inverted copy.

\[ x \rightarrow self.inverted().transform(self.transform(x)) \]

transform(self, points)
Performs the transformation on the given array of values.

Accepts a numpy array of shape (N x input_dims) and returns a numpy array of shape
(N x output_dims).

Alternatively, accepts a numpy array of length input_dims and returns a numpy array
of length output_dims.

transform_affine(self, points)
Performs only the affine part of this transformation on the given array of values.

\[ transform(values) \text{ is always equivalent to transform_affine(transform_non_affine(values)).} \]

In non-affine transformations, this is generally a no-op. In affine transformations,
this is equivalent to transform(values).

Accepts a numpy array of shape (N x input_dims) and returns a numpy array of shape
(N x output_dims).

Alternatively, accepts a numpy array of length input_dims and returns a numpy array
of length output_dims.

transform_non_affine(self, points)
Performs only the non-affine part of the transformation.

\[ transform(values) \text{ is always equivalent to transform_affine(transform_non_affine(values)).} \]

In non-affine transformations, this is generally equivalent to transform(values). In
affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x input_dims) and returns a numpy array of shape
(N x output_dims).

Alternatively, accepts a numpy array of length input_dims and returns a numpy array
of length output_dims.

transform_path(self, path)
Returns a transformed path.

\[ path: \text{a } Path \text{ instance.} \]

In some cases, this transform may insert curves into the path that began as line
segments.

transform_path_affine(self, path)
Returns a path, transformed only by the affine part of this transform.

\[ path: \text{a } Path \text{ instance.} \]

\[ transform_path(path) \text{ is equivalent to transform_path_affine(transform_path_non_affine(values)).} \]

transform_path_non_affine(self, path)
Returns a path, transformed only by the non-affine part of this transform.
path: a Path instance.

transform_path(path) is equivalent to transform_path_affine(transform_path_non_affine(values)).

class matplotlib.transforms.LockableBbox(bbox, x0=None, y0=None, x1=None, y1=None, **kwargs)

Bases: matplotlib.transforms.BboxBase

A Bbox where some elements may be locked at certain values.

When the child bounding box changes, the bounds of this bbox will update accordingly with the exception of the locked elements.

Parameters

bbox [Bbox] The child bounding box to wrap.

x0 [float or None] The locked value for x0, or None to leave unlocked.

y0 [float or None] The locked value for y0, or None to leave unlocked.

x1 [float or None] The locked value for x1, or None to leave unlocked.

y1 [float or None] The locked value for y1, or None to leave unlocked.

get_points(self)

locked_x0

float or None: The value used for the locked x0.

locked_x1

float or None: The value used for the locked x1.

locked_y0

float or None: The value used for the locked y0.

locked_y1

float or None: The value used for the locked y1.

class matplotlib.transforms.ScaledTranslation(xt, yt, scale_trans, **kwargs)

Bases: matplotlib.transforms.Affine2DBase

A transformation that translates by xt and yt, after xt and yt have been transformed by scale_trans.

get_matrix(self)

Get the Affine transformation array for the affine part of this transform.

class matplotlib.transforms.Transform(shorthand_name=None)

Bases: matplotlib.transforms.TransformNode

The base class of all TransformNode instances that actually perform a transformation.

All non-affine transformations should be subclasses of this class. New affine transformations should be subclasses of Affine2D.

Subclasses of this class should override the following members (at minimum):

- input_dims
- output_dims
- transform()
- is_separable
- has_inverse
• `inverted()` (if `has_inverse` is True)

If the transform needs to do something non-standard with `matplotlib.path.Path` objects, such as adding curves where there were once line segments, it should override:

• `transform_path()`

Creates a new `TransformNode`.

**Parameters**

- `shorthand_name` [str] A string representing the “name” of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

- `contains_branch(self, other)`
  Return whether the given transform is a sub-tree of this transform.

  This routine uses transform equality to identify sub-trees, therefore in many situations it is object id which will be used.

  For the case where the given transform represents the whole of this transform, returns True.

- `contains_branch_seperately(self, other_transform)`
  Returns whether the given branch is a sub-tree of this transform on each separate dimension.

  A common use for this method is to identify if a transform is a blended transform containing an axes’ data transform. e.g.:

```
x_isdata, y_isdata = trans.contains_branch_seperately(ax.transData)
```

- `depth`
  Returns the number of transforms which have been chained together to form this Transform instance.

**Note:** For the special case of a Composite transform, the maximum depth of the two is returned.

- `get_affine(self)`
  Get the affine part of this transform.

- `get_matrix(self)`
  Get the Affine transformation array for the affine part of this transform.

- `has_inverse = False`
  True if this transform has a corresponding inverse transform.

- `input_dims = None`
  The number of input dimensions of this transform. Must be overridden (with integers) in the subclass.

- `inverted(self)`
  Return the corresponding inverse transformation.

  The return value of this method should be treated as temporary. An update to `self` does not cause a corresponding update to its inverted copy.

```
x === self.inverted().transform(self.transform(x))
```
is_separable = False
True if this transform is separable in the x- and y- dimensions.

output_dims = None
The number of output dimensions of this transform. Must be overridden (with integers) in the subclass.

`transform(self, values)`
Performs the transformation on the given array of values.

Accepts a numpy array of shape (N x `input_dims`) and returns a numpy array of shape (N x `output_dims`).

Alternatively, accepts a numpy array of length `input_dims` and returns a numpy array of length `output_dims`.

`transform_affine(self, values)`
Performs only the affine part of this transformation on the given array of values.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to `transform(values)`.

Accepts a numpy array of shape (N x `input_dims`) and returns a numpy array of shape (N x `output_dims`).

Alternatively, accepts a numpy array of length `input_dims` and returns a numpy array of length `output_dims`.

`transform_angles(self, angles, pts, radians=False, pushoff=1e-05)`
Transforms a set of angles anchored at specific locations.

**Parameters**

- `angles` [(N,) array-like] The angles to transform.
- `pts` [(N, 2) array-like] The points where the angles are anchored.
- `radians` [bool, default: False] Whether `angles` are radians or degrees.
- `pushoff` [float] For each point in `pts` and angle in `angles`, the transformed angle is computed by transforming a segment of length `pushoff` starting at that point and making that angle relative to the horizontal axis, and measuring the angle between the horizontal axis and the transformed segment.

**Returns**

- `transformed_angles` [(N,) array]

`transform_bbox(self, bbox)`
Transform the given bounding box.

Note, for smarter transforms including caching (a common requirement for matplotlib figures), see `TransformedBbox`.

`transform_non_affine(self, values)`
Performs only the non-affine part of the transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.
Accepts a numpy array of shape (N x \texttt{input\_dims}) and returns a numpy array of shape (N x \texttt{output\_dims}).

Alternatively, accepts a numpy array of length \texttt{input\_dims} and returns a numpy array of length \texttt{output\_dims}.

\texttt{transform\_path}(\texttt{self}, \texttt{path})

Returns a transformed path.

\texttt{path}: a \texttt{Path} instance.

In some cases, this transform may insert curves into the path that began as line segments.

\texttt{transform\_path\_affine}(\texttt{self}, \texttt{path})

Returns a path, transformed only by the affine part of this transform.

\texttt{path}: a \texttt{Path} instance.

\texttt{transform\_path}(\texttt{path}) is equivalent to \texttt{transform\_path\_affine}(\texttt{transform\_path\_non\_affine}(\texttt{values})).

\texttt{transform\_path\_non\_affine}(\texttt{self}, \texttt{path})

Returns a path, transformed only by the non-affine part of this transform.

\texttt{path}: a \texttt{Path} instance.

\texttt{transform\_path}(\texttt{path}) is equivalent to \texttt{transform\_path\_affine}(\texttt{transform\_path\_non\_affine}(\texttt{values})).

\texttt{transform\_point}(\texttt{self}, \texttt{point})

A convenience function that returns the transformed copy of a single point.

The point is given as a sequence of length \texttt{input\_dims}. The transformed point is returned as a sequence of length \texttt{output\_dims}.

class matplotlib.transforms.TransformNode(\texttt{shorthand\_name=None})

\texttt{Bases: object}

\texttt{TransformNode} is the base class for anything that participates in the transform tree and needs to invalidate its parents or be invalidated. This includes classes that are not really transforms, such as bounding boxes, since some transforms depend on bounding boxes to compute their values.

Creates a new \texttt{TransformNode}.

**Parameters**

\texttt{shorthand\_name} [str] A string representing the “name” of the transform. The name carries no significance other than to improve the readability of \texttt{str(transform)} when DEBUG=True.

\texttt{INVALID} = 3

\texttt{INVALID\_AFFINE} = 2

\texttt{INVALID\_NON\_AFFINE} = 1

\texttt{frozen}(\texttt{self})

Returns a frozen copy of this transform node. The frozen copy will not update when its children change. Useful for storing a previously known state of a transform where \texttt{copy.deepcopy()} might normally be used.

\texttt{invalidate}(\texttt{self})

Invalidates this \texttt{TransformNode} and triggers an invalidation of its ancestors. Should be called any time the transform changes.
is_affine = False
is_bbox = False
pass_through = False

If pass_through is True, all ancestors will always be invalidated, even if ‘self’ is already invalid.

set_children(self, *children)
Set the children of the transform, to let the invalidation system know which transforms can invalidate this transform. Should be called from the constructor of any transforms that depend on other transforms.

class matplotlib.transforms.TransformWrapper(child)
Bases: matplotlib.transforms.Transform

A helper class that holds a single child transform and acts equivalently to it.
This is useful if a node of the transform tree must be replaced at run time with a transform of a different type. This class allows that replacement to correctly trigger invalidation.

Note that TransformWrapper instances must have the same input and output dimensions during their entire lifetime, so the child transform may only be replaced with another child transform of the same dimensions.

child: A class:Transform instance. This child may later be replaced with set().

frozen(self)
Returns a frozen copy of this transform node. The frozen copy will not update when its children change. Useful for storing a previously known state of a transform where copy.deepcopy() might normally be used.

has_inverse
is_affine
is_separable
pass_through = True

set(self, child)
Replace the current child of this transform with another one.
The new child must have the same number of input and output dimensions as the current child.

class matplotlib.transforms.TransformedBbox(bbox, transform, **kwargs)
Bases: matplotlib.transforms.BboxBase

A Bbox that is automatically transformed by a given transform. When either the child bounding box or transform changes, the bounds of this bbox will update accordingly.

Parameters
bbox [Bbox]
transform [Transform]

get_points(self)

class matplotlib.transforms.TransformedPatchPath(patch)
Bases: matplotlib.transforms.TransformedPath
A TransformedPatchPath caches a non-affine transformed copy of the Patch. This cached copy is automatically updated when the non-affine part of the transform or the patch changes.

Create a new TransformedPatchPath from the given Patch.

```python
class matplotlib.transforms.TransformedPath(path, transform)
```

Bases: matplotlib.transforms.TransformNode

A TransformedPath caches a non-affine transformed copy of the Path. This cached copy is automatically updated when the non-affine part of the transform changes.

**Note:** Paths are considered immutable by this class. Any update to the path’s vertices/codes will not trigger a transform recomputation.

Create a new TransformedPath from the given Path and Transform.

```python
get_affine(self)
```

```python
get_fully_transformed_path(self)
```

Return a fully-transformed copy of the child path.

```python
get_transformed_path_and_affine(self)
```

Return a copy of the child path, with the non-affine part of the transform already applied, along with the affine part of the path necessary to complete the transformation.

```python
get_transformed_points_and_affine(self)
```

Return a copy of the child path, with the non-affine part of the transform already applied, along with the affine part of the path necessary to complete the transformation. Unlike `get_transformed_path_and_affine()`, no interpolation will be performed.

```python
matplotlib.transforms.blended_transform_factory(x_transform, y_transform)
```

Create a new “blended” transform using `x_transform` to transform the x-axis and `y_transform` to transform the y-axis.

A faster version of the blended transform is returned for the case where both child transforms are affine.

```python
matplotlib.transforms.composite_transform_factory(a, b)
```

Create a new composite transform that is the result of applying transform `a` then transform `b`.

Shortcut versions of the blended transform are provided for the case where both child transforms are affine, or one or the other is the identity transform.

Composite transforms may also be created using the ‘+’ operator, e.g.:

```python
c = a + b
```

```python
matplotlib.transforms.interval_contains(interval, val)
```

Check, inclusively, whether an interval includes a given value.

**Parameters**

- `interval` [sequence of scalar] A 2-length sequence, endpoints that define the interval.

- `val` [scalar] Value to check is within interval.

**Returns**
bool Returns True if given val is within the interval.

matplotlib.transforms.interval_contains_open(interval, val)
Check, excluding endpoints, whether an interval includes a given value.

Parameters
interval [sequence of scalar] A 2-length sequence, endpoints that define the interval.
val [scalar] Value to check is within interval.

Returns
bool Returns true if given val is within the interval.

matplotlib.transforms.nonsingular(vmin, vmax, expander=0.001, tiny=1e-15, increasing=True)
Modify the endpoints of a range as needed to avoid singularities.

Parameters
vmin, vmax [float] The initial endpoints.
expander [float, optional, default: 0.001] Fractional amount by which vmin and vmax are expanded if the original interval is too small, based on tiny.
tiny [float, optional, default: 1e-15] Threshold for the ratio of the interval to the maximum absolute value of its endpoints. If the interval is smaller than this, it will be expanded. This value should be around 1e-15 or larger; otherwise the interval will be approaching the double precision resolution limit.
increasing [bool, optional, default: True] If True, swap vmin, vmax if vmin > vmax.

Returns
vmin, vmax [float] Endpoints, expanded and/or swapped if necessary. If either input is inf or NaN, or if both inputs are 0 or very close to zero, it returns -expander, expander.

matplotlib.transforms.offset_copy(trans, fig=None, x=0.0, y=0.0, units='inches')
Return a new transform with an added offset.

Parameters
trans [Transform instance] Any transform, to which offset will be applied.
fig [Figure, optional, default: None] Current figure. It can be None if units are 'dots'.
x, y [float, optional, default: 0.0] Specifies the offset to apply.
units [{‘inches’, ‘points’, ‘dots’}, optional] Units of the offset.

Returns
trans [Transform instance] Transform with applied offset.
17.52 matplotlib.tri

Unstructured triangular grid functions.

class matplotlib.tri.Triangulation(x, y, triangles=None, mask=None)

An unstructured triangular grid consisting of npoints points and ntri triangles. The triangles can either be specified by the user or automatically generated using a Delaunay triangulation.

Parameters

- **x, y** [array-like of shape (npoints)] Coordinates of grid points.
- **triangles** [integer array_like of shape (ntri, 3), optional] For each triangle, the indices of the three points that make up the triangle, ordered in an anticlockwise manner. If not specified, the Delaunay triangulation is calculated.
- **mask** [boolean array-like of shape (ntri), optional] Which triangles are masked out.

Notes

For a Triangulation to be valid it must not have duplicate points, triangles formed from colinear points, or overlapping triangles.

Attributes

- **edges** [int array of shape (nedges, 2)] Return integer array of shape (nedges, 2) containing all edges of non-masked triangles.
- **neighbors** [int array of shape (ntri, 3)] Return integer array of shape (ntri, 3) containing neighbor triangles.
- **mask** [bool array of shape (ntri, 3)] Masked out triangles.
- **is_delaunay** [bool] Whether the Triangulation is a calculated Delaunay triangulation (where triangles was not specified) or not.

**calculate_plane_coefficients**(self, z)

Calculate plane equation coefficients for all unmasked triangles from the point (x, y) coordinates and specified z-array of shape (npoints). The returned array has shape (npoints, 3) and allows z-value at (x, y) position in triangle tri to be calculated using \( z = array[tri, 0] \times x + array[tri, 1] \times y + array[tri, 2] \).

**edges**

Return integer array of shape (nedges, 2) containing all edges of non-masked triangles.

Each row defines an edge by its start point index and end point index. Each edge appears only once, i.e. for an edge between points \( i \) and \( j \), there will only be either \((i, j)\) or \((j, i)\).

**get_cpp_triangulation**(self)

Return the underlying C++ Triangulation object, creating it if necessary.

**static get_from_args_and_kwargs**(args, **kwargs)

Return a Triangulation object from the args and kwargs, and the remaining args and kwargs with the consumed values removed.
There are two alternatives: either the first argument is a Triangulation object, in
which case it is returned, or the args and kwargs are sufficient to create a new
Triangulation to return. In the latter case, see Triangulation.__init__ for the possible
args and kwargs.

get_masked_triangles(self)
Return an array of triangles that are not masked.

get_trifinder(self)
Return the default matplotlib.tri.TriFinder of this triangulation, creating it if nec-
essary. This allows the same TriFinder object to be easily shared.

neighbors
Return integer array of shape (ntri, 3) containing neighbor triangles.
For each triangle, the indices of the three triangles that share the same edges,
or -1 if there is no such neighboring triangle. neighbors[i,j] is the triangle that
is the neighbor to the edge from point index triangles[i,j] to point index trian-
gles[i,(j+1)%3].

set_mask(self, mask)
Set or clear the mask array. This is either None, or a boolean array of shape (ntri).

class matplotlib.tri.TriFinder(triangulation)
Abstract base class for classes used to find the triangles of a Triangulation in which (x,y)
points lie.
Rather than instantiate an object of a class derived from TriFinder, it is usually better to
use the function matplotlib.tri.Triangulation.get_trifinder().
Derived classes implement __call__(x,y) where x,y are array_like point coordinates of the
same shape.

class matplotlib.tri.TrapezoidMapTriFinder(triangulation)
Bases: matplotlib.tri.trifinder.TriFinder

TriFinder class implemented using the trapezoid map algorithm from the book "Compu-
tational Geometry, Algorithms and Applications", second edition, by M. de Berg, M. van
Kreveld, M. Overmars and O. Schwarzkopf.
The triangulation must be valid, i.e. it must not have duplicate points, triangles formed
from colinear points, or overlapping triangles. The algorithm has some tolerance to
triangles formed from colinear points, but this should not be relied upon.

class matplotlib.tri.TriInterpolator(triangulation, z, trifinder=None)
Abstract base class for classes used to perform interpolation on triangular grids.
Derived classes implement the following methods:
• __call__(x, y), where x, y are array_like point coordinates of the same shape, and
  that returns a masked array of the same shape containing the interpolated z-values.
• gradient(x, y), where x, y are array_like point coordinates of the same shape, and
  that returns a list of 2 masked arrays of the same shape containing the 2 derivatives
  of the interpolator (derivatives of interpolated z values with respect to x and y).

class matplotlib.tri.LinearTriInterpolator(triangulation, z, trifinder=None)
Bases: matplotlib.tri.triinterpolate.TriInterpolator
A LinearTriInterpolator performs linear interpolation on a triangular grid.
Each triangle is represented by a plane so that an interpolated value at point (x,y) lies on
the plane of the triangle containing (x,y). Interpolated values are therefore continuous
across the triangulation, but their first derivatives are discontinuous at edges between triangles.

**Parameters**

- **triangulation** [Triangulation object] The triangulation to interpolate over.
- **z** [array_like of shape (npoints,)] Array of values, defined at grid points, to interpolate between.
- **trifinder** [TriFinder object, optional] If this is not specified, the Triangulation’s default TriFinder will be used by calling `matplotlib.tri.Triangulation.get_trifinder()`.

**Methods**

<table>

</tr>
<tr>
<td>'gradient' (x, y)</td>
<td>Returns interpolated derivatives at x,y points</td>
</tr>
</tbody>
</table>

**gradient**(self, x, y)

Returns a list of 2 masked arrays containing interpolated derivatives at the specified x,y points.

**Parameters**

- **x**, **y** [array-like] x and y coordinates of the same shape and any number of dimensions.

**Returns**

- **dzdx**, **dzdy** [np.ma.array] 2 masked arrays of the same shape as x and y; values corresponding to (x,y) points outside of the triangulation are masked out. The first returned array contains the values of $\frac{\partial z}{\partial x}$ and the second those of $\frac{\partial z}{\partial y}$.

**class** matplotlib.tri.CubicTriInterpolator(triangulation, z, kind='min_E', trifinder=None, dz=None)

**Bases:** matplotlib.tri.triinterpolate.TriInterpolator

A CubicTriInterpolator performs cubic interpolation on triangular grids.

In one-dimension - on a segment - a cubic interpolating function is defined by the values of the function and its derivative at both ends. This is almost the same in 2-d inside a triangle, except that the values of the function and its 2 derivatives have to be defined at each triangle node.

The CubicTriInterpolator takes the value of the function at each node - provided by the user - and internally computes the value of the derivatives, resulting in a smooth interpolation. (As a special feature, the user can also impose the value of the derivatives at each node, but this is not supposed to be the common usage.)

**Parameters**

- **triangulation** [Triangulation object] The triangulation to interpolate over.
- **z** [array_like of shape (npoints,)] Array of values, defined at grid points, to interpolate between.
**kind** [{‘min_E’, ‘geom’, ‘user’}, optional] Choice of the smoothing algorithm, in order to compute the interpolant derivatives (defaults to ‘min_E’):

- if ‘min_E’ (default) The derivatives at each node is computed to minimize a bending energy.
- if ‘geom’: The derivatives at each node is computed as a weighted average of relevant triangle normals. To be used for speed optimization (large grids).
- if ‘user’: The user provides the argument $dz$, no computation is hence needed.

**trifinder** [TriFinder object, optional] If not specified, the Triangulation’s default TriFinder will be used by calling `matplotlib.tri.Triangulation.get_trifinder()`.

**dz** [tuple of array_likes (dzdx, dzdy), optional] Used only if kind = ‘user’. In this case $dz$ must be provided as (dzdx, dzdy) where dzdx, dzdy are arrays of the same shape as $z$ and are the interpolant first derivatives at the triangulation points.

**Notes**

This note is a bit technical and details the way a `CubicTriInterpolator` computes a cubic interpolation.

The interpolation is based on a Clough-Tocher subdivision scheme of the triangulation mesh (to make it clearer, each triangle of the grid will be divided in 3 child-triangles, and on each child triangle the interpolated function is a cubic polynomial of the 2 coordinates). This technique originates from FEM (Finite Element Method) analysis; the element used is a reduced Hsieh-Clough-Tocher (HCT) element. Its shape functions are described in [R0be0c58fd53f-1]. The assembled function is guaranteed to be C1-smooth, i.e., it is continuous and its first derivatives are also continuous (this is easy to show inside the triangles but is also true when crossing the edges).

In the default case (kind = ’min_E’), the interpolant minimizes a curvature energy on the functional space generated by the HCT element shape functions - with imposed values but arbitrary derivatives at each node. The minimized functional is the integral of the so-called total curvature (implementation based on an algorithm from [R0be0c58fd53f-2] - PCG sparse solver):

$$E(z) = \frac{1}{2} \int_{\Omega} \left( \frac{\partial^2 z}{\partial x^2} \right)^2 + \left( \frac{\partial^2 z}{\partial y^2} \right)^2 + 2 \left( \frac{\partial^2 z}{\partial y \partial x} \right)^2 \, dx \, dy$$

If the case kind = ’geom’ is chosen by the user, a simple geometric approximation is used (weighted average of the triangle normal vectors), which could improve speed on very large grids.

gradient(self, x, y)

Returns a list of 2 masked arrays containing interpolated derivatives at the specified x,y points.

Parameters

- x, y [array-like] x and y coordinates of the same shape and any number of dimensions.

Returns

- dzdx, dzdy [np.ma.array] 2 masked arrays of the same shape as x and y; values corresponding to (x,y) points outside of the triangulation are masked out. The first returned array contains the values of $\frac{\partial z}{\partial x}$ and the second those of $\frac{\partial z}{\partial y}$.

class matplotlib.tri.TriRefiner(triangulation)

Abstract base class for classes implementing mesh refinement.

A TriRefiner encapsulates a Triangulation object and provides tools for mesh refinement and interpolation.

Derived classes must implements:

- refine_triangulation(return_tri_index=False, **kwargs), where the optional keyword arguments kwars are defined in each TriRefiner concrete implementation, and which returns:
  - a refined triangulation
  - optionally (depending on return_tri_index), for each point of the refined triangulation: the index of the initial triangulation triangle to which it belongs.

- refine_field(z, triinterpolator=None, **kwargs), where:
  - z array of field values (to refine) defined at the base triangulation nodes
  - triinterpolator is a TriInterpolator (optional)
  - the other optional keyword arguments kwars are defined in each TriRefiner concrete implementation
  and which returns (as a tuple) a refined triangular mesh and the interpolated values of the field at the refined triangulation nodes.

class matplotlib.tri.UniformTriRefiner(triangulation)

Bases: matplotlib.tri.trirefine.TriRefiner

Uniform mesh refinement by recursive subdivisions.

Parameters

- triangulation [Triangulation] The encapsulated triangulation (to be refined)

refine_field(self, z, triinterpolator=None, subdiv=3)

Refines a field defined on the encapsulated triangulation.
Returns \( \text{refi\_tri} \) (refined triangulation), \( \text{refi\_z} \) (interpolated values of the field at the node of the refined triangulation).

**Parameters**

- \( z \) [1d-array-like of length \( n\_points \)] Values of the field to refine, defined at the nodes of the encapsulated triangulation. (\( n\_points \) is the number of points in the initial triangulation)

- \( \text{trinterpolator} \) [\text{TriInterpolator}, optional] Interpolator used for field interpolation. If not specified, a \text{CubicTriInterpolator} will be used.

- \( \text{subdiv} \) [integer, optional] Recursion level for the subdivision. Defaults to 3. Each triangle will be divided into \( 4^{\text{subdiv}} \) child triangles.

**Returns**

- \( \text{refi\_tri} \) [\text{Triangulation} object] The returned refined triangulation

- \( \text{refi\_z} \) [1d array of length: \( \text{refi\_tri} \) node count.] The returned interpolated field (at \( \text{refi\_tri} \) nodes)

**refine\_triangulation** (\texttt{self}, return\_tri\_index=False, subdiv=3)

Computes an uniformly refined triangulation \( \text{refi\_triangulation} \) of the encapsulated triangulation.

This function refines the encapsulated triangulation by splitting each father triangle into 4 child sub-triangles built on the edges midside nodes, recursively (level of recursion \( \text{subdiv} \)). In the end, each triangle is hence divided into \( 4^{\text{subdiv}} \) child triangles. The default value for \( \text{subdiv} \) is 3 resulting in 64 refined subtriangles for each triangle of the initial triangulation.

**Parameters**

- \( \text{return\_tri\_index} \) [boolean, optional] Boolean indicating whether an index table indicating the father triangle index of each point will be returned. Default value False.

- \( \text{subdiv} \) [integer, optional] Recursion level for the subdivision. Defaults value 3. Each triangle will be divided into \( 4^{\text{subdiv}} \) child triangles.

**Returns**

- \( \text{refi\_triangulation} \) [\text{Triangulation}] The returned refined triangulation

- \( \text{found\_index} \) [array-like of integers] Index of the initial triangulation containing triangle, for each point of \( \text{refi\_triangulation} \). Returned only if \( \text{return\_tri\_index} \) is set to True.

class \texttt{matplotlib.tri.TriAnalyzer}(\texttt{triangulation})

Define basic tools for triangular mesh analysis and improvement.

A TriAnalyzer encapsulates a \text{Triangulation} object and provides basic tools for mesh analysis and mesh improvement.

**Parameters**

- \( \text{triangulation} \) [\text{Triangulation} object] The encapsulated triangulation to analyze.

**Attributes**

- ‘scale\_factors’
circle_ratios(self, rescale=True)

Returns a measure of the triangulation triangles flatness.

The ratio of the incircle radius over the circumcircle radius is a widely used indicator of a triangle flatness. It is always <= 0.5 and == 0.5 only for equilateral triangles. Circle ratios below 0.01 denote very flat triangles.

To avoid unduly low values due to a difference of scale between the 2 axis, the triangular mesh can first be rescaled to fit inside a unit square with scale_factors (Only if rescale is True, which is its default value).

Parameters

rescale [boolean, optional] If True, a rescaling will be internally performed (based on scale_factors, so that the (unmasked) triangles fit exactly inside a unit square mesh. Default is True.

Returns

circle_ratios [masked array] Ratio of the incircle radius over the circumcircle radius, for each ‘rescaled’ triangle of the encapsulated triangulation. Values corresponding to masked triangles are masked out.

get_flat_tri_mask(self, min_circle_ratio=0.01, rescale=True)

Eliminates excessively flat border triangles from the triangulation.

Returns a mask new_mask which allows to clean the encapsulated triangulation from its border-located flat triangles (according to their circle_ratios()). This mask is meant to be subsequently applied to the triangulation using matplotlib.tri.Triangulation.set_mask(). new_mask is an extension of the initial triangulation mask in the sense that an initially masked triangle will remain masked.

The new_mask array is computed recursively; at each step flat triangles are removed only if they share a side with the current mesh border. Thus no new holes in the triangulated domain will be created.

Parameters

min_circle_ratio [float, optional] Border triangles with incircle/circumcircle radii ratio r/R will be removed if r/R < min_circle_ratio. Default value: 0.01

rescale [boolean, optional] If True, a rescaling will first be internally performed (based on scale_factors), so that the (unmasked) triangles fit exactly inside a unit square mesh. This rescaling accounts for the difference of scale which might exist between the 2 axis. Default (and recommended) value is True.

Returns

new_mask [array-like of booleans] Mask to apply to encapsulated triangulation. All the initially masked triangles remain masked in the new_mask.

Notes

The rationale behind this function is that a Delaunay triangulation - of an unstructured set of points - sometimes contains almost flat triangles at its border, leading
to artifacts in plots (especially for high-resolution contouring). Masked with computed `new_mask`, the encapsulated triangulation would contain no more unmasked border triangles with a circle ratio below `min_circle_ratio`, thus improving the mesh quality for subsequent plots or interpolation.

**scale_factors**

Factors to rescale the triangulation into a unit square.

Returns $k$, tuple of 2 scale factors.

**Returns**

$k$ [tuple of 2 floats (kx, ky)] Tuple of floats that would rescale the triangulation: $[\text{triangulation}.x \times kx, \text{triangulation}.y \times ky]$ fits exactly inside a unit square.

### 17.53 matplotlib.type1font

This module contains a class representing a Type 1 font.

This version reads pfa and pfb files and splits them for embedding in pdf files. It also supports SlantFont and ExtendFont transformations, similarly to pdfTeX and friends. There is no support yet for subsetting.

**Usage:**

```python
clear_part, encrypted_part, finale = font.parts
slanted_font = font.transform({'slant': 0.167})
extended_font = font.transform({'extend': 1.2})
```

**Sources:**

- Adobe Technical Note #5040, Supporting Downloadable PostScript Language Fonts.

**class matplotlib.type1font.Type1Font(input)**

Bases: `object`

A class representing a Type-1 font, for use by backends.

**Attributes**

- **parts** [tuple] A 3-tuple of the cleartext part, the encrypted part, and the finale of zeros.

- **prop** [Dict[str, Any]] A dictionary of font properties.

Initialize a Type-1 font. `input` can be either the file name of a pfb file or a 3-tuple of already-decoded Type-1 font parts.

**transform(self, effects)**

Transform the font by slanting or extending. `effects` should be a dict where `effects['slant']` is the tangent of the angle that the font is to be slanted to the
right (so negative values slant to the left) and effects['extend'] is the multiplier by
which the font is to be extended (so values less than 1.0 condense). Returns a new
*Type1Font* object.

## 17.54 Matplotlib.units

The classes here provide support for using custom classes with Matplotlib, e.g., those that
do not expose the array interface but know how to convert themselves to arrays. It also
supports classes with units and units conversion. Use cases include converters for custom
objects, e.g., a list of datetime objects, as well as for objects that are unit aware. We don’t
assume any particular units implementation; rather a units implementation must provide the
register with the Registry converter dictionary and a *ConversionInterface*. For example, here
is a complete implementation which supports plotting with native datetime objects:

```python
import matplotlib.units as units
import matplotlib.dates as dates
import matplotlib.ticker as ticker
import datetime

class DateConverter(units.ConversionInterface):
    @staticmethod
    def convert(value, unit, axis):
        'Convert a datetime value to a scalar or array'
        return dates.date2num(value)

    @staticmethod
    def axisinfo(unit, axis):
        'Return major and minor tick locators and formatters'
        if unit != 'date': return None
        majloc = dates.AutoDateLocator()
        majfmt = dates.AutoDateFormatter(majloc)
        return AxisInfo(majloc=majloc,
                        majfmt=majfmt,
                        label='date')

    @staticmethod
    def default_units(x, axis):
        'Return the default unit for x or None'
        return 'date'

# Finally we register our object type with the Matplotlib units registry.
units.registry[datetime.date] = DateConverter()
```

```py
class matplotlib.units.AxisInfo(
majloc=None, minloc=None, majfmt=None,
    minfmt=None, label=None, default_limits=None)

Bases: object

Information to support default axis labeling, tick labeling, and limits.

An instance of this class must be returned by *ConversionInterface.axisinfo*.

**Parameters**
**majloc, minloc** [Locator, optional] Tick locators for the major and minor ticks.

**majfmt, minfmt** [Formatter, optional] Tick formatters for the major and minor ticks.

**label** [str, optional] The default axis label.

**default_limits** [optional] The default min and max limits of the axis if no data has been plotted.

**Notes**

If any of the above are `None`, the axis will simply use the default value.

**exception** `matplotlib.units.ConversionError`

**Bases:** `TypeError`

**class** `matplotlib.units.ConversionInterface`

**Bases:** `object`

The minimal interface for a converter to take custom data types (or sequences) and convert them to values Matplotlib can use.

**static** `axisinfo(unit, axis)`

Return an `AxisInfo` for the axis with the specified units.

**static** `convert(obj, unit, axis)`

Convert `obj` using `unit` for the specified `axis`.

If `obj` is a sequence, return the converted sequence. The output must be a sequence of scalars that can be used by the numpy array layer.

**static** `default_units(x, axis)`

Return the default unit for `x` or `None` for the given axis.

**static** `is_numlike(x)`

The Matplotlib datalim, autoscaling, locators etc work with scalars which are the units converted to floats given the current unit. The converter may be passed these floats, or arrays of them, even when units are set.

**class** `matplotlib.units.Registry`

**Bases:** `dict`

Register types with conversion interface.

**get_converter(self, x)**

Get the converter interface instance for `x`, or `None`. 
17.55 `matplotlib.widgets`

Widgets that are designed to work for any of the GUI backends. All of these widgets require you to predefine a `matplotlib.axes.Axes` instance and pass that as the first arg. `matplotlib` doesn't try to be too smart with respect to layout - you will have to figure out how wide and tall you want your Axes to be to accommodate your widget.

```python
class matplotlib.widgets.AxesWidget(ax)
    Bases: matplotlib.widgets.Widget

    Widget that is connected to a single `Axes`.
```

To guarantee that the widget remains responsive and not garbage-collected, a reference to the object should be maintained by the user.
This is necessary because the callback registry maintains only weak-refs to the functions, which are member functions of the widget. If there are no references to the widget object it may be garbage collected which will disconnect the callbacks.

Attributes:

- **ax** [Axes] The parent axes for the widget
- **canvas** [FigureCanvasBase subclass] The parent figure canvas for the widget.
- **active** [bool] If False, the widget does not respond to events.

```python
connect_event(self, event, callback)
```
Connect callback with an event.
This should be used in lieu of `figure.canvas.mpl_connect` since this function stores callback ids for later clean up.

```python
disconnect_events(self)
```
Disconnect all events created by this widget.

```python
class matplotlib.widgets.Button(ax, label, image=None, color='0.85', hovercolor='0.95')
```
A GUI neutral button.

For the button to remain responsive you must keep a reference to it. Call `on_clicked()` to connect to the button.

**Attributes**

- **ax** The `matplotlib.axes.Axes` the button renders into.
- **label** A `matplotlib.text.Text` instance.
- **color** The color of the button when not activated.
- **hovercolor** The color of the button when hovering.

**Parameters**

- **ax** [Axes] The `Axes` instance the button will be placed into.
- **label** [str] The button text. Accepts string.
- **image** [array, mpl image, Pillow Image] The image to place in the button, if not `None`. Can be any legal arg to imshow (numpy array, matplotlib Image instance, or Pillow Image).
- **color** [color] The color of the button when not activated.
- **hovercolor** [color] The color of the button when the mouse is over it.

```python
disconnect(self, cid)
```
Remove the callback function with connection id `cid`.

```python
on_clicked(self, func)
```
Connect the callback function `func` to button click events.
Returns a connection id, which can be used to disconnect the callback.

```python
class matplotlib.widgets.CheckButtons(ax, labels, actives=None)
```
A GUI neutral set of check buttons.
For the check buttons to remain responsive you must keep a reference to this object. The following attributes are exposed:

- **ax** The `matplotlib.axes.Axes` instance the buttons are located in.
- **labels** List of `matplotlib.text.Text` instances.
- **lines** List of (line1, line2) tuples for the x's in the check boxes. These lines exist for each box, but have `set_visible(False)` when its box is not checked.
- **rectangles** List of `matplotlib.patches.Rectangle` instances.

Connect to the CheckButtons with the `on_clicked()` method.

Add check buttons to `matplotlib.axes.Axes` instance `ax`.

**Parameters**

- **ax** ([Axes]) The parent axes for the widget.
- **labels** ([List[str]]) The labels of the check buttons.
- **actives** ([List[bool]], optional) The initial check states of the buttons. The list must have the same length as `labels`. If not given, all buttons are unchecked.

**Methods**

- `disconnect(self, cid)`
- `get_status(self)`
- `on_clicked(self, func)`
- `set_active(self, index)`

**class** `matplotlib.widgets.Cursor(ax, horizOn=True, vertOn=True, useblit=False, **line-props)`

Bases: `matplotlib.widgets.AxesWidget`

A crosshair cursor that spans the axes and moves with mouse cursor. For the cursor to remain responsive you must keep a reference to it.

**Parameters**

- **ax** ([`matplotlib.axes.Axes`]) The `Axes` to attach the cursor to.
- **horizOn** (bool, optional, default: True) Whether to draw the horizontal line.
- **vertOn** (bool, optional, default: True) Whether to draw the vertical line.
- **useblit** (bool, optional, default: False) Use blitting for faster drawing if supported by the backend.

**Other Parameters**
**lineprops**  
`Line2D` properties that control the appearance of the lines.

See also `axhline`.

Examples

See /gallery/widgets/cursor.

```python
clear(self, event)

Internal event handler to clear the cursor.

onmove(self, event)

Internal event handler to draw the cursor when the mouse moves.
```

```python
class matplotlib.widgets.EllipseSelector(ax, onselect, drawtype='box',
minspanx=None, minspany=None, useblit=False, lineprops=None, rect-
props=None, spancoords='data', button=None, maxdist=10,
marker_props=None, interactive=False,
state_modifier_keys=None)
```

Bases: `matplotlib.widgets.RectangleSelector`

Select an elliptical region of an axes.

For the cursor to remain responsive you must keep a reference to it.

Example usage:

```python
import numpy as np
import matplotlib.pyplot as plt
from matplotlib.widgets import EllipseSelector

def onselect(eclick, erelease):
    """eclick and erelease are matplotlib events at press and release.""
    print('startposition: (%f, %f)' % (eclick.xdata, eclick.ydata))
    print('endposition : (%f, %f)' % (erelease.xdata, erelease.ydata))
    print('used button : %d, eclick.button')

def toggle_selector(event):
    print('Key pressed.')
    if event.key in ['Q', 'q'] and toggle_selector.S.active:
        print('EllipseSelector deactivated.')
        toggle_selector.S.set_active(False)
    if event.key in ['A', 'a'] and not toggle_selector.S.active:
        print('EllipseSelector activated.')
        toggle_selector.S.set_active(True)

x = np.arange(100.) / 99
y = np.sin(x)
fig, ax = plt.subplots()
ax.plot(x, y)

toggle_selector.S = EllipseSelector(ax, onselect, drawtype='line')
fig.canvas.mpl_connect('key_press_event', toggle_selector)
plt.show()
```
Create a selector in `ax`. When a selection is made, clear the span and call `onselect` with:

```python
onselect(pos_1, pos_2)
```

and clear the drawn box/line. The `pos_1` and `pos_2` are arrays of length 2 containing the x- and y-coordinate.

If `minspanx` is not `None` then events smaller than `minspanx` in x direction are ignored (it's the same for y).

The rectangle is drawn with `rectprops`; default:

```python
rectprops = dict(facecolor='red', edgecolor='black',
                 alpha=0.2, fill=True)
```

The line is drawn with `lineprops`; default:

```python
lineprops = dict(color='black', linestyle='-',
                   linewidth=2, alpha=0.5)
```

Use `drawtype` if you want the mouse to draw a line, a box or nothing between click and actual position by setting

```python
drawtype = 'line', drawtype='box' or drawtype = 'none'. Drawing a line would result in a line from vertex A to vertex C in a rectangle ABCD.
```

`spancoords` is one of ‘data’ or ‘pixels’. If ‘data’, `minspanx` and `minspanx` will be interpreted in the same coordinates as the x and y axis. If ‘pixels’, they are in pixels.

`button` is a list of integers indicating which mouse buttons should be used for rectangle selection. You can also specify a single integer if only a single button is desired. Default is `None`, which does not limit which button can be used.

**Note, typically:** 1 = left mouse button 2 = center mouse button (scroll wheel) 3 = right mouse button

`interactive` will draw a set of handles and allow you interact with the widget after it is drawn.

`state_modifier_keys` are keyboard modifiers that affect the behavior of the widget.

The defaults are: `dict(move=' ', clear='escape', square='shift', center='ctrl')`

Keyboard modifiers, which: ‘move’: Move the existing shape. ‘clear’: Clear the current shape. ‘square’: Makes the shape square. ‘center’: Make the initial point the center of the shape. ‘square’ and ‘center’ can be combined.

```python
draw_shape(self, extents)
```

**class** `matplotlib.widgets.Lasso(ax, xy, callback=None, useblit=True)`

Bases: `matplotlib.widgets.AxesWidget`

Selection curve of an arbitrary shape.

The selected path can be used in conjunction with `contains_point()` to select data points from an image.

Unlike `LassoSelector`, this must be initialized with a starting point `xy`, and the `Lasso` events are destroyed upon release.

**Parameters**

xy [(float, float)] Coordinates of the start of the lasso.

callback [callable] Whenever the lasso is released, the callback function is called and passed the vertices of the selected path.

```python
onmove(self, event)
onrelease(self, event)
```

class matplotlib.widgets.LassoSelector(ax, onselect=None, useblit=True, lineprops=None, button=None)

Selection curve of an arbitrary shape.

For the selector to remain responsive you must keep a reference to it.

The selected path can be used in conjunction with contains_point to select data points from an image.

In contrast to Lasso, LassoSelector is written with an interface similar to RectangleSelector and SpanSelector, and will continue to interact with the axes until disconnected.

Example usage:

```python
ax = subplot(111)
ax.plot(x, y)
def onselect(verts):
    print(verts)
lasso = LassoSelector(ax, onselect)
```

**Parameters**

- **ax** [Axes] The parent axes for the widget.

- **onselect** [function] Whenever the lasso is released, the onselect function is called and passed the vertices of the selected path.

- **button** [List[Int], optional] A list of integers indicating which mouse buttons should be used for rectangle selection. You can also specify a single integer if only a single button is desired. Default is None, which does not limit which button can be used.

  Note, typically:
  - 1 = left mouse button
  - 2 = center mouse button (scroll wheel)
  - 3 = right mouse button

  onpress(self, event)
  onrelease(self, event)

```python
class matplotlib.widgets.LockDraw
Bases: object
```

Some widgets, like the cursor, draw onto the canvas, and this is not desirable under all circumstances, like when the toolbar is in zoom-to-rect mode and drawing a rectangle. To avoid this, a widget can acquire a canvas' lock with canvas.widgetlock(widget) before
drawing on the canvas; this will prevent other widgets from doing so at the same time (if they also try to acquire the lock first).

```python
def available(self, o):
    return whether drawing is available to o.

def isowner(self, o):
    return whether o owns this lock.

def locked(self):
    return whether the lock is currently held by an owner.

def release(self, o):
    release the lock from o.
```

```python
class matplotlib.widgets.MultiCursor(canvas, axes, useblit=True, horizOn=False, vertOn=True, **lineprops):
    Bases: matplotlib.widgets.Widget

    Provide a vertical (default) and/or horizontal line cursor shared between multiple axes.

    For the cursor to remain responsive you must keep a reference to it.

    Example usage:
```
```python
from matplotlib.widgets import MultiCursor
import matplotlib.pyplot as plt
import numpy as np

fig, (ax1, ax2) = plt.subplots(nrows=2, sharex=True)
t = np.arange(0.0, 2.0, 0.01)
ax1.plot(t, np.sin(2*np.pi*t))
ax2.plot(t, np.sin(4*np.pi*t))

multi = MultiCursor(fig.canvas, (ax1, ax2), color='r', lw=1, horizOn=False, vertOn=True)
plt.show()
```

```python
def clear(self, event):
    clear the cursor

def connect(self):
    connect events

def disconnect(self):
    disconnect events

def onmove(self, event):
```

```python
class matplotlib.widgets.PolygonSelector(ax, onselect, useblit=False, lineprops=None, markerprops=None, vertex_select_radius=15):
    Bases: matplotlib.widgets._SelectorWidget

    Select a polygon region of an axes.

    Place vertices with each mouse click, and make the selection by completing the polygon (clicking on the first vertex). Hold the `ctrl` key and click and drag a vertex to reposition it (the `ctrl` key is not necessary if the polygon has already been completed). Hold the `shift` key and click and drag anywhere in the axes to move all vertices. Press the `esc` key to start a new polygon.
```
For the selector to remain responsive you must keep a reference to it.

**Parameters**

- **ax** [Axes] The parent axes for the widget.
- **onselect** [function] When a polygon is completed or modified after completion, the onselect function is called and passed a list of the vertices as (xdata, ydata) tuples.
- **useblit** [bool, optional]
- **lineprops** [dict, optional] The line for the sides of the polygon is drawn with the properties given by lineprops. The default is `dict(color='k', linestyle='-', linewidth=2, alpha=0.5)`.
- **markerprops** [dict, optional] The markers for the vertices of the polygon are drawn with the properties given by markerprops. The default is `dict(marker='o', markersize=7, mec='k', mfc='k', alpha=0.5)`.
- **vertex_select_radius** [float, optional] A vertex is selected (to complete the polygon or to move a vertex) if the mouse click is within vertex_select_radius pixels of the vertex. The default radius is 15 pixels.

**Examples**

/gallery/widgets/polygon_selector_demo

```python
onmove(self, event)
    Cursor move event handler and validator
verts
    Get the polygon vertices.
```

**Returns**

- **list** A list of the vertices of the polygon as (xdata, ydata) tuples.

```python
class matplotlib.widgets.RadioButtons(ax, labels, active=0, activecolor='blue')
Bases: matplotlib.widgets.AxesWidget
```

A GUI neutral radio button.

For the buttons to remain responsive you must keep a reference to this object.

Connect to the RadioButtons with the `on_clicked()` method.

**Attributes**

- **ax** The containing Axes instance.
- **activecolor** The color of the selected button.
- **labels** A list of Text instances containing the button labels.
- **circles** A list of Circle instances defining the buttons.
- **value_selected** [str] The label text of the currently selected button.

Add radio buttons to an Axes.

**Parameters**

- **ax** [Axes] The axes to add the buttons to.
**labels** [list of str] The button labels.

**active** [int] The index of the initially selected button.

**activecolor** [color] The color of the selected button.

def disconnect(self, cid)
    Remove the observer with connection id cid.

def on_clicked(self, func)
    Connect the callback function func to button click events.
    Returns a connection id, which can be used to disconnect the callback.

def set_active(self, index)
    Select button with number index.
    Callbacks will be triggered if eventson is True.

class matplotlib.widgets.RectangleSelector(ax, onselect, drawtype='box',
    minspanx=None, minspany=None, useblit=False, lineprops=None, rectprops=None, spancoords='data',
    button=None, maxdist=10, marker_props=None, interactive=False, state_modifier_keys=None)

Bases: matplotlib.widgets._SelectorWidget

Select a rectangular region of an axes.

For the cursor to remain responsive you must keep a reference to it.

Example usage:

```python
import numpy as np
import matplotlib.pyplot as plt
from matplotlib.widgets import RectangleSelector

def onselect(eclick, erelease):
    "eclick and erelease are matplotlib events at press and release."
    print('startposition: (%.2f, %.2f)' % (eclick.xdata, eclick.ydata))
    print('endposition : (%.2f, %.2f)' % (erelease.xdata, erelease.ydata))
    print('used button :', eclick.button)

def toggle_selector(event):
    print('Key pressed.')
    if event.key in ['Q', 'q'] and toggle_selector.RS.active:
        print('RectangleSelector deactivated.')
        toggle_selector.RS.set_active(False)
    if event.key in ['A', 'a'] and not toggle_selector.RS.active:
        print('RectangleSelector activated.')
        toggle_selector.RS.set_active(True)

x = np.arange(100.) / 99
y = np.sin(x)
fig, ax = plt.subplots()
ax.plot(x, y)
toggle_selector.RS = RectangleSelector(ax, onselect, drawtype='line')
```

(continues on next page)
fig.canvas.mpl_connect('key_press_event', toggle_selector)
plt.show()

Create a selector in ax. When a selection is made, clear the span and call onselect with:

```python
onselect(pos_1, pos_2)
```

and clear the drawn box/line. The pos_1 and pos_2 are arrays of length 2 containing the x- and y-coordinate.

If `minspanx` is not `None` then events smaller than `minspanx` in x direction are ignored (it’s the same for y).

The rectangle is drawn with `rectprops`; default:

```python
rectprops = dict(facecolor='red', edgecolor = 'black',
                 alpha=0.2, fill=True)
```

The line is drawn with `lineprops`; default:

```python
lineprops = dict(color='black', linestyle='-',
                   linewidth = 2, alpha=0.5)
```

Use `drawtype` if you want the mouse to draw a line, a box or nothing between click and actual position by setting

`drawtype = 'line'`, `drawtype='box'` or `drawtype = 'none'`. Drawing a line would result in a line from vertex A to vertex C in a rectangle ABCD.

`spancoords` is one of ‘data’ or ‘pixels’. If ‘data’, `minspanx` and `minspany` will be interpreted in the same coordinates as the x and y axis. If ‘pixels’, they are in pixels.

`button` is a list of integers indicating which mouse buttons should be used for rectangle selection. You can also specify a single integer if only a single button is desired. Default is `None`, which does not limit which button can be used.

**Note, typically:** 1 = left mouse button 2 = center mouse button (scroll wheel) 3 = right mouse button

`interactive` will draw a set of handles and allow you interact with the widget after it is drawn.

`state_modifier_keys` are keyboard modifiers that affect the behavior of the widget.

The defaults are: `dict(move=' ', clear='escape', square='shift', center='ctrl')`

Keyboard modifiers, which: `move`: Move the existing shape. `clear`: Clear the current shape. `square`: Makes the shape square. `center`: Make the initial point the center of the shape. `square` and `center` can be combined.

`center`

Center of rectangle

corners

Corners of rectangle from lower left, moving clockwise.

draw_shape(self, extents)

draw_shape

Midpoint of rectangle edges from left, moving clockwise.
extents
   Return (xmin, xmax, ymin, ymax).

geometry
   Returns numpy.ndarray of shape (2,5) containing x (RectangleSelector.geometry[1, :]) and y (RectangleSelector.geometry[0,:]) coordinates of the four corners of the rectangle starting and ending in the top left corner.

class matplotlib.widgets.Slider(ax, label, valmin, valmax, valinit=0.5, valfmt='%1.2f', closedmin=True, closedmax=True, slidermin=None, slidermax=None, dragging=True, valstep=None, orientation='horizontal', **kwargs)

Bases: matplotlib.widgets.AxesWidget

A slider representing a floating point range.

Create a slider from valmin to valmax in axes ax. For the slider to remain responsive you must maintain a reference to it. Call on_changed() to connect to the slider event.

Attributes

   val [float] Slider value.

Parameters

   ax [Axes] The Axes to put the slider in.
   label [str] Slider label.
   valmin [float] The minimum value of the slider.
   valmax [float] The maximum value of the slider.
   valinit [float, optional, default: 0.5] The slider initial position.
   valfmt [str, optional, default: ”%1.2f”] Used to format the slider value, fprint format string.
   closedmin [bool, optional, default: True] Indicate whether the slider interval is closed on the bottom.
   closedmax [bool, optional, default: True] Indicate whether the slider interval is closed on the top.
   slidermin [Slider, optional, default: None] Do not allow the current slider to have a value less than the value of the Slider slidermin.
   slidermax [Slider, optional, default: None] Do not allow the current slider to have a value greater than the value of the Slider slidermax.
   dragging [bool, optional, default: True] If True the slider can be dragged by the mouse.
   valstep [float, optional, default: None] If given, the slider will snap to multiples of valstep.
Notes

Additional kwargs are passed on to `self.poly` which is the `Rectangle` that draws the slider knob. See the `Rectangle` documentation for valid property names (e.g., `facecolor`, `edgecolor`, `alpha`).

`disconnect(self, cid)`

Remove the observer with connection id `cid`

**Parameters**

`cid` [int] Connection id of the observer to be removed

`on_changed(self, func)`

When the slider value is changed call `func` with the new slider value

**Parameters**

`func` [callable] Function to call when slider is changed. The function must accept a single float as its arguments.

**Returns**

`cid` [int] Connection id (which can be used to disconnect `func`)

`reset(self)`

Reset the slider to the initial value

`set_val(self, val)`

Set slider value to `val`

**Parameters**

`val` [float]

---

```python
class matplotlib.widgets.SpanSelector(ax, onselect, direction, minspan=None, useblit=False, rectprops=None, onmove_callback=None, span_stays=False, button=None)
```

**Bases:** `matplotlib.widgets._SelectorWidget`

Visually select a min/max range on a single axis and call a function with those values. To guarantee that the selector remains responsive, keep a reference to it.

In order to turn off the SpanSelector, set `span_selector.active=False`. To turn it back on, set `span_selector.active=True`.

**Parameters**

`ax` [*matplotlib.axes.Axes* object]

`onselect` [func(min, max), min/max are floats]

`direction` ["horizontal" or "vertical"] The axis along which to draw the span selector

`minspan` [float, default is None] If selection is less than `minspan`, do not call `onselect`

`useblit` [bool, default is False] If True, use the backend-dependent blitting features for faster canvas updates.

`rectprops` [dict, default is None] Dictionary of `matplotlib.patches.Patch` properties

---
onmove_callback [func(min, max), min/max are floats, default is None]  
Called on mouse move while the span is being selected

span_stays [bool, default is False] If True, the span stays visible after the  
mouse is released

button [int or list of ints]

Determines which mouse buttons activate the span selector  
1 = left mouse button
2 = center mouse button (scroll wheel)
3 = right mouse button

Examples

```python
>>> import matplotlib.pyplot as plt
>>> import matplotlib.widgets as mwidgets
>>> fig, ax = plt.subplots()
>>> ax.plot([1, 2, 3], [10, 50, 100])
>>> def onselect(vmin, vmax):
...    print(vmin, vmax)
>>> rectprops = dict(facecolor='blue', alpha=0.5)
>>> span = mwidgets.SpanSelector(ax, onselect, 'horizontal',
...    rectprops=rectprops)
>>> fig.show()
```

See also: /gallery/widgets/span_selector

buttonDown

ignore(self, event)
    return True if event should be ignored

e new_axes(self, ax)
    Set SpanSelector to operate on a new Axes

class matplotlib.widgets.SubplotTool(targetfig, toolfig)
    Bases: matplotlib.widgets.Widget

A tool to adjust the subplot params of a matplotlib.figure.Figure.

targetfig  The figure instance to adjust.
toolfig  The figure instance to embed the subplot tool into. If None, a default figure will
    be created. If you are using this from the GUI

funcbottom(self, val)
funcspace(self, val)
funcleft(self, val)
funcright(self, val)
functop(self, val)
funcwspace(self, val)
class matplotlib.widgets.TextBox(ax, label, initial='', color='.95', hovercolor='1', label_pad=0.01)

Bases: matplotlib.widgets.AxesWidget

A GUI neutral text input box.

For the text box to remain responsive you must keep a reference to it.

The following attributes are accessible:

- **ax** The matplotlib.axes.Axes the button renders into.
- **label** A matplotlib.text.Text instance.
- **color** The color of the text box when not hovering.
- **hovercolor** The color of the text box when hovering.

Call `on_text_change()` to be updated whenever the text changes.

Call `on_submit()` to be updated whenever the user hits enter or leaves the text entry field.

**Parameters**

- **ax** [Axes] The Axes instance the button will be placed into.
- **label** [str] Label for this text box. Accepts string.
- **initial** [str] Initial value in the text box.
- **color** [color] The color of the box.
- **hovercolor** [color] The color of the box when the mouse is over it.
- **label_pad** [float] The distance between the label and the right side of the textbox.

begin_typing(self, x)

disconnect(self, cid)

Remove the observer with connection id `cid`.

on_submit(self, func)

When the user hits enter or leaves the submission box, call this `func` with event.

A connection id is returned which can be used to disconnect.

on_text_change(self, func)

When the text changes, call this `func` with event.

A connection id is returned which can be used to disconnect.

position_cursor(self, x)

set_val(self, val)

stop_typing(self)

class matplotlib.widgets.ToolHandles(ax, x, y, marker='o', marker_props=None, useblit=True)

Bases: object

Control handles for canvas tools.

**Parameters**

- **ax** [matplotlib.axes.Axes] Matplotlib axes where tool handles are displayed.
x, y [1D arrays] Coordinates of control handles.

**marker** [str] Shape of marker used to display handle. See *matplotlib.pyplot.plot*.

**marker_props** [dict] Additional marker properties. See *matplotlib.lines.Line2D*.

closest(self, x, y)
   Return index and pixel distance to closest index.

set_animated(self, val)

set_data(self, pts, y=None)
   Set x and y positions of handles

set_visible(self, val)

x

y

class matplotlib.widgets.Widget
   Bases: object

   Abstract base class for GUI neutral widgets

   active
      Is the widget active?

   drawon = True

   eventson = True

   get_active(self)
      Get whether the widget is active.

   ignore(self, event)
      Return True if event should be ignored.
      This method (or a version of it) should be called at the beginning of any event callback.

   set_active(self, active)
      Set whether the widget is active.
Toolkits are collections of application-specific functions that extend Matplotlib. The following toolkits are included:

18.1 Toolkits

Toolkits are collections of application-specific functions that extend Matplotlib.

18.1.1 mplot3d

mpl_toolkits.mplot3d provides some basic 3D plotting (scatter, surf, line, mesh) tools. Not the fastest or most feature complete 3D library out there, but it ships with Matplotlib and thus may be a lighter weight solution for some use cases. Check out the mplot3d tutorial for more information.

Fig. 1: Contourf3d 2

mplot3d
Matplotlib mplot3d toolkit

The mplot3d toolkit adds simple 3D plotting capabilities to matplotlib by supplying an axes object that can create a 2D projection of a 3D scene. The resulting graph will have the same look and feel as regular 2D plots.

See the mplot3d tutorial for more information on how to use this toolkit.

The interactive backends also provide the ability to rotate and zoom the 3D scene. One can rotate the 3D scene by simply clicking-and-dragging the scene. Zooming is done by right-clicking the scene and dragging the mouse up and down. Note that one does not use the zoom button like one would use for regular 2D plots.

mplot3d FAQ

How is mplot3d different from MayaVi?

MayaVi2 is a very powerful and featureful 3D graphing library. For advanced 3D scenes and excellent rendering capabilities, it is highly recommended to use MayaVi2.

mplot3d was intended to allow users to create simple 3D graphs with the same “look-and-feel” as matplotlib’s 2D plots. Furthermore, users can use the same toolkit that they are already familiar with to generate both their 2D and 3D plots.
My 3D plot doesn't look right at certain viewing angles

This is probably the most commonly reported issue with mplot3d. The problem is that – from some viewing angles – a 3D object would appear in front of another object, even though it is physically behind it. This can result in plots that do not look “physically correct.”

Unfortunately, while some work is being done to reduce the occurrence of this artifact, it is currently an intractable problem, and cannot be fully solved until matplotlib supports 3D graphics rendering at its core.

The problem occurs due to the reduction of 3D data down to 2D + z-order scalar. A single value represents the 3rd dimension for all parts of 3D objects in a collection. Therefore, when the bounding boxes of two collections intersect, it becomes possible for this artifact to occur. Furthermore, the intersection of two 3D objects (such as polygons or patches) cannot be rendered properly in matplotlib’s 2D rendering engine.

This problem will likely not be solved until OpenGL support is added to all of the backends (patches are greatly welcomed). Until then, if you need complex 3D scenes, we recommend using MayaVi.

I don’t like how the 3D plot is laid out, how do I change that?

Historically, mplot3d has suffered from a hard-coding of parameters used to control visuals such as label spacing, tick length, and grid line width. Work is being done to eliminate this issue. For matplotlib v1.1.0, there is a semi-official manner to modify these parameters. See the note in the axis3d section of the mplot3d API documentation for more information.

Links

- mpl3d API: mplot3d API

18.1.2 Matplotlib axes_grid1 Toolkit

The matplotlib mpl_toolkits.axes_grid1 toolkit is a collection of helper classes to ease displaying multiple images in matplotlib. While the aspect parameter in matplotlib adjusts the position of the single axes, axes_grid1 toolkit provides a framework to adjust the position of multiple axes according to their aspects.

See What is axes_grid1 toolkit? for a guide on the usage of axes_grid1.

The submodules of the axes_grid1 API are:
AxesGrid1 is a toolkit that provides helper classes to adjust the positions of multiple axes at drawing time.

**AxesGrid1**

**AxesGrid1.AxesDivider**

The AxesDivider module provides helper classes to adjust the positions of multiple axes at drawing time.

**AxesGrid1.AxesGrid**

Provides classes of simple units that will be used with AxesDivider class (or others) to determine the size of each axes.

**AxesGrid1.Colorbar**

Colorbar toolkit with two classes and a function:

**AxesGrid1.InsetLocator**

A collection of functions and objects for creating or placing inset axes.

**AxesGrid1.MplAxes**

**AxesGrid1.ParasiteAxes**

**MPL-Toolkits.AxesGrid1.AnchoredArtists**

### Classes

**AnchoredAuxTransformBox(transform, loc[, pad=0.4, borderpad=0.5, prop=None, frameon=True, **kwargs])**

An anchored container with transformed coordinates.

**AnchoredDirectionArrows(transform, label_x, ...)**

Draw two perpendicular arrows to indicate directions.

**AnchoredDrawingArea(width, height, xdescent, ...)**

An anchored container with a fixed size and fillable DrawingArea.

**AnchoredEllipse(transform, width, height, ...)**

Draw an anchored ellipse of a given size.

**AnchoredSizeBar(transform, size, label, ...)**

Draw a horizontal scale bar with a centered label underneath.

**MPL-Toolkits.AxesGrid1.AnchoredArtists.AnchoredAuxTransformBox**

class mpl_toolkits.axes_grid1.anchored_artists.AnchoredAuxTransformBox(transform, loc[, pad=0.4, borderpad=0.5, prop=None, frameon=True, **kwargs])

Bases: matplotlib.offsetbox.AnchoredOffsetBox

An anchored container with transformed coordinates.

Artists added to the drawing area are scaled according to the coordinates of the transformation used. The dimensions of this artist will scale to contain the artists added.

**Parameters**

**transform** (matplotlib.transforms.Transform) The transformation object for the coordinate system in use, i.e., matplotlib.axes.Axes.transData.
**loc** [int] Location of this artist. Valid location codes are:

```
'upper right' : 1,
'upper left' : 2,
'lower left' : 3,
'lower right' : 4,
'right' : 5,
'center left' : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center' : 10
```

**pad** [int or float, optional] Padding around the child objects, in fraction of the font size. Defaults to 0.4.

**borderpad** [int or float, optional] Border padding, in fraction of the font size. Defaults to 0.5.

**prop** [matplotlib.font_manager.FontProperties, optional] Font property used as a reference for paddings.

**frameon** [bool, optional] If True, draw a box around this artists. Defaults to True.

**kwargs** Keyworded arguments to pass to matplotlib.offsetbox.AnchoredOffsetbox.

**Examples**

To display an ellipse in the upper left, with a width of 0.1 and height of 0.4 in data coordinates:

```python
>>> box = AnchoredAuxTransformBox(ax.transData, loc='upper left')
>>> el = Ellipse((0,0), width=0.1, height=0.4, angle=30)
>>> box.drawing_area.add_artist(el)
>>> ax.add_artist(box)
```

**Attributes**

**drawing_area** [matplotlib.offsetbox.AuxTransformBox] A container for artists to display.

**Examples using** mpl_toolkits.axes_grid1.anchored_artists.AnchoredAuxTransformBox

- sphx_glr_gallery_userdemo_anchored_box03.py
mpl_toolkits.axes_grid1.anchored_artists.AnchoredDirectionArrows

class mpl_toolkits.axes_grid1.anchored_artists.AnchoredDirectionArrows(  
    transform, label_x, label_y,  
    length=0.15, fontsize=0.08,  
    loc=2, angle=0, aspect_ratio=1,  
    pad=0.4, borderpad=0.4, frameon=False, color='w',  
    alpha=1, sep_x=0.01, sep_y=0,  
    fontproperties=None,  
    back_length=0.15, head_width=10,  
    head_length=15, tail_width=2,  
    text_props=None, arrow_props=None, **kwargs)

Bases: matplotlib.offsetbox.AnchoredOffsetbox

Draw two perpendicular arrows to indicate directions.

Parameters

**transform** [matplotlib.transforms.Transform] The transformation object for the coordinate system in use, i.e., matplotlib.axes.Axes.transAxes.

**label_x, label_y** [string] Label text for the x and y arrows

**length** [int or float, optional] Length of the arrow, given in coordinates of transform. Defaults to 0.15.

**fontsize** [int, optional] Size of label strings, given in coordinates of transform. Defaults to 0.08.

**loc** [int, optional] Location of the direction arrows. Valid location codes are:

<table>
<thead>
<tr>
<th>Location</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>upper right</td>
<td>1</td>
</tr>
<tr>
<td>upper left</td>
<td>2</td>
</tr>
<tr>
<td>lower left</td>
<td>3</td>
</tr>
<tr>
<td>lower right</td>
<td>4</td>
</tr>
<tr>
<td>right</td>
<td>5</td>
</tr>
<tr>
<td>center left</td>
<td>6</td>
</tr>
<tr>
<td>center right</td>
<td>7</td>
</tr>
<tr>
<td>lower center</td>
<td>8</td>
</tr>
<tr>
<td>upper center</td>
<td>9</td>
</tr>
<tr>
<td>center</td>
<td>10</td>
</tr>
</tbody>
</table>
Defaults to 2.

**angle**  [int or float, optional] The angle of the arrows in degrees. Defaults to 0.

**aspect_ratio** [int or float, optional] The ratio of the length of arrow_x and arrow_y. Negative numbers can be used to change the direction. Defaults to 1.

**pad** [int or float, optional] Padding around the labels and arrows, in fraction of the font size. Defaults to 0.4.

**borderpad** [int or float, optional] Border padding, in fraction of the font size. Defaults to 0.4.

**frameon** [bool, optional] If True, draw a box around the arrows and labels. Defaults to False.

**color** [str, optional] Color for the arrows and labels. Defaults to white.

**alpha** [int or float, optional] Alpha values of the arrows and labels. Defaults to 1.

**sep_x, sep_y** [int or float, optional] Separation between the arrows and labels in coordinates of *transform*. Defaults to 0.01 and 0.

**fontproperties** [matplotlib.font_manager.FontProperties, optional] Font properties for the label text.

**back_length** [float, optional] Fraction of the arrow behind the arrow crossing. Defaults to 0.15.

**head_width** [int or float, optional] Width of arrow head, sent to ArrowStyle. Defaults to 10.

**head_length** [int or float, optional] Length of arrow head, sent to ArrowStyle. Defaults to 15.

**tail_width** [int or float, optional] Width of arrow tail, sent to ArrowStyle. Defaults to 2.

**text_props, arrow_props** [dict] Properties of the text and arrows, passed to *matplotlib.text.TextPath* and *matplotlib.patches.FancyArrowPatch*.

**kwargs** Keyworded arguments to pass to *matplotlib.offsetbox.AnchoredOffsetbox*.

### Notes

If *prop* is passed as a keyword argument, but *fontproperties* is not, then *prop* is be assumed to be the intended *fontproperties*. Using both *prop* and *fontproperties* is not supported.

### Examples

```python
>>> import matplotlib.pyplot as plt
>>> import numpy as np
>>> from mpl_toolkits.axes_grid1.anchored_artists import (continues on next page)
```
AnchoredDirectionArrows)

>>> fig, ax = plt.subplots()

>>> ax.imshow(np.random.random((10, 10)))

>>> arrows = AnchoredDirectionArrows(ax.transAxes, '111', '110')

>>> ax.add_artist(arrows)

>>> fig.show()

Using several of the optional parameters, creating downward pointing arrow and high contrast text labels.

>>> import matplotlib.font_manager as fm

>>> fontprops = fm.FontProperties(family='monospace')

>>> arrows = AnchoredDirectionArrows(ax.transAxes, 'East', 'South',

... loc='lower left', color='k',

... aspect_ratio=-1, sep_x=0.02,

... sep_y=0.01,

... text_props={'ec':'w', 'fc':'k'},

... fontproperties=fontprops)

Attributes

arrow_x, arrow_y (matplotlib.patches.FancyArrowPatch) Arrow x and y

text_path_x, text_path_y (matplotlib.text.TextPath) Path for arrow labels

p_x, p_y (matplotlib.patches.PathPatch) Patch for arrow labels

box (matplotlib.offsetbox.AuxTransformBox) Container for the arrows and labels.

Examples using mpl_toolkits.axes_grid1.anchored_artists.AnchoredDirectionArrows

- sphx_glr_gallery_axes_grid1_demo_anchored_direction_arrows.py

mpl_toolkits.axes_grid1.anchored_artists.AnchoredDrawingArea

class mpl_toolkits.axes_grid1.anchored_artists.AnchoredDrawingArea(width, height, xdescent, ydescent, loc, pad=0.4, borderpad=0.5, prop=None, frameon=True, **kwargs)

Bases: matplotlib.offsetbox.ArcedOffsetBox

An anchored container with a fixed size and fillable DrawingArea.

Artists added to the drawing_area will have their coordinates interpreted as pixels. Any transformations set on the artists will be overridden.

Parameters
width, height [int or float] width and height of the container, in pixels.

xdescent, ydescent [int or float] descent of the container in the x- and y-direction, in pixels.

loc [int] Location of this artist. Valid location codes are:

```
{'upper right' : 1,
 'upper left' : 2,
 'lower left' : 3,
 'lower right' : 4,
 'right' : 5,
 'center left' : 6,
 'center right' : 7,
 'lower center' : 8,
 'upper center' : 9,
 'center' : 10
```

pad [int or float, optional] Padding around the child objects, in fraction of the font size. Defaults to 0.4.

borderpad [int or float, optional] Border padding, in fraction of the font size. Defaults to 0.5.

frameon [bool, optional] If True, draw a box around this artists. Defaults to True.

**kwargs Keyworded arguments to pass to matplotlib.offsetbox.AnchoredOffsetbox.

Examples

To display blue and red circles of different sizes in the upper right of an axes ax:

```python
>>> ada = AnchoredDrawingArea(20, 20, 0, 0,
...                     loc='upper right', frameon=False)
>>> ada.drawing_area.add_artist(Circle((10, 10), 10, fc="b"))
>>> ada.drawing_area.add_artist(Circle((30, 10), 5, fc="r"))
>>> ax.add_artist(ada)
```

Attributes

drawing_area [matplotlib.offsetbox.DrawingArea] A container for artists to display.

Examples using mpl_toolkits.axes_grid1.anchored_artists.AnchoredDrawingArea

- sphx_glr_gallery_axes_grid1_simple_anchored_artists.py
- sphx_glr_gallery_userdemo_anchored_box02.py
class mpl_toolkits.axes_grid1.anchored_artists.AnchoredEllipse(transform, width, height, angle, loc, pad=0.1, borderpad=0.1, prop=None, frameon=True, **kwargs)

Bases: matplotlib.offsetbox.AnchoredOffsetbox

Draw an anchored ellipse of a given size.

Parameters

- **transform** [matplotlib.transforms.Transform] The transformation object for the coordinate system in use, i.e., matplotlib.axes.Axes.transData.
- **width, height** [int or float] Width and height of the ellipse, given in coordinates of transform.
- **angle** [int or float] Rotation of the ellipse, in degrees, anti-clockwise.
- **loc** [int] Location of this size bar. Valid location codes are:

```
'upper right' : 1,
'upper left' : 2,
'lower left' : 3,
'lower right' : 4,
'right' : 5,
'center left' : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center' : 10
```

- **pad** [int or float, optional] Padding around the ellipse, in fraction of the font size. Defaults to 0.1.
- **borderpad** [int or float, optional] Border padding, in fraction of the font size. Defaults to 0.1.
- **frameon** [bool, optional] If True, draw a box around the ellipse. Defaults to True.
- **prop** [matplotlib.font_manager.FontProperties, optional] Font property used as a reference for paddings.

**kwargs Keyworded arguments to pass to matplotlib.offsetbox.AnchoredOffsetbox.

Attributes

- **ellipse** [matplotlib.patches.Ellipse] Ellipse patch drawn.

Examples using mpl_toolkits.axes_grid1.anchored_artists.AnchoredEllipse

- sphx_glr_gallery_axes_grid1_simple_anchored_artists.py
mpl_toolkits.axes_grid1.anchored_artists.AnchoredSizeBar

class mpl_toolkits.axes_grid1.anchored_artists.AnchoredSizeBar(transform, size, label, loc, pad=0.1, borderpad=0.1, sep=2, frameon=True, size_vertical=0, color='black', label_top=False, **kwargs)

Bases: matplotlib.offsetbox.AnchoredOffsetbox

Draw a horizontal scale bar with a center-aligned label underneath.

Parameters

size [int or float] Horizontal length of the size bar, given in coordinates of transform.

label [str] Label to display.

loc [int] Location of this size bar. Valid location codes are:

<table>
<thead>
<tr>
<th>Location Code</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>'upper right'</td>
<td>1,</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2,</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3,</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4,</td>
</tr>
<tr>
<td>'right'</td>
<td>5,</td>
</tr>
<tr>
<td>'center left'</td>
<td>6,</td>
</tr>
<tr>
<td>'center right'</td>
<td>7,</td>
</tr>
<tr>
<td>'lower center'</td>
<td>8,</td>
</tr>
<tr>
<td>'upper center'</td>
<td>9,</td>
</tr>
<tr>
<td>'center'</td>
<td>10</td>
</tr>
</tbody>
</table>

pad [int or float, optional] Padding around the label and size bar, in fraction of the font size. Defaults to 0.1.

borderpad [int or float, optional] Border padding, in fraction of the font size. Defaults to 0.1.

sep [int or float, optional] Separation between the label and the size bar, in points. Defaults to 2.

frameon [bool, optional] If True, draw a box around the horizontal bar and label. Defaults to True.

size_vertical [int or float, optional] Vertical length of the size bar, given in coordinates of transform. Defaults to 0.

color [str, optional] Color for the size bar and label. Defaults to black.

label_top [bool, optional] If True, the label will be over the size bar. Defaults to False.

fill_bar [bool, optional] If True and if size_vertical is nonzero, the size bar will be filled in with the color specified by the size bar. Defaults to True if size_vertical is greater than zero and False otherwise.

**kwargs Keyworded arguments to pass to matplotlib.offsetbox.AnchoredOffsetbox.

Notes

If prop is passed as a keyworded argument, but fontproperties is not, then prop is be assumed to be the intended fontproperties. Using both prop and fontproperties is not supported.

Examples

```python
>>> import matplotlib.pyplot as plt
>>> import numpy as np
>>> from mpl_toolkits.axes_grid1.anchored_artists import (...
... AnchoredSizeBar)
>>> fig, ax = plt.subplots()
>>> ax.imshow(np.random.random((10,10)))
>>> bar = AnchoredSizeBar(ax.transData, 3, '3 data units', 4)
>>> ax.add_artist(bar)
>>> fig.show()
```

Using all the optional parameters

```python
>>> import matplotlib.font_manager as fm
>>> fontprops = fm.FontProperties(size=14, family='monospace')
>>> bar = AnchoredSizeBar(ax.transData, 3, '3 units', 4, pad=0.5,
... sep=5, borderpad=0.5, frameon=False,
... size_vertical=0.5, color='white',
... fontproperties=fontprops)
```

Attributes

size_bar [matplotlib.offsetbox.AuxTransformBox] Container for the size bar.

txt_label [matplotlib.offsetbox.TextArea] Container for the label of the size bar.

Examples using mpl_toolkits.axes_grid1.anchored_artists.AnchoredSizeBar

- sphx_glr_gallery_axes_grid1_inset_locator_demo2.py
- sphx_glr_gallery_axes_grid1_simple_anchored_artists.py
The axes divider module provides helper classes to adjust the positions of multiple axes at drawing time.

**Divider:** this is the class that is used to calculate the axes position. It divides the given rectangular area into several sub rectangles. You initialize the divider by setting the horizontal and vertical lists of sizes that the division will be based on. You then use the new_locator method, whose return value is a callable object that can be used to set the axes_locator of the axes.

### Classes

### mpl_toolkits.axes_grid1.axes_divider.Axes

```python
class mpl_toolkits.axes_grid1.axes_divider.Axes(**kwargs)
    Bases: mpl_toolkits.axes_grid1.mpl_axes.Axes

[Deprecated]
```

### Notes

Deprecated since version 3.0:

### mpl_toolkits.axes_grid1.axes_divider.AxesDivider

```python
class mpl_toolkits.axes_grid1.axes_divider.AxesDivider(axes, xref=None, yref=None)
    Bases: mpl_toolkits.axes_grid1.axes_divider.Divider

Divider based on the pre-existing axes.
```

#### Parameters

- **axes** (*Axes*)
- **xref**
- **yref**
append_axes(self, position, size, pad=None, add_to_figure=True, **kwargs)
Create an axes at the given position with the same height (or width) of the main axes.

position ["left"|"right"|"bottom"|"top"]
size and pad should be axes_grid.axes_size compatible.

get_anchor(self)
return the anchor

get_aspect(self)
return aspect

get_position(self)
return the position of the rectangle.

get_subplotspec(self)

new_horizontal(self, size, pad=None, pack_start=False, **kwargs)
Add a new axes on the right (or left) side of the main axes.

Parameters

size [axes_size or float or string] A width of the axes. If float or string is given, from_any function is used to create the size, with ref_size set to AxesX instance of the current axes.

pad [axes_size or float or string] Pad between the axes. It takes same argument as size.

pack_start [bool] If False, the new axes is appended at the end of the list, i.e., it became the right-most axes. If True, it is inserted at the start of the list, and becomes the left-most axes.

kwargs All extra keywords arguments are passed to the created axes.
If axes_class is given, the new axes will be created as an instance of the given class. Otherwise, the same class of the main axes will be used.

new_vertical(self, size, pad=None, pack_start=False, **kwargs)
Add a new axes on the top (or bottom) side of the main axes.

Parameters

size [axes_size or float or string] A height of the axes. If float or string is given, from_any function is used to create the size, with ref_size set to AxesX instance of the current axes.

pad [axes_size or float or string] Pad between the axes. It takes same argument as size.

pack_start [bool] If False, the new axes is appended at the end of the list, i.e., it became the right-most axes. If True, it is inserted at the start of the list, and becomes the left-most axes.

kwargs All extra keywords arguments are passed to the created axes.
If axes_class is given, the new axes will be created as an instance of the given class. Otherwise, the same class of the main axes will be used.

`Tight Layout guide`

`mpl_toolkits.axes_grid1.axes_divider.AxesLocator`

```python
class mpl_toolkits.axes_grid1.axes_divider.AxesLocator(axes_divider, nx, ny, nx1=None, ny1=None)
Bases: object
A simple callable object, initialized with AxesDivider class, returns the position and size of the given cell.

Parameters
- `axes_divider` [AxesDivider]
- `nx, nx1` [int] Integers specifying the column-position of the cell. When `nx1` is None, a single `nx`-th column is specified. Otherwise location of columns spanning between `nx` to `nx1` (but excluding `nx1`-th column) is specified.
- `ny, ny1` [int] Same as `nx` and `nx1`, but for row positions.

`get_subplotspec(self)`
```

`mpl_toolkits.axes_grid1.axes_divider.Divider`

```python
class mpl_toolkits.axes_grid1.axes_divider.Divider(fig, pos, horizontal, vertical, aspect=None, anchor='C')
Bases: object
This class calculates the axes position. It divides the given rectangular area into several sub-rectangles. You initialize the divider by setting the horizontal and vertical lists of sizes (mpl_toolkits.axes_grid.axes_size) that the division will be based on. You then use the new_locator method to create a callable object that can be used as the axes_locator of the axes.

Parameters
- `fig` [Figure]
- `pos` [tuple of 4 floats] position of the rectangle that will be divided
- `horizontal` [list of axes_size] sizes for horizontal division
- `vertical` [list of axes_size] sizes for vertical division
- `aspect` [bool] if True, the overall rectangular area is reduced so that the relative part of the horizontal and vertical scales have the same scale.
- `anchor` [{'C', 'SW', 'S', 'SE', 'E', 'NE', 'N', 'NW', 'W'}] placement of the reduced rectangle when `aspect` is True

18.1. Toolkits 2079
add_auto_adjustable_area(self, use_axes, pad=0.1, adjust_dirs=None)
append_size(self, position, size)
get_anchor(self)
    return the anchor
get_aspect(self)
    return aspect
get_horizontal(self)
    return horizontal sizes
get_horizontal_sizes(self, renderer)
get_locator(self)
get_position(self)
    return the position of the rectangle.
get_position_runtime(self, ax, renderer)
get_vertical(self)
    return vertical sizes
get_vertical_sizes(self, renderer)
get_vsize_hsize(self)
locate(self, nx, ny, nx1=None, ny1=None, axes=None, renderer=None)

Parameters

nx, nx1 [int] Integers specifying the column-position of the cell. When
        nx1 is None, a single nx-th column is specified. Otherwise location
        of columns spanning between nx to nx1 (but excluding nx1-th col-
       umn) is specified.

ny, ny1 [int] Same as nx and nx1, but for row positions.

axes

renderer

new_locator(self, nx, ny, nx1=None, ny1=None)
    Returns a new locator (mpl_toolkits.axes_grid.axes_divider.AxesLocator) for speci-
    fied cell.

Parameters

nx, nx1 [int] Integers specifying the column-position of the cell. When
        nx1 is None, a single nx-th column is specified. Otherwise location
        of columns spanning between nx to nx1 (but excluding nx1-th col-
        umn) is specified.

ny, ny1 [int] Same as nx and nx1, but for row positions.

set_anchor(self, anchor)

Parameters

    anchor position
<table>

```python
set_aspect(self, aspect=False)

Parameters
aspect [bool]
```

```python
set_horizontal(self, h)

Parameters
h [list of axes_size] sizes for horizontal division
```

```python
set_locator(self, _locator)
```

```python
set_position(self, pos)

Parameters
pos [tuple of 4 floats] position of the rectangle that will be divided
```

```python
set_vertical(self, v)

Parameters
v [list of axes_size] sizes for vertical division
```

```python
mpl_toolkits.axes_grid1.axes_divider.HBoxDivider

class mpl_toolkits.axes_grid1.axes_divider.HBoxDivider(fig, *args, **kwargs)
Bases: mpl_toolkits.axes_grid1.axes_divider.SubplotDivider

locate(self, nx, ny, nx1=None, ny1=None, axes=None, renderer=None)

Parameters
axes_divider [AxesDivider]

nx, nx1 [int] Integers specifying the column-position of the cell. When
nx1 is None, a single nx-th column is specified. Otherwise location
of columns spanning between nx to nx1 (but excluding nx1-th col-
umn) is specified.

ny, ny1 [int] Same as nx and nx1, but for row positions.
```

```python
axes
renderer
```
new_locator(self, nx, nx1=None)
Create a new AxesLocator for the specified cell.

Parameters

nx, nx1 [int] Integers specifying the column-position of the cell. When
nx1 is None, a single nx-th column is specified. Otherwise location
of columns spanning between nx to nx1 (but excluding nx1-th col-
umn) is specified.

ny, ny1 [int] Same as nx and nx1, but for row positions.

• sphx_glr_gallery_axes_grid1_demo_axes_hbox_divider.py

mpl_toolkits.axes_grid1.axes_divider.LocatableAxes

class mpl_toolkits.axes_grid1.axes_divider.LocatableAxes(**kwargs)
Bases: mpl_toolkits.axes_grid1.mpl_axes.Axes

[Deprecated]

Notes

Deprecated since version 3.0:

mpl_toolkits.axes_grid1.axes_divider.LocatableAxesBase

class mpl_toolkits.axes_grid1.axes_divider.LocatableAxesBase(**kwargs)
Bases: object

[Deprecated]

Notes

Deprecated since version 3.0:

mpl_toolkits.axes_grid1.axes_divider.SubplotDivider

class mpl_toolkits.axes_grid1.axes_divider.SubplotDivider(fig, *args, horizontal=None, vertical=None, aspect=None, anchor='C')
Bases: mpl_toolkits.axes_grid1.axes_divider.Divider

The Divider class whose rectangle area is specified as a subplot geometry.

Parameters

fig [matplotlib.figure.Figure]
*args [tuple (numRows, numCols, plotNum)] The array of subplots in the figure has dimensions numRows, numCols, and plotNum is the number of the subplot being created. plotNum starts at 1 in the upper left corner and increases to the right.

If numRows <= numCols <= plotNum < 10, args can be the decimal integer numRows * 100 + numCols * 10 + plotNum.

change_geometry(self, numrows, numcols, num)
change subplot geometry, e.g., from 1,1,1 to 2,2,3

get_geometry(self)
get the subplot geometry, e.g., 2,2,3

get_position(self)
return the bounds of the subplot box

get_subplotspec(self)
get the SubplotSpec instance

set_subplotspec(self, subplotspec)
set the SubplotSpec instance

update_params(self)
update the subplot position from fig.subplotpars

mpl_toolkits.axes_grid1.axes_divider.VBoxDivider

class mpl_toolkits.axes_grid1.axes_divider.VBoxDivider(fig, *args, **kwargs)

   Bases: mpl_toolkits.axes_grid1.axes_divider.HBoxDivider

   The Divider class whose rectangle area is specified as a subplot geometry.

   locate(self, nx, ny, nx1=None, ny1=None, axes=None, renderer=None)

      Parameters

      axes_divider [AxesDivider]

      nx, nx1 [int] Integers specifying the column-position of the cell. When nx1 is None, a single nx-th column is specified. Otherwise location of columns spanning between nx to nx1 (but excluding nx1-th column) is specified.

      ny, ny1 [int] Same as nx and nx1, but for row positions.

      axes

      renderer

   new_locator(self, ny, ny1=None)

Create a new AxesLocator for the specified cell.

   Parameters

   ny, ny1 [int] Integers specifying the row-position of the cell. When ny1 is None, a single ny-th row is specified. Otherwise location of rows spanning between ny to ny1 (but excluding ny1-th row) is specified.
Matplotlib, Release 3.1.3

ImageGrid(fig, rect, nrows_ncols[, ngrids, ...])
  A class that creates a grid of Axes.
```

2084 Chapter 18. Toolkits
mpl_toolkits.axes_grid1.axes_grid.AxesGrid

mpl_toolkits.axes_grid1.axes_grid.AxesGrid
    alias of mpl_toolkits.axes_grid1.axes_grid.ImageGrid

mpl_toolkits.axes_grid1.axes_grid.CbarAxes

class mpl_toolkits.axes_grid1.axes_grid.CbarAxes(*args, orientation, **kwargs)

cla(self)
    Clear the current axes.

mpl_toolkits.axes_grid1.axes_grid.CbarAxesBase

class mpl_toolkits.axes_grid1.axes_grid.CbarAxesBase

Bases: object

colorbar(self, mappable, *, locator=None, **kwargs)
toggle_label(self, b)

mpl_toolkits.axes_grid1.axes_grid.Grid

class mpl_toolkits.axes_grid1.axes_grid.Grid(fig, rect, nrows_ncols, ngrids=None, direction='row', axes_pad=0.02, add_all=True, share_all=False, share_x=True, share_y=True, label_mode='L', axes_class=None)

Bases: object

A class that creates a grid of Axes. In matplotlib, the axes location (and size) is specified in the normalized figure coordinates. This may not be ideal for images that needs to be displayed with a given aspect ratio. For example, displaying images of a same size with some fixed padding between them cannot be easily done in matplotlib. AxesGrid is used in such case.

Parameters

fig [Figure] The parent figure.
rect [(float, float, float, float) or int] The axes position, as a (left, bottom, width, height) tuple or as a three-digit subplot position code (e.g., “121”).
direction [{"row", "column"}, default: “row”]
axes_pad [float or (float, float), default: 0.02] Padding or (horizontal padding, vertical padding) between axes, in inches.
add_all [bool, default: True]
share_all [bool, default: False]
share_x [bool, default: True]
share_y [bool, default: True]
label_mode [{"L", "1", "all"}, default: "L"] Determines which axes will get tick labels:
  • "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
  • "1": Only the bottom left axes is labelled.
  • "all": all axes are labelled.
axes_class [a type that is a subclass of matplotlib.axes.Axes, default: None]

get_aspect(self)
    Return the aspect of the SubplotDivider.

get_axes_locator(self)

get_axes_pad(self)
    Return the axes padding.

Returns
    hpad, vpad Padding (horizontal pad, vertical pad) in inches.

get_divider(self)

get_geometry(self)
    Return the number of rows and columns of the grid as (nrows, ncols).

get_vsize_hsize(self)

set_aspect(self, aspect)
    Set the aspect of the SubplotDivider.

set_axes_locator(self, locator)

set_axes_pad(self, axes_pad)
    Set the padding between the axes.

Parameters
    axes_pad [(float, float)] The padding (horizontal pad, vertical pad) in inches.

set_label_mode(self, mode)
    Define which axes have tick labels.

Parameters
    mode [{"L", "1", "all"}] The label mode:
      • "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
      • "1": Only the bottom left axes is labelled.
      • "all": all axes are labelled.
mpl_toolkits.axes_grid1.axes_grid1.ImageGrid

class mpl_toolkits.axes_grid1.axes_grid1.ImageGrid(fig, rect, nrows_ncols,
ngrids=None, direction='row',
axes_pad=0.02, add_all=True,
share_all=False, aspect=True, label_mode='L',
cbar_mode=None, cbar_location='right',
cbar_pad=None, cbar_size='5%',
cbar_set_cax=True,
axes_class=None)

Bases: mpl_toolkits.axes_grid1.axes_grid.Grid

A class that creates a grid of Axes. In matplotlib, the axes location (and size) is specified in the normalized figure coordinates. This may not be ideal for images that needs to be displayed with a given aspect ratio. For example, displaying images of a same size with some fixed padding between them cannot be easily done in matplotlib. ImageGrid is used in such case.

Parameters

fig [Figure] The parent figure.
rect [(float, float, float, float) or int] The axes position, as a (left, bottom, width, height) tuple or as a three-digit subplot position code (e.g., "121").
direction [{"row", "column"}, default: "row"]
axes_pad [float or (float, float), default: 0.02] Padding or (horizontal padding, vertical padding) between axes, in inches.
add_all [bool, default: True]
share_all [bool, default: False]
aspect [bool, default: True]
label_mode [{"L", "1", "all"}, default: "L"]] Determines which axes will get tick labels:

- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": all axes are labelled.
cbar_mode [{"each", "single", "edge", None }, default: None]
cbar_location [{"left", "right", "bottom", "top"}, default: "right"]
cbar_pad [float, default: None]
cbar_size [size specification (see Size.from_any), default: "5%"]
cbar_set_cax [bool, default: True] If True, each axes in the grid has a cax attribute that is bound to associated cbar_axes.
axes_class [a type that is a subclass of matplotlib.axes.Axes, default: None]
Classes

**RGBAxes**(*args[, pad, add_all])

Parameters

**RGBAxesBase**(*args[, pad, add_all])

    base class for a 4-panel imshow (RGB, R, G, B)

mpl_toolkits.axes_grid1.axes_rgb.RGBAxes

class mpl_toolkits.axes_grid1.axes_rgb.RGBAxes(*args, pad=0, add_all=True, **kwargs)

    Bases: mpl_toolkits.axes_grid1.axes_rgb.RGBAxesBase

Parameters

    pad [float] fraction of the axes height to put as padding. defaults to 0.0
    add_all [bool] True: Add the {rgb, r, g, b} axes to the figure defaults to
    True.
    axes_class [matplotlib.axes.Axes]
    *args Unpacked into axes_class() init for RGB
    **kwargs Unpacked into axes_class() init for RGB, R, G, B axes

Examples using mpl_toolkits.axes_grid1.axes_rgb.RGBAxes

    • sphx_glr_gallery_pyplots_whats_new_99_axes_grid.py
    • sphx_glr_gallery_axes_grid1_demo_axes_rgb.py
    • sphx_glr_gallery_axes_grid1_simple_rgb.py

mpl_toolkits.axes_grid1.axes_rgb.RGBAxesBase

class mpl_toolkits.axes_grid1.axes_rgb.RGBAxesBase(*args, pad=0, add_all=True, **kwargs)

    Bases: object

    base class for a 4-panel imshow (RGB, R, G, B)

    Layout: +-------+-----+ | | R | + +----- | RGB | G | + +----- | | B | +-------+

    Attributes

    _defaultAxesClass [matplotlib.axes.Axes] defaults to ‘Axes’ in RGBAxes
    child class. No default in abstract base class

    RGB [defaultAxesClass] The axes object for the three-channel imshow
    R [defaultAxesClass] The axes object for the red channel imshow
    G [defaultAxesClass] The axes object for the green channel imshow
    B [defaultAxesClass] The axes object for the blue channel imshow
Parameters

- **pad** [float] fraction of the axes height to put as padding. defaults to 0.0
- **add_all** [bool] True: Add the {rgb, r, g, b} axes to the figure defaults to True.
- **axes_class** [matplotlib.axes.Axes]
- **args** Unpacked into axes_class() init for RGB
- **kwargs** Unpacked into axes_class() init for RGB, R, G, B axes

```python
add_RGB_to_figure(self)
Add the red, green and blue axes to the RGB composite's axes figure

```imshow_rgb(self, r, g, b, **kwargs)
Create the four images {rgb, r, g, b}

Parameters

- **r** [array-like] The red array
- **g** [array-like] The green array
- **b** [array-like] The blue array
- **kwargs** [imshow kwargs] kwargs get unpacked into the imshow calls for the four images

Returns

- **rgb** [matplotlib.image.AxesImage]
- **r** [matplotlib.image.AxesImage]
- **g** [matplotlib.image.AxesImage]
- **b** [matplotlib.image.AxesImage]

Functions

```
# imshow_rgb(ax, r, g, b, **kwargs)

# make_rgb_axes(ax, pad=0.01, axes_class=None, add_all=True)
```

18.1. Toolkits
Examples using `mpl_toolkits.axes_grid1.axes_rgb.make_rgb_axes`

- sphx_glr_gallery_axes_grid1_demo_axes_rgb.py

`mpl_toolkits.axes_grid1.axes_size`

Provides classes of simple units that will be used with AxesDivider class (or others) to determine the size of each axes. The unit classes define `get_size` method that returns a tuple of two floats, meaning relative and absolute sizes, respectively.

Note that this class is nothing more than a simple tuple of two floats. Take a look at the Divider class to see how these two values are used.

Classes

- `Add(a, b)`
- `AddList(add_list)`
- `AxesX(axes[, aspect, ref_ax])` Scaled size whose relative part corresponds to the data width of the `axes` multiplied by the `aspect`.
- `AxesY(axes[, aspect, ref_ax])` Scaled size whose relative part corresponds to the data height of the `axes` multiplied by the `aspect`.
- `Fixed(fixed_size)` Simple fixed size with absolute part = `fixed_size` and relative part = 0.
- `Fraction(fraction, ref_size)` An instance whose size is a fraction of the `ref_size`.
- `GetExtentHelper(ax, direction)`
- `MaxExtent(artist_list, w_or_h)` Size whose absolute part is the largest width (or height) of the given `artist_list`.
- `MaxHeight(artist_list)` Size whose absolute part is the largest height of the given `artist_list`.
- `MaxWidth(artist_list)` Size whose absolute part is the largest width of the given `artist_list`.
- `Padded(size, pad)` Return a instance where the absolute part of size is increase by the amount of `pad`.
- `Scalable` alias of `mpl_toolkits.axes_grid1.axes_size.Scaled`
- `Scaled(scalable_size)` Simple scaled(?) size with absolute part = 0 and relative part = `scalable_size`.
- `SizeFromFunc(func)`

`mpl_toolkits.axes_grid1.axes_size.Add`

class `mpl_toolkits.axes_grid1.axes_size.Add(a, b)`

```
Bases: mpl_toolkits.axes_grid1.axes_size._Base

get_size(self, renderer)
```
mpl_toolkits.axes_grid1.axes_size.AddList

class mpl_toolkits.axes_grid1.axes_size.AddList(add_list)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base
    get_size(self, renderer)

mpl_toolkits.axes_grid1.axes_size.AxesX

class mpl_toolkits.axes_grid1.axes_size.AxesX(axes, aspect=1.0, ref_ax=None)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base
    Scaled size whose relative part corresponds to the data width of the axes multiplied by the aspect.
    get_size(self, renderer)

Examples using mpl_toolkits.axes_grid1.axes_size.AxesX

- sphx_glr_gallery_axes_grid1_demo_axes_hbox_divider.py
- sphx_glr_gallery_axes_grid1_simple_axes_divider3.py

mpl_toolkits.axes_grid1.axes_size.AxesY

class mpl_toolkits.axes_grid1.axes_size.AxesY(axes, aspect=1.0, ref_ax=None)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base
    Scaled size whose relative part corresponds to the data height of the axes multiplied by the aspect.
    get_size(self, renderer)

Examples using mpl_toolkits.axes_grid1.axes_size.AxesY

- sphx_glr_gallery_axes_grid1_demo_axes_hbox_divider.py
- sphx_glr_gallery_axes_grid1_simple_axes_divider3.py

mpl_toolkits.axes_grid1.axes_size.Fixed

class mpl_toolkits.axes_grid1.axes_size.Fixed(fixed_size)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base
    Simple fixed size with absolute part = fixed_size and relative part = 0.
    get_size(self, renderer)
Examples using `mpl_toolkits.axes_grid1.axes_size.Fixed`

- sphx_glr_gallery_axes_grid1_demo_axes_hbox_divider.py
- sphx_glr_gallery_axes_grid1_simple_axes_divider2.py
- sphx_glr_gallery_axes_grid1_simple_axes_divider3.py

`mpl_toolkits.axes_grid1.axes_size.Fraction`

class `mpl_toolkits.axes_grid1.axes_size.Fraction(fraction, ref_size)`

Bases: `mpl_toolkits.axes_grid1.axes_size._Base`

An instance whose size is a fraction of the `ref_size`.

```python
>>> s = Fraction(0.3, AxesX(ax))
```

`get_size(self, renderer)`

`mpl_toolkits.axes_grid1.axes_size.GetExtentHelper`

class `mpl_toolkits.axes_grid1.axes_size.GetExtentHelper(ax, direction)`

Bases: `object`

`mpl_toolkits.axes_grid1.axes_size.MaxExtent`

class `mpl_toolkits.axes_grid1.axes_size.MaxExtent(artist_list, w_or_h)`

Bases: `mpl_toolkits.axes_grid1.axes_size._Base`

Size whose absolute part is the largest width (or height) of the given `artist_list`.

```python
add_artist(self, a)
get_size(self, renderer)
```

`mpl_toolkits.axes_grid1.axes_size.MaxHeight`

class `mpl_toolkits.axes_grid1.axes_size.MaxHeight(artist_list)`

Bases: `mpl_toolkits.axes_grid1.axes_size._Base`

Size whose absolute part is the largest height of the given `artist_list`.

```python
add_artist(self, a)
get_size(self, renderer)
```

`mpl_toolkits.axes_grid1.axes_size.MaxWidth`

class `mpl_toolkits.axes_grid1.axes_size.MaxWidth(artist_list)`

Bases: `mpl_toolkits.axes_grid1.axes_size._Base`

Size whose absolute part is the largest width of the given `artist_list`. 
add_artist(self, a)
get_size(self, renderer)

mpl_toolkits.axes_grid1.axes_size.Padded

class mpl_toolkits.axes_grid1.axes_size.Padded(size, pad)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base
    Return a instance where the absolute part of size is increase by the amount of pad.
    get_size(self, renderer)

mpl_toolkits.axes_grid1.axes_size.Scalable

class mpl_toolkits.axes_grid1.axes_size.Scalable
    alias of mpl_toolkits.axes_grid1.axes_size.Scaled

mpl_toolkits.axes_grid1.axes_size.Scaled

class mpl_toolkits.axes_grid1.axes_size.Scaled(scalable_size)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base
    Simple scaled(?) size with absolute part = 0 and relative part = scalable_size.
    get_size(self, renderer)

Examples using mpl_toolkits.axes_grid1.axes_size.Scaled

• sphx_glr_gallery_axes_grid1_demo_axes_hbox_divider.py
• sphx_glr_gallery_axes_grid1_simple_axes_divider2.py

mpl_toolkits.axes_grid1.axes_size.SizeFromFunc

class mpl_toolkits.axes_grid1.axes_size.SizeFromFunc(func)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base
    get_size(self, renderer)

Functions

from_any(size[, fraction_ref]) Creates Fixed unit when the first argument
     is a float, or a Fraction unit if that is a string
     that ends with %.
mpl_toolkits.axes_grid1.axes_size.from_any

```python
def from_any(size, fraction_ref=None):
    # Creates Fixed unit when the first argument is a float, or a Fraction unit if that is a string that ends with %.
    # The second argument is only meaningful when Fraction unit is created.

    a = Size.from_any(1.2)  # => Size.Fixed(1.2)
    Size.from_any("50\%", a)  # => Size.Fraction(0.5, a)
```

mpl_toolkits.axes_grid1.colorbar

Colorbar toolkit with two classes and a function:

- ColorbarBase: the base class with full colorbar drawing functionality. It can be used as-is to make a colorbar for a given colormap; a mappable object (e.g., image) is not needed.
- Colorbar: the derived class for use with images or contour plots.
- make_axes(): a function for resizing an axes and adding a second axes suitable for a colorbar

The colorbar() method uses make_axes() and Colorbar; the colorbar() function is a thin wrapper over colorbar().

class mpl_toolkits.axes_grid1.colorbar.CbarAxesLocator(locator=None, extend='neither', orientation='vertical')

CbarAxesLocator is a axes_locator for colorbar axes. It adjusts the position of the axes to make a room for extended ends, i.e., the extended ends are located outside the axes area.

- locator: [the bbox returned from the locator is used as a] initial axes location. If None, axes.bbox is used.
- extend: same as in ColorbarBase
- orientation: same as in ColorbarBase

get_end_vertices(self)
return a tuple of two vertices for the colorbar extended ends. The first vertices is for the minimum end, and the second is for the maximum end.

get_original_position(self, axes, renderer)
get the original position of the axes.

get_path_ends(self)
get the paths for extended ends

get_path_patch(self)
get the path for axes patch

class mpl_toolkits.axes_grid1.colorbar.Colorbar(ax, mappable, **kw)

add_lines(self, CS)
Add the lines from a non-filled ContourSet to the colorbar.

update_bruteforce(self, mappable)
Update the colorbar artists to reflect the change of the associated mappable.
class mpl_toolkits.axes_grid1.colorbar.ColorbarBase(ax, cmap=None, norm=None, alpha=1.0, values=None, boundaries=None, orientation='vertical', extend='neither', spacing='uniform', ticks=None, format=None, drawedges=False, filled=True)

Draw a colorbar in an existing axes.

This is a base class for the Colorbar class, which is the basis for the colorbar() method and pyplot function.

It is also useful by itself for showing a colormap. If the cmap kwarg is given but boundaries and values are left as None, then the colormap will be displayed on a 0-1 scale. To show the under- and over-value colors, specify the norm as:

```plaintext
colors.Normalize(clip=False)
```

To show the colors versus index instead of on the 0-1 scale, use:

```plaintext
norm=colors.NoNorm.
```

Useful attributes:
- `ax` the Axes instance in which the colorbar is drawn
- `lines` a LineCollection if lines were drawn, otherwise None
- `dividers` a LineCollection if drawedges is True, otherwise None

Useful public methods are `set_label()` and `add_lines()`.

```plaintext
add_lines(self, levels, colors, lineweights)
```

Draw lines on the colorbar. It deletes preexisting lines.

```plaintext
set_alpha(self, alpha)
```

set alpha value.

```plaintext
set_label_text(self, label, **kw)
```

Label the long axis of the colorbar

```plaintext
update_artists(self)
```

Update the colorbar associated artists, filled and ends. Note that lines are not updated. This needs to be called whenever clim of associated image changes.

mpl_toolkits.axes_grid1.colorbar.colorbar(mappable, cax=None, ax=None, **kw)

Create a colorbar for a ScalarMappable instance.

Documentation for the pyplot thin wrapper:

Add a colorbar to a plot.

Function signatures for the pyplot interface; all but the first are also method signatures for the colorbar() method:

```plaintext
colorbar(**kwargs)
colorbar(mappable, **kwargs)
colorbar(mappable, cax=cax, **kwargs)
colorbar(mappable, ax=ax, **kwargs)
```

arguments:
**mappable** the Image, ContourSet, etc. to which the colorbar applies; this argument is mandatory for the colorbar() method but optional for the colorbar() function, which sets the default to the current image.

keyword arguments:

**cax** None | axes object into which the colorbar will be drawn

**ax** None | parent axes object from which space for a new colorbar axes will be stolen

Additional keyword arguments are of two kinds:

axes properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>orientation</td>
<td>vertical or horizontal</td>
</tr>
<tr>
<td>fraction</td>
<td>0.15; fraction of original axes to use for colorbar</td>
</tr>
<tr>
<td>pad</td>
<td>0.05 if vertical, 0.15 if horizontal; fraction of original axes between colorbar and new image axes</td>
</tr>
<tr>
<td>shrink</td>
<td>1.0; fraction by which to shrink the colorbar</td>
</tr>
<tr>
<td>aspect</td>
<td>20; ratio of long to short dimensions</td>
</tr>
</tbody>
</table>

colorbar properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extend</td>
<td>[ ‘neither’</td>
</tr>
<tr>
<td>spacing</td>
<td>[ ‘uniform’</td>
</tr>
<tr>
<td>ticks</td>
<td>[ None</td>
</tr>
<tr>
<td>format</td>
<td>[ None</td>
</tr>
<tr>
<td>drawedges</td>
<td>Whether to draw lines at color boundaries.</td>
</tr>
</tbody>
</table>

The following will probably be useful only in the context of indexed colors (that is, when the mappable has norm=NoNorm()), or other unusual circumstances.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boundaries</td>
<td>None or a sequence</td>
</tr>
<tr>
<td>values</td>
<td>None or a sequence which must be of length 1 less than the sequence of boundaries. For each region delimited by adjacent entries in boundaries, the color mapped to the corresponding value in values will be used.</td>
</tr>
</tbody>
</table>

If `mappable` is a `ContourSet`, its `extend` kwarg is included automatically.

Note that the `shrink` kwarg provides a simple way to keep a vertical colorbar, for example, from being taller than the axes of the mappable to which the colorbar is attached; but it is a manual method requiring some trial and error. If the colorbar is too tall (or a horizontal colorbar is too wide) use a smaller value of `shrink`.

For more precise control, you can manually specify the positions of the axes objects in which the mappable and the colorbar are drawn. In this case, do not use any of the axes properties kwargs.

It is known that some vector graphics viewer (svg and pdf) renders white gaps between segments of the colorbar. This is due to bugs in the viewers not matplotlib. As a workaround the colorbar can be rendered with overlapping segments:

```python
cbar = colorbar()
cbar.solids.set_edgecolor("face")
draw()
```

However this has negative consequences in other circumstances. Particularly with semi transparent images (alpha < 1) and colorbar extensions and is not enabled by default see (issue #1188).

**returns:** `Colorbar` instance; see also its base class, `ColorbarBase`. Call the `set_label()` method to label the colorbar.

The transData of the `cax` is adjusted so that the limits in the longest axis actually corresponds to the limits in colorbar range. On the other hand, the shortest axis has a data limits of [1,2], whose unconventional value is to prevent underflow when log scale is used.

```python
mpl_toolkits.axes_grid1.colorbar.make_axes(parent, *, fraction=0.15, shrink=1.0, aspect=20, **kw)
```

Resize and reposition a parent axes, and return a child axes suitable for a colorbar

```python
cax, kw = make_axes(parent, **kw)
```

Keyword arguments may include the following (with defaults):

- **orientation** ‘vertical’ or ‘horizontal’
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>orientation</td>
<td>vertical or horizontal</td>
</tr>
<tr>
<td>fraction</td>
<td>0.15; fraction of original axes to use for colorbar</td>
</tr>
<tr>
<td>pad</td>
<td>0.05 if vertical, 0.15 if horizontal; fraction of original axes between colorbar and new image axes</td>
</tr>
<tr>
<td>shrink</td>
<td>1.0; fraction by which to shrink the colorbar</td>
</tr>
<tr>
<td>aspect</td>
<td>20; ratio of long to short dimensions</td>
</tr>
</tbody>
</table>

All but the first of these are stripped from the input kw set.

Returns (cax, kw), the child axes and the reduced kw dictionary.

**mpl_toolkits.axes_grid1.inset_locator**

A collection of functions and objects for creating or placing inset axes.

**Classes**

```python
AnchoredLocatorBase(bbox_to_anchor, ...[, ..., ])
AnchoredSizeLocator(bbox_to_anchor, x_size, ...)
AnchoredZoomLocator(parent_axes, zoom, loc)
BboxConnector(bbox1, bbox2, loc1[, loc2]) Connect two bboxes with a straight line.
BboxConnectorPatch(bbox1, bbox2, loc1a, ...) Connect two bboxes with a quadrilateral.
BboxPatch(bbox, **kwargs) Patch showing the shape bounded by a Bbox.
InsetPosition(parent, lbwh) An object for positioning an inset axes.
```

**mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase**

```python
class mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase(bbox_to_anchor, offsetbox, loc, borderpad=0.5, bbox_transform=None)
```

Bases: `matplotlib.offsetbox.AnchoredOffsetbox`

```python
draw(self, renderer)
draw the artist
```

**mpl_toolkits.axes_grid1.inset_locator.AnchoredSizeLocator**

```python
class mpl_toolkits.axes_grid1.inset_locator.AnchoredSizeLocator(bbox_to_anchor, x_size, y_size, loc, borderpad=0.5, bbox_transform=None)
```

Bases: `mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase`
get_extent(self, renderer)
    return the extent of the artist. The extent of the child added with the pad is returned

mpl_toolkits.axes_grid1.inset_locator.AnchoredZoomLocator

class mpl_toolkits.axes_grid1.inset_locator.AnchoredZoomLocator(parent_axes, zoom, loc, borderpad=0.5, bbox_to_anchor=None, bbox_transform=None)
    Bases: mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase
    get_extent(self, renderer)
    return the extent of the artist. The extent of the child added with the pad is returned

mpl_toolkits.axes_grid1.inset_locator.BboxConnector

class mpl_toolkits.axes_grid1.inset_locator.BboxConnector(bbox1, bbox2, loc1, loc2=None, **kwargs)
    Bases: matplotlib.patches.Patch
    Connect two bboxes with a straight line.

Parameters

bbox1, bbox2 [matplotlib.transforms.Bbox] Bounding boxes to connect.
loc1 [{1, 2, 3, 4}] Corner of bbox1 to draw the line. Valid values are:

<table>
<thead>
<tr>
<th>Corner</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>'upper right'</td>
<td>1</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4</td>
</tr>
</tbody>
</table>

loc2 [{1, 2, 3, 4}, optional] Corner of bbox2 to draw the line. If None, defaults to loc1. Valid values are:

<table>
<thead>
<tr>
<th>Corner</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>'upper right'</td>
<td>1</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4</td>
</tr>
</tbody>
</table>

**kwargs Patch properties for the line drawn. Valid arguments include:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agg_filter</td>
<td>a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array</td>
</tr>
<tr>
<td>alpha</td>
<td>float or None</td>
</tr>
<tr>
<td>animated</td>
<td>bool</td>
</tr>
<tr>
<td>antialiased or aa</td>
<td>unknown</td>
</tr>
<tr>
<td>capstyle</td>
<td>{'butt', 'round', 'projecting'}</td>
</tr>
<tr>
<td>clip_box</td>
<td>Bbox</td>
</tr>
<tr>
<td>clip_on</td>
<td>bool</td>
</tr>
<tr>
<td>clip_path</td>
<td>[(Path, Transform)</td>
</tr>
<tr>
<td>color</td>
<td>color</td>
</tr>
</tbody>
</table>

</table>

    static connect_bbox(bbox1, bbox2, loc1, loc2=None)
    Helper function to obtain a Path from one bbox to another.

Parameters

bbox1, bbox2  [matplotlib.transforms.Bbox] Bounding boxes to connect.

loc1 [{1, 2, 3, 4}] Corner of bbox1 to use. Valid values are:

    'upper right' : 1,
    'upper left'  : 2,
    'lower left'  : 3,
    'lower right' : 4

loc2 [{1, 2, 3, 4}, optional] Corner of bbox2 to use. If None, defaults to loc1. Valid values are:

    'upper right' : 1,
    'upper left'  : 2,
    'lower left'  : 3,
    'lower right' : 4

Returns

path [matplotlib.path.Path] A line segment from the loc1 corner of bbox1 to the loc2 corner of bbox2.

    static get_bbox_edge_pos(bbox, loc)
    Helper function to obtain the location of a corner of a bbox

Parameters

bbox

 loc
bbox [matplotlib.transforms.Bbox]

loc [{1, 2, 3, 4}] Corner of bbox. Valid values are:

<table>
<thead>
<tr>
<th>Corner</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>'upper right'</td>
<td>1</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4</td>
</tr>
</tbody>
</table>

Returns

x, y [float] Coordinates of the corner specified by loc.

get_path(self)
Return the path of this patch

Examples using mpl_toolkits.axes_grid1.inset_locator.BboxConnector

- sphx_glr_gallery_subplots_axes_and_figures_axes_zoom_effect.py

mpl_toolkits.axes_grid1.inset_locator.BboxConnectorPatch
class mpl_toolkits.axes_grid1.inset_locator.BboxConnectorPatch(bbox1, bbox2, loc1a, loc2a, loc1b, loc2b, **kwargs)

Bases: mpl_toolkits.axes_grid1.inset_locator.BboxConnector
Connect two bboxes with a quadrilateral.
The quadrilateral is specified by two lines that start and end at corners of the bboxes. The four sides of the quadrilateral are defined by the two lines given, the line between the two corners specified in bbox1 and the line between the two corners specified in bbox2.

Parameters

bbox1, bbox2 [matplotlib.transforms.Bbox] Bounding boxes to connect.

loc1a, loc2a [{1, 2, 3, 4}] Corners of bbox1 and bbox2 to draw the first line. Valid values are:

<table>
<thead>
<tr>
<th>Corner</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>'upper right'</td>
<td>1</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4</td>
</tr>
</tbody>
</table>

loc1b, loc2b [{1, 2, 3, 4}] Corners of bbox1 and bbox2 to draw the second line. Valid values are:

<table>
<thead>
<tr>
<th>Corner</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>'upper right'</td>
<td>1</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4</td>
</tr>
</tbody>
</table>

**kwargs Patch properties for the line drawn:
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>agg_filter</code></td>
<td>a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array</td>

```

Examples using mpl_toolkits.axes_grid1.inset_locator.BboxPatch

- sphx_glr_gallery_subplots_axes_and_figures_axes_zoom_effect.py

mpl_toolkits.axes_grid1.inset_locator.InsetPosition

```python
class mpl_toolkits.axes_grid1.inset_locator.InsetPosition(parent, lbwh)
    Bases: object
    An object for positioning an inset axes.
    This is created by specifying the normalized coordinates in the axes, instead of the figure.
    Parameters
```

18.1. Toolkits
lbwh [iterable of four floats] The left edge, bottom edge, width, and height of the inset axes, in units of the normalized coordinate of the parent axes.

See also:

matplotlib.axes.Axes.set_axes_locator()

Examples

The following bounds the inset axes to a box with 20% of the parent axes’s height and 40% of the width. The size of the axes specified (0, 0, 1, 1) ensures that the axes completely fills the bounding box:

```python
>>> parent_axes = plt.gca()
>>> ax_ins = plt.axes([0, 0, 1, 1])
>>> ip = InsetPosition(ax, [0.5, 0.1, 0.4, 0.2])
>>> ax_ins.set_axes_locator(ip)
```

Functions

- `inset_axes(parent_axes, width, height[, ...])` Create an inset axes with a given width and height.
- `mark_inset(parent_axes, inset_axes, loc1, ...)` Draw a box to mark the location of an area represented by an inset axes.
- `zoomed_inset_axes(parent_axes, zoom[, loc, ...])` Create an anchored inset axes by scaling a parent axes.

mpl_toolkits.axes_grid1.inset_locator.inset_axes

mpl_toolkits.axes_grid1.inset_locator.inset_axes(parent_axes, width, height[, loc=’upper right’, bbox_to_anchor=None, bbox_transform=None, axes_class=None, axes_kwags=None, borderpad=0.5])

Create an inset axes with a given width and height.

Both sizes used can be specified either in inches or percentage. For example,:

```python
inset_axes(parent_axes, width='40%', height='30%', loc=3)
```

creates in inset axes in the lower left corner of parent axes which spans over 30% in height and 40% in width of the parent axes. Since the usage of `inset_axes` may become slightly tricky when exceeding such standard cases, it is recommended to read the examples.

Parameters

**width, height** [float or str] Size of the inset axes to create. If a float is provided, it is the size in inches, e.g. `width=1.3`. If a string is provided, it is the size in relative units, e.g. `width='40%'`. By default, i.e. if neither `bbox_to_anchor` nor `bbox_transform` are specified, those are relative to the parent_axes. Otherwise they are to be understood relative to the bounding box provided via `bbox_to_anchor`.

**loc** [int or string, optional, default to 1] Location to place the inset axes. The valid locations are:

<table>
<thead>
<tr>
<th>Location</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>'upper right'</td>
<td>1</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4</td>
</tr>
<tr>
<td>'right'</td>
<td>5</td>
</tr>
<tr>
<td>'center left'</td>
<td>6</td>
</tr>
<tr>
<td>'center right'</td>
<td>7</td>
</tr>
<tr>
<td>'lower center'</td>
<td>8</td>
</tr>
<tr>
<td>'upper center'</td>
<td>9</td>
</tr>
<tr>
<td>'center'</td>
<td>10</td>
</tr>
</tbody>
</table>

**bbox_to_anchor** [tuple or `matplotlib.transforms.BboxBase`, optional] Bbox that the inset axes will be anchored to. If None, a tuple of (0, 0, 1, 1) is used if `bbox_transform` is set to `parent_axes.bbox` or `parent_axes.figure.bbox`. Otherwise, `parent_axes.bbox` is used. If a tuple, can be either [left, bottom, width, height], or [left, bottom]. If the kwargs `width` and/or `height` are specified in relative units, the 2-tuple [left, bottom] cannot be used. Note that, unless `bbox_transform` is set, the units of the bounding box are interpreted in the pixel coordinate. When using `bbox_to_anchor` with tuple, it almost always makes sense to also specify a `bbox_transform`. This might often be the axes transform `parent_axes.bbox`.

**bbox_transform** [`matplotlib.transforms.Transform`, optional] Transformation for the bbox that contains the inset axes. If None, a `transforms.IdentityTransform` is used. The value of `bbox_to_anchor` (or the return value of its get_points method) is transformed by the `bbox_transform` and then interpreted as points in the pixel coordinate (which is dpi dependent). You may provide `bbox_to_anchor` in some normalized coordinate, and give an appropriate transform (e.g., `parent_axes.bbox`).

**axes_class** [`matplotlib.axes.Axes` type, optional] If specified, the inset axes created will be created with this class’s constructor.

**axes_kwargs** [dict, optional] Keyworded arguments to pass to the constructor of the inset axes. Valid arguments include:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>

</tbody>
</table>

**borderpad** [float, optional] Padding between inset axes and the bbox_to_anchor. Defaults to 0.5. The units are axes font size, i.e. for a default font size of 10 points **borderpad = 0.5** is equivalent to a padding of 5 points.

**Returns**
inset_axes [axes_class] Inset axes object created.

Notes

The meaning of bbox_to_anchor and bbox_to_transform is interpreted differently from that of legend. The value of bbox_to_anchor (or the return value of its get_points method; the default is parent_axes.bbox) is transformed by the bbox_transform (the default is Identity transform) and then interpreted as points in the pixel coordinate (which is dpi dependent).

Thus, following three calls are identical and creates an inset axes with respect to the parent_axes:

```python
axins = inset_axes(parent_axes, "30\%", "40\%")
axins = inset_axes(parent_axes, "30\%", "40\%",
                   bbox_to_anchor=parent_axes.bbox)
axins = inset_axes(parent_axes, "30\%", "40\%",
                   bbox_to_anchor=(0, 0, 1, 1),
                   bbox_transform=parent_axes.transAxes)
```

mpl_toolkits.axes_grid1.inset_locator.mark_inset

```python
mpl_toolkits.axes_grid1.inset_locator.mark_inset(parent_axes, inset_axes, loc1, loc2, **kwargs)
```

Draw a box to mark the location of an area represented by an inset axes.

This function draws a box in parent_axes at the bounding box of inset_axes, and shows a connection with the inset axes by drawing lines at the corners, giving a “zoomed in” effect.

Parameters

- **parent_axes** [matplotlib.axes.Axes] Axes which contains the area of the inset axes.
- **loc1, loc2** [{1, 2, 3, 4}] Corners to use for connecting the inset axes and the area in the parent axes.
- ****kwargs Patch properties for the lines and box drawn:

</tbody>
</table>

**Returns**

- **pp** [matplotlib.patches.Patch] The patch drawn to represent the area of the inset axes.
- **p1, p2** [matplotlib.patches.Patch] The patches connecting two corners of the inset axes and its area.

**Examples using mpl_toolkits.axes_grid1.inset_locator.mark_inset**

- sphx_glr_gallery_axes_grid1_inset_locator_demo2.py
Create an anchored inset axes by scaling a parent axes. For usage, also see the examples.

**Parameters**

- **parent_axes** ([matplotlib.axes.Axes]) Axes to place the inset axes.
- **zoom** ([float]) Scaling factor of the data axes. `zoom > 1` will enlarge the coordinates (i.e., “zoomed in”), while `zoom < 1` will shrink the coordinates (i.e., “zoomed out”).
- **loc** ([int or string, optional, default to 1]) Location to place the inset axes. The valid locations are:
  
  - `upper right` : 1
  - `upper left` : 2
  - `lower left` : 3
  - `lower right` : 4
  - `right` : 5
  - `center left` : 6
  - `center right` : 7
  - `lower center` : 8
  - `upper center` : 9
  - `center` : 10

- **bbox_to_anchor** ([tuple or matplotlib.transforms.BboxBase, optional]) Bbox that the inset axes will be anchored to. If None, `parent_axes.bbox` is used. If a tuple, can be either [left, bottom, width, height], or [left, bottom]. If the kwargs `width` and/or `height` are specified in relative units, the 2-tuple [left, bottom] cannot be used. Note that the units of the bounding box are determined through the transform in use. When using `bbox_to_anchor` it almost always makes sense to also specify a `bbox_transform`. This might often be the axes transform `parent_axes.transAxes`.

- **bbox_transform** ([matplotlib.transforms.Transform, optional]) Transformation for the bbox that contains the inset axes. If None, a `transforms.IdentityTransform` is used (i.e. pixel coordinates). This is useful when not providing any argument to `bbox_to_anchor`. When using `bbox_to_anchor` it almost always makes sense to also specify a `bbox_transform`. This might often be the axes transform `parent_axes.transAxes`. Inversely, when specifying the axes- or figure-transform here, be aware that not specifying `bbox_to_anchor` will use `parent_axes.bbox`, the units of which are in display (pixel) coordinates.

- **axes_class** ([matplotlib.axes.Axes type, optional]) If specified, the inset axes created will be created with this class’s constructor.
**axes_kwargs** [dict, optional] Keyworded arguments to pass to the constructor of the inset axes. Valid arguments include:

<table>

**borderpad** [float, optional] Padding between inset axes and the bbox_to_anchor. Defaults to 0.5. The units are axes font size, i.e. for a default font size of 10 points \( \text{borderpad} = 0.5 \) is equivalent to a padding of 5 points.

Returns

- **inset_axes** [axes_class] Inset axes object created.

Examples using `mpl_toolkits.axes_grid1.inset_locator.zoomed_inset_axes`

- sphx_glr_gallery_axes_grid1_demo_colorbar_of_inset_axes.py
- sphx_glr_gallery_axes_grid1_inset_locator_demo2.py

`mpl_toolkits.axes_grid1.mpl_axes`

Classes

```python
Axes(fig, rect[, facecolor, frameon, ...]) Build an axes in a figure.
SimpleAxisArtist(axis, axisnum, spine)
SimpleChainedObjects(objects)
```

`mpl_toolkits.axes_grid1.mpl_axes.Axes`

class `mpl_toolkits.axes_grid1.mpl_axes.Axes(fig, rect, facecolor=None, frameon=True, sharex=None, sharey=None, label="", xscale=None,yscale=None, **kwars)`

Build an axes in a figure.

**Parameters**

- **fig** [Figure] The axes is build in the Figure `fig`.
- **rect** [[left, bottom, width, height]] The axes is build in the rectangle `rect`. `rect` is in Figure coordinates.
- **sharex, sharey** [Axes, optional] The x or y axis is shared with the x or y axis in the input `Axes`.
- **frameon** [bool, optional] True means that the axes frame is visible.
- ****kwargs Other optional keyword arguments:

</table>
Returns

**axes** *(Axes)* The new *Axes* object.

```python
class AxisDict() -> new empty dictionary
dict(mapping) -> new dictionary initialized from a mapping object’s (key, value) pairs
dict(Iterable) -> new dictionary initialized as if via: d = {} for k, v in iterable: d[k] = v
dict(**kwargs) -> new dictionary initialized with the name=value pairs in the keyword argument list. For example: dict(one=1, two=2)
```

Bases: *dict*

**axis**

Convenience method to get or set some axis properties.

**Call signatures:**

```python
xmin, xmax, ymin, ymax = axis()
xmin, xmax, ymin, ymax = axis([xmin, xmax, ymin, ymax])
xmin, xmax, ymin, ymax = axis(option)
xmin, xmax, ymin, ymax = axis(**kwargs)
```

**Parameters**

- **xmin, xmax, ymin, ymax** *(float, optional)* The axis limits to be set.
  
  Either none or all of the limits must be given. This can also be achieved using

  ```python
  ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))
  ```

- **option** *(bool or str)* If a bool, turns axis lines and labels on or off. If a string, possible values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>‘on’</td>
<td>Turn on axis lines and labels. Same as <code>True</code>.</td>
</tr>
<tr>
<td>‘off’</td>
<td>Turn off axis lines and labels. Same as <code>False</code>.</td>
</tr>
<tr>
<td>‘equal’</td>
<td>Set equal scaling (i.e., make circles circular) by changing axis limits.</td>
</tr>
<tr>
<td>‘scaled’</td>
<td>Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box.</td>
</tr>
<tr>
<td>‘tight’</td>
<td>Set limits just large enough to show all data.</td>
</tr>
<tr>
<td>‘auto’</td>
<td>Automatic scaling (fill plot box with data).</td>
</tr>
<tr>
<td>‘normal’</td>
<td>Same as ‘auto’; deprecated.</td>
</tr>
<tr>
<td>‘image’</td>
<td>‘scaled’ with axis limits equal to data limits.</td>
</tr>
<tr>
<td>‘square’</td>
<td>Square plot; similar to ‘scaled’, but initially forcing xmax-xmin = ymax-ymin.</td>
</tr>
</tbody>
</table>

- **emit** *(bool, optional, default `True`)* Whether observers are notified of the axis limit change. This option is passed on to `set_xlim` and `set_ylim`.

**Returns**

- **xmin, xmax, ymin, ymax** *(float)* The axis limits.
See also:

matplotlib.axes.Axes.set_xlim
matplotlib.axes.Axes.set_ylim

cla(self)
Clear the current axes.

Examples using mpl_toolkits.axes_grid1.mpl_axes.Axes

mpl_toolkits.axes_grid1.mpl_axes.SimpleAxisArtist

class mpl_toolkits.axes_grid1.mpl_axes.SimpleAxisArtist(axis, axisnum, spine)
    Bases: matplotlib.artist.Artist
    label
    major_ticklabels
    major_ticks
    set_label(self, txt)
    Set a label that will be displayed in the legend.

    Parameters
    s [object] s will be converted to a string by calling str.

    set_visible(self, b)
    Set the artist’s visibility.

    Parameters
    b [bool]

    toggle(self, all=None, ticks=None, ticklabels=None, label=None)

mpl_toolkits.axes_grid1.mpl_axes.SimpleChainedObjects

alias of mpl_toolkits.axes_grid1.parasite_axes.AxesHostAxes

mpl_toolkits.axes_grid1.parasite_axes.HostAxesBase

class mpl_toolkits.axes_grid1.parasite_axes.HostAxesBase(**args, **kwargs)

Bases: object

cla(self)

draw(self, renderer)

get_aux_axes(self, tr, viewlim_mode='equal', axes_class=None)

get_tightbbox(self, renderer, call_axes_locator=True, bbox_extra_artists=None)

pick(self, mouseevent)

twin(self, aux_trans=None, axes_class=None)

Create a twin of Axes with no shared axis.

While self will have ticks on the left and bottom axis, the returned axes will have
ticks on the top and right axis.

twinx(self, axes_class=None)

Create a twin of Axes with a shared x-axis but independent y-axis.

The y-axis of self will have ticks on the left and the returned axes will have ticks on
the right.

twiny(self, axes_class=None)

Create a twin of Axes with a shared y-axis but independent x-axis.

The x-axis of self will have ticks on the bottom and the returned axes will have ticks on
the top.

• sphx_glr_gallery_axisartist_demo_parasite_axes.py
• sphx_glr_gallery_axisartist_demo_parasite_axes2.py

Functions

host_axes(*args[, axes_class, figure]) Create axes that can act as a hosts to parasitic axes.

host_subplot(*args[, axes_class, figure]) Create a subplot that can act as a host to parasitic axes.

host_subplot_class_factory(axes_class)

mpl_toolkits.axes_grid1.parasite_axes.host_axes

mpl_toolkits.axes_grid1.parasite_axes.host_axes(*args, axes_class=None, figure=None, **kwargs)
    Create axes that can act as a hosts to parasitic axes.

Parameters

    figure [matplotlib.figure.Figure] Figure to which the axes will be added. Defaults to the current figure pyplot.gcf().

    *args, **kwargs Will be passed on to the underlying Axes object creation.

mpl_toolkits.axes_grid1.parasite_axes.host_subplot

mpl_toolkits.axes_grid1.parasite_axes.host_subplot(*args, axes_class=None, figure=None, **kwargs)
    Create a subplot that can act as a host to parasitic axes.

Parameters

    figure [matplotlib.figure.Figure] Figure to which the subplot will be added. Defaults to the current figure pyplot.gcf().

    *args, **kwargs Will be passed on to the underlying Axes object creation.

mpl_toolkits.axes_grid1.parasite_axes.host_subplot_class_factory(axes_class)

### 18.1.3 Matplotlib axisartist Toolkit

The *axisartist* namespace includes a derived Axes implementation (mpl_toolkits.axisartist.Axes). The biggest difference is that the artists that are responsible for drawing axis lines, ticks, ticklabels, and axis labels are separated out from the mpl’s Axis class. This change was strongly motivated to support curvilinear grid.

You can find a tutorial describing usage of axisartist at the *axisartist* user guide.

![Image](image.png)

**The submodules of the axisartist API are:**

- **axisartist.angle_helper**
- **axisartist.axes_divider**
- **axisartist.axes_grid**
- **axisartist.axes_rgb**
- **axisartist.axis_artist**
  
  axis_artist.py module provides axis-related artists.
- **axisartist.axisline_style**
- **axisartist.axislines**
  
  Axislines includes modified implementation of the Axes class.
- **axisartist.clip_path**
- **axisartist.floating_axes**
  
  An experimental support for curvilinear grid.
- **axisartist.grid_finder**
- **axisartist.grid_helper_curvelinear**
  
  An experimental support for curvilinear grid.
- **axisartist.parasite_axes**

mpl_toolkits.axisartist.angle_helper

**Classes**
**ExtremeFinderCycle** (nx, ny[, lon_cycle, ...]) When there is a cycle, e.g., longitude goes from 0-360.

**FormatterDMS**

**FormatterHMS**

**LocatorBase** (den[, include_last])

**LocatorD** (den[, include_last])

**LocatorDM** (den[, include_last])

**LocatorDMS** (den[, include_last])

**LocatorH** (den[, include_last])

**LocatorHM** (den[, include_last])

**LocatorHMS** (den[, include_last])

**mpl_toolkits.axisartist.angle_helper.ExtremeFinderCycle**

```python
class mpl_toolkits.axisartist.angle_helper.ExtremeFinderCycle(nx, ny, lon_cycle=360.0, lat_cycle=None, lon_minmax=None, lat_minmax=(-90, 90))
```

Bases: `mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple`

When there is a cycle, e.g., longitude goes from 0-360.

| Parameters |

mpl_toolkits.axisartist.axes_grid.AxesGrid

mpl_toolkits.axisartist.axes_grid.AxesGrid
   alias of mpl_toolkits.axisartist.axes_grid.ImageGrid

mpl_toolkits.axisartist.axislines.Axes

mpl_toolkits.axisartist.axislines.Axes

class mpl_toolkits.axisartist.axes_grid.CbarAxes(*args, orientation, **kwargs)

cla(self)
   Clear the current axes.
mpl_toolkits.axisartist.axes_grid.Grid

class mpl_toolkits.axisartist.axes_grid.Grid(fig, rect, nrows_ncols, ngrids=None, direction='row', axes_pad=0.02, add_all=True, share_all=False, share_x=True, share_y=True, label_mode='L', axes_class=None)

Bases: mpl_toolkits.axes_grid1.axes_grid.Grid

Parameters

fig [Figure] The parent figure.
rect [(float, float, float, float) or int] The axes position, as a (left, bottom, width, height) tuple or as a three-digit subplot position code (e.g., "121").
direction [{"row", "column"}, default: "row"]
axes_pad [float or (float, float), default: 0.02] Padding or (horizontal padding, vertical padding) between axes, in inches.
add_all [bool, default: True]
share_all [bool, default: False]
share_x [bool, default: True]
share_y [bool, default: True]
label_mode [{"L", "1", "all"}, default: "L"] Determines which axes will get tick labels:
  • "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
  • "1": Only the bottom left axes is labelled.
  • "all": all axes are labelled.
axes_class [a type that is a subclass of matplotlib.axes.Axes, default: None]

mpl_toolkits.axisartist.axes_grid.ImageGrid

class mpl_toolkits.axisartist.axes_grid.ImageGrid(fig, rect, nrows_ncols, ngrids=None, direction='row', axes_pad=0.02, add_all=True, share_all=False, aspect=True, label_mode='L', cbar_mode=None, cbar_location='right', cbar_pad=None, cbar_size='5%', cbar_set_cax=True, axes_class=None)

Bases: mpl_toolkits.axes_grid1.axes_grid.ImageGrid

Parameters

fig [Figure] The parent figure.
rect [(float, float, float, float) or int] The axes position, as a (left, bottom, width, height) tuple or as a three-digit subplot position code (e.g., “121”).

direction [{"row", "column"}, default: “row”]

axes_pad [float or (float, float), default: 0.02] Padding or (horizontal padding, vertical padding) between axes, in inches.

add_all [bool, default: True]

share_all [bool, default: False]

aspect [bool, default: True]

label_mode [{“L”, “1”, “all”}, default: “L”] Determines which axes will get tick labels:

• “L”: All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.

• “1”: Only the bottom left axes is labelled.

• “all”: all axes are labelled.

cbar_mode [{“each”, “single”, “edge”, None }, default: None]

cbar_location [{“left”, “right”, “bottom”, “top”}, default: “right”]

cbar_pad [float, default: None]

cbar_size [size specification (see Size.from_any), default: “5%”]

cbar_set_cax [bool, default: True] If True, each axes in the grid has a cax attribute that is bound to associated cbar_axes.

axes_class [a type that is a subclass of matplotlib.axes.Axes, default: None]

mpl_toolkits.axisartist.axes_rgb

Classes

RGBAaxes(*args[, pad, add_all])

Parameters

mpl_toolkits.axisartist.axes_rgb.RGBAxes

class mpl_toolkits.axisartist.axes_rgb.RGBAxes(*args, pad=0, add_all=True, **kwargs)

Bases: mpl_toolkits.axes_grid1.axes_rgb.RGBAxesBase

Parameters

pad [float] fraction of the axes height to put as padding. defaults to 0.0

add_all [bool] True: Add the {rgb, r, g, b} axes to the figure defaults to True.

axes_class [matplotlib.axes.Axes]
*args Unpacked into axes_class() init for RGB
**kwargs Unpacked into axes_class() init for RGB, R, G, B axes

mpl_toolkits.axisartist.axis_artist

axis_artist.py module provides axis-related artists. They are

- axis line
- tick lines
- tick labels
- axis label
- grid lines

The main artist classes are AxisArtist and GridlinesCollection. While GridlinesCollection is responsible for drawing grid lines, AxisArtist is responsible for all other artists. AxisArtist has attributes that are associated with each type of artists:

- line: axis line
- major_ticks: major tick lines
- major_ticklabels: major tick labels
- minor_ticks: minor tick lines
- minor_ticklabels: minor tick labels
- label: axis label

Typically, the AxisArtist associated with an axes will be accessed with the axis dictionary of the axes, i.e., the AxisArtist for the bottom axis is

```python
ax.axis["bottom"]
```

where ax is an instance of mpl_toolkits.axislines.Axes. Thus, ax.axis["bottom"].line is an artist associated with the axis line, and ax.axis["bottom"].major_ticks is an artist associated with the major tick lines.

You can change the colors, fonts, line widths, etc. of these artists by calling suitable set method. For example, to change the color of the major ticks of the bottom axis to red, use

```python
ax.axis["bottom"].major_ticks.set_color("r")
```

However, things like the locations of ticks, and their ticklabels need to be changed from the side of the grid_helper.

axis_direction

AxisArtist, AxisLabel, TickLabels have an axis_direction attribute, which adjusts the location, angle, etc.,. The axis_direction must be one of “left”, “right”, “bottom”, ”top”, and follows the Matplotlib convention for rectangular axis.

For example, for the bottom axis (the left and right is relative to the direction of the increasing coordinate),

- ticklabels and axislabel are on the right
• ticklabels and axislabel have text angle of 0
• ticklabels are baseline, center-aligned
• axislabel is top, center-aligned

The text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>left</th>
<th>bottom</th>
<th>right</th>
<th>top</th>
</tr>
</thead>
<tbody>
<tr>
<td>ticklabels location</td>
<td>left</td>
<td>right</td>
<td>right</td>
<td>left</td>
</tr>
<tr>
<td>axislabel location</td>
<td>left</td>
<td>right</td>
<td>right</td>
<td>left</td>
</tr>
<tr>
<td>ticklabels angle</td>
<td>90</td>
<td>0</td>
<td>-90</td>
<td>180</td>
</tr>
<tr>
<td>axislabel angle</td>
<td>180</td>
<td>0</td>
<td>0</td>
<td>180</td>
</tr>
<tr>
<td>ticklabel va</td>
<td>center</td>
<td>baseline</td>
<td>center</td>
<td>baseline</td>
</tr>
<tr>
<td>axislabel va</td>
<td>center</td>
<td>top</td>
<td>center</td>
<td>bottom</td>
</tr>
<tr>
<td>ticklabel ha</td>
<td>right</td>
<td>center</td>
<td>right</td>
<td>center</td>
</tr>
<tr>
<td>axislabel ha</td>
<td>right</td>
<td>center</td>
<td>right</td>
<td>center</td>
</tr>
</tbody>
</table>

Ticks are by default direct opposite side of the ticklabels. To make ticks to the same side of the ticklabels,

```python
ax.axis["bottom"].major_ticks.set_ticks_out(True)
```

The following attributes can be customized (use the set_xxx methods):

• **Ticks**: ticksize, tick_out
• **TickLabels**: pad
• **AxisLabel**: pad

Classes

```python
AttributeCopier(ref_artist[, klass])
AxisArtist(axes, helper[, offset, ...]) An artist which draws axis (a line along which the n-th axes coord is constant) line, ticks, ticklabels, and axis label.
AxisLabel(*args[, axis_direction, axis]) Axis Label.
BezierPath(path, *args, **kwargs)
GridlinesCollection(*args[, which, axis]) which : "major" or "minor" axis : "both", "x" or "y"
LabelBase(*args, **kwargs) A base class for AxisLabel and TickLabels.
TickLabels(*[, axis_direction]) Tick Labels.
Ticks(ticksize[, tick_out, axis]) Ticks are derived from Line2D, and note that ticks themselves are markers.
```

mpl_toolkits.axisartist.axis_artist.AttributeCopier

class mpl_toolkits.axisartist.axis_artist.AttributeCopier(ref_artist, klass=<class ’matplotlib.artist.Artist’>)
Bases: object

```python
class mpl_toolkits.axisartist.axis_artist.AttributeCopier(ref_artist, klass=<class ’matplotlib.artist.Artist’>)
```

```
get_attribute_from_ref_artist(self, attr_name, default_value)```
get_ref_artist(self)
set_ref_artist(self, artist)

mpl_toolkits.axisartist.axis_artist.AxisArtist

class mpl_toolkits.axisartist.axis_artist.AxisArtist(axes, helper, offset=None,
    axis_direction='bottom', **kwargs)

Bases: matplotlib.artist.Artist

An artist which draws axis (a line along which the n-th axes coord is constant) line, ticks, ticklabels, and axis label.

axes : axes helper : an AxisArtistHelper instance.

LABELPAD
ZORDER = 2.5
draw(self, renderer)
    Draw the axis lines, tick lines and labels
get_axisline_style(self)
    return the current axisline style.
get_helper(self)
    Return axis artist helper instance.
get_tightbbox(self, renderer)
    Like Artist.get_window_extent, but includes any clipping.

Parameters
    renderer [RendererBase instance] renderer that will be used to draw
        the figures (i.e. fig.canvas.get_renderer())

Returns
    bbox [BBox] The enclosing bounding box (in figure pixel co-ordinates).

get_transform(self)
    Return the Transform instance used by this artist.
invert_ticklabel_direction(self)

set_axis_direction(self, axis_direction)
    Adjust the direction, text angle, text alignment of ticklabels, labels following the matplotlib convention for the rectangle axes.

    The axis_direction must be one of [left, right, bottom, top].

<table>
<thead>
<tr>
<th>property</th>
<th>left</th>
<th>bottom</th>
<th>right</th>
<th>top</th>
</tr>
</thead>
<tbody>
<tr>
<td>ticklabels location</td>
<td>&quot;+&quot;</td>
<td>&quot;+&quot;</td>
<td>&quot;+&quot;</td>
<td>&quot;+&quot;</td>
</tr>
<tr>
<td>axislabel location</td>
<td>&quot;+&quot;</td>
<td>&quot;+&quot;</td>
<td>&quot;+&quot;</td>
<td>&quot;-&quot;</td>
</tr>
<tr>
<td>ticklabels angle</td>
<td>90</td>
<td>0</td>
<td>-90</td>
<td>180</td>
</tr>
<tr>
<td>ticklabel va</td>
<td>center</td>
<td>baseline</td>
<td>center</td>
<td>baseline</td>
</tr>
<tr>
<td>ticklabel ha</td>
<td>right</td>
<td>center</td>
<td>right</td>
<td>center</td>
</tr>
<tr>
<td>axislabel angle</td>
<td>180</td>
<td>0</td>
<td>0</td>
<td>180</td>
</tr>
<tr>
<td>axislabel va</td>
<td>center</td>
<td>top</td>
<td>center</td>
<td>bottom</td>
</tr>
<tr>
<td>axislabel ha</td>
<td>right</td>
<td>center</td>
<td>right</td>
<td>center</td>
</tr>
</tbody>
</table>
Note that the direction "+" and "-" are relative to the direction of the increasing coordinate. Also, the text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

```
set_axislabel_direction(self, label_direction)
```
Adjust the direction of the axislabel.

Note that the `label_direction` s `'+`′ and `'-'` are relative to the direction of the increasing coordinate.

**Parameters**

- **tick_direction** `[{'+', '-'}]`

```
set_axisline_style(self, axisline_style=None, **kwargs)
```
Set the axisline style.

**axisline_style can be a string with axisline style name with optional**
comma-separated attributes. Alternatively, the attrs can be provided as
keywords.

```
set_axisline_style("->,size=1.5")
```
Old attrs simply are forgotten.
Without argument (or with arrowstyle=None), return available styles as a list of strings.

```
set_label(self, s)
```
Set a label that will be displayed in the legend.

**Parameters**

- **s** [object] s will be converted to a string by calling `str`.

```
set_ticklabel_direction(self, tick_direction)
```
Adjust the direction of the ticklabel.

Note that the `label_direction` s `'+`′ and `'-'` are relative to the direction of the increasing coordinate.

**Parameters**

- **tick_direction** `[{'+', '-'}]`

```
toggle(self, all=None, ticks=None, ticklabels=None, label=None)
```
Toggle visibility of ticks, ticklabels, and (axis) label. To turn all off,

```
axis.toggle(all=False)
```
To turn all off but ticks on

```
axis.toggle(all=False, ticks=True)
```
To turn all on but (axis) label off

```
axis.toggle(all=True, label=False))
```
class mpl_toolkits.axisartist.axis_artist.AxisLabel(*args, axis_direction='bottom', axis=None, **kwargs)

Axis Label. Derived from Text. The position of the text is updated in the fly, so changing text position has no effect. Otherwise, the properties can be changed as a normal Text.
To change the pad between ticklabels and axis label, use set_pad.

draw(self, renderer)
   Draws the Text object to the given renderer.

get_color(self)
   Return the color of the text

get_pad(self)
   return pad in points. See set_pad for more details.

get_ref_artist(self)

get_text(self)
   Get the text as string

get_window_extent(self, renderer)
   Return the Bbox bounding the text, in display units.
   In addition to being used internally, this is useful for specifying clickable regions in a png file on a web page.

Parameters

renderer [Renderer, optional] A renderer is needed to compute the bounding box. If the artist has already been drawn, the renderer is cached; thus, it is only necessary to pass this argument when calling get_window_extent before the first draw. In practice, it is usually easier to trigger a draw first (e.g. by saving the figure).

dpi [float, optional] The dpi value for computing the bbox, defaults to self.figure.dpi (not the renderer dpi); should be set e.g. if to match regions with a figure saved with a custom dpi value.

set_axis_direction(self, d)
   Adjust the text angle and text alignment of axis label according to the matplotlib convention.

<table>
<thead>
<tr>
<th>property</th>
<th>left</th>
<th>bottom</th>
<th>right</th>
<th>top</th>
</tr>
</thead>
<tbody>
<tr>
<td>axislabel angle</td>
<td>180</td>
<td>0</td>
<td>0</td>
<td>180</td>
</tr>
<tr>
<td>axislabel va</td>
<td>center</td>
<td>top</td>
<td>center</td>
<td>bottom</td>
</tr>
<tr>
<td>axislabel ha</td>
<td>right</td>
<td>center</td>
<td>right</td>
<td>center</td>
</tr>
</tbody>
</table>

Note that the text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

set_default_alignment(self, d)

set_default_angle(self, d)
set_pad(self, pad)
Set the pad in points. Note that the actual pad will be the sum of the internal pad and the external pad (that are set automatically by the AxisArtist), and it only set the internal pad.

mpl_toolkits.axisartist.axis_artist.BezierPath

class mpl_toolkits.axisartist.axis_artist.BezierPath(path, *args, **kwargs)
Bases: matplotlib.lines.Line2D
draw(self, renderer)
Draw the Artist using the given renderer.
This method will be overridden in the Artist subclasses. Typically, it is implemented to not have any effect if the Artist is not visible (Artist.get_visible is False).

Parameters
renderer [RendererBase subclass.]

recache(self)

set_path(self, path)

mpl_toolkits.axisartist.axis_artist.GridlinesCollection

class mpl_toolkits.axisartist.axis_artist.GridlinesCollection(*args, which='major', axis='both', **kwargs)
Bases: matplotlib.collections.LineCollection
which : “major” or “minor” axis : “both”, “x” or “y”
draw(self, renderer)
Draw the Artist using the given renderer.
This method will be overridden in the Artist subclasses. Typically, it is implemented to not have any effect if the Artist is not visible (Artist.get_visible is False).

Parameters
renderer [RendererBase subclass.]

set_axis(self, axis)

set_grid_helper(self, grid_helper)

set_which(self, which)

mpl_toolkits.axisartist.axis_artist.LabelBase

class mpl_toolkits.axisartist.axis_artist.LabelBase(*args, **kwargs)
Bases: matplotlib.text.Text
A base class for AxisLabel and TickLabels. The position and angle of the text are calculated by to offset_ref_angle, text_ref_angle, and offset_radius attributes.
draw(self, renderer)
Draws the Text object to the given renderer.
get_window_extent(self, renderer)

Return the Bbox bounding the text, in display units.

In addition to being used internally, this is useful for specifying clickable regions in a png file on a web page.

Parameters

renderer [Renderer, optional] A renderer is needed to compute the bounding box. If the artist has already been drawn, the renderer is cached; thus, it is only necessary to pass this argument when calling get_window_extent before the first draw. In practice, it is usually easier to trigger a draw first (e.g. by saving the figure).

dpi [float, optional] The dpi value for computing the bbox, defaults to self.figure.dpi (not the renderer dpi); should be set e.g. if to match regions with a figure saved with a custom dpi value.

mpl_toolkits.axisartist.axis_artist.TickLabels

class mpl_toolkits.axisartist.axis_artist.TickLabels(*, axis_direction='bottom', **kwargs)

Tick Labels. While derived from Text, this single artist draws all ticklabels. As in AxisLabel, the position of the text is updated in the fly, so changing text position has no effect. Otherwise, the properties can be changed as a normal Text. Unlike the ticklabels of the mainline matplotlib, properties of single ticklabel alone cannot modified.

To change the pad between ticks and ticklabels, use set_pad.

draw(self, renderer)

Draws the Text object to the given renderer.

get_ref_artist(self)

get_texts_widths_heights_descents(self, renderer)

return a list of width, height, descent for ticklabels.

get_window_extents(self, renderer)

invert_axis_direction(self)

set_axis_direction(self, label_direction)

Adjust the text angle and text alignment of ticklabels according to the matplotlib convention.

The label_direction must be one of [left, right, bottom, top].

<table>
<thead>
<tr>
<th>property</th>
<th>left</th>
<th>bottom</th>
<th>right</th>
<th>top</th>
</tr>
</thead>
<tbody>
<tr>
<td>ticklabels angle</td>
<td>90</td>
<td>0</td>
<td>-90</td>
<td>180</td>
</tr>
<tr>
<td>ticklabel va</td>
<td>center</td>
<td>baseline</td>
<td>center</td>
<td>baseline</td>
</tr>
<tr>
<td>ticklabel ha</td>
<td>right</td>
<td>center</td>
<td>right</td>
<td>center</td>
</tr>
</tbody>
</table>

Note that the text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

set_locs_angles_labels(self, locs_angles_labels)
mpl_toolkits.axisartist.axis_artist.Ticks

class mpl_toolkits.axisartist.axis_artist.Ticks(ticksize, tick_out=False, *, axis=None, **kwargs)

    Bases: matplotlib.lines.Line2D, mpl_toolkits.axisartist.axis_artist.AttributeCopier

Ticks are derived from Line2D, and note that ticks themselves are markers. Thus, you should use set_mec, set_mew, etc.

To change the tick size (length), you need to use set_ticksize. To change the direction of the ticks (ticks are in opposite direction of ticklabels by default), use set_tick_out(False).

draw(self, renderer)
    Draw the Artist using the given renderer.

    This method will be overridden in the Artist subclasses. Typically, it is implemented to not have any effect if the Artist is not visible (Artist.get_visible is False).

Parameters
    renderer [RendererBase subclass.]

get_color(self)
    Return the line color.
    See also set_color.

get_markeredgecolor(self)
    Return the marker edge color.
    See also set_markeredgecolor.

get_markeredgewidth(self)
    Return the marker edge width in points.
    See also set_markeredgewidth.

get_ref_artist(self)

get_tick_out(self)
    Return True if the tick will be rotated by 180 degree.

get_ticksize(self)
    Return length of the ticks in points.

set_locs_angles(self, locs_angles)

set_tick_out(self, b)
    set True if tick need to be rotated by 180 degree.

set_ticksize(self, ticksize)
    set length of the ticks in points.
**AxislineStyle**

AxislineStyle is a container class which defines style classes for AxisArtists.

```
 mpl_toolkits.axisartist.axisline_style.AxislineStyle
```

class mpl_toolkits.axisartist.axisline_style.AxislineStyle

    Bases: matplotlib.patches._Style

AxislineStyle is a container class which defines style classes for AxisArtists. An instance of any axisline style class is an callable object, whose call signature is

```
__call__(self, axis_artist, path, transform)
```

When called, this should return a mpl artist with following methods implemented.

```
def set_path(self, path):
    # set the path for axisline.
def set_line_mutation_scale(self, scale):
    # set the scale
def draw(self, renderer):
    # draw
```

return the instance of the subclass with the given style name.

class FilledArrow(size=1)

    Bases: mpl_toolkits.axisartist.axisline_style.SimpleArrow

    size  size of the arrow as a fraction of the ticklabel size.

    ArrowAxisClass
        alias of _FancyAxislineStyle.FilledArrow

class SimpleArrow(size=1)

    Bases: mpl_toolkits.axisartist.axisline_style._Base

    A simple arrow.

    size  size of the arrow as a fraction of the ticklabel size.

    ArrowAxisClass
        alias of _FancyAxislineStyle.SimpleArrow

    new_line(self, axis_artist, transform)
```

**mpl_toolkits.axisartist.axesline**

Axislines includes modified implementation of the Axes class. The biggest difference is that the artists responsible for drawing the axis spine, ticks, ticklabels and axis labels are separated out from mpl’s Axis class. Originally, this change was motivated to support curvilinear grid. Here are a few reasons that I came up with a new axes class:

- “top” and “bottom” x-axis (or “left” and “right” y-axis) can have different ticks (tick locations and labels). This is not possible with the current mpl, although some twin axes trick can help.
• Curvilinear grid.
• angled ticks.

In the new axes class, xaxis and yaxis is set to not visible by default, and new set of artist (AxisArtist) are defined to draw axis line, ticks, ticklabels and axis label. Axes.axis attribute serves as a dictionary of these artists, i.e., ax.axis[“left”] is a AxisArtist instance responsible to draw left y-axis. The default Axes.axis contains “bottom”, “left”, “top” and “right”.

AxisArtist can be considered as a container artist and has following children artists which will draw ticks, labels, etc.

• line
• major_ticks, major_ticklabels
• minor_ticks, minor_ticklabels
• offsetText
• label

Note that these are separate artists from Axis class of the original mpl, thus most of tick-related command in the original mpl won’t work, although some effort has made to work with. For example, color and markerwidth of the ax.axis[“bottom”].major_ticks will follow those of Axes.xaxis unless explicitly specified.

In addition to AxisArtist, the Axes will have gridlines attribute, which obviously draws grid lines. The gridlines needs to be separated from the axis as some gridlines can never pass any axis.

Classes

```python
Axes(*args[, grid_helper])
AxesZero(*args[, grid_helper])
AxisArtistHelper
AxisArtistHelperRectlinear
GridHelperBase()
GridHelperRectlinear(axes)
SimpleChainedObjects(**kwargs) [Deprecated]
```

mpl_toolkits.axisartist.axislines.Axes

class mpl_toolkits.axisartist.axislines.Axes(*args, grid_helper=None, **kwargs)
Bases: matplotlib.axes._axes.Axes

class AxisDict(**kwargs)
Bases: dict
[Deprecated]

Notes

Deprecated since version 3.1:
axis

Convenience method to get or set some axis properties.

Call signatures:

\[
\begin{align*}
\text{xmin, xmax, ymin, ymax} &= \text{axis}() \\
\text{xmin, xmax, ymin, ymax} &= \text{axis}([\text{xmin, xmax, ymin, ymax}]) \\
\text{xmin, xmax, ymin, ymax} &= \text{axis}(\text{option}) \\
\text{xmin, xmax, ymin, ymax} &= \text{axis}(**\text{kwargs})
\end{align*}
\]

Parameters

- **xmin, xmax, ymin, ymax** [float, optional] The axis limits to be set. Either none or all of the limits must be given. This can also be achieved using

  \[
  \text{ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))}
  \]

- **option** [bool or str] If a bool, turns axis lines and labels on or off. If a string, possible values are:

  \[
  \text{Value} | \text{Description} \\
  \hline
  \text{'on'}  & \text{Turn on axis lines and labels. Same as True.} \\
  \text{'off'} & \text{Turn off axis lines and labels. Same as False.} \\
  \text{'equal'} & \text{Set equal scaling (i.e., make circles circular) by changing axis limits.} \\
  \text{'scaled'} & \text{Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box.} \\
  \text{'tight'} & \text{Set limits just large enough to show all data.} \\
  \text{'auto'} & \text{Automatic scaling (fill plot box with data).} \\
  \text{'normal'} & \text{Same as 'auto'; deprecated.} \\
  \text{'image'} & \text{'scaled' with axis limits equal to data limits.} \\
  \text{'square'} & \text{'scaled', but initially forcing xmax-xmin = ymax-ymin.}
  \]

- **emit** [bool, optional, default True] Whether observers are notified of the axis limit change. This option is passed on to `set_xlim` and `set_ylim`.

Returns

- **xmin, xmax, ymin, ymax** [float] The axis limits.

See also:

- `matplotlib.axes.Axes.set_xlim`
- `matplotlib.axes.Axes.set_ylim`
- `cla(self)`
  
  Clear the current axes.

- `get_children(self)`
  
  Return a list of the child `Artists` of this `Artist`. 

get_grid_helper(self)

grid(self, b=None, which='major', axis='both', **kwargs)
    Toggle the gridlines, and optionally set the properties of the lines.

invalidate_grid_helper(self)

new_fixed_axis(self, loc, offset=None)

new_floating_axis(self, nth_coord, value, axis_direction='bottom')

new_gridlines(self, grid_helper=None)
    Create and return a new GridlineCollection instance.

    which : “major” or “minor”
    axis : “both”, “x” or “y”

toggle_axisline(self, b=None)

mpl_toolkits.axisartist.axislines.AxesZero

class mpl_toolkits.axisartist.axislines.AxesZero(*args, grid_helper=None, **kwargs)
    Bases: mpl_toolkits.axisartist.axislines.Axes

   tick_loc, tick_angle, tick_label, (optionally) tick_label
   get_tick_transform(self, axes)
   update_lim(self, axes)

mpl_toolkits.axisartist.floating_axes.FloatingAxes

mpl_toolkits.axisartist.floating_axes.FloatingAxes
   alias of mpl_toolkits.axisartist.floating_axes.FloatingAxesHostAxes

mpl_toolkits.axisartist.floating_axes.FloatingAxesBase

class mpl_toolkits.axisartist.floating_axes.FloatingAxesBase(*args, **kwargs)
   Bases: object
   adjust_axes_lim(self)
   cla(self)

mpl_toolkits.axisartist.floating_axes.FloatingAxisArtistHelper

class mpl_toolkits.axisartist.floating_axes.FloatingAxisArtistHelper(grid_helper, nth_coord, value, axis_direction=None)
   Bases: mpl_toolkits.axisartist.grid_helper_curvelinear.FloatingAxisArtistHelper
   nth_coord = along which coordinate value varies. nth_coord = 0 -> x axis,
   nth_coord = 1 -> y axis
**mpl_toolkits.axisartist.floating_axes.GridHelperCurveLinear**

```python
class mpl_toolkits.axisartist.floating_axes.GridHelperCurveLinear(aux_trans,
                     extremes,                      
grid_locator1=None,               
grid_locator2=None,               
tick_formatter1=None,             
tick_formatter2=None)
```

**Bases:** `mpl_toolkits.axisartist.grid_helper_curvelinear.GridHelperCurveLinear`

`aux_trans` : a transform from the source (curved) coordinate to target (rectilinear) coordinate. An instance of MPL's Transform (inverse transform should be defined) or a tuple of two callable objects which defines the transform and its inverse. The callables need take two arguments of source coordinates and should return two target coordinates: e.g., \(x_2, y_2 = \text{trans}(x_1, y_1)\)

```python
def get_boundary(self):
    return Nx2 array of x,y coordinate of the boundary

def get_data_boundary(self, side):
    return v= 0 , nth=1

def get_gridlines(self, which='major', axis='both'):
    Return list of grid lines as a list of paths (list of points).
    which : “major” or “minor” axis : “both”, “x” or “y”

def new_fixed_axis(self, loc, nth_coord=None, axis_direction=None, offset=None, axes=None)
```

**Examples using mpl_toolkits.axisartist.floating_axes.GridHelperCurveLinear**

- `sphx_glr_gallery_axisartist_demo_floating_axes.py`

**mpl_toolkits.axisartist.grid_finder**

**Classes**

```python

class mpl_toolkits.axisartist.grid_finder.FixedLocator(locs)
    Bases: object
    set_factor(self, f)

Examples using mpl_toolkits.axisartist.grid_finder.FixedLocator

- sphx_glr_gallery_axisartist_demo_floating_axes.py

mpl_toolkits.axisartist.grid_finder.FormatterPrettyPrint

class mpl_toolkits.axisartist.grid_finder.FormatterPrettyPrint(useMathText=True)
    Bases: object

mpl_toolkits.axisartist.grid_finder.GridFinder

class mpl_toolkits.axisartist.grid_finder.GridFinder(transform, extreme_finder=None, grid_locator1=None, grid_locator2=None, tick_formatter1=None, tick_formatter2=None)
    Bases: mpl_toolkits.axisartist.grid_finder.GridFinderBase
    transform : transform from the image coordinate (which will be the transData of the axes to the world coordinate.
    or transform = (transform_xy, inv_transform_xy)
    locator1, locator2 : grid locator for 1st and 2nd axis.
mpl_toolkits.axisartist.grid_finder.GridFinderBase

class mpl_toolkits.axisartist.grid_finder.GridFinderBase(extreme_finder, 
grid_locator1, grid_locator2, 
tickformatter1=None, 
tickformatter2=None)

Bases: object

the transData of the axes to the world coordinate. locator1, locator2: grid locator for
1st and 2nd axis.

Derived must define “transform_xy, inv_transform_xy” (may use update_transform)

get_grid_info(self, x1, y1, x2, y2)

lon_values, lat_values [list of grid values. if integer is given,] rough number of
grids in each direction.

update(self, **kw)

update_transform(self, aux_trans)

mpl_toolkits.axisartist.grid_finder.MaxNLocator

class mpl_toolkits.axisartist.grid_finder.MaxNLocator(nbins=10, 
steps=None, trim=True, integer=False, symmetric=False, prune=None)

Bases: matplotlib.ticker.MaxNLocator

set_factor(self, f)

Examples using mpl_toolkits.axisartist.grid_finder.MaxNLocator

• sphx_glr_gallery_axisartist_demo_axis_direction.py
• sphx_glr_gallery_axisartist_demo_curvelinear_grid2.py
• sphx_glr_gallery_axisartist_demo_floating_axes.py
• sphx_glr_gallery_axisartist_simple_axis_pad.py

mpl_toolkits.axisartist.grid_helper_curvelinear

An experimental support for curvilinear grid.

Classes

FixedAxisArtistHelper(grid_helper, side[, ...])

FloatingAxisArtistHelper(grid_helper, ...[, nth_coord = along which coordinate value
varies.]

Continued on next page
Table 34 – continued from previous page

| GridHelperCurveLinear(aux_trans[, ...]) | aux_trans : a transform from the source (curved) coordinate to target (rectilinear) coordinate. |

mpl_toolkits.axisartist.grid_helper_curvelinear.FixedAxisArtistHelper

class mpl_toolkits.axisartist.grid_helper_curvelinear.FixedAxisArtistHelper(grid_helper, side, nth_coord_ticks=None)

Bases: mpl_toolkits.axisartist.axislines.Fixed

Helper class for a fixed axis.

nth_coord = along which coordinate value varies.  nth_coord = 0  ->  x axis, nth_coord = 1  ->  y axis

change_tick_coord(self, coord_number=None)
get_tick_iterators(self, axes)
  tick_loc, tick_angle, tick_label
get_tick_transform(self, axes)
update_lim(self, axes)

mpl_toolkits.axisartist.grid_helper_curvelinear.FloatingAxisArtistHelper

class mpl_toolkits.axisartist.grid_helper_curvelinear.FloatingAxisArtistHelper(grid_helper, nth_coord, value, axis_direction=None)

Bases: mpl_toolkits.axisartist.axislines.Floating

nth_coord = along which coordinate value varies.  nth_coord = 0  ->  x axis, nth_coord = 1  ->  y axis

get_axislabel_pos_angle(self, axes)
get_axislabel_transform(self, axes)
get_line(self, axes)
get_line_transform(self, axes)
get_tick_iterators(self, axes)
  tick_loc, tick_angle, tick_label, (optionally) tick_label
get_tick_transform(self, axes)
set_extremes(self, e1, e2)
update_lim(self, axes)
mpl_toolkits.axisartist.grid_helper_curvelinear.GridHelperCurveLinear

class mpl_toolkits.axisartist.grid_helper_curvelinear.GridHelperCurveLinear(aux_trans, extreme_finder=None, grid_locator1=None, grid_locator2=None, tick_formatter1=None, tick_formatter2=None)

Bases: mpl_toolkits.axisartist.axislines.GridHelperBase

aux_trans : a transform from the source (curved) coordinate to target (rectilinear) coordinate. An instance of MPL's Transform (inverse transform should be defined) or a tuple of two callable objects which defines the transform and its inverse. The callables need take two arguments of array of source coordinates and should return two target coordinates.

e.g., x2, y2 = trans(x1, y1)

get_gridlines(self, which='major', axis='both')
    Return list of grid lines as a list of paths (list of points).

    which : “major” or ”minor” axis : “both”, ”x” or ”y”

get_tick_iterator(self, nth_coord, axis_side, minor=False)

new_fixed_axis(self, loc, nth_coord=None, axis_direction=None, offset=None, axes=None)

new_floating_axis(self, nth_coord, value, axes=None, axis_direction='bottom')

update_grid_finder(self, aux_trans=None, **kw)

mpl_toolkits.axisartist.parasite_axes

18.1.4 Matplotlib axes_grid Toolkit

Note: AxesGrid toolkit has been a part of matplotlib since v 0.99. Originally, the toolkit had a single namespace of axes_grid. In more recent version, the toolkit has divided into two separate namespace (axes_grid1 and axisartist). While axes_grid namespace is maintained for the backward compatibility, use of axes_grid1 and axisartist is recommended. For the documentation on axes_grid, see the previous version of the docs.

Matplotlib axes_grid1 Toolkit

The matplotlib mpl_toolkits.axes_grid1 toolkit is a collection of helper classes to ease displaying multiple images in matplotlib. While the aspect parameter in matplotlib adjust the position of the single axes, axes_grid1 toolkit provides a framework to adjust the position of multiple axes according to their aspects.

See What is axes_grid1 toolkit? for a guide on the usage of axes_grid1.

The submodules of the axes_grid1 API are:
Matplotlib, Release 3.1.3

The `axes_grid1` module provides helper classes to adjust the positions of multiple axes at drawing time.

- `axes_grid1.anchored_artists`
- `axes_grid1.axes_divider`
- `axes_grid1.axes_grid`
- `axes_grid1.axes_rgb`
- `axes_grid1.axes_size`
- `axes_grid1.colorbar`
- `axes_grid1.inset_locator`
- `axes_grid1.mpl_axes`
- `axes_grid1.parasite_axes`

Matplotlib axisartist Toolkit

The `axisartist` namespace includes a derived Axes implementation (`mpl_toolkits.axisartist.Axes`). The biggest difference is that the artists that are responsible for drawing axis lines, ticks, ticklabels, and axis labels are separated out from the mpl’s Axis class. This change was strongly motivated to support curvilinear grid.

You can find a tutorial describing usage of axisartist at the `axisartist` user guide.

The submodules of the `axisartist` API are:

- `axisartist.angle_helper`
- `axisartist.axes_divider`
- `axisartist.axes_grid`
- `axisartist.axes_rgb`
- `axisartist.axis_artist`
- `axisartist.axisline_style`
- `axisartist.axislines`
- `axisartist.clip_path`

Axislines includes modified implementation of the Axes class.

`axis_artist.py` module provides axis-related artists.

## 18.2 mplot3d API

### Contents

- **mplot3d API**
  - **axes3d**
  - **axis3d**
  - **art3d**
  - **Art3D Utility Functions**
  - **proj3d**

### 18.2.1 axes3d

**Note:** Significant effort went into bringing axes3d to feature-parity with regular axes objects for version 1.1.0. However, more work remains. Please report any functions that do not behave as expected as a bug. In addition, help and patches would be greatly appreciated!

```python
axes3d.Axes3D(fig[, rect, azim, elev, ...])  # 3D axes object.
```

```python
class mpl_toolkits.mplot3d.axes3d.Axes3D(fig, rect=None, *args, azim=-60, elev=30, zs=0, zs=None, sharez=None, proj_type='persp', **kwargs)
```

3D axes object.

**Parameters**

- **fig** [Figure] The parent figure.
- **rect** [(float, float, float, float)] The (left, bottom, width, height) axes position.
- **azim** [float, optional] Azimuthal viewing angle, defaults to -60.
**elev** [float, optional] Elevation viewing angle, defaults to 30.

**zscale** [[‘function’ | ‘functionlog’ | ‘linear’ | ‘log’ | ‘logit’ | ‘symlog’], optional] The z scale. Note that currently, only a linear scale is supported.

**sharez** [Axes3D, optional] Other axes to share z-limits with.

**proj_type** [[‘persp’, ‘ortho’]] The projection type, default ‘persp’.

### Notes

New in version 1.2.1: The `sharez` parameter.

```python
add_collection3d(self, col, zs=0, zdir='z')
```

Add a 3D collection object to the plot.

2D collection types are converted to a 3D version by modifying the object and adding z coordinate information.

### Supported are:

- PolyCollection
- LineCollection
- PatchCollection

```python
add_contour_set(self, cset, extend3d=False, stride=5, zdir='z', offset=None)
add_contourf_set(self, cset, zdir='z', offset=None)
```

### auto_scale_xyz

```python
auto_scale_xyz(self, X, Y, Z=None, had_data=None)
```

Convenience method for simple axis view autoscaling. See `matplotlib.axes.Axes.autoscale()` for full explanation. Note that this function applies to all three axes. Therefore, ‘z’ can be passed for `axis`, and ‘both’ applies to all three axes.

New in version 1.1.0.

```python
autoscale_view(self, tight=None, scalex=True, scaley=True, scalez=True)
```

Autoscale the view limits using the data limits. See `matplotlib.axes.Axes.autoscale_view()` for documentation. Note that this function applies to the 3D axes, and as such adds the `scalez` to the function arguments.

Changed in version 1.1.0: Function signature was changed to better match the 2D version. `tight` is now explicitly a kwarg and placed first.

Changed in version 1.2.1: This is now fully functional.

```python
bar(self, left, height, zs=0, zdir='z', *args, **kwargs)
```

Add 2D bar(s).

### Parameters

- **left** [1D array-like] The x coordinates of the left sides of the bars.
- **height** [1D array-like] The height of the bars.
- **zs** [scalar or 1D array-like] Z coordinate of bars; if a single value is specified, it will be used for all bars.
**zdir** [{‘x’, ‘y’, ‘z’}] When plotting 2D data, the direction to use as z (‘x’, ‘y’ or ‘z’); defaults to ‘z’.

**kwargs** Other arguments are forwarded to matplotlib.axes.Axes.bar.

Returns

mpl_toolkits.mplot3d.art3d.Patch3DCollection

bar3d(self, x, y, z, dx, dy, dz, color=None, zsort=’average’, shade=True, *args, **kwargs)

Generate a 3D barplot.

This method creates three dimensional barplot where the width, depth, height, and color of the bars can all be uniquely set.

**Parameters**

x, y, z [array-like] The coordinates of the anchor point of the bars.

dx, dy, dz [scalar or array-like] The width, depth, and height of the bars, respectively.

color [sequence of valid color specifications, optional] The color of the bars can be specified globally or individually. This parameter can be:
  - A single color value, to color all bars the same color.
  - An array of colors of length N bars, to color each bar independently.
  - An array of colors of length 6, to color the faces of the bars similarly.
  - An array of colors of length 6 * N bars, to color each face independently.

When coloring the faces of the boxes specifically, this is the order of the coloring:
1. -Z (bottom of box)
2. +Z (top of box)
3. -Y
4. +Y
5. -X
6. +X

zsort [str, optional] The z-axis sorting scheme passed onto Poly3DCollection

shade [bool, optional (default = True)] When true, this shades the dark sides of the bars (relative to the plot’s source of light).

**kwargs** Any additional keyword arguments are passed onto Poly3DCollection.

Returns
**collection** [Poly3DCollection] A collection of three dimensional polygons representing the bars.

can_pan(self)
Return True if this axes supports the pan/zoom button functionality.
3D axes objects do not use the pan/zoom button.

can_zoom(self)
Return True if this axes supports the zoom box button functionality.
3D axes objects do not use the zoom box button.

cla(self)
Clear axes

clabel(self, *args, **kwargs)
This function is currently not implemented for 3D axes. Returns None.

contour(self, X, Y, Z, *args, extend3d=False, stride=5, zdir='z', offset=None, **kwargs)
Create a 3D contour plot.

Parameters
X, Y, Z [array-likes] Input data.
extend3d [bool] Whether to extend contour in 3D; defaults to False.
stride [int] Step size for extending contour.
zdir [ {'x', 'y', 'z'} ] The direction to use; defaults to 'z'.
offset [scalar] If specified, plot a projection of the contour lines at this position in a plane normal to zdir
*args, **kwargs Other arguments are forwarded to matplotlib.axes.Axes.contour.

Returns
matplotlib.contour.QuadContourSet

contour3D(self, X, Y, Z, *args, extend3d=False, stride=5, zdir='z', offset=None, **kwargs)
Create a 3D contour plot.

Parameters
X, Y, Z [array-likes] Input data.
extend3d [bool] Whether to extend contour in 3D; defaults to False.
stride [int] Step size for extending contour.
zdir [ {'x', 'y', 'z'} ] The direction to use; defaults to 'z'.
offset [scalar] If specified, plot a projection of the contour lines at this position in a plane normal to zdir
*args, **kwargs Other arguments are forwarded to matplotlib.axes.Axes.contour.

Returns
matplotlib.contour.QuadContourSet
contourf(self, X, Y, Z, *args, zdir='z', offset=None, **kwargs)
Create a 3D filled contour plot.

Parameters

X, Y, Z [array-likes] Input data.

zdir [{'x', 'y', 'z'}] The direction to use; defaults to 'z'.

offset [scalar] If specified, plot a projection of the contour lines at this position in a plane normal to zdir

*args, **kwargs Other other arguments are forwarded to matplotlib.axes.Axes.contourf.

Returns

matplotlib.contour.QuadContourSet

Notes

New in version 1.1.0: The zdir and offset parameters.

contourf3D(self, X, Y, Z, *args, zdir='z', offset=None, **kwargs)
Create a 3D filled contour plot.

Parameters

X, Y, Z [array-likes] Input data.

zdir [{'x', 'y', 'z'}] The direction to use; defaults to 'z'.

offset [scalar] If specified, plot a projection of the contour lines at this position in a plane normal to zdir

*args, **kwargs Other other arguments are forwarded to matplotlib.axes.Axes.contourf.

Returns

matplotlib.contour.QuadContourSet

Notes

New in version 1.1.0: The zdir and offset parameters.

convert_zunits(self, z)
For artists in an axes, if the zaxis has units support, convert z using zaxis unit type
New in version 1.2.1.

disable_mouse_rotation(self)
Disable mouse button callbacks.

draw(self, renderer)
Draw everything (plot lines, axes, labels)

format_coord(self, xd, yd)
Given the 2D view coordinates attempt to guess a 3D coordinate. Looks for the nearest edge to the point and then assumes that the point is at the same z location as the nearest point on the edge.
format_zdata(self, z)
    Return z string formatted. This function will use the fmt_zdata attribute if it is callable, else will fall back on the zaxis major formatter

get_autoscale_on(self)
    Get whether autoscaling is applied for all axes on plot commands
    New in version 1.1.0: This function was added, but not tested. Please report any bugs.

get_autoscalez_on(self)
    Get whether autoscaling for the z-axis is applied on plot commands
    New in version 1.1.0: This function was added, but not tested. Please report any bugs.

get_axis_position(self)

get_frame_on(self)
    Get whether the 3D axes panels are drawn.

get_proj(self)
    Create the projection matrix from the current viewing position.
    elev stores the elevation angle in the z plane
    azim stores the azimuth angle in the x,y plane
    dist is the distance of the eye viewing point from the object point.

get_u_lims(self)
    Get 3D world limits.

get_xlim(self)
    Return the x-axis view limits.

    Returns
    left, right [(float, float)] The current x-axis limits in data coordinates.

    See also:

    set_xlim
    set_xbound, get_xbound
    invert_xaxis, xaxis_inverted

Notes

The x-axis may be inverted, in which case the left value will be greater than the right value.

Changed in version 1.1.0: This function now correctly refers to the 3D x-limits

get_xlim3d(self)
    Return the x-axis view limits.

    Returns
    left, right [(float, float)] The current x-axis limits in data coordinates.

    See also:
set_xlim
set_xbound, get_xbound
invert_xaxis, xaxis_inverted

Notes

The x-axis may be inverted, in which case the left value will be greater than the right value.

Changed in version 1.1.0: This function now correctly refers to the 3D x-limits.

get_ylim(self)
Return the y-axis view limits.

Returns

bottom, top [(float, float)] The current y-axis limits in data coordinates.

See also:

set_ylim
set_ybound, get_ybound
invert_yaxis, yaxis_inverted

Notes

The y-axis may be inverted, in which case the bottom value will be greater than the top value.

Changed in version 1.1.0: This function now correctly refers to the 3D y-limits.

get_ylim3d(self)
Return the y-axis view limits.

Returns

bottom, top [(float, float)] The current y-axis limits in data coordinates.

See also:

set_ylim
set_ybound, get_ybound
invert_yaxis, yaxis_inverted

Notes

The y-axis may be inverted, in which case the bottom value will be greater than the top value.

Changed in version 1.1.0: This function now correctly refers to the 3D y-limits.
get_zaxis(self)
Return the ZAxis (Axis) instance.

get_zbound(self)
Returns the z-axis numerical bounds where:

\[
\text{lowerBound} < \text{upperBound}
\]

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

get_zlabel(self)
Get the z-label text string.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

get_zlim(self)
Get 3D z limits.

get_zlim3d(self)
Get 3D z limits.

get_zmajorticklabels(self)
Get the ztick labels as a list of Text instances

New in version 1.1.0.

get_zminorticklabels(self)
Get the ztick labels as a list of Text instances

Note: Minor ticks are not supported. This function was added only for completeness.

New in version 1.1.0.

get_zscale(self)

get_zticklabels(self, minor=False)
Get ztick labels as a list of Text instances. See matplotlib.axes.Axes.get_yticklabels() for more details.

Note: Minor ticks are not supported.

New in version 1.1.0.

get_zticklines(self)
Get ztick lines as a list of Line2D instances. Note that this function is provided merely for completeness. These lines are re-calculated as the display changes.

New in version 1.1.0.

get_zticks(self, minor=False)
Return the z ticks as a list of locations See matplotlib.axes.Axes.get_yticks() for more details.

Note: Minor ticks are not supported.
New in version 1.1.0.

```
grid(self, b=True, **kwargs)
```
Set / unset 3D grid.

**Note:** Currently, this function does not behave the same as `matplotlib.axes.Axes.grid()`, but it is intended to eventually support that behavior.

Changed in version 1.1.0: This function was changed, but not tested. Please report any bugs.

```
have_units(self)
```
Return True if units are set on the x, y, or z axes

```
invert_zaxis(self)
```
Invert the z-axis.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

```
locator_params(self, axis=’both’, tight=None, **kwargs)
```
Convenience method for controlling tick locators.

See `matplotlib.axes.Axes.locator_params()` for full documentation. Note that this is for Axes3D objects, therefore, setting axis to ‘both’ will result in the parameters being set for all three axes. Also, axis can also take a value of ‘z’ to apply parameters to the z axis.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

```
margins(self, *margins, x=None, y=None, z=None, tight=True)
```
Convenience method to set or retrieve autoscaling margins.

**signatures:** margins()

returns xmargin, ymargin, zmargin

```
margins(margin)
margins(xmargin, ymargin, zmargin)
margins(x=xmargin, y=ymargin, z=zmargin)
margins(..., tight=False)
```

All forms above set the xmargin, ymargin and zmargin parameters. All keyword parameters are optional. A single positional argument specifies xmargin, ymargin and zmargin. Passing both positional and keyword arguments for xmargin, ymargin, and/or zmargin is invalid.

The `tight` parameter is passed to `autoscale_view()`, which is executed after a margin is changed; the default here is True, on the assumption that when margins are specified, no additional padding to match tick marks is usually desired. Setting `tight` to None will preserve the previous setting.

Specifying any margin changes only the autoscaling; for example, if `xmargin` is not None, then `xmargin` times the X data interval will be added to each end of that interval before it is used in autoscaling.
New in version 1.1.0.

```python
mouse_init(self, rotate_btn=1, zoom_btn=3)
```
Initializes mouse button callbacks to enable 3D rotation of the axes. Also optionally sets the mouse buttons for 3D rotation and zooming.

**Parameters**

- **rotate_btn** (int or list of int) The mouse button or buttons to use for 3D rotation of the axes; defaults to 1.
- **zoom_btn** (int or list of int) The mouse button or buttons to use to zoom the 3D axes; defaults to 3.

```python
name = '3d'
```

**plot**(*self, xs, ys, *args, zdir='z', **kwargs*)
Plot 2D or 3D data.

**Parameters**

- **xs** [1D array-like] x coordinates of vertices.
- **ys** [1D array-like] y coordinates of vertices.
- **zs** [scalar or 1D array-like] z coordinates of vertices; either one for all points or one for each point.
- **zdir** [\{'x', 'y', 'z'\}] When plotting 2D data, the direction to use as z ('x', 'y' or 'z'); defaults to 'z'.
- ****kwargs** Other arguments are forwarded to \*matplotlib.axes.Axes.plot.*

```python
plot3D(self, xs, ys, *args, zdir='z', **kwargs)
```
Plot 2D or 3D data.

**Parameters**

- **xs** [1D array-like] x coordinates of vertices.
- **ys** [1D array-like] y coordinates of vertices.
- **zs** [scalar or 1D array-like] z coordinates of vertices; either one for all points or one for each point.
- **zdir** [\{'x', 'y', 'z'\}] When plotting 2D data, the direction to use as z ('x', 'y' or 'z'); defaults to 'z'.
- ****kwargs** Other arguments are forwarded to \*matplotlib.axes.Axes.plot.*

```python
plot_surface(self, X, Y, Z, *args, norm=None, vmin=None, vmax=None, lightsource=None, **kwargs)
```
Create a surface plot.

By default it will be colored in shades of a solid color, but it also supports color mapping by supplying the **cmap** argument.

**Note:** The **rcount** and **ccount** kwargs, which both default to 50, determine the maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points.
Parameters

- **X, Y, Z** [2d arrays] Data values.
- **rcount, ccount** [int] Maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points. Defaults to 50.
  
  New in version 2.0.
- **rstride, cstride** [int] Downsampling stride in each direction. These arguments are mutually exclusive with *rcount* and *ccount*. If only one of *rstride* or *cstride* is set, the other defaults to 10.
  
  ‘classic’ mode uses a default of *rstride* = *cstride* = 10 instead of the new default of *rcount* = *ccount* = 50.
- **color** [color-like] Color of the surface patches.
- **cmap** [Colormap] Colormap of the surface patches.
- **facecolors** [array-like of colors.] Colors of each individual patch.
- **norm** [Normalize] Normalization for the colormap.
- **vmin, vmax** [float] Bounds for the normalization.
- **shade** [bool] Whether to shade the facecolors. Defaults to True. Shading is always disabled when *cmap* is specified.
- **lightsource** [LightSource] The lightsource to use when *shade* is True.

**kwargs Other arguments are forwarded to Poly3DCollection.

```python
plot_trisurf(self, *args, color=None, norm=None, vmin=None, vmax=None, lightsource=None, **kwargs)
```

Plot a triangulated surface.

The (optional) triangulation can be specified in one of two ways; either:

```python
plot_trisurf(triangulation, ...)
```

where triangulation is a *Triangulation* object, or:

```python
plot_trisurf(X, Y, ...)
plot_trisurf(X, Y, triangles, ...)
plot_trisurf(X, Y, triangles=triangles, ...)
```

in which case a Triangulation object will be created. See *Triangulation* for an explanation of these possibilities.

The remaining arguments are:

```python
plot_trisurf(..., Z)
```

where Z is the array of values to contour, one per point in the triangulation.

**Parameters**

- **X, Y, Z** [array-like] Data values as 1D arrays.
- **color** Color of the surface patches.
- **cmap** A colormap for the surface patches.
norm [Normalize] An instance of Normalize to map values to colors.

vmin, vmax [scalar, optional, default: None] Minimum and maximum value to map.

shade [bool] Whether to shade the facecolors. Defaults to True. Shading is always disabled when cmap is specified.

lightsource [LightSource] The lightsource to use when shade is True.

**kwargs All other arguments are passed on to Poly3DCollection

Examples

```
New in version 1.2.0.

plot_wireframe(self, X, Y, Z, *args, **kwargs)
    Plot a 3D wireframe.

Note: The rcount andccount kwargs, which both default to 50, determine the maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points.

Parameters

The arguments could be array-like or scalars, so long as they can be broadcast together. The arguments can also be masked arrays. If an element in any of argument is masked, then that corresponding quiver element will not be plotted.

**Parameters**

- **X, Y, Z** [array-like] The x, y and z coordinates of the arrow locations (default is tail of arrow; see pivot kwarg)
- **U, V, W** [array-like] The x, y and z components of the arrow vectors
- **length** [float] The length of each quiver, default to 1.0, the unit is the same with the axes
**arrow_length_ratio** [float] The ratio of the arrow head with respect to the quiver, default to 0.3

**pivot** [{'tail', 'middle', 'tip'}] The part of the arrow that is at the grid point; the arrow rotates about this point, hence the name pivot. Default is 'tail'

**normalize** [bool] When True, all of the arrows will be the same length. This defaults to False, where the arrows will be different lengths depending on the values of u,v,w.

**kwargs** Any additional keyword arguments are delegated to LineCollection

```python
quiver3d(X, Y, Z, U, V, W, /, length=1, arrow_length_ratio=.3, pivot='tail', normalize=False, **kwargs)
```

Plot a 3D field of arrows.

The arguments could be array-like or scalars, so long as they they can be broadcast together. The arguments can also be masked arrays. If an element in any of argument is masked, then that corresponding quiver element will not be plotted.

**Parameters**

**X, Y, Z** [array-like] The x, y and z coordinates of the arrow locations (default is tail of arrow; see pivot kwarg)

**U, V, W** [array-like] The x, y and z components of the arrow vectors

**length** [float] The length of each quiver, default to 1.0, the unit is the same with the axes

**arrow_length_ratio** [float] The ratio of the arrow head with respect to the quiver, default to 0.3

**pivot** [{'tail', 'middle', 'tip'}] The part of the arrow that is at the grid point; the arrow rotates about this point, hence the name pivot. Default is 'tail'

**normalize** [bool] When True, all of the arrows will be the same length. This defaults to False, where the arrows will be different lengths depending on the values of u,v,w.

**kwargs** Any additional keyword arguments are delegated to LineCollection

```python
scatter(self, xs, ys, zs=0, zdir='z', s=20, c=None, depthshade=True, *args, **kwargs)
```

Create a scatter plot.

**Parameters**

**xs, ys** [array-like] The data positions.

**zs** [float or array-like, optional, default: 0] The z-positions. Either an array of the same length as xs and ys or a single value to place all points in the same plane.

**zdir** [{'x', 'y', 'z', '-x', '-y', '-z'}, optional, default: 'z'] The axis direction for the zs. This is useful when plotting 2D data on a 3D Axes. The data must be passed as xs, ys. Setting zdir to 'y' then plots the data to the x-z-plane.

See also /gallery/mplot3d/2dcollections3d.
s [scalar or array-like, optional, default: 20] The marker size in points**2. Either an array of the same length as xs and ys or a single value to make all markers the same size.

c [color, sequence, or sequence of color, optional] The marker color. Possible values:
  • A single color format string.
  • A sequence of color specifications of length n.
  • A sequence of n numbers to be mapped to colors using cmap and norm.
  • A 2-D array in which the rows are RGB or RGBA.
  For more details see the c argument of scatter.

depthshade [bool, optional, default: True] Whether to shade the scatter markers to give the appearance of depth. Each call to scatter() will perform its depthshading independently.

**kwargs All other arguments are passed on to scatter.

Returns
  paths [PathCollection]

scatter3D(self, xs, ys, zs=0, zdir='z', s=20, c=None, depthshade=True, *args, **kwargs)
Create a scatter plot.

Parameters
  xs, ys [array-like] The data positions.

  zs [float or array-like, optional, default: 0] The z-positions. Either an array of the same length as xs and ys or a single value to place all points in the same plane.

  zdir [{'x', 'y', 'z', '-x', '-y', '-z'}, optional, default: 'z'] The axis direction for the zs. This is useful when plotting 2D data on a 3D Axes. The data must be passed as xs, ys. Setting zdir to 'y' then plots the data to the x-z-plane.
  See also /gallery/mplot3d/2dcollections3d.

  s [scalar or array-like, optional, default: 20] The marker size in points**2. Either an array of the same length as xs and ys or a single value to make all markers the same size.

  c [color, sequence, or sequence of color, optional] The marker color. Possible values:
  • A single color format string.
  • A sequence of color specifications of length n.
  • A sequence of n numbers to be mapped to colors using cmap and norm.
  • A 2-D array in which the rows are RGB or RGBA.
  For more details see the c argument of scatter.
**depthshade**  [bool, optional, default: True] Whether to shade the scatter markers to give the appearance of depth. Each call to `scatter()` will perform its depthshading independently.

**kwargs**  All other arguments are passed on to `scatter`.

Returns

paths  [PathCollection]

**set_autoscale_on**(self, b)
Set whether autoscaling is applied on plot commands

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

Parameters

b  [bool]

**set_autoscalez_on**(self, b)
Set whether autoscaling for the z-axis is applied on plot commands

New in version 1.1.0.

Parameters

b  [bool]

**set_axis_off**(self)
Turn the x- and y-axis off.

This affects the axis lines, ticks, ticklabels, grid and axis labels.

**set_axis_on**(self)
Turn the x- and y-axis on.

This affects the axis lines, ticks, ticklabels, grid and axis labels.

**set_frame_on**(self, b)
Set whether the 3D axes panels are drawn.

Parameters

b  [bool]

**set_proj_type**(self, proj_type)
Set the projection type.

Parameters

proj_type  [str] Type of projection, accepts ‘persp’ and ‘ortho’.

**set_title**(self, label, fontdict=None, loc=’center’, **kwargs)
Set a title for the axes.

Set one of the three available axes titles. The available titles are positioned above the axes in the center, flush with the left edge, and flush with the right edge.

Parameters

label  [str] Text to use for the title

fontdict  [dict] A dictionary controlling the appearance of the title text, the default fontdict is:
{'fontsize': rcParams['axes.titlesize'],
'fontweight' : rcParams['axes.titleweight'],
'verticalalignment': 'baseline',
'horizontalalignment': 'loc'}

loc [{{'center', 'left', 'right'}, str, optional}] Which title to set, defaults to 'center'

pad [float] The offset of the title from the top of the axes, in points. Default is None to use rcParams['axes.titlepad'].

Returns
text [Text] The matplotlib text instance representing the title

Other Parameters

**kwargs [Text properties] Other keyword arguments are text properties, see Text for a list of valid text properties.

set_top_view(self)

set_xlim(self, left=None, right=None, emit=True, auto=False, *, xmin=None, xmax=None)
Set 3D x limits.

See matplotlib.axes.Axes.set_xlim() for full documentation.

set_xlim3d(self, left=None, right=None, emit=True, auto=False, *, xmin=None, xmax=None)
Set 3D x limits.

See matplotlib.axes.Axes.set_xlim() for full documentation.

set_xscale(self, value, **kwargs)
Set the x-axis scale.

Parameters

value [{"linear"}] The axis scale type to apply. 3D axes currently only support linear scales; other scales yield nonsensical results.

**kwargs Keyword arguments are nominally forwarded to the scale class, but none of them is applicable for linear scales.

set_ylim(self, bottom=None, top=None, emit=True, auto=False, *, ymin=None, ymax=None)
Set 3D y limits.

See matplotlib.axes.Axes.set_ylim() for full documentation.

set_ylim3d(self, bottom=None, top=None, emit=True, auto=False, *, ymin=None, ymax=None)
Set 3D y limits.

See matplotlib.axes.Axes.set_ylim() for full documentation.

set_yscale(self, value, **kwargs)
Set the y-axis scale.

Parameters

value [{"linear"}] The axis scale type to apply. 3D axes currently only support linear scales; other scales yield nonsensical results.
**kwargs: Keyword arguments are nominally forwarded to the scale class, but none of them is applicable for linear scales.

```python
set_zbound(self, lower=None, upper=None)
```
Set the lower and upper numerical bounds of the z-axis. This method will honor axes inversion regardless of parameter order. It will not change the _autoscaleZon attribute.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

```python
set_zlabel(self, zlabel, fontdict=None, labelpad=None, **kwargs)
```
Set zlabel. See doc for set_ylabel() for description.

```python
set_zlim(self, bottom=None, top=None, emit=True, auto=False, *, zmin=None, zmax=None)
```
Set 3D z limits.

See `matplotlib.axes.Axes.set_ylim()` for full documentation.

```python
set_zlim3d(self, bottom=None, top=None, emit=True, auto=False, *, zmin=None, zmax=None)
```
Set 3D z limits.

See `matplotlib.axes.Axes.set_ylim()` for full documentation.

```python
set_zmargin(self, m)
```
Set padding of Z data limits prior to autoscaling.

- m times the data interval will be added to each end of that interval before it is used in autoscaling.

accepts: float in range 0 to 1

New in version 1.1.0.

```python
set_zscale(self, value, **kwargs)
```
Set the z-axis scale.

**Parameters**

- `value` [{"linear"]: The axis scale type to apply. 3D axes currently only support linear scales; other scales yield nonsensical results.

- **kwargs: Keyword arguments are nominally forwarded to the scale class, but none of them is applicable for linear scales.

```python
set_zticklabels(self, *args, **kwargs)
```
Set z-axis tick labels. See `matplotlib.axes.Axes.set_yticklabels()` for more details.

**Note:** Minor ticks are not supported by Axes3D objects.

New in version 1.1.0.

```python
set_zticks(self, *args, **kwargs)
```
Set z-axis tick locations. See `matplotlib.axes.Axes.set_yticks()` for more details.

**Note:** Minor ticks are not supported.

New in version 1.1.0.
text(self, x, y, z, s, zdir=None, **kwargs)
    Add text to the plot. kwargs will be passed on to Axes.text, except for the zdir keyword, which sets the direction to be used as the z direction.

text2D(self, x, y, s, fontdict=None, withdash=<deprecated parameter>, **kwargs)
    Add text to the axes.
    Add the text s to the axes at location x, y in data coordinates.

Parameters

x, y [scalars] The position to place the text. By default, this is in data coordinates. The coordinate system can be changed using the transform parameter.
s [str] The text.
fontdict [dictionary, optional, default: None] A dictionary to override the default text properties. If fontdict is None, the defaults are determined by your rc parameters.

Returns

text [Text] The created Text instance.

Other Parameters

**kwargs [Text properties.] Other miscellaneous text parameters.

Examples

Individual keyword arguments can be used to override any given parameter:

```python
>>> text(x, y, s, fontsize=12)
```

The default transform specifies that text is in data coords, alternatively, you can specify text in axis coords (0,0 is lower-left and 1,1 is upper-right). The example below places text in the center of the axes:

```python
>>> text(0.5, 0.5, 'matplotlib', horizontalalignment='center',
...      verticalalignment='center', transform=ax.transAxes)
```

You can put a rectangular box around the text instance (e.g., to set a background color) by using the keyword bbox. bbox is a dictionary of Rectangle properties. For example:

```python
>>> text(x, y, s, bbox=dict(facecolor='red', alpha=0.5))
```

text3D(self, x, y, z, s, zdir=None, **kwargs)
    Add text to the plot. kwargs will be passed on to Axes.text, except for the zdir keyword, which sets the direction to be used as the z direction.

tick_params(self, axis='both', **kwargs)
    Convenience method for changing the appearance of ticks and tick labels.
    See matplotlib.axes.Axes.tick_params() for more complete documentation.
The only difference is that setting `axis` to 'both' will mean that the settings are applied to all three axes. Also, the `axis` parameter also accepts a value of 'z', which would mean to apply to only the z-axis.

Also, because of how Axes3D objects are drawn very differently from regular 2D axes, some of these settings may have ambiguous meaning. For simplicity, the 'z' axis will accept settings as if it was like the 'y' axis.

**Note:** Axes3D currently ignores some of these settings.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

```python
ticklabel_format(self, *, style=",", scilimits=None, useOffset=None, axis='both')
```

Convenience method for manipulating the ScalarFormatter used by default for linear axes in Axes3D objects.

See `matplotlib.axes.Axes.ticklabel_format()` for full documentation. Note that this version applies to all three axes of the Axes3D object. Therefore, the `axis` argument will also accept a value of 'z' and the value of 'both' will apply to all three axes.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

```python
tricontour(self, *args, extend3d=False, stride=5, zdir='z', offset=None, **kwargs)
```

Create a 3D contour plot.

Changed in version 1.3.0: Added support for custom triangulations

**Note:** This method currently produces incorrect output due to a longstanding bug in 3D PolyCollection rendering.

**Parameters**

- `X, Y, Z` [array-likes] Input data.
- `extend3d` [bool] Whether to extend contour in 3D; defaults to False.
- `stride` [int] Step size for extending contour.
- `zdir` [ {'x', 'y', 'z'} ] The direction to use; defaults to 'z'.
- `offset` [scalar] If specified, plot a projection of the contour lines at this position in a plane normal to zdir

*args, **kwargs Other arguments are forwarded to `matplotlib.axes.Axes.tricontour`.

**Returns**

`matplotlib.tri.tricontour.TriContourSet`

```python
tricontourf(self, *args, zdir='z', offset=None, **kwargs)
```

Create a 3D filled contour plot.

**Note:** This method currently produces incorrect output due to a longstanding bug in 3D PolyCollection rendering.
Parameters

X, Y, Z [array-likes] Input data.

zdir [{'x', 'y', 'z'}] The direction to use; defaults to 'z'.

offset [scalar] If specified, plot a projection of the contour lines at this position in a plane normal to zdir

*args, **kwargs Other arguments are forwarded to matplotlib.axes.Axes.tricontourf.

Returns

matplotlib.tri.tricontour.TriContourSet

Notes

New in version 1.1.0: The zdir and offset parameters.

Changed in version 1.3.0: Added support for custom triangulations

tunit_cube(self, vals=None, M=None)
tunit_edges(self, vals=None, M=None)
unit_cube(self, vals=None)
update_datalim(self, xys, **kwargs)
    Extend the dataLim BBox to include the given points.
    If no data is set currently, the BBox will ignore its limits and set the bound to be the bounds of the xydata (xys). Otherwise, it will compute the bounds of the union of its current data and the data in xys.

Parameters

xys [2D array-like] The points to include in the data limits BBox. This can be either a list of (x, y) tuples or a Nx2 array.

updatex, updatey [bool, optional, default True] Whether to update the x/y limits.

view_init(self, elev=None, azim=None)
    Set the elevation and azimuth of the axes in degrees (not radians).
    This can be used to rotate the axes programmatically.
    'elev' stores the elevation angle in the z plane (in degrees). 'azim' stores the azimuth angle in the x,y plane (in degrees).
    If elev or azim are None (default), then the initial value is used which was specified in the Axes3D constructor.

voxels([x, y, z], filled, facecolors=None, edgecolors=None, **kwargs)
    Plot a set of filled voxels
    All voxels are plotted as 1x1x1 cubes on the axis, with filled[0,0,0] placed with its lower corner at the origin. Occluded faces are not plotted.
    New in version 2.1.

Parameters
filled [3D np.array of bool] A 3d array of values, with truthy values indicating which voxels to fill

x, y, z [3D np.array, optional] The coordinates of the corners of the voxels. This should broadcast to a shape one larger in every dimension than the shape of filled. These can be used to plot non-cubic voxels.

If not specified, defaults to increasing integers along each axis, like those returned by `indices()`. As indicated by the / in the function signature, these arguments can only be passed positionally.

facecolors, edgecolors [array_like, optional] The color to draw the faces and edges of the voxels. Can only be passed as keyword arguments. This parameter can be:

- A single color value, to color all voxels the same color. This can be either a string, or a 1D rgb/rgba array
- None, the default, to use a single color for the faces, and the style default for the edges.
- A 3D ndarray of color names, with each item the color for the corresponding voxel. The size must match the voxels.
- A 4D ndarray of rgb/rgba data, with the components along the last axis.

shade [bool] Whether to shade the facecolors. Defaults to True. Shading is always disabled when cmap is specified.

New in version 3.1.

lightsource [LightSource] The lightsource to use when shade is True.

New in version 3.1.

**kwargs Additional keyword arguments to pass onto `Poly3DCollection()`

Returns

faces [dict] A dictionary indexed by coordinate, where faces[i,j,k] is a Poly3DCollection of the faces drawn for the voxel filled[i,j,k]. If no faces were drawn for a given voxel, either because it was not asked to be drawn, or it is fully occluded, then (i,j,k) not in faces.

Examples

zaxis_date(self, tz=None)
Sets up z-axis ticks and labels that treat the z data as dates.

tz is a timezone string or tzinfo instance. Defaults to rc value.

**Note:** This function is merely provided for completeness. Axes3D objects do not officially support dates for ticks, and so this may or may not work as expected.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.
zaxis_inverted(self)
Returns True if the z-axis is inverted.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

18.2.2 axis3d

Note: See mpl_toolkits.mplot3d.axis3d._axinfo for a dictionary containing constants that may be modified for controlling the look and feel of mplot3d axes (e.g., label spacing, font colors and panel colors). Historically, axis3d has suffered from having hard-coded constants that precluded user adjustments, and this dictionary was implemented in version 1.1 as a stop-gap measure.

axis3d.Axis(adir, v_intervalx, d_intervalx, An Axis class for the 3D plots.
...

mpl_toolkits.mplot3d.axis3d.Axis

class mpl_toolkits.mplot3d.axis3d.Axis(adir, v_intervalx, d_intervalx, axes, *args, rotate_label=None, **kwargs)

Bases: matplotlib.axis.XAxis

An Axis class for the 3D plots.

d_interval
draw(self, renderer)
Draw the axis lines, grid lines, tick lines and labels
set_rotate_label(self, val)

Whether to rotate the axis label: True, False or None. If set to None the label will be rotated if longer than 4 chars.

v_interval

18.2.3 art3d

<table>
<thead>
<tr>

<td>Text object with 3D position and direction.</td>
</tr>
</tbody>
</table>

mpl_toolkits.mplot3d.art3d.Line3D

class mpl_toolkits.mplot3d.art3d.Line3D(xs, ys, zs, *args, **kwargs)

Bases: matplotlib.lines.Line2D

3D line object.

Keyword arguments are passed onto Line2D().

draw(self, renderer)

This method will be overridden in the Artist subclasses. Typically, it is implemented to not have any effect if the Artist is not visible (Artist.get_visible is False).
Notes

Accepts x, y, z arguments or a single array_like (x, y, z)

**mpl_toolkits.mplot3d.art3d.Line3DCollection**

```python
class mpl_toolkits.mplot3d.art3d.Line3DCollection(segments, linewidths=None, colors=None, antialiaseds=None, linestyles='solid', offsets=None, transOffset=None, norm=None, cmap=None, pickradius=5, zorder=2, facecolors='none', **kwargs)
```

**Bases:** *matplotlib.collections.LineCollection*

A collection of 3D lines.

**Parameters**

- **segments** A sequence of \((line0, line1, line2)\), where:

  ```
  linen = (x0, y0), (x1, y1), \ldots (xm, ym)
  ```

  or the equivalent numpy array with two columns. Each line can be a different length.
colors [sequence, optional] A sequence of RGBA tuples (e.g., arbitrary color strings, etc, not allowed).

antialiaseds [sequence, optional] A sequence of ones or zeros.

linestyles [string, tuple, optional] Either one of [‘solid’ | ‘dashed’ | ‘dash-dot’ | ‘dotted’], or a dash tuple. The dash tuple is:

```
(offset, onoffseq)
```

where onoffseq is an even length tuple of on and off ink in points.

norm [Normalize, optional] Normalize instance.

cmap [string or Colormap, optional] Colormap name or Colormap instance.

pickradius [float, optional] The tolerance in points for mouse clicks picking a line. Default is 5 pt.

facecolors [optional] The facecolors of the LineCollection. Default is ‘none’. Setting to a value other than ‘none’ will lead to a filled polygon being drawn between points on each line.
Notes

If `linewidths`, `colors`, or `antialiaseds` is None, they default to their rcParams setting, in sequence form.

If `offsets` and `transOffset` are not None, then `offsets` are transformed by `transOffset` and applied after the segments have been transformed to display coordinates.

If `offsets` is not None but `transOffset` is None, then the `offsets` are added to the segments before any transformation. In this case, a single offset can be specified as:

```
offsets=(xo,yo)
```

and this value will be added cumulatively to each successive segment, so as to produce a set of successively offset curves.

The use of `ScalarMappable` is optional. If the `ScalarMappable` array `_A` is not None (i.e., a call to `set_array()` has been made), at draw time a call to scalar mappable will be made to set the colors.

```python
do_3d_projection(self, renderer)
    Project the points according to renderer matrix.

draw(self, renderer, project=False)
    Draw the Artist using the given renderer.
    This method will be overridden in the Artist subclasses. Typically, it is implemented to not have any effect if the Artist is not visible (Artist.get_visible is False).
```

**Parameters**

- `renderer` ([`RendererBase` subclass.]

```python
set_segments(self, segments)
    Set 3D segments.

set_sort_zpos(self, val)
    Set the position to use for z-sorting.
```

class mpl_toolkits.mplot3d.art3d.Patch3D

```python
class mpl_toolkits.mplot3d.art3d.Patch3D(*args, zs=(), zdir='z', **kwargs)
    Bases: matplotlib.patches.Patch
    3D patch object.

do_3d_projection(self, renderer)

get_facecolor(self)
    Return the face color of the Patch.

get_path(self)
    Return the path of this patch

set_3d_properties(self, verts, zs=0, zdir='z')
```
class mpl_toolkits.mplot3d.art3d.Patch3DCollection(*args, zs=0, zdir='z', depthshade=True, **kwargs)

Bases: matplotlib.collections.PatchCollection

A collection of 3D patches.

Create a collection of flat 3D patches with its normal vector pointed in \textit{zdir} direction, and located at \textit{zs} on the \textit{zdir} axis. 'zs' can be a scalar or an array-like of the same length as the number of patches in the collection.

Constructor arguments are the same as for \textit{PatchCollection}. In addition, keywords \textit{zs}=0 and \textit{zdir}='z' are available.

Also, the keyword argument "depthshade" is available to indicate whether or not to shade the patches in order to give the appearance of depth (default is \textit{True}). This is typically desired in scatter plots.

do_3d_projection(self, renderer)

set_3d_properties(self, zs, zdir)

set_sort_zpos(self, val)

Set the position to use for z-sorting.

class mpl_toolkits.mplot3d.art3d.Path3DCollection(*args, zs=0, zdir='z', depthshade=True, **kwargs)

Bases: matplotlib.collections.PathCollection

A collection of 3D paths.

Create a collection of flat 3D paths with its normal vector pointed in \textit{zdir} direction, and located at \textit{zs} on the \textit{zdir} axis. 'zs' can be a scalar or an array-like of the same length as the number of paths in the collection.

Constructor arguments are the same as for \textit{PathCollection}. In addition, keywords \textit{zs}=0 and \textit{zdir}='z' are available.

Also, the keyword argument "depthshade" is available to indicate whether or not to shade the patches in order to give the appearance of depth (default is \textit{True}). This is typically desired in scatter plots.

do_3d_projection(self, renderer)

set_3d_properties(self, zs, zdir)

set_sort_zpos(self, val)

Set the position to use for z-sorting.

class mpl_toolkits.mplot3d.art3d.PathPatch3D

Bases: mpl_toolkits.mplot3d.art3d.Patch3D

3D PathPatch object.

do_3d_projection(self, renderer)
set_3d_properties(self, path, zs=0, zdir='z')

Examples using mpl_toolkits.mplot3d.art3d.PathPatch3D

• sphx_glr_gallery_mplot3d_pathpatch3d.py

mpl_toolkits.mplot3d.art3d.Poly3DCollection

class mpl_toolkits.mplot3d.art3d.Poly3DCollection(verts, *args, zsort='average', **kwargs)

Bases: matplotlib.collections.PolyCollection
A collection of 3D polygons.
Create a Poly3DCollection.
verts should contain 3D coordinates.
Keyword arguments: zsort, see set_zsort for options.
Note that this class does a bit of magic with the _facecolors and _edgecolors properties.

do_3d_projection(self, renderer)
    Perform the 3D projection for this object.
get_edgecolor(self)
get_facecolor(self)
get_vector(self, segments3d)
    Optimize points for projection.
set_3d_properties(self)
set_alpha(self, alpha)
    Set the alpha transparencies of the collection.

Parameters

alpha [float or None]

set_edgecolor(self, colors)
    Set the edgecolor(s) of the collection.

Parameters

c [color or sequence of colors or ‘face’] The collection edgecolor(s).
    If a sequence, the patches cycle through it. If ‘face’, match the facecolor.

set_facecolor(self, colors)
    Set the facecolor(s) of the collection. c can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.
    If c is ‘none’, the patch will not be filled.

Parameters

c [color or sequence of colors]
set_sort_zpos(self, val)
    Set the position to use for z-sorting.

set_verts(self, verts, closed=True)
    Set 3D vertices.

set_verts_and_codes(self, verts, codes)
    Sets 3D vertices with path codes.

set_zsort(self, zsort)
    Sets the calculation method for the z-order.

Parameters

    zsort {‘average’, ‘min’, ‘max’}] The function applied on the z-coordinates of the vertices in the viewer's coordinate system, to determine the z-order. True is deprecated and equivalent to ‘average’.

Examples using mpl_toolkits.mplot3d.art3d.Poly3DCollection

- sphx_glr_gallery_pyplots_whats_new_1_subplot3d.py
- sphx_glr_gallery_frontpage_3D.py
- sphx_glr_gallery_mplot3d_custom_shaded_3d_surface.py
- sphx_glr_gallery_mplot3d_mixed_subplots.py
- sphx_glr_gallery_mplot3d_polys3d.py
- sphx_glr_gallery_mplot3d_subplot3d.py
- sphx_glr_gallery_mplot3d_surface3d.py
- sphx_glr_gallery_mplot3d_surface3d_3.py

mpl_toolkits.mplot3d.art3d.Text3D

class mpl_toolkits.mplot3d.art3d.Text3D(x=0, y=0, z=0, text='', zdir='z', **kwargs)
    Bases: matplotlib.text.Text

    Text object with 3D position and direction.

Parameters

    x, y, z The position of the text.
    text [str] The text string to display.
    zdir [{‘x’, ‘y’, ‘z’, None, 3-tuple}] The direction of the text. See get_dir_vector for a description of the values.

Other Parameters

    **kwargs All other parameters are passed on to Text.

draw(self, renderer)
    Draws the Text object to the given renderer.

get_tightbbox(self, renderer)
    Like Artist.get_window_extent, but includes any clipping.
Parameters

renderer [RendererBase instance] renderer that will be used to draw the figures (i.e. fig.canvas.get_renderer())

Returns

bbox [BBox] The enclosing bounding box (in figure pixel co-ordinates).

set_3d_properties(self, z=0, zdir='z')

</table>
[Deprecated] Stretch the color argument to provide the required number `num`.

**Notes**

Deprecated since version 3.1.

### mpl_toolkits.mplot3d.art3d.get_dir_vector

`mpl_toolkits.mplot3d.art3d.get_dir_vector(zdir)`

Return a direction vector.

**Parameters**

- `zdir` [{‘x’, ‘y’, ‘z’, None, 3-tuple}] The direction. Possible values are: - ‘x’: equivalent to (1, 0, 0) - ‘y’: equivalent to (0, 1, 0) - ‘z’: equivalent to (0, 0, 1) - None: equivalent to (0, 0, 0) - an iterable (x, y, z) is returned unchanged.

**Returns**

- `x, y, z` [array-like] The direction vector. This is either a numpy.array or `zdir` itself if `zdir` is already a length-3 iterable.

### mpl_toolkits.mplot3d.art3d.get_patch_verts

`mpl_toolkits.mplot3d.art3d.get_patch_verts(patch)`

[Deprecated] Return a list of vertices for the path of a patch.

**Notes**

Deprecated since version 3.1.

### mpl_toolkits.mplot3d.art3d.juggle_axes

`mpl_toolkits.mplot3d.art3d.juggle_axes(xs, ys, zs, zdir)`

Reorder coordinates so that 2D `xs`, `ys` can be plotted in the plane orthogonal to `zdir`. `zdir` is normally `x`, `y` or `z`. However, if `zdir` starts with a ‘-’ it is interpreted as a compensation for `rotate_axes`.

### mpl_toolkits.mplot3d.art3d.line_2d_to_3d

`mpl_toolkits.mplot3d.art3d.line_2d_to_3d(line, zs=0, zdir=’z’)`

Convert a 2D line to 3D.

### mpl_toolkits.mplot3d.art3d.line_collection_2d_to_3d

`mpl_toolkits.mplot3d.art3d.line_collection_2d_to_3d(col, zs=0, zdir=’z’)`

Convert a LineCollection to a Line3DCollection object.
**mpl_toolkits.mplot3d.art3d.norm_angle**

\[ \text{Deprecated] Return the given angle normalized to } -180 < \alpha \leq 180 \, \text{degrees.} \]

**Notes**

Deprecated since version 3.1.

**mpl_toolkits.mplot3d.art3d.norm_text_angle**

\[ \text{Deprecated] Return the given angle normalized to } -90 < \alpha \leq 90 \, \text{degrees.} \]

**Notes**

Deprecated since version 3.1.

**mpl_toolkits.mplot3d.art3d.patch_2d_to_3d**

\[ \text{Convert a Patch to a Patch3D object.} \]

**mpl_toolkits.mplot3d.art3d.patch_collection_2d_to_3d**

\[ \text{Convert a PatchCollection into a Patch3DCollection object (or a PathCollection into a Path3DCollection object).} \]

**Parameters**

- \(za\) The location or locations to place the patches in the collection along the \(zdir\) axis. Default: 0.
- \(zdir\) The axis in which to place the patches. Default: "z".
- \(depthshade\) Whether to shade the patches to give a sense of depth. Default: True.

**mpl_toolkits.mplot3d.art3d.path_to_3d_segment**

\[ \text{Deprecated] Convert a path to a 3D segment.} \]

**Notes**

Deprecated since version 3.1.
mpl_toolkits.mplot3d.art3d.path_to_3d_segment_with_codes

mpl_toolkits.mplot3d.art3d.path_to_3d_segment_with_codes(path, zs=0, zdir='z')
    [Deprecated] Convert a path to a 3D segment with path codes.

Notes

Deprecated since version 3.1.

mpl_toolkits.mplot3d.art3d.pathpatch_2d_to_3d

mpl_toolkits.mplot3d.art3d.pathpatch_2d_to_3d(pathpatch, z=0, zdir='z')
    Convert a PathPatch to a PathPatch3D object.

Examples using mpl_toolkits.mplot3d.art3d.pathpatch_2d_to_3d

• sphx_glr_gallery_mplot3d_pathpatch3d.py

mpl_toolkits.mplot3d.art3d.paths_to_3d_segments

mpl_toolkits.mplot3d.art3d.paths_to_3d_segments(paths, zs=0, zdir='z')
    [Deprecated] Convert paths from a collection object to 3D segments.

Notes

Deprecated since version 3.1.

mpl_toolkits.mplot3d.art3d.paths_to_3d_segments_with_codes

mpl_toolkits.mplot3d.art3d.paths_to_3d_segments_with_codes(paths, zs=0, zdir='z')
    [Deprecated] Convert paths from a collection object to 3D segments with path codes.

Notes

Deprecated since version 3.1.

mpl_toolkits.mplot3d.art3d.poly_collection_2d_to_3d

mpl_toolkits.mplot3d.art3d.poly_collection_2d_to_3d(col, zs=0, zdir='z')
    Convert a PolyCollection to a Poly3DCollection object.
mpl_toolkits.mplot3d.art3d.rotate_axes

mpl_toolkits.mplot3d.art3d.rotate_axes(xs, ys, zs, zdir)
Reorder coordinates so that the axes are rotated with zdir along the original z axis. Prepending the axis with a ‘-’ does the inverse transform, so zdir can be x, -x, y, -y, z or -z

mpl_toolkits.mplot3d.art3d.text_2d_to_3d

mpl_toolkits.mplot3d.art3d.text_2d_to_3d(obj, z=0, zdir='z')
Convert a Text to a Text3D object.

mpl_toolkits.mplot3d.art3d.zalpha

mpl_toolkits.mplot3d.art3d.zalpha(colors, zs)

[Deprecated] Modify the alphas of the color list according to depth.

Notes
Deprecated since version 3.1.

18.2.5 proj3d

proj3d.inv_transform(xs, ys, zs, M)
proj3d.line2d(p0, p1)
[Deprecated] Return 2D equation of line in the form ax+by+c = 0
proj3d.line2d_dist(l, p)
[Deprecated] Distance from line to point line is a tuple of coefficients a, b, c
proj3d.line2d_seg_dist(p1, p2, p0)
[Deprecated] distance(s) from line defined by p1 - p2 to point(s) p0
proj3d.mod(v)
[Deprecated] 3d vector length
proj3d.persp_transformation(zfront, zback)
proj3d.proj_points(points, M)
proj3d.proj_trans_clip_points(points, M)
[Deprecated]
proj3d.proj_transform(xs, ys, zs, M)
Transform the points by the projection matrix
proj3d.proj_transform_clip(xs, ys, zs, M)
Transform the points by the projection matrix and return the clipping result returns txs,tsy,tzs,tis
proj3d.proj_transform_vec(vec, M)
[Deprecated]
proj3d.proj_transform_vec_clip(vec, M)
[Deprecated]
proj3d.rot_x(V, alpha)
proj3d.transform(xs, ys, zs)
Transform the points by the projection matrix
proj3d.vec_pad_ones(xs, ys, zs)
[Deprecated]
proj3d.view_transformation(E, R, V)

Continued on next page
Table 41 – continued from previous page

`proj3d.world_transformation(xmin, xmax, ...)`

`mpl_toolkits.mplot3d.proj3d.inv_transform`

`mpl_toolkits.mplot3d.proj3d.inv_transform(xs, ys, zs, M)`

`mpl_toolkits.mplot3d.proj3d.line2d`

`mpl_toolkits.mplot3d.proj3d.line2d(p0, p1)`

[Deprecated] Return 2D equation of line in the form \( ax+by+c = 0 \)

**Notes**

Deprecated since version 3.1.

`mpl_toolkits.mplot3d.proj3d.line2d_dist`

`mpl_toolkits.mplot3d.proj3d.line2d_dist(l, p)`

[Deprecated] Distance from line to point line is a tuple of coefficients \( a, b, c \)

**Notes**

Deprecated since version 3.1.

`mpl_toolkits.mplot3d.proj3d.line2d_seg_dist`

`mpl_toolkits.mplot3d.proj3d.line2d_seg_dist(p1, p2, p0)`

[Deprecated] distance(s) from line defined by \( p1 - p2 \) to point(s) \( p0 \)

\[ p0[0] = x(s) \]
\[ p0[1] = y(s) \]

intersection point \( p = p1 + u*(p2-p1) \) and intersection point lies within segment if \( u \) is between 0 and 1

**Notes**

Deprecated since version 3.1.

`mpl_toolkits.mplot3d.proj3d.mod`

`mpl_toolkits.mplot3d.proj3d.mod(v)`

[Deprecated] 3d vector length
Notes

Deprecated since version 3.1.

mpl_toolkits.mplot3d.pro3d.persp_transformation

mpl_toolkits.mplot3d.pro3d.persp_transformation(zfront, zback)

mpl_toolkits.mplot3d.pro3d.proj_points

mpl_toolkits.mplot3d.pro3d.proj_points(points, M)

mpl_toolkits.mplot3d.pro3d.proj_trans_clip_points

mpl_toolkits.mplot3d.pro3d.proj_trans_clip_points(points, M)

[Deprecated]

Notes

Deprecated since version 3.1:

mpl_toolkits.mplot3d.pro3d.proj_trans_points

mpl_toolkits.mplot3d.pro3d.proj_trans_points(points, M)

mpl_toolkits.mplot3d.pro3d.proj_transform

mpl_toolkits.mplot3d.pro3d.proj_transform(xs, ys, zs, M)

Transform the points by the projection matrix

mpl_toolkits.mplot3d.pro3d.proj_transform_clip

mpl_toolkits.mplot3d.pro3d.proj_transform_clip(xs, ys, zs, M)

Transform the points by the projection matrix and return the clipping result returns txs, tys, tzs, tis

mpl_toolkits.mplot3d.pro3d.proj_transform_vec

mpl_toolkits.mplot3d.pro3d.proj_transform_vec(vec, M)

[Deprecated]

Notes

Deprecated since version 3.1:
mpl_toolkits.mplot3d.proj3d.proj_transform_vec_clip

mpl_toolkits.mplot3d.proj3d.proj_transform_vec_clip(vec, M)

[Deprecated]

Notes

Deprecated since version 3.1:

mpl_toolkits.mplot3d.proj3d.rot_x

mpl_toolkits.mplot3d.proj3d.rot_x(V, alpha)

mpl_toolkits.mplot3d.proj3d.transform

mpl_toolkits.mplot3d.proj3d.transform(xs, ys, zs, M)

Transform the points by the projection matrix

mpl_toolkits.mplot3d.proj3d.vec_pad_ones

mpl_toolkits.mplot3d.proj3d.vec_pad_ones(xs, ys, zs)

[Deprecated]

Notes

Deprecated since version 3.1:

mpl_toolkits.mplot3d.proj3d.view_transformation

mpl_toolkits.mplot3d.proj3d.view_transformation(E, R, V)

mpl_toolkits.mplot3d.proj3d.world_transformation

mpl_toolkits.mplot3d.proj3d.world_transformation(xmin, xmax, ymin, ymax, zmin, zmax)

18.3 Matplotlib axes_grid Toolkit

**Note:** AxesGrid toolkit has been a part of matplotlib since v 0.99. Originally, the toolkit had a single namespace of axes_grid. In more recent version, the toolkit has divided into two separate namespace (axes_grid1 and axisartist). While axes_grid namespace is maintained for the backward compatibility, use of axes_grid1 and axisartist is recommended. For the documentation on axes_grid, see the previous version of the docs.

Third party packages
Several external packages that extend or build on Matplotlib functionality are listed below. They are maintained and distributed separately from Matplotlib and thus need to be installed individually.

Please submit an issue or pull request on Github if you have created a package that you would like to have included. We are also happy to host third party packages within the Matplotlib Github Organization.
22.1 Basemap

Basemap plots data on map projections, with continental and political boundaries.

contour lines over filled continet background

22.2 Cartopy

Cartopy builds on top of Matplotlib to provide object oriented map projection definitions and close integration with Shapely for powerful yet easy-to-use vector data processing tools. An example plot from the Cartopy gallery:
22.3 Geoplot

Geoplot builds on top of Matplotlib and Cartopy to provide a “standard library” of simple, powerful, and customizable plot types. An example plot from the Geoplot gallery:
22.4 Ridge Map

`ridge_map` uses Matplotlib, SRTM.py, NumPy, and scikit-image to make ridge plots of your favorite ridges.
23.1 ggplot

ggplot is a port of the R ggplot2 package to python based on Matplotlib.

23.2 holoviews

holoviews makes it easier to visualize data interactively, especially in a Jupyter notebook, by providing a set of declarative plotting objects that store your data and associated metadata. Your data is then immediately visualizable alongside or overlaid with other data, either statically or with automatically provided widgets for parameter exploration.
23.3 plotnine

plotnine implements a grammar of graphics, similar to R’s ggplot2. The grammar allows users to compose plots by explicitly mapping data to the visual objects that make up the plot.
24.1 Broken Axes

`brokenaxes` supplies an axes class that can have a visual break to indicate a discontinuous range.

![Graph showing sin and cos functions with broken axes.]

24.2 DeCiDa

`DeCiDa` is a library of functions and classes for electron device characterization, electronic circuit design and general data visualization and analysis.

24.3 Matplotlib-Venn

`Matplotlib-Venn` provides a set of functions for plotting 2- and 3-set area-weighted (or un-weighted) Venn diagrams.

24.4 mpl-probscale

`mpl-probscale` is a small extension that allows Matplotlib users to specify probability scales.
Simply importing the `probscale` module registers the scale with Matplotlib, making it accessible via e.g., `ax.set_xscale('prob')` or `plt.yscale('prob')`.

![Normal probability scale](image)

![Beta probability scale ($\alpha=3$, $\beta=2$)](image)

![Beta probability scale ($\alpha=2$, $\beta=7$)](image)

![Linear scale (for reference)](image)

### 24.5 mpl-scatter-density

`mpl-scatter-density` is a small package that makes it easy to make scatter plots of large numbers of points using a density map. The following example contains around 13 million points and the plotting (excluding reading in the data) took less than a second on an average laptop:
When used in interactive mode, the density map is downsampled on-the-fly while panning/zooming in order to provide a smooth interactive experience.

### 24.6 mplstereonet

`mplstereonet` provides stereonets for plotting and analyzing orientation data in Matplotlib.

### 24.7 Natgrid

`mpl_toolkits.natgrid` is an interface to the natgrid C library for gridding irregularly spaced data.

### 24.8 pyUpSet

`pyUpSet` is a static Python implementation of the UpSet suite by Lex et al. to explore complex intersections of sets and data frames.

### 24.9 seaborn

`seaborn` is a high level interface for drawing statistical graphics with Matplotlib. It aims to
make visualization a central part of exploring and understanding complex datasets.

24.10 WCSAxes

The Astropy core package includes a submodule called WCSAxes (available at astropy.visualization.wcsaxes) which adds Matplotlib projections for Astronomical image data. The following is an example of a plot made with WCSAxes which includes the original coordinate system of the image and an overlay of a different coordinate system:

24.11 Windrose

Windrose is a Python Matplotlib, Numpy library to manage wind data, draw windroses (also known as polar rose plots), draw probability density functions and fit Weibull distributions.
24.12 Yellowbrick

Yellowbrick is a suite of visual diagnostic tools for machine learning that enables human steering of the model selection process. Yellowbrick combines scikit-learn with matplotlib using an estimator-based API called the Visualizer, which wraps both sklearn models and matplotlib Axes. Visualizer objects fit neatly into the machine learning workflow allowing data scientists to integrate visual diagnostic and model interpretation tools into experimentation without extra steps.
25.1 mplcursors

mplcursors provides interactive data cursors for Matplotlib.

25.2 MplDataCursor

MplDataCursor is a toolkit written by Joe Kington to provide interactive “data cursors” (clickable annotation boxes) for Matplotlib.

25.3 animatplot

animatplot is a library for producing interactive animated plots with the goal of making production of animated plots almost as easy as static ones.
For an animated version of the above picture and more examples, see the animatplot gallery.
26.1 mplcairo

mplcairo is a cairo backend for Matplotlib, with faster and more accurate marker drawing, support for a wider selection of font formats and complex text layout, and various other features.

26.2 gr

gr is a framework for cross-platform visualisation applications, which can be used as a high-performance Matplotlib backend.
27.1 adjustText

adjustText is a small library for automatically adjusting text position in Matplotlib plots to minimize overlaps between them, specified points and other objects.
27.2 iTerm2 terminal backend

`matplotlib_iterm2` is an external Matplotlib backend using the iTerm2 nightly build inline image display feature.
27.3 mpl-template

mpl-template provides a customizable way to add engineering figure elements such as a title block, border, and logo.

27.4 numpngw

numpngw provides functions for writing NumPy arrays to PNG and animated PNG files. It also includes the class AnimatedPNGWriter that can be used to save a Matplotlib animation as an animated PNG file. See the example on the PyPI page or at the numpngw github repository.

Part VI

The Matplotlib Developers’ Guide
This project is a community effort, and everyone is welcome to contribute. We follow the Python Software Foundation Code of Conduct in everything we do.

The project is hosted on https://github.com/matplotlib/matplotlib

28.1 Submitting a bug report

If you find a bug in the code or documentation, do not hesitate to submit a ticket to the Bug Tracker. You are also welcome to post feature requests or pull requests.

If you are reporting a bug, please do your best to include the following:

1. A short, top-level summary of the bug. In most cases, this should be 1-2 sentences.
2. A short, self-contained code snippet to reproduce the bug, ideally allowing a simple copy and paste to reproduce. Please do your best to reduce the code snippet to the minimum required.
3. The actual outcome of the code snippet.
4. The expected outcome of the code snippet.
5. The Matplotlib version, Python version and platform that you are using. You can grab the version with the following commands:

```python
>>> import matplotlib
>>> matplotlib.__version__
'1.5.3'
>>> import platform
>>> platform.python_version()
'2.7.12'
```

We have preloaded the issue creation page with a Markdown template that you can use to organize this information.

Thank you for your help in keeping bug reports complete, targeted and descriptive.

28.2 Retrieving and installing the latest version of the code

When developing Matplotlib, sources must be downloaded, built, and installed into a local environment on your machine.
Follow the instructions detailed here to set up your environment to build Matplotlib from source.

**Warning:** When working on Matplotlib sources, having multiple versions installed by different methods into the same environment may not always work as expected.

To work on Matplotlib sources, it is strongly recommended to set up an alternative development environment, using the something like virtual environments in python, or a conda environment.

If you choose to use an already existing environment, and not a clean virtual or conda environment, uninstall the current version of Matplotlib in that environment using the same method used to install it.

If working on Matplotlib documentation only, the above steps are not absolutely necessary.

We use Git for version control and GitHub for hosting our main repository.

You can check out the latest sources with the command (see Set up your fork for more details):

```
git clone https://github.com/matplotlib/matplotlib.git
```

and navigate to the matplotlib directory. If you have the proper privileges, you can use `git@` instead of `https://`, which works through the ssh protocol and might be easier to use if you are using 2-factor authentication.

### 28.2.1 Building Matplotlib for image comparison tests

Matplotlib’s test suite makes heavy use of image comparison tests, meaning the result of a plot is compared against a known good result. Unfortunately, different versions of FreeType produce differently formed characters, causing these image comparisons to fail. To make them reproducible, Matplotlib can be built with a special local copy of FreeType. This is recommended for all Matplotlib developers.

Copy `setup.cfg.template` to `setup.cfg` and edit it to contain:

```
[test]
local_freetype = True
tests = True
```

or set the `MPLLOCALFREETYPE` environmental variable to any true value. If you have previously built Matplotlib with a different version of FreeType, you will also need to remove the c/c++ build products. Do this is to delete the build folder or `git clean -xd`. If you are going to be regularly working on Matplotlib, consider putting

```
export MPLLOCALFREETYPE=1
```

in your shell start up files.

### 28.2.2 Installing Matplotlib in developer mode

To install Matplotlib (and compile the C-extensions) run the following command from the top-level directory
This installs Matplotlib in ‘editable/develop mode’, i.e., builds everything and places the correct link entries in the install directory so that python will be able to import Matplotlib from the source directory. Thus, any changes to the *.py files will be reflected the next time you import the library. If you change the C-extension source (which might happen if you change branches) you will need to run

```
python setup.py build
```

or re-run `python -mpip install -ve ..`

Alternatively, if you do

```
python -mpip install -v .
```

all of the files will be copied to the installation directory however, you will have to rerun this command every time the source is changed. Additionally you will need to copy setup.cfg. template to setup.cfg and edit it to contain

```
[test]
local_freetype = True
tests = True
```

In either case you can then run the tests to check your work environment is set up properly:

```
pytest
```

**Note:** Additional dependencies for testing: pytest (version 3.6 or later), Ghostscript, Inkscape

**See also:**
- Developer’s tips for testing

## 28.3 Contributing code

### 28.3.1 How to contribute

The preferred way to contribute to Matplotlib is to fork the main repository on GitHub, then submit a “pull request” (PR).

The best practices for using GitHub to make PRs to Matplotlib are documented in the Development workflow section.

A brief overview is:

1. Create an account on GitHub if you do not already have one.
2. Fork the project repository: click on the ‘Fork’ button near the top of the page. This creates a copy of the code under your account on the GitHub server.
3. Clone this copy to your local disk:
4. Create a branch to hold your changes:

```
$ git checkout -b my-feature origin/master
```

and start making changes. Never work in the master branch!

5. Work on this copy, on your computer, using Git to do the version control. When you’re done editing e.g., `lib/matplotlib/collections.py`, do:

```
$ git add lib/matplotlib/collections.py
$ git commit
```

to record your changes in Git, then push them to GitHub with:

```
$ git push -u origin my-feature
```

Finally, go to the web page of your fork of the Matplotlib repo, and click ‘Pull request’ to send your changes to the maintainers for review. You may want to consider sending an email to the mailing list for more visibility.

### See also:

- Working with Matplotlib source code

#### 28.3.2 Contributing pull requests

It is recommended to check that your contribution complies with the following rules before submitting a pull request:

- If your pull request addresses an issue, please use the title to describe the issue and mention the issue number in the pull request description to ensure that a link is created to the original issue.

- All public methods should have informative docstrings with sample usage when appropriate. Use the numpy docstring standard.

- Formatting should follow the recommendations of [PEP8](https://peps.python.org/). You should consider installing/enabling automatic PEP8 checking in your editor. Part of the test suite is checking PEP8 compliance, things go smoother if the code is mostly PEP8 compliant to begin with.

- Each high-level plotting function should have a simple example in the Example section of the docstring. This should be as simple as possible to demonstrate the method. More complex examples should go in the examples tree.

- Changes (both new features and bugfixes) should be tested. See [Developer’s tips for testing](https://docs.scipy.org/doc/scipy/reference/tutorial/testing.html) for more details.

- Import the following modules using the standard scipy conventions:
• If your change is a major new feature, add an entry to the What’s new section by adding a new file in doc/users/next_whats_new (see doc/users/next_whats_new/README.rst for more information).

• If you change the API in a backward-incompatible way, please document it in doc/api/api_changes, by adding a new file describing your changes (see doc/api/api_changes/README.rst for more information)

• See below for additional points about Keyword argument processing, if applicable for your pull request.

In addition, you can check for common programming errors with the following tools:

• Code with a good unittest coverage (at least 70%, better 100%), check with:

  ```
  python -mpip install coverage
  pytest --cov=matplotlib --showlocals -v
  ```

• No pyflakes warnings, check with:

  ```
  python -mpip install pyflakes
  pyflakes path/to/module.py
  ```

**Note:** The current state of the Matplotlib code base is not compliant with all of those guidelines, but we expect that enforcing those constraints on all new contributions will move the overall code base quality in the right direction.

### 28.3.3 Issues for New Contributors

New contributors should look for the following tags when looking for issues. We strongly recommend that new contributors tackle issues labeled good first issue as they are easy, well documented issues, that do not require an understanding of the different submodules of Matplotlib. This helps the contributor become familiar with the contribution workflow, and for the core devs to become acquainted with the contributor; besides which, we frequently underestimate how easy an issue is to solve!
28.4 Other ways to contribute

Code is not the only way to contribute to Matplotlib. For instance, documentation is also a very important part of the project and often doesn’t get as much attention as it deserves. If you find a typo in the documentation, or have made improvements, do not hesitate to send an email to the mailing list or submit a GitHub pull request. Full documentation can be found under the doc/ directory.

It also helps us if you spread the word: reference the project from your blog and articles or link to it from your website!

28.5 Coding guidelines

28.5.1 New modules and files: installation

- If you have added new files or directories, or reorganized existing ones, make sure the new files are included in the match patterns in MANIFEST.in, and/or in package_data in setup.py.

28.5.2 C/C++ extensions

- Extensions may be written in C or C++.
- Code style should conform to PEP7 (understanding that PEP7 doesn’t address C++, but most of its admonitions still apply).
- Python/C interface code should be kept separate from the core C/C++ code. The interface code should be named FOO_wrap.cpp or FOO_wrapper.cpp.
- Header file documentation (aka docstrings) should be in Numpydoc format. We don’t plan on using automated tools for these docstrings, and the Numpydoc format is well understood in the scientific Python community.

28.5.3 Keyword argument processing

Matplotlib makes extensive use of **kwargs for pass-through customizations from one function to another. A typical example is in matplotlib.pyplot.text(). The definition of the pylab text function is a simple pass-through to matplotlib.axes.Axes.text():

```python
# in pylab.py
def text(*args, **kwargs):
    ret = gca().text(*args, **kwargs)
    draw_if_interactive()
    return ret
text()
```

text() in simplified form looks like this, i.e., it just passes all args and kwargs on to matplotlib.text.Text.__init__():

```python
# in pylab.py
def text(*args, **kwargs):
    ret = gca().text(*args, **kwargs)
    draw_if_interactive()
    return ret
text()
```
# in axes/_axes.py
```python
def text(self, x, y, s, fontdict=None, withdash=False, **kwargs):
    t = Text(x=x, y=y, text=s, **kwargs)
    and __init__() (again with liberties for illustration) just passes them on to the matplotlib.
    artist.Artist.update() method:
```

```python
# in text.py
def __init__(self, x=0, y=0, text=' ', **kwargs):
    Artist.__init__(self)
    self.update(kwargs)
```

`update` does the work looking for methods named like `set_property` if `property` is a keyword argument. i.e., no one looks at the keywords, they just get passed through the API to the artist constructor which looks for suitably named methods and calls them with the value.

As a general rule, the use of `**kwargs` should be reserved for pass-through keyword arguments, as in the example above. If all the keyword args are to be used in the function, and not passed on, use the key/value keyword args in the function definition rather than the `**kwargs` idiom.

In some cases, you may want to consume some keys in the local function, and let others pass through. Instead of poping arguments to use off `**kwargs`, specify them as keyword-only arguments to the local function. This makes it obvious at a glance which arguments will be consumed in the function. For example, in `plot()`, `scalex` and `scaley` are local arguments and the rest are passed on as `Line2D()` keyword arguments:

```python
# in axes/_axes.py
def plot(self, *args, scalex=True, scaley=True, **kwargs):
    lines = []
    for line in self._get_lines(*args, **kwargs):
        self.add_line(line)
        lines.append(line)
```

## 28.5.4 Using logging for debug messages

Matplotlib uses the standard python `logging` library to write verbose warnings, information, and debug messages. Please use it! In all those places you write `print()` statements to do your debugging, try using `log.debug()` instead!

To include `logging` in your module, at the top of the module, you need to import `logging`. Then calls in your code like:

```python
_log = logging.getLogger(__name__)  # right after the imports

# code
# more code
_log.info('Here is some information')
_log.debug('Here is some more detailed information')
```

will log to a logger named `matplotlib.yourmodulename`.

If an end-user of Matplotlib sets up `logging` to display at levels more verbose than `logger.WARN` in their code with the Matplotlib-provided helper:
plt.set_loglevel("debug")

or manually with

```python
import logging
logging.basicConfig(level=logging.DEBUG)
import matplotlib.pyplot as plt
```

Then they will receive messages like:

```
DEBUG:matplotlib.backends:backend MacOSX version unknown
DEBUG:matplotlib.yourmodulename:Here is some information
DEBUG:matplotlib.yourmodulename:Here is some more detailed information
```

**Which logging level to use?**

There are five levels at which you can emit messages.

- `logging.critical` and `logging.error` are really only there for errors that will end the use of the library but not kill the interpreter.

- `logging.warning` and `cbook._warn_external` are used to warn the user, see below.

- `logging.info` is for information that the user may want to know if the program behaves oddly. They are not displayed by default. For instance, if an object isn't drawn because its position is NaN, that can usually be ignored, but a mystified user could call `logging.basicConfig(level=logging.INFO)` and get an error message that says why.

- `logging.debug` is the least likely to be displayed, and hence can be the most verbose. “Expected” code paths (e.g., reporting normal intermediate steps of layouting or rendering) should only log at this level.

By default, `logging` displays all log messages at levels higher than `logging.WARNING` to `sys.stderr`.

The `logging tutorial` suggests that the difference between `logging.warning` and `cbook._warn_external` (which uses `warnings.warn`) is that `cbook._warn_external` should be used for things the user must change to stop the warning (typically in the source), whereas `logging.warning` can be more persistent. Moreover, note that `cbook._warn_external` will by default only emit a given warning *once* for each line of user code, whereas `logging.warning` will display the message every time it is called.

By default, `warnings.warn` displays the line of code that has the `warn` call. This usually isn’t more informative than the warning message itself. Therefore, Matplotlib uses `cbook._warn_external` which uses `warnings.warn`, but goes up the stack and displays the first line of code outside of Matplotlib. For example, for the module:

```python
# in my_matplotlib_module.py
import warnings

def set_range(bottom, top):
    if bottom == top:
        warnings.warn('Attempting to set identical bottom==top')
```

running the script:
from matplotlib import my_matplotlib_module
my_matplotlib_module.set_range(0, 0)  # set range

will display:

UserWarning: Attempting to set identical bottom==top
warnings.warn('Attempting to set identical bottom==top')

Modifying the module to use cbook._warn_external:

from matplotlib import cbook

def set_range(bottom, top):
    if bottom == top:
        cbook._warn_external('Attempting to set identical bottom==top')

and running the same script will display:

UserWarning: Attempting to set identical bottom==top
my_matplotlib_module.set_range(0, 0)  # set range

28.5.5 Developing a new backend

If you are working on a custom backend, the backend setting in matplotlibrc (Customizing Matplotlib with style sheets and rcParams) supports an external backend via the module directive. If my_backend.py is a Matplotlib backend in your PYTHONPATH, you can set it on one of several ways

- in matplotlibrc:
  
  backend : module://my_backend

- with the MPLBACKEND environment variable:

  > export MPLBACKEND="module://my_backend"
  > python simple_plot.py

- with the use directive in your script:

  import matplotlib
  matplotlib.use('module://my_backend')

28.5.6 Writing examples

We have hundreds of examples in subdirectories of matplotlib/examples, and these are automatically generated when the website is built to show up in the examples section of the website.

Any sample data that the example uses should be kept small and distributed with Matplotlib in the lib/matplotlib/mpl-data/sample_data/ directory. Then in your example code you can load it into a file handle with:
import matplotlib.cbook as cbook
fh = cbook.get_sample_data('mydata.dat')
Matplotlib’s testing infrastructure depends on pytest. The tests are in lib/matplotlib/tests, and customizations to the pytest testing infrastructure are in matplotlib.testing.

### 29.1 Requirements

Install the latest version of Matplotlib as documented in *Retrieving and installing the latest version of the code* In particular, follow the instructions to use a local FreeType build.

The following software is required to run the tests:

- **pytest** (>=3.6)
- **Ghostscript** (>= 9.0, to render PDF files)
- **Inkscape** (to render SVG files)

Optionally you can install:

- **pytest-cov** (>=2.3.1) to collect coverage information
- **pytest-flake8** to test coding standards using **flake8**
- **pytest-timeout** to limit runtime in case of stuck tests
- **pytest-xdist** to run tests in parallel

### 29.2 Running the tests

Running the tests is simple. Make sure you have pytest installed and run:

```
pytest
```

in the root directory of the repository.

pytest can be configured via a lot of **commandline parameters**. Some particularly useful ones are:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-v or --verbose</td>
<td>Be more verbose</td>
</tr>
<tr>
<td>-n NUM</td>
<td>Run tests in parallel over NUM processes (requires pytest-xdist)</td>
</tr>
<tr>
<td>--timeout=SECONDS</td>
<td>Set timeout for results from each test process (requires pytest-timeout)</td>
</tr>
<tr>
<td>--capture=no or -s</td>
<td>Do not capture stdout</td>
</tr>
<tr>
<td>--flake8</td>
<td>Check coding standards using <strong>flake8</strong> (requires pytest-flake8)</td>
</tr>
</tbody>
</table>
To run a single test from the command line, you can provide a file path, optionally followed by the function separated by two colons, e.g., (tests do not need to be installed, but Matplotlib should be):

```bash
pytest lib/matplotlib/tests/test_simplification.py::test_clipping
```

or, if tests are installed, a dot-separated path to the module, optionally followed by the function separated by two colons, such as:

```bash
pytest --pyargs matplotlib.tests.test_simplification::test_clipping
```

If you want to run the full test suite, but want to save wall time try running the tests in parallel:

```bash
pytest --verbose -n 5
```

Depending on your version of Python and pytest-xdist, you may need to set `PYTHONHASHSEED` to a fixed value when running in parallel:

```bash
PYTHONHASHSEED=0 pytest --verbose -n 5
```

An alternative implementation that does not look at command line arguments and works from within Python is to run the tests from the Matplotlib library function `matplotlib.test()`:

```python
import matplotlib
matplotlib.test()
```

## 29.3 Writing a simple test

Many elements of Matplotlib can be tested using standard tests. For example, here is a test from `matplotlib.tests.test_basic`:

```python
def test_simple():
    """
    very simple example test
    """
    assert 1 + 1 == 2
```

Pytest determines which functions are tests by searching for files whose names begin with "test_" and then within those files for functions beginning with "test" or classes beginning with "Test".

Some tests have internal side effects that need to be cleaned up after their execution (such as created figures or modified rc params). The pytest fixture `mpl_test_settings()` will automatically clean these up; there is no need to do anything further.

## 29.4 Random data in tests

Random data is a very convenient way to generate data for examples, however the randomness is problematic for testing (as the tests must be deterministic!). To work around this set the seed in each test. For numpy use:
import numpy as np
np.random.seed(19680801)

and Python’s random number generator:

import random
random.seed(19680801)

The seed is John Hunter’s birthday.

29.5 Writing an image comparison test

Writing an image-based test is only slightly more difficult than a simple test. The main consideration is that you must specify the “baseline”, or expected, images in the `image_comparison` decorator. For example, this test generates a single image and automatically tests it:

```python
from matplotlib.testing.decorators import image_comparison
import matplotlib.pyplot as plt

@image_comparison(baseline_images=['line_dashes'], remove_text=True, extensions=['png'])
def test_line_dashes():
    fig, ax = plt.subplots()
    ax.plot(range(10), linestyle=(0, (3, 3)), lw=5)
```

The first time this test is run, there will be no baseline image to compare against, so the test will fail. Copy the output images (in this case `result_images/test_lines/test_line_dashes.png`) to the correct subdirectory of `baseline_images` tree in the source directory (in this case `lib/matplotlib/tests/baseline_images/test_lines`). Put this new file under source code revision control (with `git add`). When rerunning the tests, they should now pass.

Baseline images take a lot of space in the Matplotlib repository. An alternative approach for image comparison tests is to use the `check_figures_equal` decorator, which should be used to decorate a function taking two `Figure` parameters and draws the same images on the figures using two different methods (the tested method and the baseline method). The decorator will arrange for setting up the figures and then collect the drawn results and compare them.

See the documentation of `image_comparison` and `check_figures_equal` for additional information about their use.

29.6 Known failing tests

If you’re writing a test, you may mark it as a known failing test with the `pytest.mark.xfail()` decorator. This allows the test to be added to the test suite and run on the buildbots without causing undue alarm. For example, although the following test will fail, it is an expected failure:

```python
import pytest

@pytest.mark.xfail
```
def test_simple_fail():
    '''very simple example test that should fail'''
    assert 1 + 1 == 3

Note that the first argument to the xfail() decorator is a fail condition, which can be a value such as True, False, or may be a dynamically evaluated expression. If a condition is supplied, then a reason must also be supplied with the reason='message' keyword argument.

29.7 Creating a new module in matplotlib.tests

We try to keep the tests categorized by the primary module they are testing. For example, the tests related to the mathtext.py module are in test_mathtext.py.

29.8 Using Travis CI

Travis CI is a hosted CI system “in the cloud”.

Travis is configured to receive notifications of new commits to GitHub repos (via GitHub “service hooks”) and to run builds or tests when it sees these new commits. It looks for a YAML file called .travis.yml in the root of the repository to see how to test the project.

Travis CI is already enabled for the main matplotlib GitHub repository – for example, see its Travis page.

If you want to enable Travis CI for your personal Matplotlib GitHub repo, simply enable the repo to use Travis CI in either the Travis CI UI or the GitHub UI (Admin | Service Hooks). For details, see the Travis CI Getting Started page. This generally isn’t necessary, since any pull request submitted against the main Matplotlib repository will be tested.

Once this is configured, you can see the Travis CI results at https://travis-ci.org/your_GitHub_user_name/matplotlib – here’s an example.

29.9 Using tox

Tox is a tool for running tests against multiple Python environments, including multiple versions of Python (e.g., 3.6, 3.7) and even different Python implementations altogether (e.g., CPython, PyPy, Jython, etc.), as long as all these versions are available on your system’s $PATH (consider using your system package manager, e.g. apt-get, yum, or Homebrew, to install them).

Tox makes it easy to determine if your working copy introduced any regressions before submitting a pull request. Here’s how to use it:

$ pip install tox
$ tox

You can also run tox on a subset of environments:
$ tox -e py36,py37

Tox processes everything serially so it can take a long time to test several environments. To speed it up, you might try using a new, parallelized version of tox called detox. Give this a try:

$ pip install -U -i http://pypi.testrun.org detox
$ detox

Tox is configured using a file called tox.ini. You may need to edit this file if you want to add new environments to test (e.g., py33) or if you want to tweak the dependencies or the way the tests are run. For more info on the tox.ini file, see the Tox Configuration Specification.

### 29.10 Building old versions of Matplotlib

When running a git bisect to see which commit introduced a certain bug, you may (rarely) need to build very old versions of Matplotlib. The following constraints need to be taken into account:

- Matplotlib 1.3 (or earlier) requires numpy 1.8 (or earlier).

30.1 Getting started

30.1.1 General file structure

All documentation is built from the doc/ directory. This directory contains both reStructured-Text (ReST; .rst) files that contain pages in the documentation and configuration files for Sphinx.

The .rst files are kept in doc/users, doc/devel, doc/api and doc/faq. The main entry point is doc/index.rst, which pulls in the index.rst file for the users guide, developers guide, api reference, and FAQs. The documentation suite is built as a single document in order to make the most effective use of cross referencing.

Sphinx also creates .rst files that are staged in doc/api from the docstrings of the classes in the Matplotlib library. Except for doc/api/api_changes/, these .rst files are created when the documentation is built.

Similarly, the contents of doc/gallery and doc/tutorials are generated by the Sphinx Gallery from the sources in examples and tutorials. These sources consist of python scripts that have ReST documentation built into their comments. Don’t directly edit the .rst files in doc/gallery and doc/tutorials as they are regenerated when the documentation are built.

30.1.2 Installing dependencies

The documentation for Matplotlib is generated from reStructuredText (ReST) using the Sphinx documentation generation tool. There are several extra requirements that are needed to build the documentation. They are listed in doc-requirements.txt, which is shown below:

```
# Requirements for building docs
#
# You will first need a matching Matplotlib installation
# e.g (from the Matplotlib root directory)
#    pip install -e .
#
# Install the documentation requirements with:
#    pip install -r requirements/doc/doc-requirements.txt
#
sphinx>=1.3,<1.5.0
!=1.6.4,!=1.7.3,!=1.8.0,<2.0.0
colorspacious
```

(continues on next page)
Matplotlib, Release 3.1.3

ipython
ipywidgets
numpydoc>=0.8
pillow>=3.4,!=5.4.0
sphinx-gallery>=0.2
sphinx-copybutton

Note:

- You’ll need a minimal working LaTeX distribution for many examples to run.
- Graphviz is not a Python package, and needs to be installed separately.

30.1.3 Building the docs

The documentation sources are found in the doc/ directory in the trunk. The configuration file for Sphinx is doc/conf.py. It controls which directories Sphinx parses, how the docs are built, and how the extensions are used. To build the documentation in html format, cd into doc/ and run:

```
make html
```

Other useful invocations include

```
# Delete built files. May help if you get errors about missing paths or broken links.
make clean

# Build pdf docs.
make latexpdf
```

The SPHINXOPTS variable is set to -W by default to turn warnings into errors. To unset it, use

```
make SPHINXOPTS= html
```

You can use the O variable to set additional options:

- make O=-j4 html runs a parallel build with 4 processes.
- make O=-Dplot_formats=png:100 html saves figures in low resolution.
- make O=-Dplot_gallery=0 html skips the gallery build.

Multiple options can be combined using e.g. make O='--j4 -Dplot_gallery=0' html.

On Windows, options needs to be set as environment variables, e.g. set O=-W -j4 & make html.

30.2 Writing ReST pages

Most documentation is either in the docstring of individual classes and methods, in explicit .rst files, or in examples and tutorials. All of these use the ReST syntax. Users should look
at the ReST documentation for a full description. But some specific hints and conventions Matplotlib uses are useful for creating documentation.

### 30.2.1 Formatting and style conventions

It is useful to strive for consistency in the Matplotlib documentation. Here are some formatting and style conventions that are used.

#### Section name formatting

For everything but top-level chapters, use **upper lower** for section titles, e.g., Possible hangups rather than Possible Hangups

#### Function arguments

Function arguments and keywords within docstrings should be referred to using the *emphasis* role. This will keep Matplotlib’s documentation consistent with Python’s documentation:

```
Here is a description of *argument*
```

Do not use the `default role`:

```
Do not describe `argument` like this. As per the next section, this syntax will (unsuccessfully) attempt to resolve the argument as a link to a class or method in the library.
```

nor the ``literal`` role:

```
Do not describe ``argument`` like this.
```

### 30.2.2 Referring to other documents and sections

Sphinx allows internal references between documents.

Documents can be linked with the :doc: directive:

```
See the :doc:`/faq/installing_faq`
```

```
See the tutorial :doc:`/tutorials/introductory/sample_plots`
```

```
See the example :doc:`/gallery/lines_bars_and_markers/simple_plot`
```

will render as:

```
See the Installation
See the tutorial Sample plots in Matplotlib
See the example /gallery/lines_bars_and_markers/simple_plot
```

Sections can also be given reference names. For instance from the Installation link:
How to completely remove Matplotlib

Occasionally, problems with Matplotlib can be solved with a clean...

and refer to it using the standard reference syntax:

```markdown
See :ref:`clean-install`
```

will give the following link: *How to completely remove Matplotlib*

To maximize internal consistency in section labeling and references, use hyphen separated, descriptive labels for section references. Keep in mind that contents may be reorganized later, so avoid top level names in references like `user` or `devel` or `faq` unless necessary, because for example the FAQ “what is a backend?” could later become part of the users guide, so the label:

```markdown
See :ref:`what-is-a-backend`
```

is better than:

```markdown
See :ref:`faq-backend`
```

In addition, since underscores are widely used by Sphinx itself, use hyphens to separate words.

### 30.2.3 Referring to other code

To link to other methods, classes, or modules in Matplotlib you can use back ticks, for example:

```python
`matplotlib.collections.LineCollection`
```

generates a link like this: `matplotlib.collections.LineCollection`.  

*Note:* We use the sphinx setting `default_role = 'obj'` so that you don’t have to use qualifiers like `:class:`, `:func:`, `:meth:` and the likes.

Often, you don’t want to show the full package and module name. As long as the target is unambiguous you can simply leave them out:

```python
`.LineCollection`
```

and the link still works: `LineCollection`.

If there are multiple code elements with the same name (e.g. `plot()` is a method in multiple classes), you’ll have to extend the definition:

```python
`.pyplot.plot` or `.Axes.plot`
```

These will show up as `pyplot.plot` or `Axes.plot`. To still show only the last segment you can add a tilde as prefix:
will render as `plot` or `plot`.
Other packages can also be linked via `intersphinx`:

```bash
python -m sphinx.ext.intersphinx 'https://docs.scipy.org/doc/numpy/objects.inv'
```

### 30.2.4 Including figures and files

Image files can directly included in pages with the `image::` directive. E.g., `users/navigation_toolbar.rst` displays the toolbar icons with a call to a static image:

```rst
.. image:: ../../static/toolbar.png
```

as rendered on the page: *Interactive navigation*.

Files can be included verbatim. For instance the `matplotlibrc` file is important for customizing `Matplotlib`, and is included verbatim in the tutorial in *Customizing Matplotlib with style sheets and rcParams*:

```rst
.. literalinclude:: ../../../static/matplotlibrc
```

This is rendered at the bottom of *Customizing Matplotlib with style sheets and rcParams*. Note that this is in a tutorial; see *Writing examples and tutorials* below.

The examples directory is also copied to `doc/gallery` by sphinx-gallery, so plots from the examples directory can be included using

```rst
.. plot:: gallery/lines_bars_and_markers/simple_plot.py
```

Note that the python script that generates the plot is referred to, rather than any plot that is created. Sphinx-gallery will provide the correct reference when the documentation is built.

### 30.3 Writing docstrings

Most of the API documentation is written in docstrings. These are comment blocks in source code that explain how the code works.

**Note:** Some parts of the documentation do not yet conform to the current documentation style. If in doubt, follow the rules given here and not what you may see in the source code. Pull requests updating docstrings to the current style are very welcome.
All new or edited docstrings should conform to the numpydoc docstring guide. Much of the ReST syntax discussed above (Writing ReST pages) can be used for links and references. These docstrings eventually populate the doc/api directory and form the reference documentation for the library.

### 30.3.1 Example docstring

An example docstring looks like:

```python
def hlines(self, y, xmin, xmax, colors='k', linestyles='solid',
        label='', **kwargs):
    """
    Plot horizontal lines at each *y* from *xmin* to *xmax*.
    
    Parameters
    ----------
    y: float or array-like
       y-indexes where to plot the lines.
    xmin, xmax: float or array-like
       Respective beginning and end of each line. If scalars are
       provided, all lines will have the same length.
    colors: array-like of colors, optional, default: 'k'
    linestyles: {'solid', 'dashed', 'dashdot', 'dotted'}, optional
    label: string, optional, default: ''
    
    Returns
    -------
    lines: `~matplotlib.collections.LineCollection`
    
    Other Parameters
    ----------------
    **kwargs: `~matplotlib.collections.LineCollection` properties.
    
    See also
    --------
    vlines: vertical lines
    axhline: horizontal line across the axes
    ""
```

See the `hlines` documentation for how this renders.

The Sphinx website also contains plenty of documentation concerning ReST markup and working with Sphinx in general.

### 30.3.2 Formatting conventions

The basic docstring conventions are covered in the numpydoc docstring guide and the Sphinx documentation. Some Matplotlib-specific formatting conventions to keep in mind:
Function arguments

Function arguments and keywords within docstrings should be referred to using the `*emphasis*` role. This will keep Matplotlib’s documentation consistent with Python’s documentation:

```
If *linestyles* is *None*, the 'solid' is used.
```

Do not use the `default role` or the `literal` role:

```
Neither `argument` nor `argument` should be used.
```

Quotes for strings

Matplotlib does not have a convention whether to use single-quotes or double-quotes. There is a mixture of both in the current code.

Use simple single or double quotes when giving string values, e.g.

```
If 'tight', try to figure out the tight bbox of the figure.
```

Parameter type descriptions

The main goal for parameter type descriptions is to be readable and understandable by humans. If the possible types are too complex use a simplification for the type description and explain the type more precisely in the text.

Generally, the numpydoc docstring guide conventions apply. The following rules expand on them where the numpydoc conventions are not specific.

Use `float` for a type that can be any number.

Use `(float, float)` to describe a 2D position.

Use array-like for homogeneous numeric sequences, which could typically be a numpy.array. Dimensionality may be specified using `2D`, `3D`, `n-dimensional`. If you need to have variables denoting the sizes of the dimensions, use capital letters in brackets (array-like `(M, N)`). When referring to them in the text they are easier read and no special formatting is needed.

`float` is the implicit default dtype for array-likes. For other dtypes use array-like of `int`.

Some possible uses:

```
2D array-like
array-like (N)
array-like (M, N)
array-like (M, N, 3)
array-like of int
```

Non-numeric homogeneous sequences are described as lists, e.g.:

```
list of str
list of `.Artist`
```
Referencing types

Generally, the rules from referring-to-other-code apply. More specifically:

Use full references `~matplotlib.colors.Normalize` with an abbreviation tilde in parameter types. While the full name helps the reader of plain text docstrings, the HTML does not need to show the full name as it links to it. Hence, the ~-shortening keeps it more readable.

Use abbreviated links `.Normalize` in the text.

```
norm : `~matplotlib.colors.Normalize`, optional
    A `.Normalize` instance is used to scale luminance data to 0, 1.
```

See also sections

Sphinx automatically links code elements in the definition blocks of See also sections. No need to use backticks there:

```
See also
--------
vlines : vertical lines
axhline: horizontal line across the axes
```

Wrapping parameter lists

Long parameter lists should be wrapped using a \ for continuation and starting on the new line without any indent (no indent because pydoc will parse the docstring and strip the line continuation so that indent would result in a lot of whitespace within the line):

```
def add_axes(self, *args, **kwargs):
    """
    ...

    Parameters
    ----------

    projection : {'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', \ 
                 'rectilinear'}, optional
        The projection type of the axes.
    ...
    """
```

Alternatively, you can describe the valid parameter values in a dedicated section of the docstring.

rcParams

rcParams can be referenced with the custom :rc: role: :rc:`foo` yields rcParams["foo"] = 'default', which is a link to the matplotlibrc file description.
30.3.3 Deprecated formatting conventions

Formerly, we have used square brackets for explicit parameter lists ['solid' | 'dashed' | 'dotted']. With numpydoc we have switched to their standard using curly braces {'solid', 'dashed', 'dotted'}.

30.3.4 Setters and getters

Artist properties are implemented using setter and getter methods (because Matplotlib pre-dates the introductions of the property decorator in Python). By convention, these setters and getters are named set_PROPERTYNAME and get_PROPERTYNAME; the list of properties thusly defined on an artist and their values can be listed by the setp and getp functions.

**Note:** ACCEPTS blocks have recently become optional. You may now use a numpydoc Parameters block because the accepted values can now be read from the type description of the first parameter.

Property setter methods should indicate the values they accept using a (legacy) special block in the docstring, starting with ACCEPTS, as follows:

```python
# in lines.py
def set_linestyle(self, linestyle):
    ""
    Set the linestyle of the line
    ACCEPTS: ['-' | '--' | '-' | ':' | 'steps' | 'None' | ' ' | '']
    ""
```

The ACCEPTS block is used to render a table of all properties and their acceptable values in the docs; it can also be displayed using, e.g., plt.setp(Line2D) (all properties) or plt.setp(Line2D, 'linestyle') (just one property).

There are cases in which the ACCEPTS string is not useful in the generated Sphinx documentation, e.g. if the valid parameters are already defined in the numpydoc parameter list. You can hide the ACCEPTS string from Sphinx by making it a ReST comment (i.e. use .. ACCEPTS:):

```python
def set_linestyle(self, linestyle):
    ""
    An ACCEPTS string invisible to Sphinx.
    .. ACCEPTS: ['-' | '--' | '-' | ':' | 'steps' | 'None' | ' ' | '']
    ""
```

30.3.5 Keyword arguments

**Note:** The information in this section is being actively discussed by the development team, so use the docstring interpolation only if necessary. This section has been left in place for now because this interpolation is part of the existing documentation.
Since Matplotlib uses a lot of pass-through `**kwargs`, e.g., in every function that creates a line (`plot`, `semilogx`, `semilogy`, etc...), it can be difficult for the new user to know which `**kwargs` are supported. Matplotlib uses a docstring interpolation scheme to support documentation of every function that takes a `**kwargs`. The requirements are:

1. single point of configuration so changes to the properties don’t require multiple doc-string edits.
2. as automated as possible so that as properties change, the docs are updated automatically.

The function `matplotlib.artist.kwdoc` and the decorator `matplotlib.docstring.dedent_interpd` facilitate this. They combine Python string interpolation in the docstring with the Matplotlib artist introspection facility that underlies `setp` and `getp`. The `kwdoc` function gives the list of properties as a docstring. In order to use this in another docstring, first update the `matplotlib.docstring.interpd` object, as seen in this example from `matplotlib.lines`:

```python
# in lines.py
docstring.interpd.update(Line2D=artist.kwdoc(Line2D))
```

Then in any function accepting `Line2D` pass-through `**kwargs`, e.g., `matplotlib.axes.Axes.plot`:

```python
# in azes.py
@docstring.dedent_interpd
def plot(self, *args, **kwargs):
    ""
    Some stuff omitted
    The kwargs are Line2D properties:
    %(_Line2D_docstr)s

    kwargs scalex and scaley, if defined, are passed on
    to autoscale_view to determine whether the x and y axes are
    autoscaled; default True. See Axes.autoscale_view for more
    information
    ""
```

Note there is a problem for `Artist` `__init__` methods, e.g., `matplotlib.patches.Patch.__init__`, which supports `Patch` `**kwargs`, since the artist inspector cannot work until the class is fully defined and we can’t modify the `Patch.__init__` docstring outside the class definition. There are some some manual hacks in this case, violating the “single entry point” requirement above – see the `docstring.interpd.update` calls in `matplotlib.patches`.

### 30.3.6 Inheriting docstrings

If a subclass overrides a method but does not change the semantics, we can reuse the parent docstring for the method of the child class. Python does this automatically, if the subclass method does not have a docstring.

Use a plain comment `# docstring inherited` to denote the intention to reuse the parent docstring. That way we do not accidentally create a docstring in the future:

```python
class A:
    def foo():
```

(continues on next page)
class B(A):
    def foo():
        # docstring inherited
        pass
The format of these files is relatively straightforward. Properly formatted comment blocks are treated as ReST text, the code is displayed, and figures are put into the built page.

For instance the example /gallery/lines_bars_and_markers/simple_plot example is generated from /examples/lines_bars_and_markers/simple_plot.py, which looks like:

```python
###
============
Simple Plot
============

Create a simple plot.

```import matplotlib.pyplot as plt
import numpy as np

# Data for plotting
t = np.arange(0.0, 2.0, 0.01)
s = 1 + np.sin(2 * np.pi * t)

# Note that using plt.subplots below is equivalent to using
# fig = plt.figure and then ax = fig.add_subplot(111)
fig, ax = plt.subplots()
ax.plot(t, s)
ax.set(xlabel='time (s)', ylabel='voltage (mV)',
       title='About as simple as it gets, folks')
ax.grid()
plt.show()
```

The first comment block is treated as ReST text. The other comment blocks render as comments in /gallery/lines_bars_and_markers/simple_plot.

Tutorials are made with the exact same mechanism, except they are longer, and typically have more than one comment block (i.e. Usage Guide). The first comment block can be the same as the example above. Subsequent blocks of ReST text are delimited by a line of ### characters:

```python
###
============
Simple Plot
============

Create a simple plot.

```...

ax.grid()
plt.show()

# Second plot
# ===========
#
# This is a second plot that is very nice
```

(continues on next page)
fig, ax = plt.subplots()  
ax.plot(np.sin(range(50)))

In this way text, code, and figures are output in a “notebook” style.

## 30.4.1 Order of examples in the gallery

The order of the sections of the *Tutorials* and the gallery, as well as the order of the examples within each section are determined in a two step process from within the `/doc/sphinxext/gallery_order.py`:

- **Explicit order**: This file contains a list of folders for the section order and a list of examples for the subsection order. The order of the items shown in the doc pages is the order those items appear in those lists.

- **Implicit order**: If a folder or example is not in those lists, it will be appended after the explicitely ordered items and all of those additional items will be ordered by pathname (for the sections) or by filename (for the subsections).

As a consequence, if you want to let your example appear in a certain position in the gallery, extend those lists with your example. In case no explicit order is desired or necessary, still make sure to name your example consistently, i.e. use the main function or subject of the example as first word in the filename; e.g. an image example should ideally be named similar to `imshow_mynewexample.py`.

## 30.5 Miscellaneous

### 30.5.1 Adding animations

There is a Matplotlib Google/Gmail account with username `mplgithub` which was used to setup the github account but can be used for other purposes, like hosting Google docs or Youtube videos. You can embed a Matplotlib animation in the docs by first saving the animation as a movie using `matplotlib.animation.Animation.save()`, and then uploading to Matplotlib's Youtube channel and inserting the embedding string youtube provides like:

```html
.. raw:: html
   :file: "example.html"

<iframe width="420" height="315"
   src="http://www.youtube.com/embed/32cjc6V0OZY"
   frameborder="0" allowfullscreen>
</iframe>
```

An example save command to generate a movie looks like this

```python
ani = animation.FuncAnimation(fig, animate, np.arange(1, len(y)),
                               interval=25, blit=True, init_func=init)
ani.save('double_pendulum.mp4', fps=15)
```

Contact Michael Droettboom for the login password to upload youtube videos of google docs to the mplgithub account.
30.5.2 Generating inheritance diagrams

Class inheritance diagrams can be generated with the `inheritance-diagram` directive. To use it, provide the directive with a number of class or module names (separated by whitespace). If a module name is provided, all classes in that module will be used. All of the ancestors of these classes will be included in the inheritance diagram.

A single option is available: `parts` controls how many of parts in the path to the class are shown. For example, if `parts == 1`, the class `matplotlib.patches.Patch` is shown as `Patch`. If `parts == 2`, it is shown as `patches.Patch`. If `parts == 0`, the full path is shown.

Example:

```plaintext
.. inheritance-diagram::: matplotlib.patches matplotlib.lines matplotlib.text
  :parts: 2
```

![Inheritance Diagram](image)

30.5.3 Emacs helpers

There is an emacs mode `rst.el` which automates many important ReST tasks like building and updating table-of-contents, and promoting or demoting section headings. Here is the basic `.emacs` configuration:
Some helpful functions:

C-c TAB - rst-toc-insert

   Insert table of contents at point

C-c C-u - rst-toc-update

   Update the table of contents at point

C-c C-l rst-shift-region-left

   Shift region to the left

C-c C-r rst-shift-region-right

   Shift region to the right
PLOT DIRECTIVE DOCUMENTATION

A directive for including a matplotlib plot in a Sphinx document.

By default, in HTML output, plot will include a .png file with a link to a high-res .png and .pdf.
In LaTeX output, it will include a .pdf.

The source code for the plot may be included in one of three ways:

1. **A path to a source file** as the argument to the directive:

   ```
   .. plot:: path/to/plot.py
   ```

   When a path to a source file is given, the content of the directive may optionally contain a caption for the plot:

   ```
   .. plot:: path/to/plot.py
   
   This is the caption for the plot
   ```

   Additionally, one may specify the name of a function to call (with no arguments) immediately after importing the module:

   ```
   .. plot:: path/to/plot.py plot_function1
   ```

2. Included as **inline content** to the directive:

   ```
   .. plot::
   
   import matplotlib.pyplot as plt
   import matplotlib.image as mpimg
   import numpy as np
   img = mpimg.imread('static/stinkbug.png')
   imgplot = plt.imshow(img)
   ```

3. Using **doctest** syntax:

   ```
   .. plot::
   
   A plotting example:
   >>> import matplotlib.pyplot as plt
   >>> plt.plot([1,2,3], [4,5,6])
   ```
31.1 Options

The `plot` directive supports the following options:

- **format** [‘python’, ‘doctest’] Specify the format of the input
- **include-source** [bool] Whether to display the source code. The default can be changed using the `plot_include_source` variable in `conf.py`
- **encoding** [str] If this source file is in a non-UTF8 or non-ASCII encoding, the encoding must be specified using the `:encoding:` option. The encoding will not be inferred using the `-*- coding -*-` metacomment.
- **context** [bool or str] If provided, the code will be run in the context of all previous `plot` directives for which the `:context:` option was specified. This only applies to inline code `plot` directives, not those run from files. If the `:context: reset` option is specified, the context is reset for this and future plots, and previous figures are closed prior to running the code. `:context:close-figs` keeps the context but closes previous figures before running the code.
- **nofigs** [bool] If specified, the code block will be run, but no figures will be inserted. This is usually useful with the `:context:` option.

Additionally, this directive supports all of the options of the `image` directive, except for `target` (since `plot` will add its own target). These include `alt`, `height`, `width`, `scale`, `align` and `class`.

31.2 Configuration options

The `plot` directive has the following configuration options:

- **plot_include_source** Default value for the `include-source` option
- **plot_html_show_source_link** Whether to show a link to the source in HTML.
- **plot_pre_code** Code that should be executed before each plot. If not specified or `None` it will default to a string containing:

```python
import numpy as np
from matplotlib import pyplot as plt
```

- **plot_basedir** Base directory, to which `plot::` file names are relative to. (If `None` or empty, file names are relative to the directory where the file containing the directive is.)
- **plot_formats** File formats to generate. List of tuples or strings:

```python
[('suffix', dpi), suffix, ...]
```

that determine the file format and the DPI. For entries whose DPI was omitted, sensible defaults are chosen. When passing from the command line through `sphinx_build` the list should be passed as `suffix:dpi,suffix:dpi,...`

- **plot_html_show_formats** Whether to show links to the files in HTML.
- **plot_rcparams** A dictionary containing any non-standard `rcParams` that should be applied before each plot.
**plot_apply_rcparams** By default, rcParams are applied when context option is not used in a plot directive. This configuration option overrides this behavior and applies rcParams before each plot.

**plot_working_directory** By default, the working directory will be changed to the directory of the example, so the code can get at its data files, if any. Also its path will be added to sys.path so it can import any helper modules sitting beside it. This configuration option can be used to specify a central directory (also added to sys.path) where data files and helper modules for all code are located.

**plot_template** Provide a customized template for preparing restructured text.

```python
class matplotlib.sphinxext.plot_directive.PlotDirective(name, arguments, options, content, content_offset, block_text, state, state_machine)
```

Implementation of the .. plot:: directive.

See the module docstring for details.

```python
run(self)
```

Run the plot directive.

```python
eexception matplotlib.sphinxext.plot_directive.PlotError
```

`matplotlib.sphinxext.plot_directive.mark_plot_labels(app, document)`

To make plots referenceable, we need to move the reference from the “htmlonly” (or “latexonly”) node to the actual figure node itself.

`matplotlib.sphinxext.plot_directive.out_of_date(derived, original)`

Return whether derived is out-of-date relative to original, both of which are full file paths.

```python
matplotlib.sphinxext.plot_directive.plot_directive(name, arguments, options, content, content_offset, block_text, state, state_machine)
```

[Deprecated] Implementation of the .. plot:: directive.

See the module docstring for details.

**Notes**

Deprecated since version 3.1.

```python
matplotlib.sphinxext.plot_directive.remove_coding(text)
```

Remove the coding comment, which six.exec doesn’t like.

```python
matplotlib.sphinxext.plot_directive.render_figures(code, code_path, output_dir, output_base, context, function_name, config, context_reset=False, close_figs=False)
```

Run a pyplot script and save the images in output_dir.

Save the images under output_dir with file names derived from output_base

```python
matplotlib.sphinxext.plot_directive.run_code(code, code_path, ns=None, function_name=None)
```

Import a Python module from a path, and run the function given by name, if function_name is not None.
matplotlib.sphinxext.plot_directive.split_code_at_show(text)
    Split code at plt.show().

matplotlib.sphinxext.plot_directive.unescape_doctest(text)
    Extract code from a piece of text, which contains either Python code or doctests.
Matplotlib supports the addition of custom procedures that transform the data before it is displayed.

There is an important distinction between two kinds of transformations. Separable transformations, working on a single dimension, are called “scales”, and non-separable transformations, that handle data in two or more dimensions at a time, are called “projections”.

From the user’s perspective, the scale of a plot can be set with `set_xscale()` and `set_yscale()`. Projections can be chosen using the `projection` keyword argument to the `plot()` or `subplot()` functions, e.g.:

```python
plot(x, y, projection="custom")
```

This document is intended for developers and advanced users who need to create new scales and projections for matplotlib. The necessary code for scales and projections can be included anywhere: directly within a plot script, in third-party code, or in the matplotlib source tree itself.

### 32.1 Creating a new scale

Adding a new scale consists of defining a subclass of `matplotlib.scale.ScaleBase`, that includes the following elements:

- A transformation from data coordinates into display coordinates.
- An inverse of that transformation. This is used, for example, to convert mouse positions from screen space back into data space.
- A function to limit the range of the axis to acceptable values (`limit_range_for_scale()`). A log scale, for instance, would prevent the range from including values less than or equal to zero.
- Locators (major and minor) that determine where to place ticks in the plot, and optionally, how to adjust the limits of the plot to some “good” values. Unlike `limit_range_for_scale()`, which is always enforced, the range setting here is only used when automatically setting the range of the plot.
- Formatters (major and minor) that specify how the tick labels should be drawn.

Once the class is defined, it must be registered with matplotlib so that the user can select it.
A full-fledged and heavily annotated example is in /gallery/scales/custom_scale. There are also some classes in matplotlib.scale that may be used as starting points.

### 32.2 Creating a new projection

Adding a new projection consists of defining a projection axes which subclasses matplotlib.axes.Axes and includes the following elements:

- A transformation from data coordinates into display coordinates.
- An inverse of that transformation. This is used, for example, to convert mouse positions from screen space back into data space.
- Transformations for the gridlines, ticks and ticklabels. Custom projections will often need to place these elements in special locations, and matplotlib has a facility to help with doing so.
- Setting up default values (overriding cla()), since the defaults for a rectilinear axes may not be appropriate.
- Defining the shape of the axes, for example, an elliptical axes, that will be used to draw the background of the plot and for clipping any data elements.
- Defining custom locators and formatters for the projection. For example, in a geographic projection, it may be more convenient to display the grid in degrees, even if the data is in radians.
- Set up interactive panning and zooming. This is left as an “advanced” feature left to the reader, but there is an example of this for polar plots in matplotlib.projections.polar.
- Any additional methods for additional convenience or features.

Once the projection axes is defined, it can be used in one of two ways:

- By defining the class attribute name, the projection axes can be registered with matplotlib.projections.register_projection() and subsequently simply invoked by name:

```python
plt.axes(projection='my_proj_name')
```

- For more complex, parameterisable projections, a generic “projection” object may be defined which includes the method _as_mpl_axes. _as_mpl_axes should take no arguments and return the projection’s axes subclass and a dictionary of additional arguments to pass to the subclass’ __init__ method. Subsequently a parameterised projection can be initialised with:

```python
plt.axes(projection=MyProjection(param1=param1_value))
```

where MyProjection is an object which implements a _as_mpl_axes method.

A full-fledged and heavily annotated example is in /gallery/misc/custom_projection. The polar plot functionality in matplotlib.projections.polar may also be of interest.

### 32.3 API documentation

- matplotlib.scale
- `matplotlib.projections`
- `matplotlib.projections.polar`
WORKING WITH *MATPLOTLIB* SOURCE CODE

Contents:

### 33.1 Introduction

These pages describe a git and github workflow for the Matplotlib project.

There are several different workflows here, for different ways of working with Matplotlib.

This is not a comprehensive git reference, it’s just a workflow for our own project. It’s tailored to the github hosting service. You may well find better or quicker ways of getting stuff done with git, but these should get you started.

For general resources for learning git, see *git resources*.

### 33.2 Install git

#### 33.2.1 Overview

<table>
<thead>
<tr>
<th>OS</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debian / Ubuntu</td>
<td><code>sudo apt-get install git</code></td>
</tr>
<tr>
<td>Fedora</td>
<td><code>sudo yum install git</code></td>
</tr>
<tr>
<td>Windows</td>
<td>Download and install msysGit</td>
</tr>
<tr>
<td>OS X</td>
<td>Use the git-osx-installer</td>
</tr>
</tbody>
</table>

#### 33.2.2 In detail

See the git page for the most recent information.

Have a look at the github install help pages available from *github help*

33.3 Following the latest source

These are the instructions if you just want to follow the latest Matplotlib source, but you don’t need to do any development for now.

The steps are:

- *Install git*
- get local copy of the Matplotlib github git repository
- update local copy from time to time

33.3.1 Get the local copy of the code

From the command line:

```
git clone git://github.com/matplotlib/matplotlib.git
```

You now have a copy of the code tree in the new matplotlib directory.

33.3.2 Updating the code

From time to time you may want to pull down the latest code. Do this with:

```
cd matplotlib
git pull
```

The tree in matplotlib will now have the latest changes from the initial repository.

33.4 Making a patch

You’ve discovered a bug or something else you want to change in Matplotlib — excellent!
You’ve worked out a way to fix it — even better!
You want to tell us about it — best of all!

The easiest way is to make a patch or set of patches. Here we explain how. Making a patch is the simplest and quickest, but if you’re going to be doing anything more than simple quick things, please consider following the *Git for development* model instead.

33.4.1 Making patches

Overview

```
# tell git who you are
git config --global user.email you@yourdomain.example.com
git config --global user.name "Your Name Comes Here"
# get the repository if you don't have it
```
Then, send the generated patch files to the Matplotlib mailing list — where we will thank you warmly.

In detail

1. Tell git who you are so it can label the commits you’ve made:

   ```
   git config --global user.email you@yourdomain.example.com
   git config --global user.name "Your Name Comes Here"
   ```

2. If you don’t already have one, clone a copy of the Matplotlib repository:

   ```
   git clone git://github.com/matplotlib/matplotlib.git
   cd matplotlib
   ```

3. Make a ‘feature branch’. This will be where you work on your bug fix. It’s nice and safe and leaves you with access to an unmodified copy of the code in the main branch:

   ```
   git branch the-fix-im-thinking-of
   git checkout the-fix-im-thinking-of
   ```

4. Do some edits, and commit them as you go:

   ```
   # hack, hack, hack
   # Tell git about any new files you’ve made
   git add somewhere/tests/test_my_bug.py
   # commit work in progress as you go
   git commit -am 'BF - added tests for Funny bug'
   # hack hack, hack
   git commit -am 'BF - added fix for Funny bug'
   # make the patch files
   git format-patch -M -C master
   ```

   Note the -am options to commit. The m flag just signals that you’re going to type a message on the command line. The a flag — you can just take on faith — or see why the -a flag?

5. When you have finished, check you have committed all your changes:

   ```
   git status
   ```
6. Finally, make your commits into patches. You want all the commits since you branched from the master branch:

```bash
git format-patch -M -C master
```

You will now have several files named for the commits:

<table>
<thead>
<tr>
<th>Patch Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0001-BF-added-tests-for-Funny-bug.patch</td>
<td></td>
</tr>
<tr>
<td>0002-BF-added-fix-for-Funny-bug.patch</td>
<td></td>
</tr>
</tbody>
</table>

Send these files to the Matplotlib mailing list.

When you are done, to switch back to the main copy of the code, just return to the master branch:

```bash
git checkout master
```

### 33.4.2 Moving from patching to development

If you find you have done some patches, and you have one or more feature branches, you will probably want to switch to development mode. You can do this with the repository you have.

Fork the Matplotlib repository on github — *Making your own copy (fork) of Matplotlib*. Then:

```bash
# checkout and refresh master branch from main repo
git checkout master
git pull origin master
# rename pointer to main repository to 'upstream'
git remote rename origin upstream
# point your repo to default read / write to your fork on github
git remote add origin git@github.com:your-user-name/matplotlib.git
# push up any branches you've made and want to keep
git push origin the-fix-im-thinking-of
```

Then you can, if you want, follow the *Development workflow*.

### 33.5 Git for development

Contents:

#### 33.5.1 Making your own copy (fork) of Matplotlib

You need to do this only once. The instructions here are very similar to the instructions at [https://help.github.com/forking/](https://help.github.com/forking/) — please see that page for more detail. We’re repeating some of it here just to give the specifics for the Matplotlib project, and to suggest some default names.
**Set up and configure a github account**

If you don’t have a github account, go to the github page, and make one. You then need to configure your account to allow write access — see the Generating SSH keys help on github help.

**Create your own forked copy of Matplotlib**

1. Log into your github account.
2. Go to the Matplotlib github home at Matplotlib github.
3. Click on the fork button:

Now, after a short pause, you should find yourself at the home page for your own forked copy of Matplotlib.

### 33.5.2 Set up your fork

First you follow the instructions for *Making your own copy (fork) of Matplotlib*.

#### Overview

```bash
git clone https://github.com/your-user-name/matplotlib.git
cd matplotlib
git remote add upstream git://github.com/matplotlib/matplotlib.git
```

#### In detail

**Clone your fork**

1. Clone your fork to the local computer with `git clone https://github.com/your-user-name/matplotlib.git`
2. Investigate. Change directory to your new repo: `cd matplotlib`. Then `git branch -a` to show you all branches. You’ll get something like:

```
* master
remotes/origin/master
```
This tells you that you are currently on the master branch, and that you also have a remote connection to origin/master. What remote repository is remote/origin? Try `git remote -v` to see the URLs for the remote. They will point to your github fork.

Now you want to connect to the upstream Matplotlib github repository, so you can merge in changes from trunk.

**Linking your repository to the upstream repo**

```bash
cd matplotlib
git remote add upstream git://github.com/matplotlib/matplotlib.git
```

**upstream** here is just the arbitrary name we’re using to refer to the main Matplotlib repository at Matplotlib github.

Note that we’ve used `git://` for the URL rather than `https://` or `git@`. The `git://` URL is read only. This means that we can’t accidentally (or deliberately) write to the upstream repo, and we are only going to use it to merge into our own code.

Just for your own satisfaction, show yourself that you now have a new ‘remote’, with `git remote -v show`, giving you something like:

```
upstream  git://github.com/matplotlib/matplotlib.git (fetch)
upstream  git://github.com/matplotlib/matplotlib.git (push)
origin    https://github.com/your-user-name/matplotlib.git (fetch)
origin    https://github.com/your-user-name/matplotlib.git (push)
```

### 33.5.3 Configure git

**Overview**

Your personal git configurations are saved in the `.gitconfig` file in your home directory. Here is an example `.gitconfig` file:

```bash
[user]
    name = Your Name
    email = you@yourdomain.example.com

[alias]
    ci = commit -a
    co = checkout
    st = status
    stat = status
    br = branch
    wdiff = diff --color-words

[core]
    editor = vim

[merge]
    summary = true
```
You can edit this file directly or you can use the `git config --global` command:

```
git config --global user.name "Your Name"
git config --global user.email you@yourdomain.example.com
git config --global alias.ci "commit -a"
git config --global alias.co checkout
git config --global alias.st "status -a"
git config --global alias.stat "status -a"
git config --global alias.br branch
git config --global alias.wdiff "diff --color-words"
git config --global core.editor vim
git config --global merge.summary true
```

To set up on another computer, you can copy your ~/.gitconfig file, or run the commands above.

**In detail**

**user.name and user.email**

It is good practice to tell `git` who you are, for labeling any changes you make to the code. The simplest way to do this is from the command line:

```
git config --global user.name "Your Name"
git config --global user.email you@yourdomain.example.com
```

This will write the settings into your git configuration file, which should now contain a user section with your name and email:

```
[user]
  name = Your Name
  email = you@yourdomain.example.com
```

Of course you’ll need to replace Your Name and you@yourdomain.example.com with your actual name and email address.

**Aliases**

You might well benefit from some aliases to common commands.

For example, you might well want to be able to shorten `git checkout` to `git co`. Or you may want to alias `git diff --color-words` (which gives a nicely formatted output of the diff) to `git wdiff`

The following `git config --global` commands:

```
git config --global alias.ci "commit -a"
git config --global alias.co checkout
git config --global alias.st "status -a"
git config --global alias.stat "status -a"
git config --global alias.br branch
git config --global alias.wdiff "diff --color-words"
```
will create an alias section in your .gitconfig file with contents like this:

```
[alias]
  ci = commit -a
  co = checkout
  st = status -a
  stat = status -a
  br = branch
  wdiff = diff --color-words
```

### Editor

You may also want to make sure that your editor of choice is used

```
git config --global core.editor vim
```

### Merging

To enforce summaries when doing merges (~/gitconfig file again):

```
[merge]
  log = true
```

Or from the command line:

```
git config --global merge.log true
```

### Fancy log output

This is a very nice alias to get a fancy log output; it should go in the alias section of your .gitconfig file:

```
lg = log --graph --pretty=format:'%Cred%h%Creset -%C(yellow)%d%Creset %s %Cgreen(%cr) → %C(bold blue)[%an] %Creset' --abbrev-commit --date=relative
```

You use the alias with:

```
git lg
```

and it gives graph / text output something like this (but with color!):

```
* 6d8e1ee - (HEAD, origin/my-fancy-feature, my-fancy-feature) NF - a fancy file (45 minutes ago) [Matthew Brett]
* d304a73 - (origin/placeholder, placeholder) Merge pull request #48 from hhuuggoo/master (2 weeks ago) [Jonathan Terhorst]
|\  
| * 4aff2a8 - fixed bug 35, and added a test in test_bugfixes (2 weeks ago) [Hugo]
| /
* a7ff2e5 - Added notes on discussion/proposal made during Data Array Summit. (2 weeks ago) [Corran Webster]
```

(continues on next page)
33.5.4 Development workflow

You already have your own forked copy of the Matplotlib repository, by following Making your own copy (fork) of Matplotlib. You have Set up your fork. You have configured git by following Configure git. Now you are ready for some real work.

**Workflow summary**

In what follows we’ll refer to the upstream Matplotlib master branch, as “trunk”.

- Don’t use your master branch for anything. Consider deleting it.
- When you are starting a new set of changes, fetch any changes from trunk, and start a new feature branch from that.
- Make a new branch for each separable set of changes — “one task, one branch” (ipython git workflow).
- Name your branch for the purpose of the changes - e.g. bugfix-for-issue-14 or refactor-database-code.
- If you can possibly avoid it, avoid merging trunk or any other branches into your feature branch while you are working.
- If you do find yourself merging from trunk, consider Rebasing on trunk
- Ask on the Matplotlib mailing list if you get stuck.
- Ask for code review!

This way of working helps to keep work well organized, with readable history. This in turn makes it easier for project maintainers (that might be you) to see what you’ve done, and why you did it.

See linux git workflow and ipython git workflow for some explanation.
Consider deleting your master branch

It may sound strange, but deleting your own master branch can help reduce confusion about which branch you are on. See deleting master on github for details.

Update the mirror of trunk

First make sure you have done Linking your repository to the upstream repo. From time to time you should fetch the upstream (trunk) changes from github:

```
git fetch upstream
```

This will pull down any commits you don’t have, and set the remote branches to point to the right commit. For example, ‘trunk’ is the branch referred to by (remote/branchname) upstream/master - and if there have been commits since you last checked, upstream/master will change after you do the fetch.

Make a new feature branch

When you are ready to make some changes to the code, you should start a new branch. Branches that are for a collection of related edits are often called ‘feature branches’.

Making an new branch for each set of related changes will make it easier for someone reviewing your branch to see what you are doing.

Choose an informative name for the branch to remind yourself and the rest of us what the changes in the branch are for. For example add-ability-to-fly, or buxfix-for-issue-42.

```
# Update the mirror of trunk
git fetch upstream
# Make new feature branch starting at current trunk
git branch my-new-feature upstream/master
git checkout my-new-feature
```

Generally, you will want to keep your feature branches on your public github fork of Matplotlib. To do this, you git push this new branch up to your github repo. Generally (if you followed the instructions in these pages, and by default), git will have a link to your github repo, called origin. You push up to your own repo on github with:

```
git push origin my-new-feature
```

In git >= 1.7 you can ensure that the link is correctly set by using the --set-upstream option:

```
git push --set-upstream origin my-new-feature
```

From now on git will know that my-new-feature is related to the my-new-feature branch in the github repo.

The editing workflow
Overview

```bash
# hack hack
git add my_new_file
git commit -am 'NF - some message'
git push
```

In more detail

1. Make some changes
2. See which files have changed with `git status` (see `git status`). You’ll see a listing like this one:

```bash
# On branch ny-new-feature
# Changed but not updated:
# (use "git add <file>..." to update what will be committed)
# (use "git checkout -- <file>..." to discard changes in working directory)
#
#   modified:   README
#
# Untracked files:
# (use "git add <file>..." to include in what will be committed)
#
#   INSTALL
no changes added to commit (use "git add" and/or "git commit -a")
```
3. Check what the actual changes are with `git diff` (git diff).
4. Add any new files to version control `git add new_file_name` (see `git add`).
5. To commit all modified files into the local copy of your repo, do `git commit -am 'A commit message'`. Note the -am options to commit. The m flag just signals that you’re going to type a message on the command line. The a flag — you can just take on faith — or see why the -a flag? — and the helpful use-case description in the tangled working copy problem. The `git commit` manual page might also be useful.
6. To push the changes up to your forked repo on github, do a `git push` (see `git push`).

Ask for your changes to be reviewed or merged

When you are ready to ask for someone to review your code and consider a merge:

1. Go to the URL of your forked repo, say `https://github.com/your-user-name/matplotlib`.
2. Use the ‘Switch Branches’ dropdown menu near the top left of the page to select the branch with your changes:
3. Click on the ‘Pull request’ button:

Enter a title for the set of changes, and some explanation of what you’ve done. Say if there is anything you’d like particular attention for - like a complicated change or some code you are not happy with.

If you don’t think your request is ready to be merged, just say so in your pull request message. This is still a good way of getting some preliminary code review.

Some other things you might want to do

Delete a branch on github

```
git checkout master
# delete branch locally
git branch -D my-unwanted-branch
# delete branch on github
git push origin :my-unwanted-branch
```

Note the colon : before my-unwanted-branch. See also: https://help.github.com/articles/pushing-to-a-remote/#deleting-a-remote-branch-or-tag

Several people sharing a single repository

If you want to work on some stuff with other people, where you are all committing into the same repository, or even the same branch, then just share it via github.

First fork Matplotlib into your account, as from Making your own copy (fork) of Matplotlib.

Then, go to your forked repository github page, say https://github.com/your-user-name/matplotlib

2272 Chapter 33. Working with Matplotlib source code
Click on the ‘Admin’ button, and add anyone else to the repo as a collaborator:

![Admin Button](image)

Now all those people can do:

```
$ git clone https://github.com/your-user-name/matplotlib.git
```

Remember that links starting with https or git@ are read-write, and that git@ uses the ssh protocol; links starting with git:// are read-only.

Your collaborators can then commit directly into that repo with the usual:

```
$ git commit -am 'ENH - much better code'
$ git push origin master # pushes directly into your repo
```

### Explore your repository

To see a graphical representation of the repository branches and commits:

```
$ gitk --all
```

To see a linear list of commits for this branch:

```
$ git log
```

You can also look at the network graph visualizer for your github repo.

Finally the *Fancy log output* `lg` alias will give you a reasonable text-based graph of the repository.

### Rebasing on trunk

Let’s say you thought of some work you’d like to do. You *Update the mirror of trunk* and *Make a new feature branch* called `cool-feature`. At this stage trunk is at some commit, let’s call it E. Now you make some new commits on your `cool-feature` branch, let’s call them A, B, C. Maybe your changes take a while, or you come back to them after a while. In the meantime, trunk has progressed from commit E to commit (say) G:

```
A---B---C cool-feature
  /  
D---E---F---G trunk
```

At this stage you consider merging trunk into your feature branch, and you remember that this here page sternly advises you not to do that, because the history will get messy. Most of the time you can just ask for a review, and not worry that trunk has got a little ahead. But
sometimes, the changes in trunk might affect your changes, and you need to harmonize them. In this situation you may prefer to do a rebase.

rebase takes your changes (A, B, C) and replays them as if they had been made to the current state of trunk. In other words, in this case, it takes the changes represented by A, B, C and replays them on top of G. After the rebase, your history will look like this:

```
A'--B'--C' cool-feature
     /          \\
D---E---F---G trunk
```

See rebase without tears for more detail.

To do a rebase on trunk:

```
# Update the mirror of trunk
git fetch upstream
# go to the feature branch
git checkout cool-feature
# make a backup in case you mess up
git branch tmp cool-feature
# rebase cool-feature onto trunk
git rebase --onto upstream/master upstream/master cool-feature
```

In this situation, where you are already on branch cool-feature, the last command can be written more succinctly as:

```
git rebase upstream/master
```

When all looks good you can delete your backup branch:

```
git branch -D tmp
```

If it doesn’t look good you may need to have a look at Recovering from mess-ups.

If you have made changes to files that have also changed in trunk, this may generate merge conflicts that you need to resolve - see the git rebase man page for some instructions at the end of the “Description” section. There is some related help on merging in the git user manual - see resolving a merge.

**Recovering from mess-ups**

Sometimes, you mess up merges or rebases. Luckily, in git it is relatively straightforward to recover from such mistakes.

If you mess up during a rebase:

```
git rebase --abort
```

If you notice you messed up after the rebase:

```
# reset branch back to the saved point
git reset --hard tmp
```

If you forgot to make a backup branch:
# look at the reflog of the branch
```bash
$ git reflog show cool-feature
```

<table>
<thead>
<tr>
<th>Commit</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>8630830</td>
<td>cool-feature@{0}: commit: BUG: io: close file handles immediately</td>
</tr>
</tbody>
</table>
| 278dd2a | cool-feature@{1}: rebase finished: refs/heads/my-feature-branch onto ...
| 26aa21a | cool-feature@{2}: commit: BUG: lib: make seek_gzip_factory not leak gzip obj |

# reset the branch to where it was before the botched rebase
```bash
$ git reset --hard cool-feature@{2}
```

## Rewriting commit history

**Note:** Do this only for your own feature branches.

There’s an embarrassing typo in a commit you made? Or perhaps the you made several false starts you would like the posterity not to see.

This can be done via *interactive rebasing*.

Suppose that the commit history looks like this:

```
$ git log --oneline
eadc391 Fix some remaining bugs
a815645 Modify it so that it works
2dec1ac Fix a few bugs + disable
13d7934 First implementation
6ad92e5 * masked is now an instance of a new object, MaskedConstant
29001ed Add pre-nep for a copule of structured_array_extensions.
... 
```

and 6ad92e5 is the last commit in the *cool-feature* branch. Suppose we want to make the following changes:

- Rewrite the commit message for 13d7934 to something more sensible.
- Combine the commits 2dec1ac, a815645, eadc391 into a single one.

We do as follows:

```
# make a backup of the current state
$ git branch tmp HEAD
# interactive rebase
$ git rebase -i 6ad92e5
```

This will open an editor with the following text in it:

```
pick 13d7934 First implementation
pick 2dec1ac Fix a few bugs + disable
pick a815645 Modify it so that it works
pick eadc391 Fix some remaining bugs
```

(continues on next page)
To achieve what we want, we will make the following changes to it:

```
r 13d7934 First implementation
pick 2dec1ac Fix a few bugs + disable
f a815645 Modify it so that it works
f eadc391 Fix some remaining bugs
```

This means that (i) we want to edit the commit message for 13d7934, and (ii) collapse the last three commits into one. Now we save and quit the editor.

Git will then immediately bring up an editor for editing the commit message. After revising it, we get the output:

```
[detached HEAD 721fc64] FOO: First implementation
  2 files changed, 199 insertions(+), 66 deletions(-)
[detached HEAD 0f22701] Fix a few bugs + disable
  1 files changed, 79 insertions(+), 61 deletions(-)
Successfully rebased and updated refs/heads/my-feature-branch.
```

and the history looks now like this:

```
0f22701 Fix a few bugs + disable
721fc64 ENH: Sophisticated feature
6ad92e5 * masked is now an instance of a new object, MaskedConstant
```

If it went wrong, recovery is again possible as explained above.

### 33.5.5 Maintainer workflow

This page is for maintainers — those of us who merge our own or other peoples’ changes into the upstream repository.

Being as how you’re a maintainer, you are completely on top of the basic stuff in Development workflow.

The instructions in Linking your repository to the upstream repo add a remote that has read-only access to the upstream repo. Being a maintainer, you’ve got read-write access.

It’s good to have your upstream remote have a scary name, to remind you that it’s a read-write remote:
Integrating changes

Let’s say you have some changes that need to go into trunk (upstream-rw/master).
The changes are in some branch that you are currently on. For example, you are looking at someone’s changes like this:

```
git remote add someone git://github.com/someone/matplotlib.git
git fetch someone
git branch cool-feature --track someone/cool-feature
git checkout cool-feature
```

So now you are on the branch with the changes to be incorporated upstream. The rest of this section assumes you are on this branch.

A few commits

If there are only a few commits, consider rebasing to upstream:

```
# Fetch upstream changes
git fetch upstream-rw

# rebase
git rebase upstream-rw/master
```

Remember that, if you do a rebase, and push that, you’ll have to close any github pull requests manually, because github will not be able to detect the changes have already been merged.

A long series of commits

If there are a longer series of related commits, consider a merge instead:

```
git fetch upstream-rw
git merge --no-ff upstream-rw/master
```

The merge will be detected by github, and should close any related pull requests automatically.

Note the --no-ff above. This forces git to make a merge commit, rather than doing a fast-forward, so that these set of commits branch off trunk then rejoin the main history with a merge, rather than appearing to have been made directly on top of trunk.

Check the history

Now, in either case, you should check that the history is sensible and you have the right commits:
The first line above just shows the history in a compact way, with a text representation of the
history graph. The second line shows the log of commits excluding those that can be reached
from trunk (upstream-rw/master), and including those that can be reached from current HEAD
(implied with the .. at the end). So, it shows the commits unique to this branch compared to
trunk. The -p option shows the diff for these commits in patch form.

Push to trunk

This pushes the my-new-feature branch in this repository to the master branch in the upstream-rw
repository.

33.6 git resources

33.6.1 Tutorials and summaries

- [github help](https://github.com) has an excellent series of how-to guides.
- The [pro git book](https://git-scm.com/book) is a good in-depth book on git.
- A [git cheat sheet](https://git-scm.com/docs) is a page giving summaries of common commands.
- The [git user manual](https://git-scm.com/docs)
- The [git tutorial](https://git-scm.com/docs)
- The [git community book](https://git-scm.com/docs)
- [git ready](https://git-scm.com/docs) — a nice series of tutorials
- [git magic](https://git-scm.com/docs) — extended introduction with intermediate detail
- [The git parable](https://git-scm.com/docs) is an easy read explaining the concepts behind git.
- [git foundation](https://git-scm.com/docs) expands on the [git parable](https://git-scm.com/docs).
- Fernando Perez’ git page — [Fernando’s git page](https://git-scm.com/docs) — many links and tips
- A good but technical page on [git concepts](https://git-scm.com/docs)
- [git svn crash course](https://git-scm.com/docs): git for those of us used to subversion

33.6.2 Advanced git workflow

There are many ways of working with git; here are some posts on the rules of thumb that
other projects have come up with:

- Linus Torvalds on [git management](https://git-scm.com/docs)
• Linus Torvalds on [Linux git workflow](https://git-scm.com/book/en/v2/Git-Basics-Branching-and-Merging). Summary; use the git tools to make the history of your edits as clean as possible; merge from upstream edits as little as possible in branches where you are doing active development.

### 33.6.3 Manual pages online

You can get these on your own machine with (e.g) `git help push` or (same thing) `git push --help`, but, for convenience, here are the online manual pages for some common commands:

- `git add`
- `git branch`
- `git checkout`
- `git clone`
- `git commit`
- `git config`
- `git diff`
- `git log`
- `git pull`
- `git push`
- `git remote`
- `git status`

### 33.7 Two and three dots in difference specs

Thanks to Yarik Halchenko for this explanation.

Imagine a series of commits A, B, C, D... Imagine that there are two branches, `topic` and `master`. You branched `topic` off `master` when `master` was at commit 'E'. The graph of the commits looks like this:

```
A---B---C topic
    /
D---E---F---G master
```

Then:

```
git diff master..topic
```

will output the difference from G to C (i.e. with effects of F and G), while:

```
git diff master...topic
```

would output just differences in the topic branch (i.e. only A, B, and C).
34.1 Pull request checklist

34.1.1 Branch selection

In general target the master branch for all new features and bug-fixes. PRs may target maintenance or doc branches on a case-by-case basis.

34.1.2 Documentation

- Every new feature should be documented. If it’s a new module, don’t forget to add a new rst file to the API docs.
- Each high-level plotting function should have a small example in the Example section of the docstring. This should be as simple as possible to demonstrate the method. More complex examples should go in the examples section of the documentation.
- Build the docs and make sure all formatting warnings are addressed.
- See Writing documentation for our documentation style guide.
- If your change is a major new feature, add an entry to doc/users/whats_new.rst.
- If you change the API in a backward-incompatible way, please document it in doc/api/api_changes.rst.

34.2 PR Review guidelines

- Be patient and kind with contributors.
- If you have commit rights, then you are trusted to use them. Please help review and merge PRs!
- Documentation and examples may be merged by the first reviewer. Use the threshold “is this better than it was?” as the review criteria.
- For code changes (anything in src or lib) at least two developers (those with commit rights) should review all pull requests. If you are the first to review a PR and approve of the changes use the github ‘approve review’ tool to mark it as such. If you are a subsequent reviewer please approve the review and if you think no more review is needed, merge the PR.
Ensure that all API changes are documented in doc/api/api_changes and significant new features have an entry in doc/user/whats_new.

- Make sure the Travis, Appveyor, circle, and codecov tests are passing before merging.
  - Whenever a pull request is created or updated, Travis and Appveyor automatically run the test suite on all versions of Python supported by Matplotlib. The tox support in Matplotlib may be useful for testing locally.
- Do not self merge, except for ‘small’ patches to un-break the CI or when another reviewer explicitly allows it (ex, “Approve modulo CI passing, may self merge when green”)
- Squashing is case-by-case. The balance is between burden on the contributor, keeping a relatively clean history, and keeping a history usable for bisecting. The only time we are really strict about it is to eliminate binary files (ex multiple test image re-generations) and to remove upstream merges.
- Do not let perfect be the enemy of the good, particularly for documentation or example PRs. If you find yourself making many small suggestions, either open a PR against the original branch, push changes to the contributor branch, or merge the PR and then open a new PR against upstream.
- If you push to a contributor branch leave a comment explaining what you did, ex “I took the liberty of pushing a small clean-up PR to your branch, thanks for your work.”. If you are going to make substantial changes to the code or intent of the PR please check with the contributor first.

### 34.3 Branches and Backports

The current active branches are

- **master** This will be Matplotlib 3.0. Supports Python 3.5+.
- **v2.2.x** Maintenance branch for Matplotlib 2.2 LTS. Supports Python 2.7, 3.4+
- **v2.2.N-doc** Documentation for the current release. On a patch release, this will be replaced by a properly named branch for the new release.

We always will backport to 2.2.x

- critical bug fixes (segfault, failure to import, things that the user can not work around)
- fixes for regressions against 2.0 or 2.1

Everything else (regressions against 1.x versions, bugs/api inconsistencies the user can work around in their code) are on a case-by-case basis, should be low-risk, and need someone to advocate for and shepherd through the backport.

The only changes to be backported to 2.2.N-doc are changes to doc, examples, or tutorials. Any changes to lib or src should not be backported to this branch.

#### 34.3.1 Automated backports

We use meeseeksdev bot to automatically backport merges to the correct maintenance branch base on the milestone. To work properly the milestone must be set before merging. If you have commit rights, the bot can also be manually triggered after a merge by leaving a message @meeseeksdev backport to BRANCH on the PR. If there are conflicts meeseekdevs will inform you that the backport needs to be done manually.
The target branch is configured by putting `on-merge: backport` to `TARGETBRANCH` in the milestone description on its own line.

If the bot is not working as expected, please report issues to Meeseeksdev.

### 34.3.2 Manual backports

When doing backports please copy the form used by meeseekdev, Backport PR #XXXX: TITLE OF PR. If you need to manually resolve conflicts make note of them and how you resolved them in the commit message.

We do a backport from master to v2.2.x assuming:

- `matplotlib` is a read-only remote branch of the matplotlib/matplotlib repo

The `TARGET_SHA` is the hash of the merge commit you would like to backport. This can be read off of the github PR page (in the UI with the merge notification) or through the git CLI tools.

Assuming that you already have a local branch `v2.2.x` (if not, then `git checkout -b v2.2.x`), and that your remote pointing to `https://github.com/matplotlib/matplotlib` is called `upstream`:

```
git fetch upstream
git checkout v2.2.x  # or include -b if you don't already have this.
git reset --hard upstream/v2.2.x
git cherry-pick -m 1 TARGET_SHA
# resolve conflicts and commit if required
```

Files with conflicts can be listed by `git status`, and will have to be fixed by hand (search on `<<<<<<<`). Once the conflict is resolved, you will have to re-add the file(s) to the branch and then continue the cherry pick:

```
git add lib/matplotlib/conflicted_file.py
git add lib/matplotlib/conflicted_file2.py
git cherry-pick --continue
```

Use your discretion to push directly to upstream or to open a PR; be sure to push or PR against the v2.2.x upstream branch, not master!
This document is only relevant for matplotlib release managers.
A guide for developers who are doing a matplotlib release.

**Note:** This assumes that a read-only remote for the canonical repository is remote and a read/write remote is DANGER.

### 35.1 All Releases

#### 35.1.1 Testing

We use travis-ci for continuous integration. When preparing for a release, the final tagged commit should be tested locally before it is uploaded:

```bash
pytest -n 8.
```

In addition the following test should be run and manually inspected:

```bash
python unit/memleak.py agg agg.pdf
```

In addition the following should be run and manually inspected, but is currently broken:

```bash
pushd examples/tests/
python backend_driver_sgskip.py
popd
```

#### 35.1.2 GitHub Stats

We automatically extract GitHub issue, PRs, and authors from GitHub via the API. copy the current `github_stats.rst` to `github_stats_X.Y.Z.rst`.

To re-generate the updated

```bash
python tools/github_stats.py --since-tag v2.2.0 --milestone=v3.0 --project 'matplotlib' --links > doc/users/github_stats.rst
```
Review and commit changes. Some issue/PR titles may not be valid rst (the most common issue is `*` which is interpreted as unclosed markup).

### 35.1.3 Update and Validate the Docs

Merge the most recent ‘doc’ branch (v3.0.2-doc) into the branch you are going to tag on and delete the doc branch on GitHub.

Before tagging, update the “what’s new” and “API changes” listings.

for the “what’s new”

1. copy the current content to a file in doc/users/prev_whats_new
2. merge all of the files in doc/users/next_whats_new/ into doc/users/whats_new.rst and delete the individual files
3. comment out the next whats new glob at the top

Similarly for the “API changes”

1. copy the current api changes to a file is doc/api/prev_api_changes
2. merge all of the files in doc/api/next_api_changes/ into doc/api/whats_new.rst
3. comment out the next API changes at the top.

In both cases step 3 will have to be un-done right after the release.

Finally, make sure that the docs build cleanly

```bash
make -Cdoc O=-j$(nproc) html latexpdf
```

After the docs are built, check that all of the links, internal and external, are still valid. We use linkchecker for this, which has not been ported to python3 yet. You will need to create a python2 environment with requests==2.9.0 and linkchecker

```bash
conda create -p /tmp/lnkchk python=2 requests=2.9.0
source activate /tmp/lnkchk
pip install linkchecker
pushd doc/build/html
linkchecker index.html --check-extern
popd
```

Address any issues which may arise. The internal links are checked on travis, this should only flag failed external links.

### 35.1.4 Create release commit and tag

To create the tag, first create an empty commit with a very terse set of the release notes in the commit message

```bash
git commit --allow-empty
```

and then create a signed, annotated tag with the same text in the body message

```bash
git tag -a -s v2.0.0
```
which will prompt you for your gpg key password and an annotation. For pre releases it is important to follow PEP 440 so that the build artifacts will sort correctly in pypi. Finally, push the tag to GitHub

```bash
git push -t DANGER v2.0.0
```

Congratulations, the scariest part is done!

To prevent issues with any down-stream builders which download the tarball from GitHub it is important to move all branches away from the commit with the tag¹:

```bash
git commit --allow-empty
git push DANGER master
```

If this is a final release, also create a ‘doc’ branch (this is not done for pre-releases):

```bash
git branch v2.0.0-doc
git push DANGER v2.0.0-doc
```

and if this is a major or minor release, also create a bug-fix branch (a micro release will be cut off of this branch):

```bash
git branch v2.0.x
```

On this branch un-comment the globs from Update and Validate the Docs. And then

```bash
git push DANGER v2.0.x
```

### 35.1.5 Release Management / DOI

Via the GitHub UI, turn the newly pushed tag into a release. If this is a pre-release remember to mark it as such.

For final releases also get a DOI from zenodo and edit doc/citing.rst with DOI link and commit to the VER-doc branch and push to GitHub

```bash
git checkout v2.0.0-doc
git push DANGER v2.0.0-doc:v2.0.0-doc
```

### 35.1.6 Building binaries

We distribute mac, windows, and many linux wheels as well as a source tarball via pypi. Before uploading anything, contact the various builders. Mac and manylinux wheels are built

¹ The tarball that is provided by GitHub is produced using `git archive`. We use versioneer which uses a format string in `lib/matplotlib/_version.py` to have git insert a list of references to exported commit (see .gitattributes for the configuration). This string is then used by versioneer to produce the correct version, based on the git tag, when users install from the tarball. However, if there is a branch pointed at the tagged commit, then the branch name will also be included in the tarball. When the branch eventually moves, anyone how checked the hash of the tarball before the branch moved will have an incorrect hash.

To generate the file that GitHub does use

```bash
git archive v2.0.0 -o matplotlib-2.0.0.tar.gz --prefix=matplotlib-2.0.0/
```
on travis. You need to edit the .travis.yml file and push to the correct branch of the build project. For new minor versions create a new branch, for bug-fixes continue to use the current release branch.

The auto-tick bot should open a pull request into the conda-forge feedstock. Review and merge (if you have the power to).

**Warning:** Because this is automated, it is extremely important to bump all branches away from the tag as discussed in *Create release commit and tag*.

If this is a final release the following downstream packagers should be contacted:

- Debian
- Fedora
- Arch
- Gentoo
- Macports
- Homebrew
- Christoph Gohlke
- Continuum
- Enthought

This can be done ahead of collecting all of the binaries and uploading to pypi.

### 35.1.7 make distribution and upload to pypi / SF

Once you have collected all of the wheels (expect this to take about a day), generate the tarball

```
$ git checkout v2.0.0
$ git clean -xfd
$ python setup.py sdist
```

and copy all of the wheels into dist directory. You should use *twine* to upload all of the files to pypi

```
$ twine upload -s dist/matplotlib*tar.gz
$ twine upload dist/*whl
```

Congratulations, you have now done the second scariest part!

Additionally, for a final release, upload all of the files to sourceforge.

### 35.1.8 Build and Deploy Documentation

To build the documentation you must have the tagged version installed, but build the docs from the ver-doc branch. An easy way to arrange this is:
pip install matplotlib
pip install -r requirements/doc/doc-requirements.txt
git checkout v2.0.0-doc
git clean -xfd
cd doc
make O=-n$(nproc) html latexpdf

which will build both the html and pdf version of the documentation.

The built documentation exists in the matplotlib.github.com repository. Pushing changes to master automatically updates the website.

The documentation is organized by version. At the root of the tree is always the documentation for the latest stable release. Under that, there are directories containing the documentation for older versions. The documentation for current master are built on travis and push to the devdocs repository. These are available at matplotlib.org/devdocs.

Assuming you have this repository checked out in the same directory as matplotlib

cd ../matplotlib.github.com
mkdir 2.0.0
rsync -a ../matplotlib/doc/build/html/* 2.0.0
cp ../matplotlib/doc/build/latex/Matplotlib.pdf 2.0.0

which will copy the built docs over. If this is a final release, also replace the top-level docs

rsync -a 2.0.0/* ./

You will need to manually edit versions.html to show the last 3 tagged versions. Now commit and push everything to GitHub

git add *
git commit -m 'Updating docs for v2.0.0'
git push DANGER master

Congratulations you have now done the third scariest part!

If you have access, clear the cloudflare caches.

It typically takes about 5-10 minutes for GitHub to process the push and update the live web page (remember to clear your browser cache).

35.1.9 Announcing

The final step is to announce the release to the world. A short version of the release notes along with acknowledgments should be sent to

- matplotlib-user@python.org
- matplotlib-devel@python.org
- matplotlib-announce@python.org

For final releases announcements should also be sent to the numpy/scipy/scikit-image mailing lists.
In addition, announcements should be made on social networks (twitter via the @matplotlib account, any other via personal accounts). NumFOCUS should be contacted for inclusion in their newsletter.
MINIMUM VERSION OF DEPENDENCIES POLICY

For the purpose of this document, ‘minor version’ is in the sense of SemVer (major, minor, patch) and includes both major and minor releases. For projects that use date-based versioning, every release is a ‘minor version’.

36.1 Python and numpy

- support minor versions of Python initially released 36 months prior to our planned release date.
- support minor versions of numpy initially released in the 36 months prior to our planned release date or oldest that supports the minimum python version (which ever is higher)

We will bump the minimum python and numpy versions as we can every minor and major release, but never on a patch release.

36.2 Python Dependencies

For python dependencies we should support at least:

**with compiled extensions** minor versions initially released in the 36 months prior to our planned release date or the oldest that support our minimum python + numpy

**without compiled extensions** minor versions initially released in the 24 months prior to our planned release date or the oldest that supports our minimum python.

We will only bump these dependencies as we need new features or the old versions no longer support our minimum numpy or python.

36.3 Test and Documentation Dependencies

As these packages are only needed for testing or building the docs and not needed by end-users, we can be more aggressive about dropping support for old versions. However, we need to be careful to not over-run what down-stream packagers support (as most of the run the tests and build the documentation as part of the packaging process).

We will support at least minor versions of the development dependencies released in the 12 months prior to our planned release.
We will only bump these as needed or versions no longer support our minimum Python and numpy.

36.4 System and C-dependencies

For system or c-dependencies (libpng, freetype, GUI frameworks, latex, gs, ffmpeg) support as old as practical. These can be difficult to install for end-users and we want to be usable on as many systems as possible. We will bump these on a case-by-case basis.
MATPLOTLIB ENHANCEMENT PROPOSALS

Matplotlib Enhancement Proposals (MEP), inspired by cpython’s PEP’s but less formal, are design documents for large or controversial changes to Matplotlib. These documents should provide a discussion of both why and how the changes should be made.

To create a new MEP open a pull request (PR) adding a file based on the template to this the MEP directory. For the initial PR only a rough description is required and it should be merged quickly. Further detailed discussion can happen in follow on PRs.

37.1 MEP Template

- Status
- Branches and Pull requests
- Abstract
- Detailed description
- Implementation
- Backward compatibility
- Alternatives

This MEP template is a guideline of the sections that a MEP should contain. Extra sections may be added if appropriate, and unnecessary sections may be noted as such.

37.1.1 Status

MEPs go through a number of phases in their lifetime:

- **Discussion**: The MEP is being actively discussed on the mailing list and it is being improved by its author. The mailing list discussion of the MEP should include the MEP number (MEPxxx) in the subject line so they can be easily related to the MEP.
- **Progress**: Consensus was reached and implementation work has begun.
- **Completed**: The implementation has been merged into master.
- **Superseded**: This MEP has been abandoned in favor of another approach.
- **Rejected**: There are currently no plans to implement the proposal.
37.1.2 Branches and Pull requests

All development branches containing work on this MEP should be linked to from here.
All pull requests submitted relating to this MEP should be linked to from here. (A MEP does not need to be implemented in a single pull request if it makes sense to implement it in discrete phases).

37.1.3 Abstract

The abstract should be a short description of what the MEP will achieve.

37.1.4 Detailed description

This section describes the need for the MEP. It should describe the existing problem that it is trying to solve and why this MEP makes the situation better. It should include examples of how the new functionality would be used and perhaps some use cases.

37.1.5 Implementation

This section lists the major steps required to implement the MEP. Where possible, it should be noted where one step is dependent on another, and which steps may be optionally omitted. Where it makes sense, each step should include a link related pull requests as the implementation progresses.

37.1.6 Backward compatibility

This section describes the ways in which the MEP breaks backward incompatibility.

37.1.7 Alternatives

If there were any alternative solutions to solving the same problem, they should be discussed here, along with a justification for the chosen approach.

37.2 MEP8: PEP8

- Status
- Branches and Pull requests
- Abstract
- Detailed description
- Implementation
37.2.1 Status

Completed
We are currently enforcing a sub-set of pep8 on new code contributions.

37.2.2 Branches and Pull requests

None so far.

37.2.3 Abstract

The matplotlib codebase predates PEP8, and therefore is less than consistent style-wise in some areas. Bringing the codebase into compliance with PEP8 would go a long way to improving its legibility.

37.2.4 Detailed description

Some files use four space indentation, some use three. Some use different levels in the same file.
For the most part, class/function/variable naming follows PEP8, but it wouldn’t hurt to fix where necessary.

37.2.5 Implementation

The implementation should be fairly mechanical: running the pep8 tool over the code and fixing where appropriate.
This should be merged in after the 2.0 release, since the changes will likely make merging any pending pull requests more difficult.
Additionally, and optionally, PEP8 compliance could be tracked by an automated build system.

37.2.6 Backward compatibility

Public names of classes and functions that require change (there shouldn’t be many of these) should first be deprecated and then removed in the next release cycle.

37.2.7 Alternatives

PEP8 is a popular standard for Python code style, blessed by the Python core developers, making any alternatives less desirable.
### 37.3 MEP9: Global interaction manager

- **Status**
- **Branches and Pull requests**
- **Abstract**
- **Detailed description**
- **Implementation**
- **Current summary of the mixin**
- **Backward compatibility**
- **Alternatives**

Add a global manager for all user interactivity with artists; make any artist resizeable, moveable, highlightable, and selectable as desired by the user.

#### 37.3.1 Status

**Discussion**

#### 37.3.2 Branches and Pull requests

https://github.com/dhyams/matplotlib/tree/MEP9

#### 37.3.3 Abstract

The goal is to be able to interact with matplotlib artists in a very similar way as drawing programs do. When appropriate, the user should be able to move, resize, or select an artist that is already on the canvas. Of course, the script writer is ultimately in control of whether an artist is able to be interacted with, or whether it is static.

This code to do this has already been privately implemented and tested, and would need to be migrated from its current “mixin” implementation, to a bona-fide part of matplotlib.

The end result would be to have four new keywords available to matplotlib.artist.Artist: `_moveable_`, `_resizeable_`, `_selectable_`, and `_highlightable_`. Setting any one of these keywords to True would activate interactivity for that artist.

In effect, this MEP is a logical extension of event handling in matplotlib; matplotlib already supports “low level” interactions like left mouse presses, a key press, or similar. The MEP extends the support to the logical level, where callbacks are performed on the artists when certain interactive gestures from the user are detected.

#### 37.3.4 Detailed description

This new functionality would be used to allow the end-user to better interact with the graph. Many times, a graph is almost what the user wants, but a small repositioning and/or resizing
of components is necessary. Rather than force the user to go back to the script to trial-and-error the location, and simple drag and drop would be appropriate.

Also, this would better support applications that use matplotlib; here, the end-user has no reasonable access or desire to edit the underlying source in order to fine-tune a plot. Here, if matplotlib offered the capability, one could move or resize artists on the canvas to suit their needs. Also, the user should be able to highlight (with a mouse over) an artist, and select it with a double-click, if the application supports that sort of thing. In this MEP, we also want to support the highlighting and selection natively; it is up to application to handle what happens when the artist is selected. A typical handling would be to display a dialog to edit the properties of the artist.

In the future, as well (this is not part of this MEP), matplotlib could offer backend-specific property dialogs for each artist, which are raised on artist selection. This MEP would be a necessary stepping stone for that sort of capability.

There are currently a few interactive capabilities in matplotlib (e.g. legend.draggable()), but they tend to be scattered and are not available for all artists. This MEP seeks to unify the interactive interface and make it work for all artists.

The current MEP also includes grab handles for resizing artists, and appropriate boxes drawn when artists are moved or resized.

### 37.3.5 Implementation

- Add appropriate methods to the “tree” of artists so that the interactivity manager has a consistent interface for the interactivity manager to deal with. The proposed methods to add to the artists, if they are to support interactivity, are:
  - `get_pixel_position_ll(self)`: get the pixel position of the lower left corner of the artist’s bounding box
  - `get_pixel_size(self)`: get the size of the artist’s bounding box, in pixels
  - `set_pixel_position_and_size(self,x,y,dx,dy)`: set the new size of the artist, such that it fits within the specified bounding box.

- add capability to the backends to 1) provide cursors, since these are needed for visual indication of moving/resizing, and 2) provide a function that gets the current mouse position

- Implement the manager. This has already been done privately (by dhyams) as a mixin, and has been tested quite a bit. The goal would be to move the functionality of the manager into the artists so that it is in matplotlib properly, and not as a “monkey patch” as I currently have it coded.

### 37.3.6 Current summary of the mixin

(Note that this mixin is for now just private code, but can be added to a branch obviously)

InteractiveArtistMixin:

Mixin class to make any generic object that is drawn on a matplotlib canvas moveable and possibly resizeable. The Powerpoint model is followed as closely as possible; not because I’m enamoured with Powerpoint, but because that’s what most people understand. An artist can also be selectable, which means that the artist will receive the on_activated() callback when double clicked. Finally, an artist can be highlightable, which means that a highlight is drawn
on the artist whenever the mouse passes over. Typically, highlightable artists will also be selectable, but that is left up to the user. So, basically there are four attributes that can be set by the user on a per-artist basis:

- highlightable
- selectable
- moveable
- resizeable

To be moveable (draggable) or resizeable, the object that is the target of the mixin must support the following protocols:

- get_pixel_position_ll(self)
- get_pixel_size(self)
- set_pixel_position_and_size(self, x, y, sx, sy)

Note that nonresizeable objects are free to ignore the sx and sy parameters. To be highlightable, the object that is the target of the mixin must also support the following protocol:

- get_highlight(self)

Which returns a list of artists that will be used to draw the highlight.

If the object that is the target of the mixin is not a matplotlib artist, the following protocols must also be implemented. Doing so is usually fairly trivial, as there has to be an artist somewhere that is being drawn. Typically your object would just route these calls to that artist.

- get_figure(self)
- get_axes(self)
- contains(self, event)
- set_animated(self, flag)
- draw(self, renderer)
- get_visible(self)

The following notifications are called on the artist, and the artist can optionally implement these.

- on_select_begin(self)
- on_select_end(self)
- on_drag_begin(self)
- on_drag_end(self)
- on_activated(self)
- on_highlight(self)
- on_right_click(self, event)
- on_left_click(self, event)
- on_middle_click(self, event)
- on_context_click(self, event)
- on_key_up(self, event)
The following notifications are called on the canvas, if no interactive artist handles the event:

- on_key_down(self, event)
- on_press(self, event)
- on_left_click(self, event)
- on_middle_click(self, event)
- on_right_click(self, event)
- on_context_click(self, event)
- on_key_up(self, event)
- on_key_down(self, event)

The following functions, if present, can be used to modify the behavior of the interactive object:

- press_filter(self, event) # determines if the object wants to have the press event routed to it
- handle_unpicked_cursor() # can be used by the object to set a cursor as the cursor passes over the object when it is unpicked.

Supports multiple canvases, maintaining a drag lock, motion notifier, and a global “enabled” flag per canvas. Supports fixed aspect ratio resizings by holding the shift key during the resize.

Known problems:

- Zorder is not obeyed during the selection/drag operations. Because of the blit technique used, I do not believe this can be fixed. The only way I can think of is to search for all artists that have a zorder greater then me, set them all to animated, and then redraw them all on top during each drag refresh. This might be very slow; need to try.
- the mixin only works for wx backends because of two things: 1) the cursors are hard-coded, and 2) there is a call to wx.GetMousePosition() Both of these shortcomings are reasonably fixed by having each backend supply these things.

37.3.7 Backward compatibility

No problems with backward compatibility, although once this is in place, it would be appropriate to obsolete some of the existing interactive functions (like legend.draggable())

37.3.8 Alternatives

None that I know of.

37.4 MEP10: Docstring consistency

- Status
37.4.1 Status

Progress
This is still an on-going effort

37.4.2 Branches and Pull requests

37.4.3 Abstract

matplotlib has a great deal of inconsistency between docstrings. This not only makes the docs harder to read, but it is harder on contributors, because they don’t know which specifications to follow. There should be a clear docstring convention that is followed consistently.

The organization of the API documentation is difficult to follow. Some pages, such as pyplot and axes, are enormous and hard to browse. There should instead be short summary tables that link to detailed documentation. In addition, some of the docstrings themselves are quite long and contain redundant information.

Building the documentation takes a long time and uses a `make.py` script rather than a Makefile.

37.4.4 Detailed description

There are number of new tools and conventions available since matplotlib started using Sphinx that make life easier. The following is a list of proposed changes to docstrings, most of which involve these new features.
Numpy docstring format

Numpy docstring format: This format divides the docstring into clear sections, each having different parsing rules that make the docstring easy to read both as raw text and as HTML. We could consider alternatives, or invent our own, but this is a strong choice, as it’s well used and understood in the Numpy/Scipy community.

Cross references

Most of the docstrings in matplotlib use explicit “roles” when linking to other items, for example: :func:`myfunction`. As of Sphinx 0.4, there is a “default_role” that can be set to “obj”, which will polymorphically link to a Python object of any type. This allows one to write `myfunction` instead. This makes docstrings much easier to read and edit as raw text. Additionally, Sphinx allows for setting a current module, so links like `~matplotlib.axes.Axes.set_xlim` could be written as `~axes.Axes.set_xlim`.

Overriding signatures

Many methods in matplotlib use the *args and **kwargs syntax to dynamically handle the keyword arguments that are accepted by the function, or to delegate on to another function. This, however, is often not useful as a signature in the documentation. For this reason, many matplotlib methods include something like:

```python
def annotate(self, *args, **kwargs):
    ""
    Create an annotation: a piece of text referring to a data point.

    Call signature::

    annotate(s, xy, xytext=None, xycoords='data',
             textcoords='data', arrowprops=None, **kwargs)
    ""
```

This can’t be parsed by Sphinx, and is rather verbose in raw text. As of Sphinx 1.1, if the autodoc_docstring_signature config value is set to True, Sphinx will extract a replacement signature from the first line of the docstring, allowing this:

```python
def annotate(self, *args, **kwargs):
    ""
    annotate(s, xy, xytext=None, xycoords='data',
             textcoords='data', arrowprops=None, **kwargs)
    ""
```

Create an annotation: a piece of text referring to a data point.
```

The explicit signature will replace the actual Python one in the generated documentation.
Linking rather than duplicating

Many of the docstrings include long lists of accepted keywords by interpolating things into the docstring at load time. This makes the docstrings very long. Also, since these tables are the same across many docstrings, it inserts a lot of redundant information in the docs – particularly a problem in the printed version.

These tables should be moved to docstrings on functions whose only purpose is for help. The docstrings that refer to these tables should link to them, rather than including them verbatim.

autosummary extension

The Sphinx autosummary extension should be used to generate summary tables, that link to separate pages of documentation. Some classes that have many methods (e.g. `Axes.axes`) should be documented with one method per page, whereas smaller classes should have all of their methods together.

Examples linking to relevant documentation

The examples, while helpful at illustrating how to use a feature, do not link back to the relevant docstrings. This could be addressed by adding module-level docstrings to the examples, and then including that docstring in the parsed content on the example page. These docstrings could easily include references to any other part of the documentation.

Documentation using help() vs a browser

Using Sphinx markup in the source allows for good-looking docs in your browser, but the markup also makes the raw text returned using help() look terrible. One of the aims of improving the docstrings should be to make both methods of accessing the docs look good.

37.4.5 Implementation

1. The numpydoc extensions should be turned on for matplotlib. There is an important question as to whether these should be included in the matplotlib source tree, or used as a dependency. Installing Numpy is not sufficient to get the numpydoc extensions – it’s a separate install procedure. In any case, to the extent that they require customization for our needs, we should endeavor to submit those changes upstream and not fork them.

2. Manually go through all of the docstrings and update them to the new format and conventions. Updating the cross references (from `:func:`myfunc` to `func`) may be able to be semi-automated. This is a lot of busy work, and perhaps this labor should be divided on a per-module basis so no single developer is over-burdened by it.

3. Reorganize the API docs using autosummary and `sphinx-autogen`. This should hopefully have minimal impact on the narrative documentation.

4. Modify the example page generator (`gen_rst.py`) so that it extracts the module docstring from the example and includes it in a non-literal part of the example page.

5. Use `sphinx-quickstart` to generate a new-style Sphinx Makefile. The following features in the current `make.py` will have to be addressed in some other way:
• Copying of some static content
• Specifying a “small” build (only low-resolution PNG files for examples)

Steps 1, 2, and 3 are interdependent. 4 and 5 may be done independently, though 5 has some dependency on 3.

37.4.6 Backward compatibility

As this mainly involves docstrings, there should be minimal impact on backward compatibility.

37.4.7 Alternatives

None yet discussed.

37.5 MEP11: Third-party dependencies

This MEP attempts to improve the way in which third-party dependencies in matplotlib are handled.

37.5.1 Status

Completed – needs to be merged

37.5.2 Branches and Pull requests

#1157: Use automatic dependency resolution
#1290: Debundle pyparsing
#1261: Update six to 1.2
37.5.3 Abstract

One of the goals of matplotlib has been to keep it as easy to install as possible. To that end, some third-party dependencies are included in the source tree and, under certain circumstances, installed alongside matplotlib. This MEP aims to resolve some problems with that approach, bring some consistency, while continuing to make installation convenient.

At the time that was initially done, setuptools, easy_install and PyPI were not mature enough to be relied on. However, at present, we should be able to safely leverage the “modern” versions of those tools, distribute and pip.

While matplotlib has dependencies on both Python libraries and C/C++ libraries, this MEP addresses only the Python libraries so as to not confuse the issue. C libraries represent a larger and mostly orthogonal set of problems.

37.5.4 Detailed description

matplotlib depends on the following third-party Python libraries:

- Numpy
- dateutil (pure Python)
- pytz (pure Python)
- six – required by dateutil (pure Python)
- pyparsing (pure Python)
- PIL (optional)
- GUI frameworks: pygtk, gobject, tkinter, PySide, PyQt4, wx (all optional, but one is required for an interactive GUI)

Current behavior

When installing from source, a git checkout or pip:

- setup.py attempts to import numpy. If this fails, the installation fails.
- For each of dateutil, pytz and six, setup.py attempts to import them (from the top-level namespace). If that fails, matplotlib installs its local copy of the library into the top-level namespace.
- pyparsing is always installed inside of the matplotlib namespace.

This behavior is most surprising when used with pip, because no pip dependency resolution is performed, even though it is likely to work for all of these packages.

The fact that pyparsing is installed in the matplotlib namespace has reportedly (#1290) confused some users into thinking it is a matplotlib-related module and import it from there rather than the top-level.

When installing using the Windows installer, dateutil, pytz and six are installed at the top-level always, potentially overwriting already installed copies of those libraries.

TODO: Describe behavior with the OS-X installer.

When installing using a package manager (Debian, RedHat, MacPorts etc.), this behavior actually does the right thing, and there are no special patches in the matplotlib packages to
deal with the fact that we handle `dateutil`, `pytz` and `six` in this way. However, care should be
taken that whatever approach we move to continues to work in that context.

Maintaining these packages in the matplotlib tree and making sure they are up-to-date is
a maintenance burden. Advanced new features that may require a third-party pure Python
library have a higher barrier to inclusion because of this burden.

Desired behavior

Third-party dependencies are downloaded and installed from their canonical locations by
leveraging `pip`, `distribute` and PyPI.

`dateutil`, `pytz`, and `pyparsing` should be made into optional dependencies – though obviously
some features would fail if they aren’t installed. This will allow the user to decide whether
they want to bother installing a particular feature.

37.5.5 Implementation

For installing from source, and assuming the user has all of the C-level compilers and depend-
cencies, this can be accomplished fairly easily using `distribute` and following the instructions
here. The only anticipated change to the matplotlib library code will be to import `pyparsing`
from the top-level namespace rather than from within matplotlib. Note that `distribute` will
also allow us to remove the direct dependency on `six`, since it is, strictly speaking, only a
direct dependency of `dateutil`.

For binary installations, there are a number of alternatives (here ordered from best/hardest
to worst/easiest):

1. The distutils wininst installer allows a post-install script to run. It might be possible to
get this script to run `pip` to install the other dependencies. (See this thread for someone
who has trod that ground before).

2. Continue to ship `dateutil`, `pytz`, `six` and `pyparsing` in our installer, but use the post-install-
script to install them only if they can not already be found.

3. Move all of these packages inside a (new) `matplotlib.extern` namespace so it is clear
for outside users that these are external packages. Add some conditional imports in
the core matplotlib codebase so `dateutil` (at the top-level) is tried first, and failing that
`matplotlib.extern.dateutil` is used.

2 and 3 are undesirable as they still require maintaining copies of these packages in our tree
– and this is exacerbated by the fact that they are used less – only in the binary installers.
None of these 3 approaches address Numpy, which will still have to be manually installed
using an installer.

TODO: How does this relate to the Mac OS-X installer?

37.5.6 Backward compatibility

At present, matplotlib can be installed from source on a machine without the third party
dependencies and without an internet connection. After this change, an internet connection
(and a working PyPI) will be required to install matplotlib for the first time. (Subsequent
matplotlib updates or development work will run without accessing the network).
37.5.7 Alternatives

Distributing binary eggs doesn’t feel like a usable solution. That requires getting easy_install installed first, and Windows users generally prefer the well known exe or msi installer that works out of the box.

37.6 MEP12: Improve Gallery and Examples

- Status
- Branches and Pull requests
- Abstract
- Detailed description
- Implementation
  - Gallery sections
  - Clean up guidelines
    * Additional suggestions
- Backward compatibility
- Alternatives
  - Tags

37.6.1 Status

Progress

Initial changes added in 1.3. Conversion of the gallery is on-going. 29 September 2015 - The last pylab_examples where pylab is imported has been converted over to use matplotlib pyplot and numpy.

37.6.2 Branches and Pull requests

#1623, #1924, #2181

PR #2474 <https://github.com/matplotlib/matplotlib/pull/2474> _ demonstrates a single example being cleaned up and moved to the appropriate section.

37.6.3 Abstract

Reorganizing the matplotlib plot gallery would greatly simplify navigation of the gallery. In addition, examples should be cleaned-up and simplified for clarity.
37.6.4 Detailed description

The matplotlib gallery was recently set up to split examples up into sections. As discussed in that PR\(^1\), the current example sections (api, pylab_examples) aren’t terribly useful to users: New sections in the gallery would help users find relevant examples.

These sections would also guide a cleanup of the examples: Initially, all the current examples would remain and be listed under their current directories. Over time, these examples could be cleaned up and moved into one of the new sections.

This process allows users to easily identify examples that need to be cleaned up; i.e. anything in the api and pylab_examples directories.

37.6.5 Implementation

1. Create new gallery sections. [Done]
2. Clean up examples and move them to the new gallery sections (over the course of many PRs and with the help of many users/developers). [In progress]

Gallery sections

The naming of sections is critical and will guide the clean-up effort. The current sections are:

- Lines, bars, and markers (more-or-less 1D data)
- Shapes and collections
- Statistical plots
- Images, contours, and fields
- Pie and polar charts: Round things
- Color
- Text, labels, and annotations
- Ticks and spines
- Subplots, axes, and figures
- Specialty plots (e.g., sankey, radar, tornado)
- Showcase (plots with tweaks to make them publication-quality)

These names are certainly up for debate. As these sections grow, we should reevaluate them and split them up as necessary.

Clean up guidelines

The current examples in the api and pylab_examples sections of the gallery would remain in those directories until they are cleaned up. After clean-up, they would be moved to one of the new gallery sections described above. “Clean-up” should involve:

\(^1\) https://github.com/matplotlib/matplotlib/pull/714
• **sphinx-gallery docstrings:** a title and a description of the example formatted as follows, at the top of the example:

```python

Colormaps alter your perception

Here I plot the function

.. math:: f(x, y) = \sin(x) + \cos(y)

with different colormaps. Look at how colormaps alter your perception!

```

• **PEP8** clean-ups (running `flake8`, or a similar checker, is highly recommended)

• Commented-out code should be removed.

• Replace uses of `pylab` interface with `pyplot` (+ `numpy`, etc.). See `c25ef1e`

• Remove shebang line, e.g.:
  `#!/usr/bin/env python`

• Use consistent imports. In particular:
  ```python
  import numpy as np
  import matplotlib.pyplot as plt
  ```
  Avoid importing specific functions from these modules (e.g. `from numpy import sin`)

• Each example should focus on a specific feature (excluding `showcase` examples, which will show more “polished” plots). Tweaking unrelated to that feature should be removed. See `f7b2217`, `e57b5fc`, and `1458aa8`

Use of `pylab` should be demonstrated/discussed on a dedicated help page instead of the gallery examples.

**Note:** When moving an existing example, you should search for references to that example. For example, the API documentation for `axes.py` and `pyplot.py` may use these examples to generate plots. Use your favorite search tool (e.g., `grep`, `ack`, `grin`, `pss`) to search the matplotlib package. See `2dc9a46` and `aa6b410`

**Additional suggestions**

• Provide links (both ways) between examples and API docs for the methods/objects used. (issue #2222)

• Use `plt.subplots` (note trailing “s”) in preference over `plt.subplot`.

• Rename the example to clarify it’s purpose. For example, the most basic demo of `imshow` might be `imshow_demo.py`, and one demonstrating different interpolation settings would be `imshow_demo_interpolation.py` *(not* `imshow_demo2.py`).

• Split up examples that try to do too much. See `5099675` and `fc2ab07`

• Delete examples that don’t show anything new.
• Some examples exercise esoteric features for unit testing. These tweaks should be moved out of the gallery to an example in the unit directory located in the root directory of the package.

• Add plot titles to clarify intent of the example. See bd2b13c

### 37.6.6 Backward compatibility

The website for each Matplotlib version is readily accessible, so users who want to refer to old examples can still do so.

### 37.6.7 Alternatives

**Tags**

Tagging examples will also help users search the example gallery. Although tags would be a big win for users with specific goals, the plot gallery will remain the entry point to these examples, and sections could really help users navigate the gallery. Thus, tags are complementary to this reorganization.

  - `axes.Axes.get_xticklabels/set_xticklabels`
- **Alternatives**

#### 37.7.1 Status

- **Discussion**
37.7.2 Branches and Pull requests

None

37.7.3 Abstract

Wrap all of the matplotlib getter and setter methods with Python properties, allowing them to be read and written like class attributes.

37.7.4 Detailed description

Currently matplotlib uses getter and setter functions (usually prefixed with get_ and set_, respectively) for reading and writing data related to classes. However, since 2.6 Python supports properties, which allow such setter and getter functions to be accessed as though they were attributes. This proposal would implement all existing setter and getter methods as properties.

37.7.5 Implementation

1. All existing getter and setter methods will need to have two aliases, one with the get_ or set_ prefix and one without. Getter methods that currently lack prefixes should be recording in a text file.

2. Classes should be reorganized so setter and getter methods are sequential in the code, with getter methods first.

3. Getter and setter methods the provide additional optional optional arguments should have those arguments accessible in another manner, either as additional getter or setter methods or attributes of other classes. If those classes are not accessible, getters for them should be added.

4. Property decorators will be added to the setter and getter methods without the prefix. Those with the prefix will be marked as deprecated.

5. Docstrings will need to be rewritten so the getter with the prefix has the current docstring and the getter without the prefix has a generic docstring appropriate for an attribute.

6. Automatic alias generation will need to be modified so it will also create aliases for the properties.

7. All instances of getter and setter method calls will need to be changed to attribute access.

8. All setter and getter aliases with prefixes will be removed

The following steps can be done simultaneously: 1, 2, and 3; 4 and 5; 6 and 7.

Only the following steps must be done in the same release: 4, 5, and 6. All other changes can be done in separate releases. 8 should be done several major releases after everything else.
37.7.6 Backward compatibility

All existing getter methods that do not have a prefix (such as get_) will need to be changed from function calls to attribute access. In most cases this will only require removing the parenthesis.

setter and getter methods that have additional optional arguments will need to have those arguments implemented in another way, either as a separate property in the same class or as attributes or properties of another class.

Cases where the setter returns a value will need to be changed to using the setter followed by the getter.

Cases where there are set_ATTR_on() and set_ATTR_off() methods will be changed to ATTR_on properties.

37.7.7 Examples

**axes.Axes.set_axis_off/set_axis_on**

Current implementation:

```python
axes.Axes.set_axis_off()
axes.Axes.set_axis_on()
```

New implementation:

```python
True = axes.Axes.axis_on
False = axes.Axes.axis_on
axes.Axes.axis_on = True
axes.Axes.axis_on = False
```

**axes.Axes.get_xlim/set_xlim and get_autoscalex_on/set_autoscalex_on**

Current implementation:

```python
[left, right] = axes.Axes.get_xlim()
auto = axes.Axes.get_autoscalex_on()

[left, right] = axes.Axes.set_xlim(left=left, right=right, emit=emit, auto=auto)
[left, right] = axes.Axes.set_xlim(left=left, right=None, emit=emit, auto=auto)
[left, right] = axes.Axes.set_xlim(left=None, right=right, emit=emit, auto=auto)
[left, right] = axes.Axes.set_xlim(left=left, emit=emit, auto=auto)
[left, right] = axes.Axes.set_xlim(right=right, emit=emit, auto=auto)
```

New implementation:

```python
[left, right] = axes.Axes.axes_xlim
auto = axes.Axes.autoscalex_on
```

(continues on next page)
axes.Axes.axes_xlim = [left, right]
axes.Axes.axes_xlim = [left, None]
axes.Axes.axes_xlim = [None, right]
axes.Axes.axes_xlim[0] = left
axes.Axes.axes_xlim[1] = right
axes.Axes.autoscalex_on = auto
axes.Axes.emit_xlim = emit

**axes.Axes.get_title/set_title**

Current implementation:

```python
string = axes.Axes.get_title()
axes.Axes.set_title(string, fontdict=fontdict, **kwargs)
```

New implementation:

```python
string = axes.Axes.title
string = axes.Axes.title_text.text

text.Text = axes.Axes.title_text
text.Text.<attribute> = attribute
text.Text.fontdict = fontdict

axes.Axes.title = string
axes.Axes.title = text.Text
axes.Axes.title_text = string
axes.Axes.title_text = text.Text
```

**axes.Axes.get_ticklabels/set_ticklabels**

Current implementation:

```python
[text.Text] = axes.Axes.get_ticklabels()
[text.Text] = axes.Axes.get_ticklabels(minor=False)
[text.Text] = axes.Axes.get_ticklabels(minor=True)
[text.Text] = axes.Axes.([string], fontdict=None, **kwargs)
[text.Text] = axes.Axes.([string], fontdict=None, minor=False, **kwargs)
[text.Text] = axes.Axes.([string], fontdict=None, minor=True, **kwargs)
```

New implementation:

```python
[text.Text] = axes.Axes.ticklabels
[text.Text] = axes.Axes.xminorticklabels
axes.Axes.ticklabels = [string]
axes.Axes.xminorticklabels = [string]
axes.Axes.ticklabels = [text.Text]
axes.Axes.xminorticklabels = [text.Text]
```
37.7.8 Alternatives

Instead of using decorators, it is also possible to use the property function. This would change the procedure so that all getter methods that lack a prefix will need to be renamed or removed. This makes handling docstrings more difficult and harder to read.

It is not necessary to deprecate the setter and getter methods, but leaving them in will complicate the code.

This could also serve as an opportunity to rewrite or even remove automatic alias generation. Another alternate proposal:

Convert `set_xlim, set_xlabel, set_title, etc.` to `xlim, xlabel, title,...` to make the transition from `plt` functions to `axes` methods significantly simpler. These would still be methods, not properties, but it’s still a great usability enhancement while retaining the interface.

37.8 MEP14: Text handling

- Status
- Branches and Pull requests
- Abstract
- Detailed description
- Implementation
- Backward compatibility
- Alternatives

37.8.1 Status

- Discussion

37.8.2 Branches and Pull requests

Issue #253 demonstrates a bug where using the bounding box rather than the advance width of text results in misaligned text. This is a minor point in the grand scheme of things, but it should be addressed as part of this MEP.

37.8.3 Abstract

By reorganizing how text is handled, this MEP aims to:

- improve support for Unicode and non-ltr languages
- improve text layout (especially multi-line text)
• allow support for more fonts, especially non-Apple-format TrueType fonts and OpenType fonts.
• make the font configuration easier and more transparent

37.8.4 Detailed description

Text layout
At present, matplotlib has two different ways to render text: “built-in” (based on FreeType and our own Python code), and “usetex” (based on calling out to a TeX installation). Adjunct to the “built-in” renderer there is also the Python-based “mathtext” system for rendering mathematical equations using a subset of the TeX language without having a TeX installation available. Support for these two engines in strewn about many source files, including every backend, where one finds clauses like

```python
if rcParams['text.usetex']:
# do one thing else:
# do another
```

Adding a third text rendering approach (more on that later) would require editing all of these places as well, and therefore doesn’t scale.

Instead, this MEP proposes adding a concept of “text engines”, where the user could select one of many different approaches for rendering text. The implementations of each of these would be localized to their own set of modules, and not have little pieces around the whole source tree.

Why add more text rendering engines? The “built-in” text rendering has a number of shortcomings.

• It only handles right-to-left languages, and doesn’t handle many special features of Unicode, such as combining diacriticals.
• The multiline support is imperfect and only supports manual line-breaking – it can not break up a paragraph into lines of a certain length.
• It also does not handle inline formatting changes in order to support something like Markdown, reStructuredText or HTML. (Though rich-text formatting is contemplated in this MEP, since we want to make sure this design allows it, the specifics of a rich-text formatting implementation is outside of the scope of this MEP.)

Supporting these things is difficult, and is the “full-time job” of a number of other projects:

• pango/harfbuzz
• QtTextLayout
• Microsoft DirectWrite
• Apple Core Text

Of the above options, it should be noted that harfbuzz is designed from the start as a cross platform option with minimal dependencies, so therefore is a good candidate for a single option to support.

Additionally, for supporting rich text, we could consider using WebKit, and possibly whether than represents a good single cross-platform option. Again, however, rich text formatting is outside of the scope of this project.

Rather than trying to reinvent the wheel and add these features to matplotlib’s “built-in” text renderer, we should provide a way to leverage these projects to get more powerful text
layout. The “built-in” renderer will still need to exist for reasons of ease of installation, but its feature set will be more limited compared to the others. [TODO: This MEP should clearly decide what those limited features are, and fix any bugs to bring the implementation into a state of working correctly in all cases that we want it to work. I know @leejjoon has some thoughts on this.]

**Font selection**

Going from an abstract description of a font to a file on disk is the task of the font selection algorithm – it turns out to be much more complicated than it seems at first.

The “built-in” and “usetex” renderers have very different ways of handling font selection, given their different technologies. TeX requires the installation of TeX-specific font packages, for example, and can not use TrueType fonts directly. Unfortunately, despite the different semantics for font selection, the same set of font properties are used for each. This is true of both the `FontProperties` class and the font-related `rcParams` (which basically share the same code underneath). Instead, we should define a core set of font selection parameters that will work across all text engines, and have engine-specific configuration to allow the user to do engine-specific things when required. For example, it is possible to directly select a font by name in the “built-in” using `font.family`, but the same is not possible with “usetex”. It may be possible to make it easier to use TrueType fonts by using XeTeX, but users will still want to use the traditional metafonts through TeX font packages. So the issue still stands that different text engines will need engine-specific configuration, and it should be more obvious to the user which configuration will work across text engines and which are engine-specific.

Note that even excluding “usetex”, there are different ways to find fonts. The default is to use the font list cache in `font_manager.py` which matches fonts using our own algorithm based on the CSS font matching algorithm. It doesn’t always do the same thing as the native font selection algorithms on Linux (`fontconfig`), Mac and Windows, and it doesn’t always find all of the fonts on the system that the OS would normally pick up. However, it is cross-platform, and always finds the fonts that ship with matplotlib. The Cairo and MacOSX backends (and presumably a future HTML5-based backend) currently bypass this mechanism and use the OS-native ones. The same is true when not embedding fonts in SVG, PS or PDF files and opening them in a third-party viewer. A downside there is that (at least with Cairo, need to confirm with MacOSX) they don’t always find the fonts we ship with matplotlib. (It may be possible to add the fonts to their search path, though, or we may need to find a way to install our fonts to a location the OS expects to find them).

There are also special modes in the PS and PDF to only use the core fonts that are always available to those formats. There, the font lookup mechanism must only match against those fonts. It is unclear whether the OS-native font lookup systems can handle this case.

There is also experimental support for using `fontconfig` for font selection in matplotlib, turned off by default. `fontconfig` is the native font selection algorithm on Linux, but is also cross-platform and works well on the other platforms (though obviously is an additional dependency there).

Many of the text layout libraries proposed above (pango, QtTextLayout, DirectWrite and CoreText etc.) insist on using the font selection library from their own ecosystem.

All of the above seems to suggest that we should move away from our self-written font selection algorithm and use the native APIs where possible. That’s what Cairo and MacOSX backends already want to use, and it will be a requirement of any complex text layout library. On Linux, we already have the bones of a `fontconfig` implementation (which could also be accessed through pango). On Windows and Mac we may need to write custom wrappers. The nice thing is that the API for font lookup is relatively small, and essentially consist of “given a dictionary of font properties, give me a matching font file”.
Font subsetting

Font subsetting is currently handled using ttconv. ttconv was a standalone commandline utility for converting TrueType fonts to subsetted Type 3 fonts (among other features) written in 1995, which matplotlib (well, I) forked in order to make it work as a library. It only handles Apple-style TrueType fonts, not ones with the Microsoft (or other vendor) encodings. It doesn’t handle OpenType fonts at all. This means that even though the STIX fonts come as .otf files, we have to convert them to .ttf files to ship them with matplotlib. The Linux packagers hate this – they’d rather just depend on the upstream STIX fonts. ttconv has also been shown to have a few bugs that have been difficult to fix over time.

Instead, we should be able to use FreeType to get the font outlines and write our own code (probably in Python) to output subsetted fonts (Type 3 on PS and PDF and paths on SVG). Freetype, as a popular and well-maintained project, handles a wide variety of fonts in the wild. This would remove a lot of custom C code, and remove some code duplication between backends.

Note that subsetting fonts this way, while the easiest route, does lose the hinting in the font, so we will need to continue, as we do now, provide a way to embed the entire font in the file where possible.

Alternative font subsetting options include using the subsetting built-in to Cairo (not clear if it can be used without the rest of Cairo), or using fontforge (which is a heavy and not terribly cross-platform dependency).

Freetype wrappers

Our FreeType wrapper could really use a reworking. It defines its own image buffer class (when a Numpy array would be easier). While FreeType can handle a huge diversity of font files, there are limitations to our wrapper that make it much harder to support non-Apple-vendor TrueType files, and certain features of OpenType files. (See #2088 for a terrible result of this, just to support the fonts that ship with Windows 7 and 8). I think a fresh rewrite of this wrapper would go a long way.

Text anchoring and alignment and rotation

The handling of baselines was changed in 1.3.0 such that the backends are now given the location of the baseline of the text, not the bottom of the text. This is probably the correct behavior, and the MEP refactoring should also follow this convention.

In order to support alignment on multi-line text, it should be the responsibility of the (proposed) text engine to handle text alignment. For a given chunk of text, each engine calculates a bounding box for that text and the offset of the anchor point within that box. Therefore, if the va of a block was “top”, the anchor point would be at the top of the box.

Rotating of text should always be around the anchor point. I’m not sure that lines up with current behavior in matplotlib, but it seems like the sanest/least surprising choice. [This could be revisited once we have something working]. Rotation of text should not be handled by the text engine – that should be handled by a layer between the text engine and the rendering backend so it can be handled in a uniform way. [I don’t see any advantage to rotation being handled by the text engines individually...]

There are other problems with text alignment and anchoring that should be resolved as part of this work. [TODO: enumerate these].

Other minor problems to fix

The mathtext code has backend-specific code – it should instead provide its output as just another text engine. However, it’s still desirable to have mathtext layout inserted as part of a larger layout performed by another text engine, so it should be possible to do this. It’s
an open question whether embedding the text layout of an arbitrary text engine in another should be possible.

The text mode is currently set by a global rcParam ("text.usetex") so it’s either all on or all off. We should continue to have a global rcParam to choose the text engine ("text.layout_engine"), but it should under the hood be an overridable property on the Text object, so the same figure can combine the results of multiple text layout engines if necessary.

### 37.8.5 Implementation

A concept of a “text engine” will be introduced. Each text engine will implement a number of abstract classes. The TextFont interface will represent text for a given set of font properties. It isn’t necessarily limited to a single font file – if the layout engine supports rich text, it may handle a number of font files in a family. Given a TextFont instance, the user can get a TextLayout instance, which represents the layout for a given string of text in a given font. From a TextLayout, an iterator over TextSpans is returned so the engine can output raw editable text using as few spans as possible. If the engine would rather get individual characters, they can be obtained from the TextSpan instance:

```python
class TextFont(TextFontBase):
    def __init__(self, font_properties):
        """
        Create a new object for rendering text using the given font properties.
        """
        pass

    def get_layout(self, s, ha, va):
        """
        Get the TextLayout for the given string in the given font and
        the horizontal (left, center, right) and vertical alignment (top,
        center, baseline, bottom)
        """
        pass

class TextLayout(TextLayoutBase):
    def get_metrics(self):
        """
        Return the bounding box of the layout, anchored at (0, 0).
        """
        pass

    def get_spans(self):
        """
        Returns an iterator over the spans of different in the layout.
        This is useful for backends that want to editable raw text as
        individual lines. For rich text where the font may change,
        each span of different font type will have its own span.
        """
        pass

    def get_image(self):
        """
        Returns a rasterized image of the text. Useful for raster backends,
        (continues on next page)
```

(continues on next page)
like Agg.

In all likelihood, this will be overridden in the backend, as it can be created from get_layout(), but certain backends may want to override it if their library provides it (as freetype does).

```python
def get_rectangles(self):
    """
    Returns an iterator over the filled black rectangles in the layout. Used by TeX and mathtext for drawing, for example, fraction lines.
    ""
    pass

def get_path(self):
    """
    Returns a single Path object of the entire laid out text.
    [Not strictly necessary, but might be useful for textpath functionality]
    ""
    pass
```

class TextSpan(TextSpanBase):
    x, y           # Position of the span -- relative to the text layout as a whole
    # where (0, 0) is the anchor. y is the baseline of the span.
    fontfile       # The font file to use for the span
    text           # The text content of the span

def get_path(self):
    pass  # See TextLayout.get_path

def get_chars(self):
    """
    Returns an iterator over the characters in the span.
    ""
    pass
```

class TextChar(TextCharBase):
    x, y           # Position of the character -- relative to the text layout as a whole, where (0, 0) is the anchor. y is in the baseline of the character.
    codepoint     # The unicode code point of the character -- only for informational purposes, since the mapping of codepoint to glyph_id may have been handled in a complex way by the layout engine. This is an int # to avoid problems on narrow Unicode builds.
    glyph_id      # The index of the glyph within the font
    fontfile      # The font file to use for the char

def get_path(self):
    """
```
Get the path for the character.

```python
pass
```

Graphic backends that want to output subset of fonts would likely build up a file-global dictionary of characters where the keys are (fontname, glyph_id) and the values are the paths so that only one copy of the path for each character will be stored in the file.

Special casing: The “usetex” functionality currently is able to get Postscript directly from TeX to insert directly in a Postscript file, but for other backends, parses a DVI file and generates something more abstract. For a case like this, TextLayout would implement get_spans for most backends, but add get_ps for the Postscript backend, which would look for the presence of this method and use it if available, or fall back to get_spans. This kind of special casing may also be necessary, for example, when the graphics backend and text engine belong to the same ecosystem, e.g. Cairo and Pango, or MacOSX and CoreText.

There are three main pieces to the implementation:

1) Rewriting the freetype wrapper, and removing ttconv.
   a) Once (1) is done, as a proof of concept, we can move to the upstream STIX .otf fonts
   b) Add support for web fonts loaded from a remote URL. (Enabled by using freetype for font subsetting).

2) Refactoring the existing “builtin” and “usetex” code into separate text engines and to follow the API outlined above.

3) Implementing support for advanced text layout libraries.

(1) and (2) are fairly independent, though having (1) done first will allow (2) to be simpler. (3) is dependent on (1) and (2), but even if it doesn’t get done (or is postponed), completing (1) and (2) will make it easier to move forward with improving the “builtin” text engine.

### 37.8.6 Backward compatibility

The layout of text with respect to its anchor and rotation will change in hopefully small, but improved, ways. The layout of multiline text will be much better, as it will respect horizontal alignment. The layout of bidirectional text or other advanced Unicode features will now work inherently, which may break some things if users are currently using their own workarounds.

Fonts will be selected differently. Hacks that used to sort of work between the “builtin” and “usetex” text rendering engines may no longer work. Fonts found by the OS that weren’t previously found by matplotlib may be selected.

### 37.8.7 Alternatives

TBD
37.9 MEP15 - Fix axis autoscaling when limits are specified for one axis only

• Status
• Branches and Pull requests
• Abstract
• Detailed description
• Implementation
• Backward compatibility
• Alternatives

37.9.1 Status

Discussion

37.9.2 Branches and Pull requests

None so far.

37.9.3 Abstract

When one axis of a 2-dimensional plot if overridden via `xlim` or `ylim`, automatic scaling of the remaining axis should be based on the data that falls within the specified limits of the first axis.

37.9.4 Detailed description

When axis limits for a 2-D plot are specified for one axis only (via `xlim` or `ylim`), matplotlib currently does not currently rescale the other axis. The result is that the displayed curves or symbols may be compressed into a tiny portion of the available area, so that the final plot conveys much less information than it would with appropriate axis scaling.

The proposed change of behavior would make matplotlib choose the scale for the remaining axis using only the data that falls within the limits for the axis where limits were specified.

37.9.5 Implementation

I don’t know enough about the internals of matplotlib to be able to suggest an implementation.
37.9.6 Backward compatibility

From the standpoint of software interfaces, there would be no break in backward compatibility. Some outputs would be different, but if the user truly desires the previous behavior, he/she can achieve this by overriding the axis scaling for both axes.

37.9.7 Alternatives

The only alternative that I can see is to maintain the status quo.

37.10 MEP19: Continuous Integration

37.10.1 Status

Completed

37.10.2 Branches and Pull requests

37.10.3 Abstract

matplotlib could benefit from better and more reliable continuous integration, both for testing and building installers and documentation.

37.10.4 Detailed description

Current state-of-the-art

Testing

matplotlib currently uses Travis-CI for automated tests. While Travis-CI should be praised for how much it does as a free service, it has a number of shortcomings:

- It often fails due to network timeouts when installing dependencies.
- It often fails for inexplicable reasons.
- build or test products can only be saved from build off of branches on the main repo, not pull requests, so it is often difficult to “post mortem” analyse what went wrong. This is particularly frustrating when the failure can not be subsequently reproduced locally.
- It is not extremely fast. matplotlib’s cpu and memory requirements for testing are much higher than the average Python project.
- It only tests on Ubuntu Linux, and we have only minimal control over the specifics of the platform. It can be upgraded at any time outside of our control, causing unexpected delays at times that may not be convenient in our release schedule.

On the plus side, Travis-CI’s integration with github – automatically testing all pending pull requests – is exceptional.

Builds
There is no centralized effort for automated binary builds for matplotlib. However, the following disparate things are being done [If the authors mentioned here could fill in detail, that would be great!]:

- @sandrotosi: builds Debian packages
- @takluyver: Has automated Ubuntu builds on Launchpad
- @cgohlke: Makes Windows builds (don’t know how automated that is)
- @r-owen: Makes OS-X builds (don’t know how automated that is)

**Documentation**

Documentation of master is now built by travis and uploaded to [http://matplotlib.org/devdocs/index.html](http://matplotlib.org/devdocs/index.html)

@NelleV, I believe, generates the docs automatically and posts them on the web to chart MEP10 progress.

**Peculiarities of matplotlib**

matplotlib has complex requirements that make testing and building more taxing than many other Python projects.

- The CPU time to run the tests is quite high. It puts us beyond the free accounts of many CI services (e.g. ShiningPanda)
- It has a large number of dependencies, and testing the full matrix of all combinations is impractical. We need to be clever about what space we test and guarantee to support.

**Requirements**

This section outlines the requirements that we would like to have.

1. Testing all pull requests by hooking into the Github API, as Travis-CI does
2. Testing on all major platforms: Linux, Mac OS-X, MS Windows (in that order of priority, based on user survey)
3. Retain the last n days worth of build and test products, to aid in post-mortem debugging.
4. Automated nightly binary builds, so that users can test the bleeding edge without installing a complete compilation environment.
5. Automated benchmarking. It would be nice to have a standard benchmark suite (separate from the tests) whose performance could be tracked over time, in different backends and platforms. While this is separate from building and testing, ideally it would run on the same infrastructure.
6. Automated nightly building and publishing of documentation (or as part of testing, to ensure PRs don’t introduce documentation bugs). (This would not replace the static documentation for stable releases as a default).
7. The test systems should be manageable by multiple developers, so that no single person becomes a bottleneck. (Travis-CI’s design does this well – storing build configuration in the git repository, rather than elsewhere, is a very good design.)
8. Make it easy to test a large but sparse matrix of different versions of matplotlib's dependencies. The matplotlib user survey provides some good data as to where to focus our efforts: https://docs.google.com/spreadsheet/ccc?key=0AjrPjTMRTwTdHpQS25pcTZIRWdqX0pNckNSU01sMHc

9. Nice to have: A decentralized design so that those with more obscure platforms can publish build results to a central dashboard.

37.10.5 Implementation

This part is yet-to-be-written.

However, ideally, the implementation would be a third-party service, to avoid adding system administration to our already stretched time. As we have some donated funds, this service may be a paid one if it offers significant time-saving advantages over free offerings.

37.10.6 Backward compatibility

Backward compatibility is not a major concern for this MEP. We will replace current tools and procedures with something better and throw out the old.

37.10.7 Alternatives

37.10.8 Hangout Notes

CI Infrastructure

- We like Travis and it will probably remain part of our arsenal in any event. The reliability issues are being looked into.
- Enable Amazon S3 uploads of testing products on Travis. This will help with post-mortem of failures (@mdboom is looking into this now).
- We want Mac coverage. The best bet is probably to push Travis to enable it for our project by paying them for a Pro account (since they don’t otherwise allow testing on both Linux and Mac).
- We want Windows coverage. Shining Panda is an option there.
- Investigate finding or building a tool that would collect and synthesize test results from a number of sources and post it to Github using the Github API. This may be of general use to the Scipy community.
- For both Windows and Mac, we should document (or better yet, script) the process of setting up the machine for a build, and how to build binaries and installers. This may require getting information from Russel Owen and Christoph Gohlke. This is a necessary step for doing automated builds, but would also be valuable for a number of other reasons.
The test framework itself

• We should investigate ways to make it take less time
  - Eliminating redundant tests, if possible
  - General performance improvements to matplotlib will help
• We should be covering more things, particularly more backends
• We should have more unit tests, fewer integration tests, if possible

37.11 MEP21: color and cm refactor

• Status
• Branches and Pull requests
• Abstract
• Detailed description
• Implementation
• Backward compatibility
• Alternatives

37.11.1 Status

• Discussion: This MEP has not commenced yet, but here are some ongoing ideas which may become a part of this MEP:

37.11.2 Branches and Pull requests

37.11.3 Abstract

• color
  - tidy up the namespace
  - Define a “Color” class
  - make it easy to convert from one color type to another `hex -> RGB`, `RGB -> hex`, `HSV -> RGB` etc.
  - improve the construction of a colormap - the dictionary approach is archaic and overly complex (though incredibly powerful)
  - make it possible to interpolate between two or more color types in different modes, especially useful for construction of colormaps in HSV space for instance
• cm
  - rename the module to something more descriptive - mappables?
Overall, there are a lot of improvements that can be made with matplotlib color handling - managing backwards compatibility will be difficult as there are some badly named variables/modules which really shouldn’t exist - but a clear path and message for migration should be available, with a large amount of focus on this in the API changes documentation.

37.11.4 Detailed description

37.11.5 Implementation

37.11.6 Backward compatibility

37.11.7 Alternatives

37.12 MEP22: Toolbar rewrite

37.12.1 Status

Progress

37.12.2 Branches and Pull requests

Previous work

- https://github.com/matplotlib/matplotlib/pull/1849
- https://github.com/matplotlib/matplotlib/pull/2557
- https://github.com/matplotlib/matplotlib/pull/2465

Pull Requests:

- Removing the NavigationToolbar classes https://github.com/matplotlib/matplotlib/pull/2740 CLOSED
37.12.3 Abstract

The main goal of this MEP is to make it easier to modify (add, change, remove) the way the user interacts with the figures.

The user interaction with the figure is deeply integrated within the Canvas and Toolbar. Making extremely difficult to do any modification.

This MEP proposes the separation of this interaction into Toolbar, Navigation and Tools to provide independent access and reconfiguration.

This approach will make easier to create and share tools among users. In the far future, we can even foresee a kind of Marketplace for Tools where the most popular can be added into the main distribution.

37.12.4 Detailed description

The reconfiguration of the Toolbar is complex, most of the time it requires a custom backend.

The creation of custom Tools sometimes interferes with the Toolbar, as example see https://github.com/matplotlib/matplotlib/issues/2694 also the shortcuts are hardcoded and again not easily modifiable https://github.com/matplotlib/matplotlib/issues/2699

The proposed solution is to take the actions out of the Toolbar and the shortcuts out of the Canvas. This actions and shortcuts will be in the form of Tools.

A new class Navigation will be the bridge between the events from the Canvas and Toolbar and redirect them to the appropriate Tool.

At the end the user interaction will be divided into three classes:

- **NavigationBase:** This class is instantiated for each FigureManager and connect the all user interactions with the Tools
- **ToolbarBase:** This existing class is relegated only as a GUI access to Tools.
- **ToolBase:** Is the basic definition of Tools.

37.12.5 Implementation

**ToolBase**(object)

Tools can have a graphical representation as the SubplotTool or not even be present in the Toolbar as Quit

The ToolBase has the following class attributes for configuration at definition time

- **keymap = None:** Key(s) to be used to trigger the tool
- **description = “”: Small description of the tool
- **image = None:** Image that is used in the toolbar
The following instance attributes are set at instantiation:

- name
- navigation

Methods

- trigger(self, event): This is the main method of the Tool, it is called when the Tool is triggered by: * Toolbar button click * keypress associated with the Tool Keymap * Call to navigation.trigger_tool(name)

- set_figure(self, figure): Set the figure and navigation attributes

- destroy(self, *args): Destroy the Tool graphical interface (if exists)

Available Tools

- ToolQuit
- ToolEnableAllNavigation
- ToolEnableNavigation
- ToolToggleGrid
- ToolToggleFullScreen
- ToolToggleYScale
- ToolToggleXScale
- ToolHome
- ToolBack
- ToolForward
- SaveFigureBase
- ConfigureSubplotsBase

ToolToggleBase(ToolBase)

The ToolToggleBase has the following class attributes for configuration at definition time

- radio_group = None: Attribute to group ‘radio’ like tools (mutually exclusive)
- cursor = None: Cursor to use when the tool is active

The Toggleable Tools, can capture keypress, mouse moves, and mouse button press

It defines the following methods

- enable(self, event): Called by ToolToggleBase.trigger method
- disable(self, event): Called when the tool is untoggled
- toggled: Property True or False

Available Tools

- ToolZoom
- ToolPan
NavigationBase

Defines the following attributes

- canvas:

  - keypresslock: **Lock to know if the** canvas **key_press_event** is available and process it

- messagelock: Lock to know if the message is available to write

Public methods for User use:

- nav_connect(self, s, func): Connect to to navigation for events
- nav_disconnect(self, cid): Disconnect from navigation event
- message_event(self, message, sender=None): Emit a tool_message_event event
- active_toggle(self): **Property** The currently toggled tools or None
- get_tool_keymap(self, name): Return a list of keys that are associated with the tool
- set_tool_keymap(self, name, *keys): Set the keys for the given tool
- remove_tool(self, name): Removes tool from the navigation control.
- add_tools(self, tools): Add multiple tools to Navigation
- add_tool(self, name, tool, group=None, position=None): Add a tool to the Navigation
- tool_trigger_event(self, name, sender=None, canvasevent=None, data=None): Trigger a tool and fire the event
- tools(self) **Property**: Return a dict with available tools with corresponding keymaps, descriptions and objects
- get_tool(self, name): Return the tool object

ToolbarBase

Methods for Backend implementation

- add_toolitem(self, name, group, position, image, description, toggle): Add a toolitem to the toolbar. This method is a callback from tool_added_event (emitted by navigation)
- set_message(self, s): Display a message on toolbar or in status bar
- toggle_toolitem(self, name): Toggle the toolitem without firing event.
- remove_toolitem(self, name): Remove a toolitem from the Toolbar

37.12.6 Backward compatibility

For backward compatibility added a ‘navigation’ key to rcsetup.validate_toolbar, that is used for Navigation classes instantiation instead of the NavigationToolbar classes

With this parameter, it makes it transparent to anyone using the existing backends.
[@pelson comment: This also gives us an opportunity to avoid needing to implement all of this in the same PR - some backends can potentially exist without the new functionality for a short while (but it must be done at some point).]

37.13 MEP23: Multiple Figures per GUI window

- **Status**
- **Branches and Pull requests**
- **Abstract**
- **Detailed description**
- **Implementation**
  - `FigureManagerBase`
  - `new_figure_manager`
  - `new_figure_manager_given_figure`
  - `NavigationBase`
- **Backward compatibility**
- **Alternatives**

### 37.13.1 Status

**Discussion**

### 37.13.2 Branches and Pull requests

**Previous work** - https://github.com/matplotlib/matplotlib/pull/2465 **To-delete**

### 37.13.3 Abstract

Add the possibility to have multiple figures grouped under the same `FigureManager`

### 37.13.4 Detailed description

Under the current structure, every canvas has its own window.

This is and may continue to be the desired method of operation for most use cases.

Sometimes when there are too many figures open at the same time, it is desirable to be able to group these under the same window [see](https://github.com/matplotlib/matplotlib/issues/2194).
The proposed solution modifies FigureManagerBase to contain and manage more than one canvas. The settings parameter `rcParams["backend.multifigure"]` control when the Multifigure behaviour is desired.

**Note**

It is important to note, that the proposed solution, assumes that the [MEP22](https://github.com/matplotlib/matplotlib/wiki/Mep22) is already in place. This is simply because the actual implementation of the Toolbar makes it pretty hard to switch between canvases.

### 37.13.5 Implementation

The first implementation will be done in GTK3 using a Notebook as canvas container.

**FigureManagerBase**

will add the following new methods

- `add_canvas`: To add a canvas to an existing FigureManager object
- `remove_canvas`: To remove a canvas from a FigureManager object, if it is the last one, it will be destroyed
- `move_canvas`: To move a canvas from one FigureManager to another.
- `set_canvas_title`: To change the title associated with a specific canvas container
- `get_canvas_title`: To get the title associated with a specific canvas container
- `get_active_canvas`: To get the canvas that is in the foreground and is subject to the gui events. There is no `set_active_canvas` because the active canvas, is defined when `show` is called on a Canvas object.

**new_figure_manager**

To control which FigureManager will contain the new figures, an extra optional parameter `figuremanager` will be added, this parameter value will be passed to `new_figure_manager_given_figure`

**new_figure_manager_given_figure**

- If `figuremanager` parameter is give, this FigureManager object will be used instead of creating a new one.
- If `rcParams["backend.multifigure"]` == True: The last FigureManager object will be used instead of creating a new one.

**NavigationBase**

Modifies the NavigationBase to keep a list of canvases, directing the actions to the active one
37.13.6 Backward compatibility

For the MultiFigure properties to be visible, the user has to activate them directly setting
rcParams['backend.multifigure'] = True

It should be backwards compatible for backends that adhere to the current FigureManagerBase
structure even if they have not implemented the MultiFigure magic yet.

37.13.7 Alternatives

Instead of modifying the FigureManagerBase it could be possible to add a parallel class, that han-
dles the cases where rcParams['backend.multifigure'] = True. This will warranty that there
won't be any problems with custom made backends, but also makes bigger the code, and
more things to maintain.

37.14 MEP24: negative radius in polar plots

37.15.1 Status

Rejected
This work is important, but this particular effort has stalled.

37.15.2 Branches and Pull requests

- development branches:
- related pull requests:
37.15.3 Abstract

This MEP aims at adding a serializable Controller objects to act as an Artist managers. Users would then communicate changes to an Artist via a Controller. In this way, functionality of the Controller objects may be added incrementally since each Artist is still responsible for drawing everything. The goal is to create an API that is usable both by graphing libraries requiring high-level descriptions of figures and libraries requiring low-level interpretations.

37.15.4 Detailed description

Matplotlib is a core plotting engine with an API that many users already understand. It’s difficult/impossible for other graphing libraries to (1) get a complete figure description, (2) output raw data from the figure object as the user has provided it, (3) understand the semantics of the figure objects without heuristics, and (4) give matplotlib a complete figure description to visualize. In addition, because an Artist has no conception of its own semantics within the figure, it’s difficult to interact with them in a natural way.

In this sense, matplotlib will adopt a standard Model-View-Controller (MVC) framework. The Model will be the user defined data, style, and semantics. The Views are the ensemble of each individual Artist, which are responsible for producing the final image based on the model. The Controller will be the Controller object managing its set of Artist objects.

The Controller must be able to export the information that it’s carrying about the figure on command, perhaps via a to_json method or similar. Because it would be extremely extraneous to duplicate all of the information in the model with the controller, only user-specified information (data + style) are explicitly kept. If a user wants more information (defaults) from the view/model, it should be able to query for it.

- This might be annoying to do, non-specified kwargs are pulled from the rcParams object which is in turn created from reading a user specified file and can be dynamically changed at run time. I suppose we could keep a dict of default defaults and compare against that. Not clear how this will interact with the style sheet [[MEP26]] - @tacawell

Additional Notes:

- The raw data does not necessarily need to be a list, ndarray, etc. Rather, it can more abstractly just have a method to yield data when needed.
- Because the Controller will contain extra information that users may not want to keep around, it should not be created by default. You should be able to both (a) instantiate a Controller with a figure and (b) build a figure with a Controller.

Use Cases:

- Export all necessary informat
- Serializing a matplotlib figure, saving it, and being able to rerun later.
- Any other source sending an appropriately formatted representation to matplotlib to open

37.15.5 Examples

Here are some examples of what the controllers should be able to do.

1. Instantiate a matplotlib figure from a serialized representation (e.g., JSON):
import json
from matplotlib.controllers import Controller

with open('my_figure') as f:
    o = json.load(f)
c = Controller(o)
fig = c.figure

2. Manage artists from the controller (e.g., Line2D):

```python
# not really sure how this should look
c.axes[0].lines[0].color = 'b'
```

3. Export serializable figure representation:

```python
o = c.to_json()
# or... we should be able to throw a figure object in there too
o = Controller.to_json(mpl_fig)
```

### 37.15.6 Implementation

1. Create base Controller objects that are able to manage Artist objects (e.g., Hist)

Comments:

- initialzation should happen via unpacking **, so we need a copy of call signature parameter for the Artist we’re ultimately trying to control. Unfortunate hard-coded repetition...
- should the additional **kwargs accepted by each Artist be tracked at the Controller
- how does a Controller know which artist belongs where? E.g., do we need to pass axes references?

Progress:

- A simple NB demonstrating some functionality for Line2DController objects: https://nbviewer.jupyter.org/gist/theengineear/f0aa8d79f64325e767c0

2. Write in protocols for the Controller to update the model.

Comments:

- how should containers be dealt with? E.g., what happens to old patches when we re-bin a histogram?
- in the link from (1), the old line is completely destroyed and redrawn, what if something is referencing it?

3. Create method by which a json object can be assembled from the Controllers

4. Deal with serializing the unserializable aspects of a figure (e.g., non-affine transforms?)

5. Be able to instantiate from a serialized representation

6. Reimplement the existing pyplot and Axes method, e.g. pyplot.hist and Axes.hist in terms of the new controller class.
> @theengineer: in #2 above, what do you mean by *get updates* from each *Artist*?

^ Yup. The *Controller* shouldn’t need to get updated. This just happens in #3. Delete comments when you see this.

### 37.15.7 Backward compatibility

- pickling will change
- non-affine transformations will require a defined pickling method

### 37.15.8 Alternatives

PR #3150 suggested adding semantics by parasitically attaching extra containers to axes objects. This is a more complete solution with what should be a more developed/flexible/powerful framework.

#### 37.16.1 Status

Rejected
37.16.2 Branches and Pull requests

37.16.3 Abstract

This MEP proposes a new stylesheet implementation to allow more comprehensive and dynamic styling of artists.

The current version of matplotlib (1.4.0) allows stylesheets based on the rcParams syntax to be applied before creation of a plot. The methodology below proposes a new syntax, based on CSS, which would allow styling of individual artists and properties, which can be applied dynamically to existing objects.

This is related to (and makes steps toward) the overall goal of moving to a DOM/tree-like architecture.

37.16.4 Detailed description

Currently, the look and appearance of existing artist objects (figure, axes, Line2D etc...) can only be updated via set_ and get_ methods on the artist object, which is quite laborious, especially if no reference to the artist(s) has been stored. The new style sheets introduced in 1.4 allow styling before a plot is created, but do not offer any means to dynamically update plots or distinguish between artists of the same type (i.e. to specify the line color and line style separately for differing Line2D objects).

The initial development should concentrate on allowing styling of artist primitives (those artists that do not contain other artists), and further development could expand the CSS syntax rules and parser to allow more complex styling. See the appendix for a list of primitives.

The new methodology would require development of a number of steps:

- A new stylesheet syntax (likely based on CSS) to allow selection of artists by type, class, id etc...
- A mechanism by which to parse a stylesheet into a tree
- A mechanism by which to translate the parse-tree into something which can be used to update the properties of relevant artists. Ideally this would implement a method by which to traverse the artists in a tree-like structure.
- A mechanism by which to generate a stylesheet from existing artist properties. This would be useful to allow a user to export a stylesheet from an existing figure (where the appearance may have been set using the matplotlib API)...

37.16.5 Implementation

It will be easiest to allow a ‘3rd party’ to modify/set the style of an artist if the ‘style’ is created as a separate class and store against the artist as a property. The GraphicsContext class already provides a the basis of a Style class and an artists draw method can be refactored to use the Style class rather than setting up it’s own GraphicsContext and transferring it’s style-related properties to it. A minimal example of how this could be implemented is shown here: https://github.com/JamesRamm/mpl_experiment

IMO, this will also make the API and code base much neater as individual get/set methods for artist style properties are now redundant... Indirectly related would be a general drive to
replace get/set methods with properties. Implementing the style class with properties would be a big stride toward this...

For initial development, I suggest developing a syntax based on a much (much much) simplified version of CSS. I am in favour of dubbing this Artist Style Sheets :+1: :

**BNF Grammar**

I propose a very simple syntax to implement initially (like a proof of concept), which can be expanded upon in the future. The BNF form of the syntax is given below and then explained.

| RuleSet ::= SelectorSequence "{("Declaration")}" |
| SelectorSequence ::= = Selector {"," Selector} |
| Declaration ::= propName":" propValue";" |
| Selector ::= ArtistIdent{"#"Ident} |
| propName ::= Ident |
| propValue ::= Ident | Number | Colour | "None" |

ArtistIdent, Ident, Number and Colour are tokens (the basic building blocks of the expression) which are defined by regular expressions.

**Syntax**

A CSS stylesheet consists of a series of **rule sets** in hierarchical order (rules are applied from top to bottom). Each rule follows the syntax

`selector {attribute: value;}

Each rule can have any number of attribute: value pairs, and a stylesheet can have any number of rules.

The initial syntax is designed only for artist primitives. It does not address the question of how to set properties on container types (whose properties may themselves be artists with settable properties), however, a future solution to this could simply be nested RuleSet s

**Selectors**

Selectors define the object to which the attribute updates should be applied. As a starting point, I propose just 2 selectors to use in initial development:

**Artist Type Selector**

Select an artist by it’s type. E.g Line2D or Text:

`Line2D {attribute: value}`

The regex for matching the artist type selector (ArtistIdent in the BNF grammar) would be:
ArtistIdent = r'(?P<ArtistIdent>\bLine2D|\bText|\bAxesImage|\bFigureImage|\bPatch)'

**GID selector**

Select an artist by its gid:

```plaintext
Line2D#{myGID} {attribute: value}
```

A gid can be any string, so the regex could be as follows:

```plaintext
Ident = r'(?P<Ident>[a-zA-Z_][a-zA-Z_0-9]*)'
```

The above selectors roughly correspond to their CSS counterparts (http://www.w3.org/TR/CSS21/selector.html)

**Attributes and values**

- Attributes are any valid (settable) property for the artist in question.
- Values are any valid value for the property (Usually a string, or number).

**Parsing**

Parsing would consist of breaking the stylesheet into tokens (the python cookbook gives a nice tokenizing recipe on page 66), applying the syntax rules and constructing a Tree. This requires defining the grammar of the stylesheet (again, we can borrow from CSS) and writing a parser. Happily, there is a recipe for this in the python cookbook aswell.

**Visitor pattern for matplotlib figure**

In order to apply the stylesheet rules to the relevant artists, we need to ‘visit’ each artist in a figure and apply the relevant rule. Here is a visitor class (again, thanks to python cookbook), where each node would be an artist in the figure. A visit_method would need to be implemented for each mpl artist, to handle the different properties for each

```python
class Visitor:
    def visit(self, node):
        name = 'visit_' + type(node).__name__
        meth = getattr(self, name, None)
        if meth is None:
            raise NotImplementedError
        return meth(node)
```

An evaluator class would then take the stylesheet rules and implement the visitor on each one of them.
37.16.6 Backward compatibility

Implementing a separate Style class would break backward compatibility as many get/set methods on an artist would become redundant. While it would be possible to alter these methods to hook into the Style class (stored as a property against the artist), I would be in favor of simply removing them to both neaten/simplify the codebase and to provide a simple, uncluttered API...

37.16.7 Alternatives

No alternatives, but some of the ground covered here overlaps with MEP25, which may assist in this development

37.16.8 Appendix

Matplotlib primitives

This will form the initial selectors which stylesheets can use.

- Questions

37.17.1 Status

Progress
37.17.2 Branches and Pull requests

Main PR (including GTK3): + https://github.com/matplotlib/matplotlib/pull/4143

37.17.3 Abstract

This MEP refactors the backends to give a more structured and consistent API, removing generic code and consolidate existing code. To do this we propose splitting:

1. FigureManagerBase and its derived classes into the core functionality class FigureManager and a backend specific class WindowBase and

2. ShowBase and its derived classes into Gcf.show_all and MainLoopBase.

37.17.4 Detailed description

This MEP aims to consolidate the backends API into one single uniform API, removing generic code out of the backend (which includes _pylab_helpers and Gcf), and push code to a more appropriate level in matplotlib. With this we automatically remove inconsistencies that appear in the backends, such as FigureManagerBase.resize(w, h) which sometimes sets the canvas, and other times set the entire window to the dimensions given, depending on the backend.

Two main places for generic code appear in the classes derived from FigureManagerBase and ShowBase.

1. FigureManagerBase has three jobs at the moment:

   1. The documentation describes it as a “Helper class for pyplot mode, wraps everything up into a neat bundle”

   2. But it doesn’t just wrap the canvas and toolbar, it also does all of the windowing tasks itself. The conflation of these two tasks gets seen the best in the following line: `python self.set_window_title("Figure %d" % num)` `This combines backend specific code self.set_window_title(title) with matplotlib generic code title = "Figure %d" % num.

   3. Currently the backend specific subclass of FigureManager decides when to end the mainloop. This also seems very wrong as the figure should have no control over the other figures.

2. ShowBase has two jobs:

   1. It has the job of going through all figure managers registered in _pylab Helpers.Gcf and telling them to show themselves.

   2. And secondly it has the job of performing the backend specific mainloop to block the main programme and thus keep the figures from dying.
37.17.5 Implementation

The description of this MEP gives us most of the solution:

1. To remove the windowing aspect out of FigureManagerBase letting it simply wrap this new class along with the other backend classes. Create a new WindowBase class that can handle this functionality, with pass-through methods (arrow_right:) to WindowBase. Classes that subclass WindowBase should also subclass the GUI specific window class to ensure backward compatibility (manager.window == manager.window).

2. Refactor the mainloop of ShowBase into MainLoopBase, which encapsulates the end of the loop as well. We give an instance of MainLoop to FigureManager as a key unlock the exit method (requiring all keys returned before the loop can die). Note this opens the possibility for multiple backends to run concurrently.

3. Now that FigureManagerBase has no backend specifics in it, to rename it to FigureManager, and move to a new file backend_managers.py noting that:

   1. This allows us to break up the conversion of backends into separate PRs as we can keep the existing FigureManagerBase class and its dependencies intact.

   2. and this also anticipates MEP22 where the new NavigationBase has morphed into a backend independent ToolManager.

37.17.6 Future compatibility

As eluded to above when discussing MEP 22, this refactor makes it easy to add in new generic features. At the moment, MEP 22 has to make ugly hacks to each class extending from FigureManagerBase. With this code, this only needs to get made in the single FigureManager
class. This also makes the later deprecation of NavigationToolBar2 very straightforward, only needing to touch the single FigureManager class

MEP 23 makes for another use case where this refactored code will come in very handy.

### 37.17.7 Backward compatibility

As we leave all backend code intact, only adding missing methods to existing classes, this should work seamlessly for all use cases. The only difference will lie for backends that used FigureManager.resize to resize the canvas and not the window, due to the standardisation of the API.

I would envision that the classes made obsolete by this refactor get deprecated and removed on the same timetable as NavigationToolBar2, also note that the change in call signature to the FigureCanvasWx constructor, while backward compatible, I think the old (imho ugly style) signature should get deprecated and removed in the same manner as everything else.

### 37.17.8 Alternatives

If there were any alternative solutions to solving the same problem, they should be discussed here, along with a justification for the chosen approach.

### 37.17.9 Questions

Mdehoon: Can you elaborate on how to run multiple backends concurrently?

OceanWolf: @mdehoon, as I say, not for this MEP, but I see this MEP opens it up as a future possibility. Basically the MainLoopBase class acts a per backend Gcf, in this MEP it tracks the number of figures open per backend, and manages the mainloops for those backends. It closes the backend specific mainloop when it detects that no figures remain open for that backend. Because of this I imagine that with only a small amount of tweaking that we can do full-multi-backend matplotlib. No idea yet why one would want to, but I leave the possibility there in MainLoopBase. With all the backend-code specifics refactored out of FigureManager also aids in this, one manager to rule them (the backends) all.

Mdehoon: @OceanWolf, OK, thanks for the explanation. Having a uniform API for the backends is very important for the maintainability of matplotlib. I think this MEP is a step in the right direction.

Discussion

37.18.2 Branches and Pull requests

The following lists any open PRs or branches related to this MEP:

3. Deprecate passings 2D numpy arrays as input: None
5. Exposing `cbook.boxplot_stats` through `Axes.boxplot` kwargs: None
6. Remove redundant statistical kwargs in `Axes.boxplot`: None
7. Remove redundant style options in `Axes.boxplot`: None
8. Remaining items that arise through discussion: None
37.18.3 Abstract

Over the past few releases, the Axes.boxplot method has grown in complexity to support fully customizable artist styling and statistical computation. This lead to Axes.boxplot being split off into multiple parts. The statistics needed to draw a boxplot are computed in cbook.boxplot_stats, while the actual artists are drawn by Axes.bxp. The original method, Axes.boxplot remains as the most public API that handles passing the user-supplied data to cbook.boxplot_stats, feeding the results to Axes.bxp, and pre-processing style information for each facet of the boxplot plots.

This MEP will outline a path forward to rollback the added complexity and simplify the API while maintaining reasonable backwards compatibility.

37.18.4 Detailed description

Currently, the Axes.boxplot method accepts parameters that allow the users to specify medians and confidence intervals for each box that will be drawn in the plot. These were provided so that advanced users could provide statistics computed in a different fashion that the simple method provided by matplotlib. However, handling this input requires complex logic to make sure that the forms of the data structure match what needs to be drawn. At the moment, that logic contains 9 separate if/else statements nested up to 5 levels deep with a for loop, and may raise up to 2 errors. These parameters were added prior to the creation of the Axes.bxp method, which draws boxplots from a list of dictionaries containing the relevant statistics. Matplotlib also provides a function that computes these statistics via cbook.boxplot_stats. Note that advanced users can now either a) write their own function to compute the stats required by Axes.bxp, or b) modify the output returned by cbook.boxplot_stats to fully customize the position of the artists of the plots. With this flexibility, the parameters to manually specify only the medians and their confidences intervals remain for backwards compatibility.

Around the same time that the two roles of Axes.boxplot were split into cbook.boxplot_stats for computation and Axes.bxp for drawing, both Axes.boxplot and Axes.bxp were written to accept parameters that individually toggle the drawing of all components of the boxplots, and parameters that individually configure the style of those artists. However, to maintain backwards compatibility, the sym parameter (previously used to specify the symbol of the fliers) was retained. This parameter itself requires fairly complex logic to reconcile the sym parameters with the newer flierprops parameter at the default style specified by matplotlibrc.

This MEP seeks to dramatically simplify the creation of boxplots for novice and advanced users alike. Importantly, the changes proposed here will also be available to downstream packages like seaborn, as seaborn smartly allows users to pass arbitrary dictionaries of parameters through the seaborn API to the underlying matplotlib functions.

This will be achieved in the following way:

1. cbook.boxplot_stats will be modified to allow pre- and post- computation transformation functions to be passed in (e.g., np.log and np.exp for lognormally distributed data).

2. Axes.boxplot will be modified to also accept and naively pass them to cbook.boxplot_stats (Alt: pass the stat function and a dict of its optional parameters).

3. Outdated parameters from Axes.boxplot will be deprecated and later removed.
Importance

Since the limits of the whiskers are computed arithmetically, there is an implicit assumption of normality in box and whisker plots. This primarily affects which data points are classified as outliers.

Allowing transformations to the data and the results used to draw boxplots will allow users to opt-out of that assumption if the data are known to not fit a normal distribution.

Below is an example of how `Axes.boxplot` classifies outliers of lognormal data differently depending on these types of transforms.

```python
import numpy as np
import matplotlib.pyplot as plt
from matplotlib import cbook

np.random.seed(0)

fig, ax = plt.subplots(figsize=(4, 6))
ax.set_yscale('log')
data = np.random.lognormal(-1.75, 2.75, size=37)

stats = cbook.boxplot_stats(data, labels=['arithmetic'])
logstats = cbook.boxplot_stats(np.log(data), labels=['log-transformed'])

for lsdict in logstats:
    for key, value in lsdict.items():
        if key != 'label':
            lsdict[key] = np.exp(value)

stats.extend(logstats)
ax.bxp(stats)
fig.show()
```

### 37.18.5 Implementation

**Passing transform functions to `cbook.boxplots_stats`**

This MEP proposes that two parameters (e.g., `transform_in` and `transform_out`) be added to the cookbook function that computes the statistics for the boxplot function. These will be optional keyword-only arguments and can easily be set to `lambda x: x` as a no-op when omitted by the user. The `transform_in` function will be applied to the data as the `boxplot_stats` function loops through each subset of the data passed to it. After the list of statistics dictionaries are computed the `transform_out` function is applied to each value in the dictionaries.

These transformations can then be added to the call signature of `Axes.boxplot` with little impact to that method’s complexity. This is because they can be directly passed to `cbook.boxplot_stats`. Alternatively, `Axes.boxplot` could be modified to accept an optional statistical function kwarg and a dictionary of parameters to be directly passed to it.

At this point in the implementation users and external libraries like seaborn would have complete control via the `Axes.boxplot` method. More importantly, at the very least, seaborn would require no changes to its API to allow users to take advantage of these new options.
Simplifications to the Axes.boxplot API and other functions

Simplifying the boxplot method consists primarily of deprecating and then removing the redundant parameters. Optionally, a next step would include rectifying minor terminological inconsistencies between Axes.boxplot and Axes.bxp.

The parameters to be deprecated and removed include:

1. usermedians - processed by 10 SLOC, 3 if blocks, a for loop
2. conf_intervals - handled by 15 SLOC, 6 if blocks, a for loop
3. sym - processed by 12 SLOC, 4 if blocks

Removing the sym option allows all code in handling the remaining styling parameters to be moved to Axes.bxp. This doesn’t remove any complexity, but does reinforce the single responsibility principle among Axes.bxp, cbook.boxplot_stats, and Axes.boxplot.

Additionally, the notch parameter could be renamed shownotches to be consistent with Axes.bxp. This kind of cleanup could be taken a step further and the whis, bootstrap, autorange could be rolled into the kwargs passed to the new statfxn parameter.

37.18.6 Backward compatibility

Implementation of this MEP would eventually result in the backwards incompatible deprecation and then removal of the keyword parameters usermedians, conf_intervals, and sym. Cursorry searches on GitHub indicated that usermedians, conf_intervals are used by few users, who all seem to have a very strong knowledge of matplotlib. A robust deprecation cycle should provide sufficient time for these users to migrate to a new API.

Deprecation of sym however, may have a much broader reach into the matplotlib userbase.

Schedule

An accelerated timeline could look like the following:

1. v2.0.1 add transforms to cbook.boxplot_stats, expose in Axes.boxplot
2. v2.1.0 Initial Deprecations , and using 2D numpy arrays as input
   a. Using 2D numpy arrays as input. The semantics around 2D arrays are generally confusing.
   b. usermedians, conf_intervals, sym parameters
3. v2.2.0
   a. remove usermedians, conf_intervals, sym parameters
   b. deprecate notch in favor of shownotches to be consistent with other parameters and Axes.bxp
4. v2.3.0
   a. remove notch parameter
   b. move all style and artist toggling logic to Axes.bxp such Axes.boxplot is little more than a broker between Axes.bxp and cbook.boxplot_stats
Anticipated Impacts to Users

As described above deprecating usermedians and conf_intervals will likely impact few users. Those who will be impacted are almost certainly advanced users who will be able to adapt to the change.

Deprecating the sym option may import more users and effort should be taken to collect community feedback on this.

Anticipated Impacts to Downstream Libraries

The source code (GitHub master as of 2016-10-17) was inspected for seaborn and python-ggplot to see if these changes would impact their use. None of the parameters nominated for removal in this MEP are used by seaborn. The seaborn APIs that use matplotlib’s boxplot function allow user’s to pass arbitrary **kwargs through to matplotlib’s API. Thus seaborn users with modern matplotlib installations will be able to take full advantage of any new features added as a result of this MEP.

Python-ggplot has implemented its own function to draw boxplots. Therefore, no impact can come to it as a result of implementing this MEP.

37.18.7 Alternatives

Variations on the theme

This MEP can be divided into a few loosely coupled components:

1. Allowing pre- and post-computation transformation function in cbook.boxplot_stats
2. Exposing that transformation in the Axes.boxplot API
3. Removing redundant statistical options in Axes.boxplot
4. Shifting all styling parameter processing from Axes.boxplot to Axes.bxp.

With this approach, #2 depends and #1, and #4 depends on #3.

There are two possible approaches to #2. The first and most direct would be to mirror the new transform_in and transform_out parameters of cbook.boxplot_stats in Axes.boxplot and pass them directly.

The second approach would be to add statfxn and statfxn_args parameters to Axes.boxplot. Under this implementation, the default value of statfxn would be cbook.boxplot_stats, but users could pass their own function. Then transform_in and transform_out would then be passed as elements of the statfxn_args parameter.

```python
def boxplot_stats(data, ..., transform_in=None, transform_out=None):
    if transform_in is None:
        transform_in = lambda x: x

    if transform_out is None:
        transform_out = lambda x: x

    output = []
    for _d in data:
```

(continues on next page)
d = transform_in(_d)
stat_dict = do_stats(d)
for key, value in stat_dict.items():
    if key != 'label':
        stat_dict[key] = transform_out(value)
output.append(d)
return output

class Axes(...):
    def boxplot_option1(data, ..., transform_in=transform_in, transform_out=transform_out):
        stats = cbook.boxplot_stats(data, ..., transform_in=transform_in,
                                    transform_out=transform_out)
        return self.bxp(stats, ...)
    def boxplot_option2(data, ..., statfxn=boxplot_stats, **statopts):
        if statfxn is None:
            statfxn = boxplot_stats
        stats = statfxn(data, **statopts)
        return self.bxp(stats, ...)

Both cases would allow users to do the following:

```python
fig, ax1 = plt.subplots()
artists1 = ax1.boxplot_optionX(data, transform_in=np.log,
                                transform_out=np.exp)
```

But Option Two lets a user write a completely custom stat function (e.g., `my_box_stats`) with fancy BCA confidence intervals and the whiskers set differently depending on some attribute of the data.

This is available under the current API:

```python
fig, ax1 = plt.subplots()
my_stats = my_box_stats(data, bootstrap_method='BCA',
                        whisker_method='dynamic')
ax1.bxp(my_stats)
```

And would be more concise with Option Two

```python
fig, ax = plt.subplots()
statopts = dict(transform_in=np.log, transform_out=np.exp)
ax.boxplot(data, ..., **statopts)
```

Users could also pass their own function to compute the stats:

```python
fig, ax1 = plt.subplots()
ax1.boxplot(data, statfxn=my_box_stats, bootstrap_method='BCA',
            whisker_method='dynamic')
```

From the examples above, Option Two seems to have only marginal benefit, but in the context of downstream libraries like seaborn, its advantage is more apparent as the following would be possible without any patches to seaborn:
This type of flexibility was the intention behind splitting the overall boxplot API in the current three functions. In practice however, downstream libraries like seaborn support versions of matplotlib dating back well before the split. Thus, adding just a bit more flexibility to the Axes.boxplot could expose all the functionality to users of the downstream libraries with modern matplotlib installation without intervention from the downstream library maintainers.

Doing less

Another obvious alternative would be to omit the added pre- and post-computation transform functionality in cbook.boxplot_stats and Axes.boxplot, and simply remove the redundant statistical and style parameters as described above.

Doing nothing

As with many things in life, doing nothing is an option here. This means we simply advocate for users and downstream libraries to take advantage of the split between cbook.boxplot_stats and Axes.bxp and let them decide how to provide an interface to that.

37.19 MEP29: Text light markup

- Status
- Branches and Pull requests
- Abstract
- Detailed description
- Implementation
  - Improvements
  - Problems
- Backward compatibility
- Alternatives

37.19.1 Status

Discussion
37.19.2 Branches and Pull requests

None at the moment, proof of concept only.

37.19.3 Abstract

This MEP proposes to add lightweight markup to the text artist.

37.19.4 Detailed description

Using different size/color/family in a text annotation is difficult because the text method accepts argument for size/color/family/weight/etc. that are used for the whole text. But, if one wants, for example, to have different colors, one has to look at the gallery where one such example is provided: [http://matplotlib.org/examples/text_labels_and_annotations/rainbow_text.html](http://matplotlib.org/examples/text_labels_and_annotations/rainbow_text.html)

This example takes a list of strings as well as a list of colors which makes it cumbersome to use. An alternative would be to use a restricted set of pango-like markup and to interpret this markup.

Some markup examples:

```
Hello <b>world!</b>
Hello <span color="blue">world!</span>
```

37.19.5 Implementation

A proof of concept is provided in [markup_example.py](#) but it currently only handles the horizontal direction.

Improvements

- This proof of concept uses regex to parse the text but it may be better to use the html.parser from the standard library.
- Computation of text fragment positions could benefit from the OffsetFrom class. See for example item 5 in [Using Complex Coordinates with Annotations](#)

Problems

- One serious problem is how to deal with text having both latex and html-like tags. For example, consider the following:

```
$\langle b>Bold</b>$
```

Recommendation would be to have mutual exclusion.
37.19.6 Backward compatibility

None at the moment since it is only a proof of concept

37.19.7 Alternatives

As proposed by @anntzer, this could be also implemented as improvements to mathtext. For example:

\textbf{world}

\textcolor{blue}{world}

\textsf{small world}
Matplotlib only uses BSD compatible code. If you bring in code from another project make sure it has a PSF, BSD, MIT or compatible license (see the Open Source Initiative licenses page for details on individual licenses). If it doesn’t, you may consider contacting the author and asking them to relicense it. GPL and LGPL code are not acceptable in the main code base, though we are considering an alternative way of distributing L/GPL code through an separate channel, possibly a toolkit. If you include code, make sure you include a copy of that code’s license in the license directory if the code’s license requires you to distribute the license with it. Non-BSD compatible licenses are acceptable in matplotlib toolkits (e.g., basemap), but make sure you clearly state the licenses you are using.

### 38.1 Why BSD compatible?

The two dominant license variants in the wild are GPL-style and BSD-style. There are countless other licenses that place specific restrictions on code reuse, but there is an important difference to be considered in the GPL and BSD variants. The best known and perhaps most widely used license is the GPL, which in addition to granting you full rights to the source code including redistribution, carries with it an extra obligation. If you use GPL code in your own code, or link with it, your product must be released under a GPL compatible license. i.e., you are required to give the source code to other people and give them the right to redistribute it as well. Many of the most famous and widely used open source projects are released under the GPL, including linux, gcc, emacs and sage.

The second major class are the BSD-style licenses (which includes MIT and the python PSF license). These basically allow you to do whatever you want with the code: ignore it, include it in your own open source project, include it in your proprietary product, sell it, whatever. python itself is released under a BSD compatible license, in the sense that, quoting from the PSF license page:

```
There is no GPL-like "copyleft" restriction. Distributing binary-only versions of Python, modified or not, is allowed. There is no requirement to release any of your source code. You can also write extension modules for Python and provide them only in binary form.
```

Famous projects released under a BSD-style license in the permissive sense of the last paragraph are the BSD operating system, python and TeX.

There are several reasons why early matplotlib developers selected a BSD compatible license. matplotlib is a python extension, and we choose a license that was based on the python license (BSD compatible). Also, we wanted to attract as many users and developers as possible, and
many software companies will not use GPL code in software they plan to distribute, even those that are highly committed to open source development, such as enthought, out of legitimate concern that use of the GPL will “infect” their code base by its viral nature. In effect, they want to retain the right to release some proprietary code. Companies and institutions who use matplotlib often make significant contributions, because they have the resources to get a job done, even a boring one. Two of the matplotlib backends (FLTK and WX) were contributed by private companies. The final reason behind the licensing choice is compatibility with the other python extensions for scientific computing: ipython, numpy, scipy, the enthought tool suite and python itself are all distributed under BSD compatible licenses.
As discussed at length elsewhere, *jet* is an empirically bad color map and should not be the default color map. Due to the position that changing the appearance of the plot breaks backward compatibility, this change has been put off for far longer than it should have been. In addition to changing the default color map we plan to take the chance to change the default color-cycle on plots and to adopt a different color map for filled plots (*imshow*, *pcolor*, *contourf*, etc) and for scatter like plots.

39.1 Default Heat Map Colormap

The choice of a new color map is fertile ground to bike-shedding ("No, it should be *this* color") so we have a proposed set criteria (via Nathaniel Smith) to evaluate proposed color maps.

- it should be a sequential colormap, because diverging colormaps are really misleading unless you know where the "center" of the data is, and for a default colormap we generally won’t.
- it should be perceptually uniform, i.e., human subjective judgments of how far apart nearby colors are should correspond as linearly as possible to the difference between the numerical values they represent, at least locally.
- it should have a perceptually uniform luminance ramp, i.e. if you convert to greyscale it should still be uniform. This is useful both in practical terms (greyscale printers are still a thing!) and because luminance is a very strong and natural cue to magnitude.
- it should also have some kind of variation in hue, because hue variation is a really helpful additional cue to perception, having two cues is better than one, and there’s no reason not to do it.
- the hue variation should be chosen to produce reasonable results even for viewers with the more common types of colorblindness. (Which rules out things like red-to-green.)
- For bonus points, it would be nice to choose a hue ramp that still works if you throw away the luminance variation, because then we could use the version with varying luminance for 2d plots, and the version with just hue variation for 3d plots. (In 3d plots you really want to reserve the luminance channel for lighting/shading, because your brain is really good at extracting 3d shape from luminance variation. If the 3d surface itself has massively varying luminance then this screws up the ability to see shape.)
- Not infringe any existing IP
39.1.1 Example script

39.1.2 Proposed Colormaps

39.2 Default Scatter Colormap

For heat-map like applications it can be desirable to cover as much of the luminence scale as possible, however when color mapping markers, having markers too close to white can be a problem. For that reason we propose using a different (but maybe related) color map to the heat map for marker-based. The design parameters are the same as above, only with a more limited luminence variation.

39.2.1 Example script

```python
import numpy as np
import matplotlib.pyplot as plt

np.random.seed(1234)

fig, (ax1, ax2) = plt.subplots(1, 2)

N = 50
x = np.random.rand(N)
y = np.random.rand(N)
colors = np.random.rand(N)
area = np.pi * (15 * np.random.rand(N))**2  # 0 to 15 point radiuses

ax1.scatter(x, y, s=area, c=colors, alpha=0.5)

X, Y = np.meshgrid(np.arange(0, 2*np.pi, .2),
                   np.arange(0, 2*np.pi, .2))
U = np.cos(X)
V = np.sin(Y)
Q = ax2.quiver(X, Y, U, V, units='width')
qd = np.random.rand(np.prod(X.shape))
Q.set_array(qd)
```

39.2.2 Proposed Colormaps

39.3 Color Cycle / Qualitative color map

When plotting lines it is frequently desirable to plot multiple lines or artists which need to be distinguishable, but there is no inherent ordering.
39.3.1 Example script

```python
import numpy as np
import matplotlib.pyplot as plt

fig, (ax1, ax2) = plt.subplots(1, 2)
x = np.linspace(0, 1, 10)
for j in range(10):
    ax1.plot(x, x * j)

th = np.linspace(0, 2*np.pi, 1024)
for j in np.linspace(0, np.pi, 10):
    ax2.plot(th, np.sin(th + j))

ax2.set_xlim(0, 2*np.pi)
```

39.3.2 Proposed Color cycle
Part VII

Glossary
AGG The Anti-Grain Geometry (Agg) rendering engine, capable of rendering high-quality images

Cairo The Cairo graphics engine

dateutil The dateutil library provides extensions to the standard datetime module

EPS Encapsulated Postscript (EPS)

FreeType FreeType is a font rasterization library used by matplotlib which supports TrueType, Type 1, and OpenType fonts.

GDK The Gimp Drawing Kit for GTK+

GTK The GIMP Toolkit (GTK) graphical user interface library

JPG The Joint Photographic Experts Group (JPEG) compression method and file format for photographic images

numpy numpy is the standard numerical array library for python, the successor to Numeric and numarray. numpy provides fast operations for homogeneous data sets and common mathematical operations like correlations, standard deviation, fourier transforms, and convolutions.

PDF Adobe’s Portable Document Format (PDF)

PNG Portable Network Graphics (PNG), a raster graphics format that employs lossless data compression which is more suitable for line art than the lossy jpg format. Unlike the gif format, png is not encumbered by requirements for a patent license.

PS Postscript (PS) is a vector graphics ASCII text language widely used in printers and publishing. Postscript was developed by adobe systems and is starting to show its age: for example is does not have an alpha channel. PDF was designed in part as a next-generation document format to replace postscript

PyGObject PyGObject provides Python wrappers for the GTK widgets library

PyQt PyQt provides python wrappers for the Qt widgets library and is required by the matplotlib Qt5Agg and Qt4Agg backends. Widely used on linux and windows; many linux distributions package this as ‘python-qt5’ or ‘python-qt4’.

Python Python is an object oriented interpreted language widely used for scripting, application development, web application servers, scientific computing and more.

Qt Qt is a cross-platform application framework for desktop and embedded development.

Qt4 Qt4 is the previous, but most widely used, version of Qt cross-platform application framework for desktop and embedded development.

Qt5 Qt5 is the current version of Qt cross-platform application framework for desktop and embedded development.

Raster graphics Raster graphics, or bitmaps, represent an image as an array of pixels which is resolution dependent. Raster graphics are generally most practical for photo-realistic images, but do not scale easily without loss of quality.

SVG The Scalable Vector Graphics format (SVG). An XML based vector graphics format supported by many web browsers.

TIFF Tagged Image File Format (TIFF) is a file format for storing images, including photographs and line art.

Tk Tk is a graphical user interface for Tcl and many other dynamic languages. It can produce rich, native applications that run unchanged across Windows, Mac OS X, Linux and more.
vector graphics use geometrical primitives based upon mathematical equations to represent images in computer graphics. Primitives can include points, lines, curves, and shapes or polygons. Vector graphics are scalable, which means that they can be resized without suffering from issues related to inherent resolution like are seen in raster graphics. Vector graphics are generally most practical for typesetting and graphic design applications.

wxpython provides python wrappers for the wxWidgets library for use with the WX and WXAgg backends. Widely used on linux, OS-X and windows, it is often packaged by linux distributions as ‘python-wxgtk’

wxWidgets WX is cross-platform GUI and tools library for GTK, MS Windows, and MacOS. It uses native widgets for each operating system, so applications will have the look-and-feel that users on that operating system expect.
