Barbs are like quiver in that they point along a vector, but the magnitude of the vector is given schematically by the presence of barbs or flags on the barb.

This will also become a home for things such as standard deviation ellipses, which can and will be derived very easily from the Quiver code.

18.42.1 Classes

</tbody>
</table>

**matplotlib.quiver.Quiver**

class matplotlib.quiver.Quiver(ax, *args[, scale=None, headwidth=3, headlength=5, headaxislength=4.5, minshaft=1, minlength=1, units='width', scale_units=None, angles='uv', width=None, color='k', pivot='tail', **kw))

Bases: matplotlib.collections.PolyCollection

Specialized PolyCollection for arrows.

The only API method is set_UVC(), which can be used to change the size, orientation, and color of the arrows; their locations are fixed when the class is instantiated. Possibly this method will be useful in animations.

Much of the work in this class is done in the draw() method so that as much information as possible is available about the plot. In subsequent draw() calls, recalculation is limited to things that might have changed, so there should be no performance penalty from putting the calculations in the draw() method.

The constructor takes one required argument, an Axes instance, followed by the args and kwargs described by the following pyplot interface documentation:

Plot a 2D field of arrows.

Call signature:

```python
quiver([X, Y], U, V, [C], **kw)
```

X, Y define the arrow locations, U, V define the arrow directions, and C optionally sets the color.

Arrow size
The default settings auto-scales the length of the arrows to a reasonable size. To change this behavior see the scale and scale_units parameters.

**Arrow shape**

The defaults give a slightly swept-back arrow; to make the head a triangle, make headaxislength the same as headlength. To make the arrow more pointed, reduce headwidth or increase headlength and headaxislength. To make the head smaller relative to the shaft, scale down all the head parameters. You will probably do best to leave minshaft alone.

**Arrow outline**

*linewidths* and *edgecolors* can be used to customize the arrow outlines.

**Parameters**

**X, Y**

[1D or 2D array-like, optional] The x and y coordinates of the arrow locations.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of U and V.

If X and Y are 1D but U, V are 2D, X, Y are expanded to 2D using X, Y = np.meshgrid(X, Y). In this case len(X) and len(Y) must match the column and row dimensions of U and V.

**U, V**

[1D or 2D array-like] The x and y direction components of the arrow vectors.

They must have the same number of elements, matching the number of arrow locations. U and V may be masked. Only locations unmasked in U, V, and C will be drawn.

**C**

[1D or 2D array-like, optional] Numeric data that defines the arrow colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *color* instead. The size of C must match the number of arrow locations.

**units**

[{'width', 'height', 'dots', 'inches', 'x', 'y', 'xy'}, default: 'width'] The arrow dimensions (except for length) are measured in multiples of this unit.

The following values are supported:

- 'width', 'height': The width or height of the axis.
- 'dots', 'inches': Pixels or inches based on the figure dpi.
- 'x', 'y', 'xy': \(X, Y\) or \(\sqrt{X^2 + Y^2}\) in data units.

The arrows scale differently depending on the units. For 'x' or 'y', the arrows get larger as one zooms in; for other units, the arrow size is independent of the zoom.
state. For 'width' or 'height', the arrow size increases with the width and height of the axes, respectively, when the window is resized; for 'dots' or 'inches', resizing does not change the arrows.

angles

[{'uv', 'xy'} or array-like, default: 'uv'] Method for determining the angle of the arrows.

- 'uv': The arrow axis aspect ratio is 1 so that if $U == V$ the orientation of the arrow on the plot is 45 degrees counter-clockwise from the horizontal axis (positive to the right).

  Use this if the arrows symbolize a quantity that is not based on $X$, $Y$ data coordinates.

- 'xy': Arrows point from $(x, y)$ to $(x+u, y+v)$. Use this for plotting a gradient field, for example.

- Alternatively, arbitrary angles may be specified explicitly as an array of values in degrees, counter-clockwise from the horizontal axis.

  In this case $U$, $V$ is only used to determine the length of the arrows.

Note: inverting a data axis will correspondingly invert the arrows only with angles='xy'.

scale

[float, optional] Number of data units per arrow length unit, e.g., m/s per plot width; a smaller scale parameter makes the arrow longer. Default is None.

If None, a simple autoscaling algorithm is used, based on the average vector length and the number of vectors. The arrow length unit is given by the scale_units parameter.

scale_units

[{'width', 'height', 'dots', 'inches', 'x', 'y', 'xy'}, optional] If the scale kwarg is None, the arrow length unit. Default is None.

e.g. scale_units is 'inches', scale is 2.0, and $(u, v) = (1, 0)$, then the vector will be 0.5 inches long.

If scale_units is 'width' or 'height', then the vector will be half the width/height of the axes.

If scale_units is 'x' then the vector will be 0.5 x-axis units. To plot vectors in the x-y plane, with $u$ and $v$ having the same units as $x$ and $y$, use angles='xy', scale_units='xy', scale=1.

width

[float, optional] Shaft width in arrow units; default depends on choice of units, above, and number of vectors; a typical starting value is about 0.005 times the width of the plot.
**headwidth**

[float, default: 3] Head width as multiple of shaft width.

**headlength**

[float, default: 5] Head length as multiple of shaft width.

**headaxislength**

[float, default: 4.5] Head length at shaft intersection.

**minshaft**

[float, default: 1] Length below which arrow scales, in units of head length. Do not set this to less than 1, or small arrows will look terrible!

**minlength**

[float, default: 1] Minimum length as a multiple of shaft width; if an arrow length is less than this, plot a dot (hexagon) of this diameter instead.

**pivot**

[{'tail', 'mid', 'middle', 'tip'}, default: 'tail'] The part of the arrow that is anchored to the X, Y grid. The arrow rotates about this point.

'mid' is a synonym for 'middle'.

**color**

[color or color sequence, optional] Explicit color(s) for the arrows. If C has been set, color has no effect.

This is a synonym for the PolyCollection facecolor parameter.

**Other Parameters**

**kwargs**

[PolyCollection properties, optional] All other keyword arguments are passed on to PolyCollection:

**Axes.quiverkey**

Add a key to a quiver plot.

```
__init__(self, ax, *args, scale=None, headwidth=3, headlength=5, headaxislength=4.5,
        minshaft=1, minlength=1, units='width', scale_units=None, angles='uv',
        width=None, color='k', pivot='tail', **kw)
```

The constructor takes one required argument, an Axes instance, followed by the args and kwargs described by the following pyplot interface documentation:

Plot a 2D field of arrows.

Call signature:

```
quiver([X, Y], U, V, [C], **kw)
```

X, Y define the arrow locations, U, V define the arrow directions, and C optionally sets the color.
Arrow size
The default settings auto-scales the length of the arrows to a reasonable size. To change this
behavior see the scale and scale_units parameters.

Arrow shape
The defaults give a slightly swept-back arrow; to make the head a triangle, make headaxis-
isslength the same as headlength. To make the arrow more pointed, reduce headwidth or increase
headlength and headaxislength. To make the head smaller relative to the shaft, scale down all
the head parameters. You will probably do best to leave minshaft alone.

Arrow outline
linewidths and edgecolors can be used to customize the arrow outlines.

Parameters

X, Y
[1D or 2D array-like, optional] The x and y coordinates of the arrow locations.
If not given, they will be generated as a uniform integer meshgrid based on the
dimensions of U and V.

If X and Y are 1D but U, V are 2D, X, Y are expanded to 2D using X, Y =
np.meshgrid(X, Y). In this case len(X) and len(Y) must match the
column and row dimensions of U and V.

U, V
[1D or 2D array-like] The x and y direction components of the arrow vectors.
They must have the same number of elements, matching the number of arrow
locations. U and V may be masked. Only locations unmasked in U, V, and C
will be drawn.

C
[1D or 2D array-like, optional] Numeric data that defines the arrow colors by
colormapping via norm and cmap.
This does not support explicit colors. If you want to set colors directly, use color
instead. The size of C must match the number of arrow locations.

units
[{width', 'height', 'dots', 'inches', 'x', 'y', 'xy'}, default: 'width'] The arrow dimen-
sions (except for length) are measured in multiples of this unit.
The following values are supported:
• 'width', 'height': The width or height of the axis.
• 'dots', 'inches': Pixels or inches based on the figure dpi.
• 'x', 'y', 'xy': X, Y or \sqrt{X^2 + Y^2} in data units.
The arrows scale differently depending on the units. For 'x' or 'y', the arrows get larger as one zooms in; for other units, the arrow size is independent of the zoom state. For 'width' or 'height', the arrow size increases with the width and height of the axes, respectively, when the window is resized; for 'dots' or 'inches', resizing does not change the arrows.

angles

[{'uv', 'xy'} or array-like, default: 'uv'] Method for determining the angle of the arrows.

• 'uv': The arrow axis aspect ratio is 1 so that if \( U == V \) the orientation of the arrow on the plot is 45 degrees counter-clockwise from the horizontal axis (positive to the right).

  Use this if the arrows symbolize a quantity that is not based on X, Y data coordinates.

• 'xy': Arrows point from (x, y) to (x+u, y+v). Use this for plotting a gradient field, for example.

• Alternatively, arbitrary angles may be specified explicitly as an array of values in degrees, counter-clockwise from the horizontal axis.

  In this case \( U, V \) is only used to determine the length of the arrows.

  Note: inverting a data axis will correspondingly invert the arrows only with angles='xy'.

scale

[float, optional] Number of data units per arrow length unit, e.g., m/s per plot width; a smaller scale parameter makes the arrow longer. Default is None.

If None, a simple autoscaling algorithm is used, based on the average vector length and the number of vectors. The arrow length unit is given by the scale_units parameter.

scale_units

[{'width', 'height', 'dots', 'inches', 'x', 'y', 'xy'}, optional] If the scale kwarg is None, the arrow length unit. Default is None.

e.g. scale_units is 'inches', scale is 2.0, and \( (u, v) = (1, 0) \), then the vector will be 0.5 inches long.

If scale_units is 'width' or 'height', then the vector will be half the width/height of the axes.

If scale_units is 'x' then the vector will be 0.5 x-axis units. To plot vectors in the x-y plane, with u and v having the same units as x and y, use angles='xy', scale_units='xy', scale=1.

width
[float, optional] Shaft width in arrow units; default depends on choice of units, above, and number of vectors; a typical starting value is about 0.005 times the width of the plot.

**headwidth**

[float, default: 3] Head width as multiple of shaft width.

**headlength**

[float, default: 5] Head length as multiple of shaft width.

**headaxislength**

[float, default: 4.5] Head length at shaft intersection.

**minshaft**

[float, default: 1] Length below which arrow scales, in units of head length. Do not set this to less than 1, or small arrows will look terrible!

**minlength**

[float, default: 1] Minimum length as a multiple of shaft width; if an arrow length is less than this, plot a dot (hexagon) of this diameter instead.

**pivot**

[{'tail', 'mid', 'middle', 'tip'}, default: 'tail'] The part of the arrow that is anchored to the X, Y grid. The arrow rotates about this point.

'mid' is a synonym for 'middle'.

**color**

[color or color sequence, optional] Explicit color(s) for the arrows. If C has been set, color has no effect.

This is a synonym for the PolyCollection facecolor parameter.

**Other Parameters**

**kwargs**

[PolyCollection properties, optional] All other keyword arguments are passed on to PolyCollection:

**See also:**

**Axes.quiverkey**

Add a key to a quiver plot.

```python
__module__ = 'matplotlib.quiver'
ax(self)
[Deprecated]
```
Notes

Deprecated since version 3.3:

draw(self, renderer)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters

renderer

[RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

get_datalim(self, transData)

Examples using matplotlib.quiver.Quiver

- sphx_glr_gallery_images_contours_and_fields_quiver_demo.py
- sphx_glr_gallery_images_contours_and_fields_quiver_simple_demo.py

matplotlib.quiver.QuiverKey

class matplotlib.quiver.QuiverKey(Q, X, Y, U, label, *, angle=0, coordinates='axes', color=None, labelsep=0.1, labelpos='N', labelcolor=None, fontproperties=None, **kw)

Bases: matplotlib.artist.Artist

Labelled arrow for use as a quiver plot scale key.

Add a key to a quiver plot.
The positioning of the key depends on $X$, $Y$, *coordinates*, and *labelpos*. If *labelpos* is 'N' or 'S', $X$, $Y$ give the position of the middle of the key arrow. If *labelpos* is 'E', $X$, $Y$ positions the head, and if *labelpos* is 'W', $X$, $Y$ positions the tail; in either of these two cases, $X$, $Y$ is somewhere in the middle of the arrow+label key object.

**Parameters**

- **Q**
  
  [matplotlib.quiver.Quiver] A *Quiver* object as returned by a call to `quiver()`.

- **X**, **Y**
  
  [float] The location of the key.

- **U**
  
  [float] The length of the key.

- **label**
  
  [str] The key label (e.g., length and units of the key).

- **angle**
  
  [float, default: 0] The angle of the key arrow, in degrees anti-clockwise from the x-axis.

- **coordinates**
  
  [{'axes', 'figure', 'data', 'inches'}, default: 'axes'] Coordinate system and units for $X$, $Y$: 'axes' and 'figure' are normalized coordinate systems with (0, 0) in the lower left and (1, 1) in the upper right; 'data' are the axes data coordinates (used for the locations of the vectors in the quiver plot itself); 'inches' is position in the figure in inches, with (0, 0) at the lower left corner.

- **color**
  
  [color] Overrides face and edge colors from $Q$.

- **labelpos**
  
  [{'N', 'S', 'E', 'W'}] Position the label above, below, to the right, to the left of the arrow, respectively.

- **labelsep**
  
  [float, default: 0.1] Distance in inches between the arrow and the label.

- **labelcolor**
  
  [color, default: `rcParams["text.color"]` (default: 'black')] Label color.

- **fontproperties**
  
  [dict, optional] A dictionary with keyword arguments accepted by the `FontProperties` initializer: `family`, `style`, `variant`, `size`, `weight`. 
**kwargs

Any additional keyword arguments are used to override vector properties taken from \( Q \).

__init__ (self, \( Q \), \( X \), \( Y \), \( U \), label, *, angle=0, coordinates='axes', color=None, labelsep=0.1, labelpos='N', labelcolor=None, fontproperties=None, **kw)

Add a key to a quiver plot.

The positioning of the key depends on \( X \), \( Y \), coordinates, and labelpos. If labelpos is 'N' or 'S', \( X \), \( Y \) give the position of the middle of the key arrow. If labelpos is 'E', \( X \), \( Y \) positions the head, and if labelpos is 'W', \( X \), \( Y \) positions the tail; in either of these two cases, \( X \), \( Y \) is somewhere in the middle of the arrow+label key object.

Parameters

\( Q \)

A Quiver object as returned by a call to quiver().

\( X \), \( Y \)

[float] The location of the key.

\( U \)

[float] The length of the key.

label

[str] The key label (e.g., length and units of the key).

angle

[float, default: 0] The angle of the key arrow, in degrees anti-clockwise from the x-axis.

coordinates

[{'axes', 'figure', 'data', 'inches'}, default: 'axes'] Coordinate system and units for \( X \), \( Y \): 'axes' and 'figure' are normalized coordinate systems with (0, 0) in the lower left and (1, 1) in the upper right; 'data' are the axes data coordinates (used for the locations of the vectors in the quiver plot itself); 'inches' is position in the figure in inches, with (0, 0) at the lower left corner.

color

[color] Overrides face and edge colors from \( Q \).

labelpos

[{'N', 'S', 'E', 'W'}] Position the label above, below, to the right, to the left of the arrow, respectively.

labelsep

[float, default: 0.1] Distance in inches between the arrow and the label.
labelcolor

[color, default: rcParams['text.color'] (default: 'black')] Label color.

fontproperties

[dict, optional] A dictionary with keyword arguments accepted by the `FontProperties` initializer: family, style, variant, size, weight.

**kwargs

Any additional keyword arguments are used to override vector properties taken from $Q$.

__module__ = 'matplotlib.quiver'

contains (self, mouseevent)

Test whether the artist contains the mouse event.

Parameters

mouseevent

[matplotlib.backend_bases.MouseEvent]

Returns

contains

[bool] Whether any values are within the radius.

details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

draw (self, renderer)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

Parameters

renderer

[RendererBase subclass.]
Notes

This method is overridden in the Artist subclasses.

```python
dictionary = {'E': 'left', 'N': 'center', 'S': 'center', 'W': 'right'}
```

```python
dictionary = {'E': 'tip', 'N': 'middle', 'S': 'middle', 'W': 'tail'}
```

```python
remove(self)
Remove the artist from the figure if possible.
```

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim` = True.

Note: there is no support for removing the artist’s legend entry.

```python
set_figure(self, fig)
Set the `Figure` instance the artist belongs to.
```

**Parameters**

- **fig**
  - `Figure`

```python
dictionary = {'E': 'center', 'N': 'bottom', 'S': 'top', 'W': 'center'}
```

Examples using `matplotlib.quiver.QuiverKey`

- sphx_glr_gallery_images_contours_and_fields_quiver_demo.py

`matplotlib.quiver.Barbs`

```python
class matplotlib.quiver.Barbs(ax, *args, pivot='tip', length=7, barbcolor=None, flagcolor=None, sizes=None, fill_empty=False, barb_increments=None, rounding=True, flip_barb=False, **kw)
```

Bases: `matplotlib.collections.PolyCollection`

Specialized PolyCollection for barbs.

The only API method is `set_UVC()`, which can be used to change the size, orientation, and color of the arrows. Locations are changed using the `set_offsets()` collection method. Possibly this method will be useful in animations.

There is one internal function `_find_tails()` which finds exactly what should be put on the barb given the vector magnitude. From there `_make_barbs()` is used to find the vertices of the polygon to represent the barb based on this information.
The constructor takes one required argument, an Axes instance, followed by the args and kwargs described by the following pyplot interface documentation:

Plot a 2D field of barbs.

Call signature:

```python
barbs([X, Y], U, V, [C], **kw)
```

Where X, Y define the barb locations, U, V define the barb directions, and C optionally sets the color.

All arguments may be 1D or 2D. U, V, C may be masked arrays, but masked X, Y are not supported at present.

Barbs are traditionally used in meteorology as a way to plot the speed and direction of wind observations, but can technically be used to plot any two dimensional vector quantity. As opposed to arrows, which give vector magnitude by the length of the arrow, the barbs give more quantitative information about the vector magnitude by putting slanted lines or a triangle for various increments in magnitude, as show schematically below:

```
/\  \\
\  
/\  \\
\ /   \\
\  
```

The largest increment is given by a triangle (or "flag"). After those come full lines (barbs). The smallest increment is a half line. There is only, of course, ever at most 1 half line. If the magnitude is small and only needs a single half-line and no full lines or triangles, the half-line is offset from the end of the barb so that it can be easily distinguished from barbs with a single full line. The magnitude for the barb shown above would nominally be 65, using the standard increments of 50, 10, and 5.

See also https://en.wikipedia.org/wiki/Wind_barb.

Parameters

X, Y

[1D or 2D array-like, optional] The x and y coordinates of the barb locations. See pivot for how the barbs are drawn to the x, y positions.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of U and V.

If X and Y are 1D but U, V are 2D, X, Y are expanded to 2D using X, Y = np.meshgrid(X, Y). In this case len(X) and len(Y) must match the column and row dimensions of U and V.

U, V

[1D or 2D array-like] The x and y components of the barb shaft.

C
[1D or 2D array-like, optional] Numeric data that defines the barb colors by color-mapping via `norm` and `cmap`.

This does not support explicit colors. If you want to set colors directly, use `barbcolor` instead.

**length**

[float, default: 7] Length of the barb in points; the other parts of the barb are scaled against this.

**pivot**

[{'tip', 'middle'} or float, default: 'tip'] The part of the arrow that is anchored to the X, Y grid. The barb rotates about this point. This can also be a number, which shifts the start of the barb that many points away from grid point.

**barbcolor**

[color or color sequence] The color of all parts of the barb except for the flags. This parameter is analogous to the `edgecolor` parameter for polygons, which can be used instead. However this parameter will override facecolor.

**flagcolor**

[color or color sequence] The color of any flags on the barb. This parameter is analogous to the `facecolor` parameter for polygons, which can be used instead. However, this parameter will override facecolor. If this is not set (and C has not either) then `flagcolor` will be set to match `barbcolor` so that the barb has a uniform color. If C has been set, `flagcolor` has no effect.

**sizes**

[dict, optional] A dictionary of coefficients specifying the ratio of a given feature to the length of the barb. Only those values one wishes to override need to be included. These features include:

- 'spacing' - space between features (flags, full/half barbs)
- 'height' - height (distance from shaft to top) of a flag or full barb
- 'width' - width of a flag, twice the width of a full barb
- 'emptybarb' - radius of the circle used for low magnitudes

**fill_empty**

[bool, default: False] Whether the empty barbs (circles) that are drawn should be filled with the flag color. If they are not filled, the center is transparent.

**rounding**

[bool, default: True] Whether the vector magnitude should be rounded when allocating barb components. If True, the magnitude is rounded to the nearest multiple of the half-barb increment. If False, the magnitude is simply truncated to the next lowest multiple.
barb_increments

[dict, optional] A dictionary of increments specifying values to associate with different parts of the barb. Only those values one wishes to override need to be included.

- 'half' - half barbs (Default is 5)
- 'full' - full barbs (Default is 10)
- 'flag' - flags (default is 50)

flip_barb

[bool or array-like of bool, default: False] Whether the lines and flags should point opposite to normal. Normal behavior is for the barbs and lines to point right (comes from wind barbs having these features point towards low pressure in the Northern Hemisphere).

A single value is applied to all barbs. Individual barbs can be flipped by passing a bool array of the same size as $U$ and $V$.

Returns

barbs

[Barbs]

Other Parameters

**kwargs

The barbs can further be customized using PolyCollection keyword arguments:

__init__(self, ax, *args, pivot='tip', length=7, barbcolor=None, flagcolor=None, sizes=None, fill_empty=False, barb_increments=None, rounding=True, flip_barb=False, **kw)

The constructor takes one required argument, an Axes instance, followed by the args and kwargs described by the following pyplot interface documentation:

Plot a 2D field of barbs.

Call signature:

barbs([X, Y], U, V, [C], **kw)

Where X, Y define the barb locations, U, V define the barb directions, and C optionally sets the color.

All arguments may be 1D or 2D. U, V, C may be masked arrays, but masked X, Y are not supported at present.

Barbs are traditionally used in meteorology as a way to plot the speed and direction of wind observations, but can technically be used to plot any two dimensional vector quantity. As opposed to arrows, which give vector magnitude by the length of the arrow, the barbs give more quantitative information about the vector magnitude by putting slanted lines or a triangle for various increments in magnitude, as show schematically below:
The largest increment is given by a triangle (or "flag"). After those come full lines (barbs). The smallest increment is a half line. There is only, of course, ever at most 1 half line. If the magnitude is small and only needs a single half-line and no full lines or triangles, the half-line is offset from the end of the barb so that it can be easily distinguished from barbs with a single full line. The magnitude for the barb shown above would nominally be 65, using the standard increments of 50, 10, and 5.

See also https://en.wikipedia.org/wiki/Wind_barb.

**Parameters**

X, Y

[1D or 2D array-like, optional] The x and y coordinates of the barb locations. See pivot for how the barbs are drawn to the x, y positions.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of U and V.

If X and Y are 1D but U, V are 2D, X, Y are expanded to 2D using X, Y = np.meshgrid(X, Y). In this case len(X) and len(Y) must match the column and row dimensions of U and V.

U, V

[1D or 2D array-like] The x and y components of the barb shaft.

C

[1D or 2D array-like, optional] Numeric data that defines the barb colors by colormapping via norm and cmap.

This does not support explicit colors. If you want to set colors directly, use barbcolor instead.

length

[float, default: 7] Length of the barb in points; the other parts of the barb are scaled against this.

pivot

['tip', 'middle'] or float, default: 'tip'] The part of the arrow that is anchored to the X, Y grid. The barb rotates about this point. This can also be a number, which shifts the start of the barb that many points away from grid point.

barbcolor
[color or color sequence] The color of all parts of the barb except for the flags. This parameter is analogous to the `edgecolor` parameter for polygons, which can be used instead. However this parameter will override facecolor.

**flagcolor**

[color or color sequence] The color of any flags on the barb. This parameter is analogous to the `facecolor` parameter for polygons, which can be used instead. However, this parameter will override facecolor. If this is not set (and `C` has not either) then `flagcolor` will be set to match `barbcolor` so that the barb has a uniform color. If `C` has been set, `flagcolor` has no effect.

**sizes**

dict, optional] A dictionary of coefficients specifying the ratio of a given feature to the length of the barb. Only those values one wishes to override need to be included. These features include:

- 'spacing' - space between features (flags, full/half bars)
- 'height' - height (distance from shaft to top) of a flag or full barb
- 'width' - width of a flag, twice the width of a full barb
- 'emptybarb' - radius of the circle used for low magnitudes

**fill_empty**

[bool, default: False] Whether the empty barbs (circles) that are drawn should be filled with the flag color. If they are not filled, the center is transparent.

**rounding**

[bool, default: True] Whether the vector magnitude should be rounded when allocating barb components. If True, the magnitude is rounded to the nearest multiple of the half-barb increment. If False, the magnitude is simply truncated to the next lowest multiple.

**barb_increments**

dict, optional] A dictionary of increments specifying values to associate with different parts of the barb. Only those values one wishes to override need to be included.

- 'half' - half barbs (Default is 5)
- 'full' - full barbs (Default is 10)
- 'flag' - flags (default is 50)

**flip_barb**

[bool or array-like of bool, default: False] Whether the lines and flags should point opposite to normal. Normal behavior is for the bars and lines to point right (comes from wind barbs having these features point towards low pressure in the Northern Hemisphere).
A single value is applied to all barbs. Individual barbs can be flipped by passing a bool array of the same size as U and V.

Returns

barbs

[Barbs]

Other Parameters

**kwargs

__module__ = 'matplotlib.quiver'

barbs_doc = '
Plot a 2D field of barbs.

Call signature::

barbs([X, Y], U, V, [C], **kw)

Where *X*, *Y* ...

set_UVC (self, U, V, C=None)

set_offsets (self, xy)

Set the offsets for the barb polygons. This saves the offsets passed in and masks them as appropriate for the existing U/V data.

Parameters

xy

[sequence of pairs of floats]

Examples using matplotlib.quiver.Barbs

18.43 matplotlib.rcsetup

The rcsetup module contains the validation code for customization using Matplotlib's rc settings.

Each rc setting is assigned a function used to validate any attempted changes to that setting. The validation functions are defined in the rcsetup module, and are used to construct the rcParams global object which stores the settings and is referenced throughout Matplotlib.

The default values of the rc settings are set in the default matplotlibrc file. Any additions or deletions to the parameter set listed here should also be propagated to the matplotlibrc.template in Matplotlib's root source directory.

```python
class matplotlib.rcsetup.ValidateInStrings (key, valid, ignorecase=False, *, _deprecated_since=None)

Bases: object

valid is a list of legal strings.
```

```python
matplotlib.rcsetup.cycler (*args, **kwargs)

Create a Cycler object much like cycler.cycler(), but includes input validation.

Call signatures:
```
cycler(cycler)
cycler(label=values[, label2=values2[, ...]])
cycler(label, values)

Form 1 copies a given Cycler object.

Form 2 creates a Cycler which cycles over one or more properties simultaneously. If multiple properties are given, their value lists must have the same length.

Form 3 creates a Cycler for a single property. This form exists for compatibility with the original cycler. Its use is discouraged in favor of the kwarg form, i.e. cycler(label=values).

Parameters

cycler

[Cycler] Copy constructor for Cycler.

label

[str] The property key. Must be a valid Artist property. For example, 'color' or 'linestyle'. Aliases are allowed, such as 'c' for 'color' and 'lw' for 'linewidth'.

values

[iterable] Finite-length iterable of the property values. These values are validated and will raise a ValueError if invalid.

Returns

Cycler

A new Cycler for the given properties.

Examples

Creating a cycler for a single property:

```python
>>> c = cycler(color=['red', 'green', 'blue'])
```

Creating a cycler for simultaneously cycling over multiple properties (e.g. red circle, green plus, blue cross):

```python
>>> c = cycler(color=['red', 'green', 'blue'],
... marker=['o', '+', 'x'])
```

matplotlib.rcsetup.validate_any(s)
matplotlib.rcsetup.validate_anylist(s)
matplotlib.rcsetup.validate_aspect(s)
matplotlib.rcsetup.validate_axisbelow(s)
matplotlib.rcsetup.validate_backend(s)

matplotlib.rcsetup.validate_bbox(s)

matplotlib.rcsetup.validate_bool(b)
    Convert b to bool or raise.

matplotlib.rcsetup.validate_bool_maybe_none(b)
    [Deprecated] Convert b to bool or raise, passing through None.

Notes

Deprecated since version 3.3.

matplotlib.rcsetup.validate_color(s)
    Return a valid color arg.

matplotlib.rcsetup.validate_color_for_prop_cycle(s)

matplotlib.rcsetup.validate_color_or_auto(s)

matplotlib.rcsetup.validate_color_or_inherit(s)
    Return a valid color arg.

matplotlib.rcsetup.validate_colorlist(s)
    return a list of colorspecs

matplotlib.rcsetup.validate_cycler(s)
    Return a Cycler object from a string repr or the object itself.

matplotlib.rcsetup.validate_dashlist(s)
    return a list of floats

matplotlib.rcsetup.validate_dpi(s)
    Confirm s is string 'figure' or convert s to float or raise.

matplotlib.rcsetup.validate_fillstylelist(s)

matplotlib.rcsetup.validate_float(s)

matplotlib.rcsetup.validate_float_or_None(s)

matplotlib.rcsetup.validate_floatlist(s)
    return a list of floats

matplotlib.rcsetup.validate_font_properties(s)

matplotlib.rcsetup.validate_fontsize(s)

matplotlib.rcsetup.validate_fontsize_None(s)

matplotlib.rcsetup.validate_fontsizelist(s)

matplotlib.rcsetup.validate_fonttype(s)
    Confirm that this is a Postscript or PDF font type that we know how to convert to.

matplotlib.rcsetup.validate_fontweight(s)
Matplotlib, Release 3.4.1

matplotlib.rcsetup.validate_hatch(s)
Validate a hatch pattern. A hatch pattern string can have any sequence of the following characters: \
/ | - + * . x o O.

matplotlib.rcsetup.validate_hatchlist(s)
Validate a hatch pattern. A hatch pattern string can have any sequence of the following characters: \
/ | - + * . x o O.

matplotlib.rcsetup.validate_hinting(s)
[ Deprecated ]

Notes

Deprecated since version 3.3:

matplotlib.rcsetup.validate_hist_bins(s)
matplotlib.rcsetup.validate_int(s)
matplotlib.rcsetup.validate_int_or_None(s)
matplotlib.rcsetup.validate_markevery(s)
Validate the markevery property of a Line2D object.

Parameters

s
[None, int, float, slice, length-2 tuple of ints,] length-2 tuple of floats, list of ints

Returns

None, int, float, slice, length-2 tuple of ints,
length-2 tuple of floats, list of ints

matplotlib.rcsetup.validate_markeverylist(s)
Validate the markevery property of a Line2D object.

Parameters

s
[None, int, float, slice, length-2 tuple of ints,] length-2 tuple of floats, list of ints

Returns

None, int, float, slice, length-2 tuple of ints,
length-2 tuple of floats, list of ints

matplotlib.rcsetup.validate_movie_writer(s)
[Deprecated]
Matplotlib, Release 3.4.1

Notes

Deprecated since version 3.3:

matplotlib.rcsetup.validate_nseq_float(n)
[Deprecated]

Notes

Deprecated since version 3.3:

matplotlib.rcsetup.validate_nseq_int(n)
[Deprecated]

Notes

Deprecated since version 3.3:

matplotlib.rcsetup.validate_ps_distiller(s)
matplotlib.rcsetup.validate_sketch(s)
matplotlib.rcsetup.validate_string(s)
matplotlib.rcsetup.validate_string_or_None(s)
matplotlib.rcsetup.validate_stringlist(s)
return a list of strings
matplotlib.rcsetup.validate_webagg_address(s)
[Deprecated]

Notes

Deprecated since version 3.3:

matplotlib.rcsetup.validate_whiskers(s)

18.44 matplotlib.sankey

Module for creating Sankey diagrams using Matplotlib.

class matplotlib.sankey.Sankey(ax=None, scale=1.0, unit='', format='%G', gap=0.25, radius=0.1, shoulder=0.03, offset=0.15, head_angle=100, margin=0.4, tolerance=1e-06, **kwargs)

Bases: object

Sankey diagram.
Sankey diagrams are a specific type of flow diagram, in which the width of the arrows is shown proportionally to the flow quantity. They are typically used to visualize energy or material or cost transfers between processes. Wikipedia (6/1/2011)

Create a new Sankey instance.

The optional arguments listed below are applied to all subdiagrams so that there is consistent alignment and formatting.

In order to draw a complex Sankey diagram, create an instance of `Sankey` by calling it without any kwargs:

```python
sankey = Sankey()
```

Then add simple Sankey sub-diagrams:

```python
sankey.add() # 1  
sankey.add() # 2  
#...  
sankey.add() # n
```

Finally, create the full diagram:

```python
sankey.finish()
```

Or, instead, simply daisy-chain those calls:

```python
Sankey().add().add... .add().finish()
```

**Other Parameters**

- **ax**
  
  [Axes] Axes onto which the data should be plotted. If `ax` isn’t provided, new Axes will be created.

- **scale**
  
  [float] Scaling factor for the flows. `scale` sizes the width of the paths in order to maintain proper layout. The same scale is applied to all subdiagrams. The value should be chosen such that the product of the scale and the sum of the inputs is approximately 1.0 (and the product of the scale and the sum of the outputs is approximately -1.0).

- **unit**
  
  [str] The physical unit associated with the flow quantities. If `unit` is None, then none of the quantities are labeled.

- **format**
  
  [str or callable] A Python number formatting string or callable used to label the flows with their quantities (i.e., a number times a unit, where the unit is given). If
a format string is given, the label will be format % quantity. If a callable
is given, it will be called with quantity as an argument.

**gap**

[ float ] Space between paths that break in/break away to/from the top or bottom.

**radius**

[ float ] Inner radius of the vertical paths.

**shoulder**

[ float ] Size of the shoulders of output arrows.

**offset**

[ float ] Text offset (from the dip or tip of the arrow).

**head_angle**

[ float ] Angle, in degrees, of the arrow heads (and negative of the angle of the tails).

**margin**

[ float ] Minimum space between Sankey outlines and the edge of the plot area.

**tolerance**

[ float ] Acceptable maximum of the magnitude of the sum of flows. The magnitude
of the sum of connected flows cannot be greater than tolerance.

**kwargs**

Any additional keyword arguments will be passed to add(), which will create
the first subdiagram.

**See also:**

Sankey.add
Sankey.finish

**Examples**

add (self, patchlabel='', flows=None, orientations=None, labels='', trunklength=1.0, path-
lengths=0.25, prior=None, connect=0, 0, rotation=0, **kwargs)

Add a simple Sankey diagram with flows at the same hierarchical level.

**Parameters**

**patchlabel**

[ str ] Label to be placed at the center of the diagram. Note that label (not patch-
label) can be passed as keyword argument to create an entry in the legend.
The default settings produce a diagram like this.

```
flows
[list of float] Array of flow values. By convention, inputs are positive and outputs
are negative.

Flows are placed along the top of the diagram from the inside out in order of
their index within `flows`. They are placed along the sides of the diagram from the
top down and along the bottom from the outside in.

If the sum of the inputs and outputs is nonzero, the discrepancy will appear as a
cubic Bezier curve along the top and bottom edges of the trunk.

orientations
[list of {-1, 0, 1}] List of orientations of the flows (or a single orientation to be
used for all flows). Valid values are 0 (inputs from the left, outputs to the right),
1 (from and to the top) or -1 (from and to the bottom).

labels
[list of (str or None)] List of labels for the flows (or a single label to be used for
all flows). Each label may be None (no label), or a labeling string. If an entry
is a (possibly empty) string, then the quantity for the corresponding flow will be
shown below the string. However, if the `unit` of the main diagram is None, then
quantities are never shown, regardless of the value of this argument.
```
**trunklength**

[float] Length between the bases of the input and output groups (in data-space units).

**pathlengths**

[list of float] List of lengths of the vertical arrows before break-in or after break-away. If a single value is given, then it will be applied to the first (inside) paths on the top and bottom, and the length of all other arrows will be justified accordingly. The *pathlengths* are not applied to the horizontal inputs and outputs.

**prior**

[int] Index of the prior diagram to which this diagram should be connected.

**connect**

[(int, int)] A (prior, this) tuple indexing the flow of the prior diagram and the flow of this diagram which should be connected. If this is the first diagram or *prior* is *None*, *connect* will be ignored.

**rotation**

[float] Angle of rotation of the diagram in degrees. The interpretation of the *orientations* argument will be rotated accordingly (e.g., if *rotation* == 90, an
orientations entry of 1 means to/from the left). rotation is ignored if this diagram is connected to an existing one (using prior and connect).

Returns

Sankey

The current Sankey instance.

Other Parameters

**kwargs

Additional keyword arguments set matplotlib.patches.PathPatch properties, listed below. For example, one may want to use fill=False or label="A legend entry".

<table>

See also:

Sankey.finish

**finish**(self)

Adjust the axes and return a list of information about the Sankey subdiagram(s).

Return value is a list of subdiagrams represented with the following fields:
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>patch</td>
<td>Sankey outline (an instance of <code>PathPatch</code>)</td>
</tr>
<tr>
<td>flows</td>
<td>values of the flows (positive for input, negative for output)</td>
</tr>
<tr>
<td>angles</td>
<td>list of angles of the arrows [deg/90] For example, if the diagram has not been rotated, an input to the top side will have an angle of 3 (DOWN), and an output from the top side will have an angle of 1 (UP). If a flow has been skipped (because its magnitude is less than <code>tolerance</code>), then its angle will be <code>None</code>.</td>

`Sankey.add`

### 18.45 matplotlib.scale

Scales define the distribution of data values on an axis, e.g. a log scaling.

They are attached to an `Axis` and hold a `Transform`, which is responsible for the actual data transformation.

See also `axes.Axes.set_xscale` and the scales examples in the documentation.

```python
class matplotlib.scale.FuncScale(axis, functions):
    Bases: matplotlib.scale.ScaleBase

    Provide an arbitrary scale with user-supplied function for the axis.

Parameters

axis

    `[Axis]` The axis for the scale.

functions

    `[(callable, callable)]` two-tuple of the forward and inverse functions for the scale. The forward function must be monotonic.

Both functions must have the signature:

```python
def forward(values: array-like) -> array-like
```

get_transform(self)

    Return the `FuncTransform` associated with this scale.
```
name = 'function'

set_default_locators_and_formatters(self, axis)

Set the locators and formatters of \texttt{axis} to instances suitable for this scale.

class matplotlib.scale.FuncScaleLog(axis, functions, base=10)
Bases: matplotlib.scale.LogScale

Provide an arbitrary scale with user-supplied function for the axis and then put on a logarithmic axes.

Parameters

axis

\texttt{[matplotlib.axis.Axis]} The axis for the scale.

functions

\texttt{[(callable, callable)]} two-tuple of the forward and inverse functions for the scale. The forward function must be monotonic.

Both functions must have the signature:

\begin{verbatim}
def forward(values: array-like) -> array-like
\end{verbatim}

base

\texttt{[float, default: 10]} Logarithmic base of the scale.

property base

get_transform(self)

Return the \texttt{Transform} associated with this scale.

name = 'functionlog'

class matplotlib.scale.FuncTransform(forward, inverse)
Bases: matplotlib.transforms.Transform

A simple transform that takes and arbitrary function for the forward and inverse transform.

Parameters

forward

\texttt{[callable]} The forward function for the transform. This function must have an inverse and, for best behavior, be monotonic. It must have the signature:

\begin{verbatim}
def forward(values: array-like) -> array-like
\end{verbatim}

inverse

\texttt{[callable]} The inverse of the forward function. Signature as \texttt{forward}.

has_inverse = True

input_dims = 1
inverted (self)

Return the corresponding inverse transformation.

It holds $x == \text{self.inverted()}.\text{transform}(\text{self.transform}(x))$.

The return value of this method should be treated as temporary. An update to self does not cause a corresponding update to its inverted copy.

is_separable = True
output_dims = 1

transform_non_affine (self, values)

Apply only the non-affine part of this transformation.

$\text{transform(values)}$ is always equivalent to $\text{transform_affine(\text{transform_non_affine(values)})}$. In non-affine transformations, this is generally equivalent to $\text{transform(values)}$. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as NumPy array of length input_dims or shape (N x input_dims).

Returns

array

The output values as NumPy array of length input_dims or shape (N x output_dims), depending on the input.

class matplotlib.scale.InvertedLogTransform (base)

Bases: matplotlib.transforms.Transform

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of str(transform) when DEBUG=True.

has_inverse = True
input_dims = 1

inverted (self)

Return the corresponding inverse transformation.

It holds $x == \text{self.inverted()}.\text{transform}(\text{self.transform}(x))$. 

18.45. matplotlib.scale 2759
The return value of this method should be treated as temporary. An update to `self` does not cause a corresponding update to its inverted copy.

```python
is_separable = True
output_dims = 1
```

**transform_non_affine** (self, a)

Apply only the non-affine part of this transformation.

```python
transform(values) is always equivalent to transform_affine(transform_non_affine(values)).
```

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

**Parameters**

`values`

[array] The input values as NumPy array of length `input_dims` or shape (N x `input_dims`).

**Returns**

array

The output values as NumPy array of length `input_dims` or shape (N x `output_dims`), depending on the input.

```python
class matplotlib.scale.InvertedSymmetricalLogTransform(base, linthresh, linscale)
```

**Bases:** `matplotlib.transforms.Transform`

**Parameters**

`shorthand_name`

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

```python
has_inverse = True
input_dims = 1
```

**inverted** (self)

Return the corresponding inverse transformation.

```python
It holds x == self.inverted().transform(self.transform(x)).
```

The return value of this method should be treated as temporary. An update to `self` does not cause a corresponding update to its inverted copy.

```python
is_separable = True
```
output_dims = 1

**transform_non_affine** *(self, a)*

Apply only the non-affine part of this transformation.

```python
transform(values) is always equivalent to transform_affine(transform_non_affine(values)).
```

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

**Parameters**

- **values**
  - [array] The input values as NumPy array of length `input_dims` or shape (N x `input_dims`).

**Returns**

- **array**
  - The output values as NumPy array of length `input_dims` or shape (N x `output_dims`), depending on the input.

```python
class matplotlib.scale.LinearScale(axis):
    Bases: matplotlib.scale.ScaleBase
    The default linear scale.
    get_transform(self)
        Return the transform for linear scaling, which is just the `IdentityTransform`.
    name = 'linear'

set_default_locators_and_formatters(self, axis)
    Set the locators and formatters of `axis` to instances suitable for this scale.
```

```python
class matplotlib.scale.LogScale(axis, **kwargs):
    Bases: matplotlib.scale.ScaleBase
    A standard logarithmic scale. Care is taken to only plot positive values.
    Parameters
    axis
        [Axis] The axis for the scale.
    base
        [float, default: 10] The base of the logarithm.
    nonpositive
        [{‘clip’, ‘mask’}, default: ‘clip’] Determines the behavior for non-positive values. They can either be masked as invalid, or clipped to a very small positive number.
```
subs

[sequence of int, default: None] Where to place the subticks between each major
tick. For example, in a log10 scale, [2, 3, 4, 5, 6, 7, 8, 9] will place
8 logarithmically spaced minor ticks between each major tick.

property InvertedLogTransform
property LogTransform
property base

get_transform(self)
   Return the LogTransform associated with this scale.

limit_range_for_scale(self, vmin, vmax, minpos)
   Limit the domain to positive values.

name = 'log'

set_default_locators_and_formatters(self, axis)
   Set the locators and formatters of axis to instances suitable for this scale.

class matplotlib.scale.LogTransform(**kwargs)
   Bases: matplotlib.transforms.Transform

Parameters

   shorthand_name

   [str] A string representing the "name" of the transform. The name carries no sig-
nificance other than to improve the readability of str(transform) when DE-
BUG=True.

   has_inverse = True

   input_dims = 1

   inverted(self)
      Return the corresponding inverse transformation.
      
      It holds
         x == self.inverted().transform(self.transform(x)).

      The return value of this method should be treated as temporary. An update to self does not cause
      a corresponding update to its inverted copy.

   is_separable = True

   output_dims = 1

   transform_non_affine(self, a)
      Apply only the non-affine part of this transformation.
      
      transform(values) is always equivalent to transform_affine(transform_non_affine(values)).
In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

**Parameters**

`values`

[array] The input values as NumPy array of length `input_dims` or shape `(N x `input_dims`)`.

**Returns**

array

The output values as NumPy array of length `input_dims` or shape `(N x output_dims)`, depending on the input.

```python
class matplotlib.scale.LogisticTransform(**kwargs)
Bases: matplotlib.transforms.Transform

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

has_inverse = True

input_dims = 1

inverted(self)

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to `self` does not cause a corresponding update to its inverted copy.

is_separable = True

output_dims = 1

transform_non_affine(self, a)

logistic transform (base 10)

```
axis

nonpositive

[{"mask", "clip"}] Determines the behavior for values beyond the open interval ]0, 1[. They can either be masked as invalid, or clipped to a number very close to 0 or 1.

use_overline

[bool, default: False] Indicate the usage of survival notation (overline{x}) in place of standard notation (1-x) for probability close to one.

one_half

[str, default: r"frac{1}{2}"] The string used for ticks formatter to represent 1/2.

get_transform(self)

Return the LogitTransform associated with this scale.

limit_range_for_scale(self, vmin, vmax, minpos)

Limit the domain to values between 0 and 1 (excluded).

name = 'logit'

set_default_locators_and_formatters(self, axis)

Set the locators and formatters of axis to instances suitable for this scale.

class matplotlib.scale.LogitTransform(**kwargs)

Bases: matplotlib.transforms.Transform

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of str(transform) when DEBUG=True.

has_inverse = True

input_dims = 1

inverted(self)

Return the corresponding inverse transformation.

It holds x == self.inverted().transform(self.transform(x)).

The return value of this method should be treated as temporary. An update to self does not cause a corresponding update to its inverted copy.

is_separable = True

output_dims = 1
transform_non_affine(self, a)
    logit transform (base 10), masked or clipped

class matplotlib.scale.ScaleBase(axis)
    Bases: object
    The base class for all scales.
    Scales are separable transformations, working on a single dimension.
    Any subclasses will want to override:
    • name
    • get_transform()
    • set_default_locators_and_formatters()
    And optionally:
    • limit_range_for_scale()
    Construct a new scale.

Notes

The following note is for scale implementors.

For back-compatibility reasons, scales take an Axis object as first argument. However, this argument should not be used: a single scale object should be usable by multiple Axes at the same time.

get_transform(self)
    Return the Transform object associated with this scale.

limit_range_for_scale(self, vmin, vmax, minpos)
    Return the range vmin, vmax, restricted to the domain supported by this scale (if any).
    minpos should be the minimum positive value in the data. This is used by log scales to determine a minimum value.

set_default_locators_and_formatters(self, axis)
    Set the locators and formatters of axis to instances suitable for this scale.

class matplotlib.scale.SymmetricalLogScale(axis, **kwargs)
    Bases: matplotlib.scale.ScaleBase
    The symmetrical logarithmic scale is logarithmic in both the positive and negative directions from the origin.
    Since the values close to zero tend toward infinity, there is a need to have a range around zero that is linear. The parameter linthresh allows the user to specify the size of this range (-linthresh, linthresh).

Parameters

    base
        [float, default: 10] The base of the logarithm.
linthresh

[float, default: 2] Defines the range \((-x, x)\), within which the plot is linear. This avoids having the plot go to infinity around zero.

subs

[sequence of int] Where to place the subticks between each major tick. For example, in a log10 scale: \([2, 3, 4, 5, 6, 7, 8, 9]\) will place 8 logarithmically spaced minor ticks between each major tick.

linscale

[float, optional] This allows the linear range \((-\text{linthresh}, \text{linthresh})\) to be stretched relative to the logarithmic range. Its value is the number of decades to use for each half of the linear range. For example, when \text{linscale} == 1.0 (the default), the space used for the positive and negative halves of the linear range will be equal to one decade in the logarithmic range.

Construct a new scale.

Notes

The following note is for scale implementors.

For back-compatibility reasons, scales take an \text{Axis} object as first argument. However, this argument should not be used: a single scale object should be usable by multiple \text{Axes} at the same time.

property \text{InvertedSymmetricalLogTransform}

property \text{SymmetricalLogTransform}

property \text{base}

get_transform\text{(self)}

Return the \text{SymmetricalLogTransform} associated with this scale.

property \text{linscale}

property \text{linthresh}

name = 'symlog'

set_default_locators_and_formatters\text{(self, axis)}

Set the locators and formatters of \text{axis} to instances suitable for this scale.

class matplotlib.scale.\text{SymmetricalLogTransform} (\text{base, linthresh, linscale})

Bases: matplotlib.transforms.\text{Transform}

Parameters

shorthand_name
[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of \texttt{str(transform)} when DEBUG=True.

\textbf{has_inverse} = True

\textbf{input_dims} = 1

\textbf{inverted}(self)

Return the corresponding inverse transformation.

It holds \( x == \text{self.inverted()}.\text{transform(\text{self.transform(x)})} \).

The return value of this method should be treated as temporary. An update to \texttt{self} does not cause a corresponding update to its inverted copy.

\textbf{is_separable} = True

\textbf{output_dims} = 1

\textbf{transform_non_affine}(self, a)

Apply only the non-affine part of this transformation.

\text{transform(values)} \text{ is always equivalent to \text{transform affine(transform_non_affine(values))}.

In non-affine transformations, this is generally equivalent to \text{transform(values)}. In affine transformations, this is always a no-op.

\textbf{Parameters}

\textbf{values}

[\text{array}] The input values as NumPy array of length \text{input_dims} or shape (N x \text{input_dims}).

\textbf{Returns}

\textbf{array}

The output values as NumPy array of length \text{input_dims} or shape (N x \text{output_dims}), depending on the input.

\texttt{matplotlib.scale.get_scale_names()}

Return the names of the available scales.

\texttt{matplotlib.scale.register_scale(scale_class)}

Register a new kind of scale.

\textbf{Parameters}

\textbf{scale_class}

[subclass of \texttt{ScaleBase}] The scale to register.
matplotlib.scale.scale_factory(scale, axis, **kwargs)
Return a scale class by name.

Parameters

scale
[
'function', 'functionlog', 'linear', 'log', 'logit', 'symlog'
]
axis
[matplotlib.axis.Axis]

18.46 matplotlib.sphinxext.plot_directive

18.46.1 A directive for including a Matplotlib plot in a Sphinx document

By default, in HTML output, plot will include a .png file with a link to a high-res .png and .pdf. In LaTeX output, it will include a .pdf.

The source code for the plot may be included in one of three ways:

1. A path to a source file as the argument to the directive:

```
.. plot:: path/to/plot.py
```

When a path to a source file is given, the content of the directive may optionally contain a caption for the plot:

```
.. plot:: path/to/plot.py

   The plot's caption.
```

Additionally, one may specify the name of a function to call (with no arguments) immediately after importing the module:

```
.. plot:: path/to/plot.py plot_function1
```

2. Included as inline content to the directive:

```
.. plot::

    import matplotlib.pyplot as plt
    import matplotlib.image as mpimg
    import numpy as np
    img = mpimg.imread('_static/stinkbug.png')
    imgplot = plt.imshow(img)
```

3. Using doctest syntax:

```
.. plot::

    import matplotlib.pyplot as plt
    import matplotlib.image as mpimg
    import numpy as np
    img = mpimg.imread('_static/stinkbug.png')
    imgplot = plt.imshow(img)
```
.. plot::

    A plotting example:
    >>> import matplotlib.pyplot as plt
    >>> plt.plot([1, 2, 3], [4, 5, 6])

Options

The plot directive supports the following options:

format

  [{'python', 'doctest'}] The format of the input.

include-source

  [bool] Whether to display the source code. The default can be changed using the
plot_include_source variable in conf.py.

encoding

  [str] If this source file is in a non-UTF8 or non-ASCII encoding, the encoding must be
specified using the :encoding: option. The encoding will not be inferred using the
 -*- coding -*- metacoment.

context

  [bool or str] If provided, the code will be run in the context of all previous plot directives
for which the :context: option was specified. This only applies to inline code plot
directives, not those run from files. If the :context: reset option is specified, the
context is reset for this and future plots, and previous figures are closed prior to running the
code. :context: close-figs keeps the context but closes previous figures before
running the code.

nofigs

  [bool] If specified, the code block will be run, but no figures will be inserted. This is
usually useful with the :context: option.

caption

  [str] If specified, the option's argument will be used as a caption for the figure. This over-
writes the caption given in the content, when the plot is generated from a file.

Additionally, this directive supports all of the options of the image directive, except for target (since plot
will add its own target). These include alt, height, width, scale, align and class.
Configuration options

The plot directive has the following configuration options:

- **plot_include_source**
  Default value for the include-source option

- **plot_html_show_source_link**
  Whether to show a link to the source in HTML.

- **plot_pre_code**
  Code that should be executed before each plot. If not specified or None it will default to a string containing:

```python
import numpy as np
from matplotlib import pyplot as plt
```

- **plot_basedir**
  Base directory, to which plot:: file names are relative to. (If None or empty, file names are relative to the directory where the file containing the directive is.)

- **plot_formats**
  File formats to generate. List of tuples or strings:

```python
[(suffix, dpi), suffix, suffix, ...]
```

that determine the file format and the DPI. For entries whose DPI was omitted, sensible defaults are chosen. When passing from the command line through sphinx_build the list should be passed as suffix:dpi,suffix:dpi, ...

- **plot_html_show_formats**
  Whether to show links to the files in HTML.

- **plot_rcparams**
  A dictionary containing any non-standard rcParams that should be applied before each plot.

- **plot_apply_rcparams**
  By default, rcParams are applied when :context: option is not used in a plot directive. This configuration option overrides this behavior and applies rcParams before each plot.

- **plot_working_directory**
  By default, the working directory will be changed to the directory of the example, so the code can get at its data files, if any. Also its path will be added to sys.path so it can import any helper modules sitting beside it. This configuration option can be used to specify a central directory (also added to sys.path) where data files and helper modules for all code are located.
plot_template

Provide a customized template for preparing restructured text.

class matplotlib.sphinxext.plot_directive.PlotDirective (name, arguments, options, content, lineno, content_offset, block_text, state, state_machine)

The .. plot:: directive, as documented in the module's docstring.

run(self)
Run the plot directive.

exception matplotlib.sphinxext.plot_directive.PlotError

matplotlib.sphinxext.plot_directive.mark_plot_labels(app, document)
To make plots referenceable, we need to move the reference from the "htmlonly" (or "latexonly") node to the actual figure node itself.

matplotlib.sphinxext.plot_directive.out_of_date(original, derived)
Return whether derived is out-of-date relative to original, both of which are full file paths.

matplotlib.sphinxext.plot_directive.render_figures(code, code_path, output_dir, output_base, context, function_name, config, context_reset=False, close_figs=False)

Run a pyplot script and save the images in output_dir.
Save the images under output_dir with file names derived from output_base

matplotlib.sphinxext.plot_directive.run_code(code, code_path, ns=None, function_name=None)
Import a Python module from a path, and run the function given by name, if function_name is not None.

matplotlib.sphinxext.plot_directive.split_code_at_show(text)
Split code at plt.show().

matplotlib.sphinxext.plot_directive.unescape_doctest(text)
Extract code from a piece of text, which contains either Python code or doctests.
18.47 matplotlib.spines

**class** matplotlib.spines.Spine(*axes, spine_type, path, **kwargs*)

Bases: matplotlib.patches.Patch

An axis spine -- the line noting the data area boundaries.

Spines are the lines connecting the axis tick marks and noting the boundaries of the data area. They can be placed at arbitrary positions. See *set_position* for more information.

The default position is ('outward', 0).

Spines are subclasses of *Patch*, and inherit much of their behavior.

Spines draw a line, a circle, or an arc depending if *set_patch_line, set_patch_circle,* or *set_patch_arc* has been called. Line-like is the default.

**Parameters**

*axes*

[Axes] The *Axes* instance containing the spine.

*spine_type*

[str] The spine type.

*path*

[Path] The *Path* instance used to draw the spine.

**Other Parameters**

**kwargs**

Valid keyword arguments are:

| Property         | Description                                                                 |
|------------------|.partoftext                                                                 |
| agg_filter       | a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array |
| alpha            | scalar or None                                                              |
| animated         | bool                                                                        |
| antialiased or aa| unknown                                                                     |
| capstyle         | CapStyle or {'butt', 'projecting', 'round'}                                 |
| clip_box         | Bbox                                                                        |
| clip_on          | bool                                                                        |
| clip_path        | Patch or (Path, Transform) or None                                          |
| color            | color                                                                       |
| contains         | unknown                                                                     |
| edgecolor or ec  | color or None or 'auto'                                                     |
| facecolor or fc  | color or None                                                               |
| figure           | Figure                                                                      |

</table>

```python
classmethod arc_spine(axes, spine_type, center, radius, theta1, theta2, **kwargs)
    Create and return an arc Spine.

classmethod circular_spine(axes, center, radius, **kwargs)
    Create and return a circular Spine.
```

classmethod arc_spine(axes, spine_type, center, radius, theta1, theta2, **kwargs)
    Create and return an arc Spine.

classmethod circular_spine(axes, center, radius, **kwargs)
    Create and return a circular Spine.

```python
cla(self)
    [Deprecated]
```

Notes

Deprecated since version 3.4:

clear(self)
    Clear the current spine.

draw(self, renderer)
    Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters

```python
    renderer
        [RendererBase subclass.]
```
Notes

This method is overridden in the Artist subclasses.

`get_bounds(self)`
Get the bounds of the spine.

`get_patch_transform(self)`
Return the `Transform` instance mapping patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

`get_path(self)`
Return the path of this patch.

`get_position(self)`
Return the spine position.

`get_spine_transform(self)`
Return the spine transform.

`get_window_extent(self, renderer=None)`
Return the window extent of the spines in display space, including padding for ticks (but not their labels)

See also:

- `matplotlib.axes.Axes.get_tightbbox`
- `matplotlib.axes.Axes.get_window_extent`

`classmethod linear_spine(axes, spine_type, **kwargs)`
Create and return a linear `Spine`.

`register_axis(self, axis)`
Register an axis.

An axis should be registered with its corresponding spine from the Axes instance. This allows the spine to clear any axis properties when needed.

`set_bounds(self, low=None, high=None)`
Set the spine bounds.

Parameters

`low`

[floating or None, optional] The lower spine bound. Passing `None` leaves the limit unchanged.

The bounds may also be passed as the tuple `(low, high)` as the first positional argument.
high

[float or None, optional] The higher spine bound. Passing None leaves the limit unchanged.

set_color (self, c)
Set the edgecolor.

Parameters

c
[color]

Notes

This method does not modify the facecolor (which defaults to "none"), unlike the Patch.
set_color method defined in the parent class. Use Patch.set_facecolor to set the
facecolor.

set_patch_arc (self, center, radius, theta1, theta2)
Set the spine to be arc-like.

set_patch_circle (self, center, radius)
Set the spine to be circular.

set_patch_line (self)
Set the spine to be linear.

set_position (self, position)
Set the position of the spine.

Spine position is specified by a 2 tuple of (position type, amount). The position types are:

- 'outward': place the spine out from the data area by the specified number of points. (Negative
values place the spine inwards.)
- 'axes': place the spine at the specified Axes coordinate (0 to 1).
- 'data': place the spine at the specified data coordinate.

Additionally, shorthand notations define a special positions:

- 'center' -> ('axes', 0.5)
- 'zero' -> ('data', 0.0)

class matplotlib.spines.Spines (**kwargs)
Bases: collections.abc.MutableMapping

The container of all Spines in an Axes.

The interface is dict-like mapping names (e.g. 'left') to Spine objects. Additionally it implements
some pandas.Series-like features like accessing elements by attribute:
Multiple spines can be addressed simultaneously by passing a list:

```python
spines[['top', 'right']].set_visible(False)
```

Use an open slice to address all spines:

```python
spines[:].set_visible(False)
```

The latter two indexing methods will return a `SpinesProxy` that broadcasts all `set_*` calls to its members, but cannot be used for any other operation.

```python
classmethod from_dict(d)
```

```python
class matplotlib.spines.SpinesProxy(spine_dict)
Bases: object
A proxy to broadcast set_* method calls to all contained Spines.
The proxy cannot be used for any other operations on its members.
The supported methods are determined dynamically based on the contained spines. If not all spines support a given method, it's executed only on the subset of spines that support it.
```

## 18.48 matplotlib.style

Styles are predefined sets of `rcParams` that define the visual appearance of a plot.

`Customizing Matplotlib with style sheets and rcParams` describes the mechanism and usage of styles.

The `/gallery/style_sheets/style_sheets_reference` gives an overview of the built-in styles.

```python
matplotlib.style.context(style, after_reset=False)
```

Context manager for using style settings temporarily.

**Parameters**

- **style**
  
  [str, dict, Path or list] A style specification. Valid options are:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>The name of a style or a path/URL to a style file. For a list of available style names, see <code>matplotlib.style.available</code>.</td>
</tr>
<tr>
<td>dict</td>
<td>Dictionary with valid key/value pairs for <code>matplotlib.rcParams</code>.</td>
</tr>
<tr>
<td>Path</td>
<td>A path-like object which is a path to a style file.</td>
</tr>
<tr>
<td>list</td>
<td>A list of style specifiers (str, Path or dict) applied from first to last in the list.</td>
</tr>
</tbody>
</table>
after_reset

[bool] If True, apply style after resetting settings to their defaults; otherwise, apply style on top of the current settings.

matplotlib.style.reload_library()
Reload the style library.

matplotlib.style.use(style)
Use Matplotlib style settings from a style specification.

The style name of 'default' is reserved for reverting back to the default style settings.

**Note:** This updates the `rcParams` with the settings from the style. `rcParams` not defined in the style are kept.

**Parameters**

**style**

[str, dict, Path or list] A style specification. Valid options are:

<table>
<thead>
<tr>
<th>str</th>
<th>The name of a style or a path/URL to a style file. For a list of available style names, see <code>style.available</code>.</th>
</tr>
</thead>
<tbody>
<tr>
<td>dict</td>
<td>Dictionary with valid key/value pairs for <code>matplotlib.rcParams</code>.</td>
</tr>
<tr>
<td>Path</td>
<td>A path-like object which is a path to a style file.</td>
</tr>
<tr>
<td>list</td>
<td>A list of style specifiers (str, Path or dict) applied from first to last in the list.</td>
</tr>
</tbody>
</table>

matplotlib.style.library
A dict mapping from style name to `RcParams` defining that style.

This is meant to be read-only. Use `reload_library` to update.

matplotlib.style.available
List of the names of the available styles.

This is meant to be read-only. Use `reload_library` to update.

**18.49 matplotlib.table**

Tables drawing.

Use the factory function `table` to create a ready-made table from texts. If you need more control, use the `Table` class and its methods.

The table consists of a grid of cells, which are indexed by (row, column). The cell (0, 0) is positioned at the top left.
The `Cell` class is a `Rectangle` with some associated `Text`. As a user, you'll most likely not create cells yourself. Instead, you should use either the `table` factory function or `Table.add_cell`.

**Parameters**

- `xy`:
  
  [2-tuple] The position of the bottom left corner of the cell.

- `width`:
  
  [float] The cell width.

- `height`:
  
  [float] The cell height.

- `edgecolor`:
  
  [color] The color of the cell border.

- `facecolor`:
  
  [color] The cell facecolor.

- `fill`:
  
  [bool] Whether the cell background is filled.

- `text`:
  
  [str] The cell text.

- `loc`:
  
  [{’left’, ’center’, ’right’}, default: ’right’] The alignment of the text within the cell.

- `fontproperties`:
  
  [dict] A dict defining the font properties of the text. Supported keys and values are the keyword arguments accepted by `FontProperties`.

- `visible_edges`:
  
  [str, default: ’closed’] The cell edges to be drawn with a line: a substring of ’BRTL’ (bottom, right, top, left), or one of ’open’ (no edges drawn), ’closed’ (all edges drawn), ’horizontal’ (bottom and top), ’vertical’ (right and left).

**PAD = 0.1**

Padding between text and rectangle.
**auto_set_font_size** *(self, renderer)*

Shrink font size until the text fits into the cell width.

**draw** *(self, renderer)*

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible *(Artist.get_visible returns False)*.

**Parameters**

renderer

*[RendererBase subclass.]*

**Notes**

This method is overridden in the Artist subclasses.

**get_fontsize** *(self)*

Return the cell fontsize.

**get_path** *(self)*

Return a *Path* for the *visible_edges*.

**get_required_width** *(self, renderer)*

Return the minimal required width for the cell.

**get_text** *(self)*

Return the cell *Text* instance.

**get_text_bounds** *(self, renderer)*

Return the text bounds as *(x, y, width, height)* in table coordinates.

**set_figure** *(self, fig)*

Set the *Figure* instance the artist belongs to.

**Parameters**

fig

*[Figure]*

**set_fontsize** *(self, size)*

Set the text fontsize.

**set_text_props** *(self, **kwargs)*

Update the text properties.

Valid keyword arguments are:

<table>

<tr>
<td>zorder</td>
<td>float</td>
</tr>
</tbody>
</table>
**set_transform**(*self*, *trans*)

Set the artist transform.

**Parameters**

- *t*  
  
  [Transform]

**property visible_edges**

The cell edges to be drawn with a line.

Reading this property returns a substring of 'BRTL' (bottom, right, top, left').

When setting this property, you can use a substring of 'BRTL' or one of {'open', 'closed', 'horizontal', 'vertical'}.

**matplotlib.table.CustomCell**

alias of matplotlib.table.Cell

class matplotlib.table.Table(*ax*, *loc=None*, *bbox=None*, **kwargs)

Bases: matplotlib.artist.Artist

A table of cells.

The table consists of a grid of cells, which are indexed by (row, column).

For a simple table, you’ll have a full grid of cells with indices from (0, 0) to (num_rows-1, num_cols-1), in which the cell (0, 0) is positioned at the top left. However, you can also add cells with negative indices. You don’t have to add a cell to every grid position, so you can create tables that have holes.

*Note:* You’ll usually not create an empty table from scratch. Instead use `table` to create a table from data.

**Parameters**

- *ax*  
  

- *loc*  
  
  [str] The position of the cell with respect to *ax*. This must be one of the *codes*.

- *bbox*  
  
  [Bbox or None] A bounding box to draw the table into. If this is not *None*, this overrides *loc*.

**Other Parameters**

- **kwargs**  
  
  *Artist* properties.
AXESPAD = 0.02
The border between the Axes and the table edge in Axes units.

FONTSIZE = 10

add_cell(self, row, col, *args, **kwargs)
Create a cell and add it to the table.

Parameters

row
[int] Row index.

col
[int] Column index.

*args, **kwargs
All other parameters are passed on to Cell.

Returns

Cell
The created cell.

auto_set_column_width(self, col)
Automatically set the widths of given columns to optimal sizes.

Parameters

col
[int or sequence of ints] The indices of the columns to auto-scale.

auto_set_font_size(self, value=True)
Automatically set font size.

codes = {'best': 0, 'bottom': 17, 'bottom left': 12, 'bottom right': 13, 'center': 9, 'center left': 5, 'center right': 14, 'left': 11, 'right': 10, 'upper center': 8, 'upper left': 2, 'upper right': 1}
Possible values where to place the table relative to the Axes.

contains(self, mouseevent)
Test whether the artist contains the mouse event.

Parameters

mouseevent
[matplotlib.backend_bases.MouseEvent]

Returns
contains

[bool] Whether any values are within the radius.

details

[dict] An artist-specific dictionary of details of the event context, such as which
points are contained in the pick radius. See the individual Artist subclasses for
details.

draw (self, renderer)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters

renderer

[RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

property edges

The default value of visible_edges for newly added cells using add_cell.

Notes

This setting does currently only affect newly created cells using add_cell.

To change existing cells, you have to set their edges explicitly:

```python
for c in tab.get_celld().values():
    c.visible_edges = 'horizontal'
```

get_celld (self)

Return a dict of cells in the table mapping (row, column) to Cells.

Notes

You can also directly index into the Table object to access individual cells:

```python
cell = table[row, col]
```

get_children (self)

Return the Artists contained by the table.

get_window_extent (self, renderer)

Return the bounding box of the table in window coords.
scale(self, xscale,yscale)
    Scale column widths by xscale and row heights by yscale.

set_fontsize(self, size)
    Set the font size, in points, of the cell text.

Parameters

    size
        [float]

Notes

As long as auto font size has not been disabled, the value will be clipped such that the text fits horizontally into the cell.

You can disable this behavior using auto_set_font_size.

```python
>>> the_table.auto_set_font_size(False)
>>> the_table.set_fontsize(20)
```

However, there is no automatic scaling of the row height so that the text may exceed the cell boundary.

```python
matplotlib.table.table(ax, cellText=None, cellColours=None, cellLoc='right',
                       colWidths=None, rowLabels=None, rowColours=None,
                       rowLoc='left', colLabels=None, colColours=None, colLoc='center',
                       loc='bottom', bbox=None, edges='closed', **kwargs)
```

Add a table to an `Axes`.

At least one of `cellText` or `cellColours` must be specified. These parameters must be 2D lists, in which the outer lists define the rows and the inner list define the column values per row. Each row must have the same number of elements.

The table can optionally have row and column headers, which are configured using `rowLabels`, `rowColours`, `rowLoc` and `colLabels`, `colColours`, `colLoc` respectively.

For finer grained control over tables, use the `Table` class and add it to the axes with `Axes.add_table`.

Parameters

    cellText
        [2D list of str, optional] The texts to place into the table cells.

        Note: Line breaks in the strings are currently not accounted for and will result in the text exceeding the cell boundaries.

    cellColours
        [2D list of colors, optional] The background colors of the cells.
cellLoc

[{'left', 'center', 'right'}, default: 'right'] The alignment of the text within the cells.

colWidths

[list of float, optional] The column widths in units of the axes. If not given, all columns will have a width of \( 1 / ncols \).

rowLabels

[list of str, optional] The text of the row header cells.

rowColours

[list of colors, optional] The colors of the row header cells.

rowLoc

[{'left', 'center', 'right'}, default: 'left'] The text alignment of the row header cells.

colLabels

[list of str, optional] The text of the column header cells.

colColours

[list of colors, optional] The colors of the column header cells.

colLoc

[{'left', 'center', 'right'}, default: 'left'] The text alignment of the column header cells.

loc

[str, optional] The position of the cell with respect to \( ax \). This must be one of the codes.

bbox

[Bbox, optional] A bounding box to draw the table into. If this is not None, this overrides loc.

edges

[substring of 'BRTL' or {'open', 'closed', 'horizontal', 'vertical'}] The cell edges to be drawn with a line. See also visible_edges.

Returns

Table

The created table.

Other Parameters
**kwargs

Table properties.

## 18.50 matplotlib.testing

### 18.50.1 matplotlib.test()

matplotlib.test(verbosity=None, coverage=False, *, recursionlimit=<deprecated parameter>, **kwargs)

Run the matplotlib test suite.
18.50.2 matplotlib.testing

Helper functions for testing.

matplotlib.testing.set_font_settings_for_testing()
matplotlib.testing.set_reproducibility_for_testing()
matplotlib.testing.setup()

18.50.3 matplotlib.testing.compare

Utilities for comparing image results.

matplotlib.testing.compare.calculate_rms(expected_image, actual_image)
Calculate the per-pixel errors, then compute the root mean square error.

matplotlib.testing.compare.comparable_formats()
Return the list of file formats that compare_images can compare on this system.

Returns

list of str

E.g. ['png', 'pdf', 'svg', 'eps'].

matplotlib.testing.compare.compare_images(expected, actual, tol, in_decorator=False)
Compare two "image" files checking differences within a tolerance.

The two given filenames may point to files which are convertible to PNG via the converter dictionary. The underlying RMS is calculated with the calculate_rms function.

Parameters

expected
[str] The filename of the expected image.

actual
[str] The filename of the actual image.

tol
[float] The tolerance (a color value difference, where 255 is the maximal difference). The test fails if the average pixel difference is greater than this value.

in_decorator
[bool] Determines the output format. If called from image_comparison decorator, this should be True. (default=False)

Returns
None or dict or str

Return None if the images are equal within the given tolerance.

If the images differ, the return value depends on in_decorator. If in_decorator is true, a dict with the following entries is returned:

- rms: The RMS of the image difference.
- expected: The filename of the expected image.
- actual: The filename of the actual image.
- diff_image: The filename of the difference image.
- tol: The comparison tolerance.

Otherwise, a human-readable multi-line string representation of this information is returned.

Examples

```python
img1 = './baseline/plot.png'
img2 = './output/plot.png'
compare_images(img1, img2, 0.001)
```

18.50.4 matplotlib.testing.decorators

class matplotlib.testing.decorators.CleanupTestCase (methodName='runTest')
Bases: unittest.case.TestCase

A wrapper for unittest.TestCase that includes cleanup operations.

Create an instance of the class that will use the named test method when executed. Raises a ValueError if the instance does not have a method with the specified name.

classmethod setUpClass ()

Hook method for setting up class fixture before running tests in the class.

classmethod tearDownClass ()

Hook method for deconstructing the class fixture after running all tests in the class.

matplotlib.testing.decorators.check_figures_equal (*, extensions='png', 'pdf',
'svg', tol=0)

Decorator for test cases that generate and compare two figures.

The decorated function must take two keyword arguments, fig_test and fig_ref, and draw the test and reference images on them. After the function returns, the figures are saved and compared.

This decorator should be preferred over image_comparison when possible in order to keep the size of the test suite from ballooning.

Parameters
extensions

[list, default: ["png", "pdf", "svg"]] The extensions to test.

tol

[float] The RMS threshold above which the test is considered failed.

Raises

RuntimeError

If any new figures are created (and not subsequently closed) inside the test function.

Examples

Check that calling Axes.plot with a single argument plots it against [0, 1, 2, ...]:

```python
@check_figures_equal()
def test_plot(fig_test, fig_ref):
    fig_test.subplots().plot([1, 3, 5])
    fig_ref.subplots().plot([0, 1, 2], [1, 3, 5])
```

matplotlib.testing.decorators.check_freetype_version(ver)

matplotlib.testing.decorators.cleanup(style=None)

A decorator to ensure that any global state is reset before running a test.

Parameters

style

[str, dict, or list, optional] The style(s) to apply. Defaults to ["classic", "_classic_test_patch"].

matplotlib.testing.decorators.image_comparison(baseline_images, extensions=None, tol=0, freetype_version=None, remove_text=False, savefig_kwarg=None, style='classic', '_classic_test_patch')

Compare images generated by the test with those specified in baseline_images, which must correspond, else an ImageComparisonFailure exception will be raised.

Parameters

baseline_images

[list or None] A list of strings specifying the names of the images generated by calls to Figure.savefig.
If *None*, the test function must use the `baseline_images` fixture, either as a parameter or with `pytest.mark.usefixtures`. This value is only allowed when using pytest.

**extensions**

[None or list of str] The list of extensions to test, e.g. `["png", "pdf"]`. If *None*, defaults to all supported extensions: png, pdf, and svg.

When testing a single extension, it can be directly included in the names passed to `baseline_images`. In that case, `extensions` must not be set.

In order to keep the size of the test suite from ballooning, we only include the *svg* or *pdf* outputs if the test is explicitly exercising a feature dependent on that backend (see also the `check_figures_equal` decorator for that purpose).

**tol**

[float, default: 0] The RMS threshold above which the test is considered failed.

Due to expected small differences in floating-point calculations, on 32-bit systems an additional 0.06 is added to this threshold.

**freetype_version**

[str or tuple] The expected freetype version or range of versions for this test to pass.

**remove_text**

[bool] Remove the title and tick text from the figure before comparison. This is useful to make the baseline images independent of variations in text rendering between different versions of FreeType.

This does not remove other, more deliberate, text, such as legends and annotations.

**savefig_kwarg**

[dict] Optional arguments that are passed to the savefig method.

**style**

[str, dict, or list] The optional style(s) to apply to the image test. The test itself can also apply additional styles if desired. Defaults to `"classic", "_classic_test_patch"`.

`matplotlib.testing.decorators.remove_ticks_and_titles(figure)`
18.50.5 matplotlib.testing.exceptions

exception matplotlib.testing.exceptions.ImageComparisonFailure
    Bases: AssertionError

    Raise this exception to mark a test as a comparison between two images.

18.51 matplotlib.text

Classes for including text in a figure.

class matplotlib.text.Annotation(text, xy, xytext=None, xycoords='data', textcoords=None, arrowprops=None, annotation_clip=None, **kwargs)
    Bases: matplotlib.text.Text, matplotlib.text._AnnotationBase

    An Annotation is a Text that can refer to a specific position xy. Optionally an arrow pointing from the text to xy can be drawn.

    Attributes

    xy
        The annotated position.

    xycoords
        The coordinate system for xy.

    arrow_patch
        A FancyArrowPatch to point from xytext to xy.

    Annotate the point xy with text text.

    In the simplest form, the text is placed at xy.

    Optionally, the text can be displayed in another position xytext. An arrow pointing from the text to the annotated point xy can then be added by defining arrowprops.

    Parameters

    text
        [str] The text of the annotation.

    xy
        [(float, float)] The point (x, y) to annotate. The coordinate system is determined by xycoords.

    xytext
        [(float, float), default: xy] The position (x, y) to place the text at. The coordinate system is determined by textcoords.
xycoords

[<str> or Artist or Transform or callable or (float, float), default: 'data'] The coordinate system that xy is given in. The following types of values are supported:

- One of the following strings:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'figure points'</td>
<td>Points from the lower left of the figure</td>
</tr>
<tr>
<td>'figure pixels'</td>
<td>Pixels from the lower left of the figure</td>
</tr>
<tr>
<td>'figure fraction'</td>
<td>Fraction of figure from lower left</td>
</tr>
<tr>
<td>'subfigure points'</td>
<td>Points from the lower left of the subfigure</td>
</tr>
<tr>
<td>'subfigure pixels'</td>
<td>Pixels from the lower left of the subfigure</td>
</tr>
<tr>
<td>'subfigure fraction'</td>
<td>Fraction of subfigure from lower left</td>
</tr>
<tr>
<td>'axes points'</td>
<td>Points from lower left corner of axes</td>
</tr>
<tr>
<td>'axes pixels'</td>
<td>Pixels from lower left corner of axes</td>
</tr>
<tr>
<td>'axes fraction'</td>
<td>Fraction of axes from lower left</td>
</tr>
<tr>
<td>'data'</td>
<td>Use the coordinate system of the object being annotated (default)</td>
</tr>
<tr>
<td>'polar'</td>
<td>(theta, r) if not native 'data' coordinates</td>
</tr>
</tbody>
</table>

Note that 'subfigure pixels' and 'figure pixels' are the same for the parent figure, so users who want code that is usable in a subfigure can use 'subfigure pixels'.

- An Artist: xy is interpreted as a fraction of the artist’s Bbox. E.g. (0, 0) would be the lower left corner of the bounding box and (0.5, 1) would be the center top of the bounding box.

- A Transform to transform xy to screen coordinates.

- A function with one of the following signatures:

```python
def transform(renderer) -> Bbox
def transform(renderer) -> Transform
```

where renderer is a RendererBase subclass.

The result of the function is interpreted like the Artist and Transform cases above.

- A tuple (xcoords, ycoords) specifying separate coordinate systems for x and y. xcoords and ycoords must each be one of the above described types.

See Advanced Annotations for more details.

textcoords

[<str> or Artist or Transform or callable or (float, float), default: value of xycoords] The coordinate system that xytext is given in.
All *xycoords* values are valid as well as the following strings:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'offset points'</td>
<td>Offset (in points) from the <em>xy</em> value</td>
</tr>
<tr>
<td>'offset pixels'</td>
<td>Offset (in pixels) from the <em>xy</em> value</td>
</tr>
</tbody>
</table>

**arrowprops**

[dict, optional] The properties used to draw a *FancyArrowPatch* arrow between the positions *xy* and *xytext*. Note that the edge of the arrow pointing to *xytext* will be centered on the text itself and may not point directly to the coordinates given in *xytext*.

If *arrowprops* does not contain the key 'arrowstyle' the allowed keys are:

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>The width of the arrow in points</td>
</tr>
<tr>
<td>headwidth</td>
<td>The width of the base of the arrow head in points</td>
</tr>
<tr>
<td>headlength</td>
<td>The length of the arrow head in points</td>
</tr>
<tr>
<td>shrink</td>
<td>Fraction of total length to shrink from both ends</td>
</tr>
</tbody>
</table>

If *arrowprops* contains the key 'arrowstyle' the above keys are forbidden. The allowed values of 'arrowstyle' are:

<table>
<thead>
<tr>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-'</td>
<td>None</td>
</tr>
<tr>
<td>'&lt;-&gt;'</td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>'-['</td>
<td>widthB=1.0,lengthB=0.2,angleB=None</td>
</tr>
<tr>
<td>'</td>
<td>-'</td>
</tr>
<tr>
<td>'&lt;-&gt;'</td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>'&lt;-'</td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>'&lt;-&gt;'</td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>'&lt;</td>
<td>-&gt;'</td>
</tr>
<tr>
<td>'&lt;</td>
<td>--&gt;'</td>
</tr>
<tr>
<td>'&lt;</td>
<td>---&gt;'</td>
</tr>
<tr>
<td>'&lt;</td>
<td>&lt;--&gt;'</td>
</tr>
<tr>
<td>'&lt;</td>
<td>wedge'</td>
</tr>
</tbody>
</table>

Valid keys for *FancyArrowPatch* are:
<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arrowstyle</td>
<td>the arrow style</td>
</tr>
<tr>
<td>connectionstyle</td>
<td>the connection style</td>
</tr>
<tr>
<td>relpos</td>
<td>default is (0.5, 0.5)</td>
</tr>
<tr>
<td>patchA</td>
<td>default is bounding box of the text</td>
</tr>
<tr>
<td>patchB</td>
<td>default is None</td>
</tr>
<tr>
<td>shrinkA</td>
<td>default is 2 points</td>
</tr>
<tr>
<td>shrinkB</td>
<td>default is 2 points</td>
</tr>
<tr>
<td>mutation_scale</td>
<td>default is text size (in points)</td>
</tr>
<tr>
<td>mutation_aspect</td>
<td>default is 1.</td>
</tr>
<tr>
<td>?</td>
<td>any key for <code>matplotlib.patches.PathPatch</code></td>
</tr>
</tbody>
</table>

Defaults to None, i.e. no arrow is drawn.

**annotation_clip**

[bool or None, default: None] Whether to draw the annotation when the annotation point \( xy \) is outside the axes area.

- If `True`, the annotation will only be drawn when \( xy \) is within the axes.
- If `False`, the annotation will always be drawn.
- If `None`, the annotation will only be drawn when \( xy \) is within the axes and \( xy-coords \) is 'data'.

**kwargs**

Additional kwargs are passed to `Text`.

**Returns**

`Annotation`

See also:

`Advanced Annotations`

**property anncoords**

The coordinate system to use for `Annotation.xyann`.

**contains**(self, event)

Return whether the mouse event occurred inside the axis-aligned bounding-box of the text.

**draw**(self, renderer)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

**Parameters**
Notes

This method is overridden in the Artist subclasses.

get_anncoords (self)

Return the coordinate system to use for Annotation.xyann.

See also xycoords in Annotation.

get_tightbbox (self, renderer)

Like Artist.get_window_extent, but includes any clipping.

Parameters

renderer

[RendererBase subclass] renderer that will be used to draw the figures (i.e. fig.canvas.get_renderer())

Returns

Bbox

The enclosing bounding box (in figure pixel coordinates).

get_window_extent (self, renderer=None)

Return the Bbox bounding the text and arrow, in display units.

Parameters

renderer

[Renderer, optional] A renderer is needed to compute the bounding box. If the artist has already been drawn, the renderer is cached; thus, it is only necessary to pass this argument when calling get_window_extent before the first draw. In practice, it is usually easier to trigger a draw first (e.g. by saving the figure).

set_anncoords (self, coords)

Set the coordinate system to use for Annotation.xyann.

See also xycoords in Annotation.

set_figure (self, fig)

Set the Figure instance the artist belongs to.

Parameters

renderer

[RendererBase subclass.]
update_positions(self, renderer)
    Update the pixel positions of the annotation text and the arrow patch.

property xyann
    The text position.

    See also xytext in Annotation.

property xycoords

class matplotlib.text.OffsetFrom(artist, ref_coord, unit='points')
    Callable helper class for working with Annotation.

    Parameters

    artist
        [Artist or BboxBase or Transform] The object to compute the offset from.

    ref_coord
        [(float, float)] If artist is an Artist or BboxBase, this values is the location to
        of the offset origin in fractions of the artist bounding box.
        If artist is a transform, the offset origin is the transform applied to this value.

    unit
        [{'points', 'pixels'}, default: 'points'] The screen units to use (pixels or points) for
        the offset input.

get_unit(self)
    Return the unit for input to the transform used by __call__.

set_unit(self, unit)
    Set the unit for input to the transform used by __call__.

    Parameters

    unit
        [{'points', 'pixels'}]

class matplotlib.text.Text(x=0, y=0, text='', color=None, verticalalignment='baseline',
    horizontalalignment='left', multialignment=None, fontproperties=None, rotation=None, linespacing=None,
    rotation_mode=None, usetex=None, wrap=False, transform_rotates_text=False, **kwargs)

    Bases: matplotlib.artist.Artist
Handle storing and drawing of text in window or data coordinates.

Create a `Text` instance at `x`, `y` with string `text`.

Valid keyword arguments are:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>

**contains** *(self, mouseevent)*

Return whether the mouse event occurred inside the axis-aligned bounding-box of the text.

**draw** *(self, renderer)*

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible *(Artist.get_visible returns False)*.

**Parameters**

- **renderer**
  
  `[RendererBase subclass.]`

**Notes**

This method is overridden in the Artist subclasses.

**get_bbox_patch** *(self)*

Return the bbox Patch, or None if the `patches.FancyBboxPatch` is not made.

**get_c** *(self)*

Alias for **get_color**.

**get_color** *(self)*

Return the color of the text.

**get_family** *(self)*

Alias for **get_fontfamily**.

**get_font** *(self)*

Alias for **get_fontproperties**.

**get_font_properties** *(self)*

Alias for **get_fontproperties**.

**get_fontfamily** *(self)*

Return the list of font families used for font lookup.

**See also:**

`font_manager.FontProperties.get_family`
get_fontname (self)
Return the font name as a string.

See also:

```
font_manager.FontProperties.get_name
```

get_fontproperties (self)
Return the `font_manager.FontProperties`.

get_fontsize (self)
Return the font size as an integer.

See also:

```
font_manager.FontProperties.get_size_in_points
```

get_fontstyle (self)
Return the font style as a string.

See also:

```
font_manager.FontProperties.get_style
```

get_fontvariant (self)
Return the font variant as a string.

See also:

```
font_manager.FontProperties.get_variant
```

get_fontweight (self)
Return the font weight as a string or a number.

See also:

```
font_manager.FontProperties.get_weight
```

get_ha (self)
Alias for `get_horizontalalignment`.

get_horizontalalignment (self)
Return the horizontal alignment as a string. Will be one of 'left', 'center' or 'right'.

get_math_fontfamily (self)
Return the font family name for math text rendered by Matplotlib.

The default value is `rcParams["mathtext.fontset"]` (default: 'dejavusans').

See also:

```
set_math_fontfamily
```
get_name(self)
    Alias for get_fontname.

get_position(self)
    Return the (x, y) position of the text.

get_prop_tup(self, renderer=None)
    Return a hashable tuple of properties.
    Not intended to be human readable, but useful for backends who want to cache derived information about text (e.g., layouts) and need to know if the text has changed.

get_rotation(self)
    Return the text angle in degrees between 0 and 360.

get_rotation_mode(self)
    Return the text rotation mode.

get_size(self)
    Alias for get_fontsize.

get_stretch(self)
    Return the font stretch as a string or a number.
    See also:

        font_manager.FontProperties.get_stretch

g_get_style(self)
    Alias for get_fontstyle.

get_text(self)
    Return the text string.

get_transform_rotates_text(self)
    Return whether rotations of the transform affect the text direction.

g_get_unitless_position(self)
    Return the (x, y) unitless position of the text.

g_get_usetex(self)
    Return whether this Text object uses TeX for rendering.

g_get_va(self)
    Alias for get_verticalalignment.

g_get_variant(self)
    Alias for get_fontvariant.

get_verticalalignment(self)
    Return the vertical alignment as a string. Will be one of 'top', 'center', 'bottom', 'baseline' or 'center_baseline'.

g_get_weight(self)
    Alias for get_fontweight.
get_window_extent (self, renderer=None, dpi=None)

Return the Bbox bounding the text, in display units.

In addition to being used internally, this is useful for specifying clickable regions in a png file on a web page.

Parameters

renderer

[Renderer, optional] A renderer is needed to compute the bounding box. If the artist has already been drawn, the renderer is cached; thus, it is only necessary to pass this argument when calling get_window_extent before the first draw. In practice, it is usually easier to trigger a draw first (e.g. by saving the figure).

dpi

[float, optional] The dpi value for computing the bbox, defaults to self.figure.dpi (not the renderer dpi); should be set e.g. if to match regions with a figure saved with a custom dpi value.

get_wrap (self)

Return whether the text can be wrapped.

set_backgroundcolor (self, color)

Set the background color of the text by updating the bbox.

Parameters

color

[color]

See also:

set_bbox

To change the position of the bounding box.

set_bbox (self, rectprops)

Draw a bounding box around self.

Parameters

rectprops

[dict with properties for patches.FancyBboxPatch] The default boxstyle is 'square'. The mutation scale of the patches.FancyBboxPatch is set to the fontsize.
Examples

t.set_bbox(dict(facecolor='red', alpha=0.5))

**set_c** *(self, color)*

Alias for *set_color*.

**set_clip_box** *(self, clipbox)*

Set the artist's clip *Bbox*.

**Parameters**

- **clipbox**
  - [Bbox]

**set_clip_on** *(self, b)*

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters**

- **b**
  - [bool]

**set_clip_path** *(self, path, transform=None)*

Set the artist's clip path.

**Parameters**

- **path**
  - [Patch or Path or TransformedPath or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

- **transform**
  - [Transform, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

**Notes**

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

For technical reasons (support of *set*), a tuple (*path, transform*) is also accepted as a single positional parameter.

**set_color** *(self, color)*

Set the foreground color of the text
Parameters

**color**

[color]

`set_family(self, fontname)`

Alias for `set_fontfamily`.

`set_font(self, fp)`

Alias for `set_fontproperties`.

`set_font_properties(self, fp)`

Alias for `set_fontproperties`.

**set_fontfamily(self, fontname)**

Set the font family. May be either a single string, or a list of strings in decreasing priority. Each string may be either a real font name or a generic font class name. If the latter, the specific font names will be looked up in the corresponding rcParams.

If a `Text` instance is constructed with `fontfamily=None`, then the font is set to `rcParams["font.family"]` (default: `['sans-serif']`), and the same is done when `set_fontfamily()` is called on an existing `Text` instance.

Parameters

**fontname**

[{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}]

See also:

`font_manager.FontProperties.set_family`

**set_fontname(self, fontname)**

Alias for `set_family`.

One-way alias only: the getter differs.

Parameters

**fontname**

[{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}]

See also:

`font_manager.FontProperties.set_family`

**set_fontproperties(self, fp)**

Set the font properties that control the text.

Parameters
fp

[font_manager.FontProperties or str or pathlib.Path] If a str, it is interpreted as a fontconfig pattern parsed by FontProperties. If a pathlib.Path, it is interpreted as the absolute path to a font file.

set_fontsize (self, fontsize)
Set the font size.

Parameters

fontsize
[float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] If float, the fontsize in points. The string values denote sizes relative to the default font size.

See also:

font_manager.FontProperties.set_size

set_fontstretch (self, stretch)
Set the font stretch (horizontal condensation or expansion).

Parameters

stretch
[(a numeric value in range 0-1000, 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded', 'ultra-expanded')]

See also:

font_manager.FontProperties.set_stretch

set_fontstyle (self, fontstyle)
Set the font style.

Parameters

fontstyle
[{'normal', 'italic', 'oblique'}]

See also:

font_manager.FontProperties.set_style

set_fontvariant (self, variant)
Set the font variant.
Parameters

variant

[{'normal', 'small-caps'}]

See also:

`font_manager.FontProperties.set_variant`

**set FontWeight** *(self, weight)*

Set the font weight.

Parameters

weight

[{'a numeric value in range 0-1000, 'ultralight', 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'}]

See also:

`font_manager.FontProperties.set_weight`

**set_ha** *(self, align)*

Alias for `set_horizontalalignment`.

**set_horizontalalignment** *(self, align)*

Set the horizontal alignment to one of

Parameters

align

[{'center', 'right', 'left'}]

**set_linespacing** *(self, spacing)*

Set the line spacing as a multiple of the font size.

The default line spacing is 1.2.

Parameters

spacing

[{'a numeric value in range 0-1000, 'ultralight', 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'}]

See also:

`font_manager.FontProperties.set_weight`

**set_ma** *(self, align)*

Alias for `set_multialignment`.  

**set_multialignment** *(self, align)*

Set the multialignment to one of
set_math_fontfamily (self, fontfamily)
Set the font family for math text rendered by Matplotlib.

This does only affect Matplotlib's own math renderer. It has no effect when rendering with TeX (usetex=True).

Parameters

fontfamily

[str] The name of the font family.

Available font families are defined in the matplotlibrc.template file.

See also:

get_math_fontfamily

set_multialignment (self, align)
Set the text alignment for multiline texts.

The layout of the bounding box of all the lines is determined by the horizontalalignment and verticalalignment properties. This property controls the alignment of the text lines within that box.

Parameters

align

[{'left', 'right', 'center'}]

set_name (self, fontname)
Alias for set_fontname.

set_position (self, xy)
Set the (x, y) position of the text.

Parameters

xy

[(float, float)]

set_rotation (self, s)
Set the rotation of the text.

Parameters

s

[‘vertical’, ‘horizontal’] The rotation angle in degrees in mathematically positive direction (counterclockwise). ‘horizontal’ equals 0, ‘vertical’ equals 90.
**set_rotation_mode** *(self, m)*
Set text rotation mode.

**Parameters**

- **m**

  [(None, 'default', 'anchor')] If None or "default", the text will be first rotated, then aligned according to their horizontal and vertical alignments. If "anchor", then alignment occurs before rotation.

**set_size** *(self, fontsize)*
Alias for *set_fontsize*.

**set_stretch** *(self, stretch)*
Alias for *set_fontstretch*.

**set_style** *(self, fontstyle)*
Alias for *set_fontstyle*.

**set_text** *(self, s)*
Set the text string *s*.
It may contain newlines (\n) or math in LaTeX syntax.

**Parameters**

- **s**

  [object] Any object gets converted to its *str* representation, except for None which is converted to an empty string.

**set_transform_rotates_text** *(self, t)*
Whether rotations of the transform affect the text direction.

**Parameters**

- **t**

  [bool]

**set_usetex** *(self, usetex)*

**Parameters**

- **usetex**

  [bool or None] Whether to render using TeX, None means to use *rcParams["text.usetex"]* (default: False).

**set(va)** *(self, align)*
Alias for *set_verticalalignment*.
**set_variant** *(self, variant)*  
Alias for *set_fontvariant.*

**set_verticalalignment** *(self, align)*  
Set the vertical alignment.

**Parameters**

align

[
{'center', 'top', 'bottom', 'baseline', 'center_baseline'}
]

**set_weight** *(self, weight)*  
Alias for *set_fontweight.*

**set_wrap** *(self, wrap)*  
Set whether the text can be wrapped.

**Parameters**

wrap

[bool]

**Notes**

Wrapping does not work together with *savefig(…, bbox_inches='tight')* (which is also used internally by *%matplotlib inline* in IPython/Jupyter). The 'tight' setting rescales the canvas to accommodate all content and happens before wrapping.

**set_x** *(self, x)*  
Set the *x* position of the text.

**Parameters**

x

[float]

**set_y** *(self, y)*  
Set the *y* position of the text.

**Parameters**

y

[float]

**update** *(self, kwargs)*  
Update this artist's properties from the dict *props.*

**Parameters**
props
    [dict]

update_bbox_position_size(self, renderer)
    Update the location and the size of the bbox.
    
    This method should be used when the position and size of the bbox needs to be updated before
    actually drawing the bbox.

update_from(self, other)
    Copy properties from other to self.

zorder = 3

matplotlib.text.get_rotation(rotation)
    Return rotation normalized to an angle between 0 and 360 degrees.

    Parameters

    rotation
        [float or {None, 'horizontal', 'vertical'}] Rotation angle in degrees. None and 'hor-
        izontal' equal 0, 'vertical' equals 90.

    Returns

    float

18.52 matplotlib.texmanager

Support for embedded TeX expressions in Matplotlib via dvipng and dvips for the raster and PostScript back-
ends. The tex and dvipng/dvips information is cached in ~/.matplotlib/tex.cache for reuse between sessions.

Requirements:

- LaTeX
- *Agg backends: dvipng>=1.6
- PS backend: psfrag, dvips, and Ghostscript>=9.0

For raster output, you can get RGBA numpy arrays from TeX expressions as follows:

texmanager = TexManager()
s = r"\TeX\ is Number $\sum_{n=1}^{\infty} \frac{-e^{i\pi}}{2^n}$!"
z = texmanager.get_rgba(s, fontsize=12, dpi=80, rgb=(1, 0, 0))

To enable TeX rendering of all text in your Matplotlib figure, set
rcParams["text.usetex"] (default: False) to True.

class matplotlib.texmanager.TexManager
    Bases: object
Convert strings to dvi files using TeX, caching the results to a directory.
Repeated calls to this constructor always return the same instance.

**property cachedir**

**property cursive**

`font_families = ('serif', 'sans-serif', 'cursive', 'monospace')`

`font_family = 'serif'`

`font_info = {'avant garde': ('pag', '\usepackage{avant}'), 'bookman': ('pbk', \renewcommand{\rmdefault}{pbk'), ...

`get_basefile(self, tex, fontsize, dpi=None)`

Return a filename based on a hash of the string, fontsize, and dpi.

`get_custom_preamble(self)`

Return a string containing user additions to the tex preamble.

`get_font_config(self)`

Return a string containing font configuration for the tex preamble.

`get_grey(self, tex, fontsize=None, dpi=None)`

Return the alpha channel.

`get_rgba(self, tex, fontsize=None, dpi=None, rgb=0, 0, 0)`

Return latex's rendering of the tex string as an rgba array.

`get_text_width_height_descent(self, tex, fontsize, renderer=None)`

Return width, height and descent of the text.

`grey_arrayd = {}`

`make_dvi(self, tex, fontsize)`

Generate a dvi file containing latex's layout of tex string.

Return the file name.

`make_dvi_preview(self, tex, fontsize)`

[Deprecated] Generate a dvi file containing latex's layout of tex string.

It calls make_tex_preview() method and store the size information (width, height, descent) in a separate file.

Return the file name.
Notes

Deprecated since version 3.3.

```python
make_png(self, tex, fontsize, dpi)
```
Generate a png file containing latex's rendering of tex string.
Return the file name.

```python
make_tex(self, tex, fontsize)
```
Generate a tex file to render the tex string at a specific font size.
Return the file name.

```python
make_tex_preview(self, tex, fontsize)
```
[Deprecated] Generate a tex file to render the tex string at a specific font size.
It uses the preview.sty to determine the dimension (width, height, descent) of the output.
Return the file name.

Notes

Deprecated since version 3.3.

```python
property monospace
property rgba_arrayd
property sans_serif
property serif
```

```python
texcache = '/home/elliott/.cache/matplotlib/tex.cache'
```

### 18.53 matplotlib.textpath

```python
class matplotlib.textpath.TextPath(xy, s, size=None, prop=None, _interpolation_steps=1, usetex=False)
```
Bases: `matplotlib.path.Path`

Create a path from the text.

Create a path from the text. Note that it simply is a path, not an artist. You need to use the `PathPatch` (or other artists) to draw this path onto the canvas.

**Parameters**

```python
xy
```
[tuple or array of two float values] Position of the text. For no offset, use `xy=(0, 0)`.
s

[ str ] The text to convert to a path.

size

[ float, optional ] Font size in points. Defaults to the size specified via the font properties `prop`.

prop

[ matplotlib.font_manager.FontProperties, optional ] Font property. If not provided, will use a default `FontProperties` with parameters from the `rcParams`.

_interpolation_steps

[ int, optional ] (Currently ignored)

usetex

[ bool, default: False ] Whether to use tex rendering.

Examples

The following creates a path from the string "ABC" with Helvetica font face; and another path from the latex fraction 1/2:

```python
from matplotlib.textpath import TextPath
from matplotlib.font_manager import FontProperties

fp = FontProperties(family="Helvetica", style="italic")
path1 = TextPath((12, 12), "ABC", size=12, prop=fp)
path2 = TextPath((0, 0), r"\frac{1}{2}"`, size=12, usetex=True)
```

Also see /gallery/text_labels_and_annotations/demo_text_path.

property codes

Return the codes

get_size(self)

Get the text size.

set_size(self, size)

Set the text size.

property vertices

Return the cached path after updating it if necessary.

class matplotlib.textpath.TextToPath

Bases: object

A class that converts strings to paths.

DPI = 72
FONT_SCALE = 100.0

get_glyphs_mathtext (self, prop, s, glyph_map=None, return_new_glyphs_only=False)
    Parse mathtext string s and convert it to a (vertices, codes) pair.

get_glyphs_tex (self, prop, s, glyph_map=None, return_new_glyphs_only=False)
    Convert the string s to vertices and codes using usetex mode.

get_glyphs_with_font (self, font, s, glyph_map=None, return_new_glyphs_only=False)
    Convert string s to vertices and codes using the provided ttf font.

get_texmanager (self)
    Return the cached TexManager instance.

get_text_path (self, prop, s, ismath=False)
    Convert text s to path (a tuple of vertices and codes for matplotlib.path.Path).

Parameters

prop
    [FontProperties] The font properties for the text.

s
    [str] The text to be converted.

ismath
    [{False, True, "TeX"}] If True, use mathtext parser. If "TeX", use tex for rendering.

Returns

verts
    [list] A list of numpy arrays containing the x and y coordinates of the vertices.

codes
    [list] A list of path codes.

Examples

Create a list of vertices and codes from a text, and create a Path from those:

```python
from matplotlib.path import Path
from matplotlib.textpath import TextToPath
from matplotlib.font_manager import FontProperties

fp = FontProperties(family="Humor Sans", style="italic")
verts, codes = TextToPath().get_text_path(fp, "ABC")
path = Path(verts, codes, closed=False)
```

Also see TextPath for a more direct way to create a path from a text.
get_text_width_height_descent(self, s, prop, ismath)

18.54 matplotlib.ticker

18.54.1 Tick locating and formatting

This module contains classes for configuring tick locating and formatting. Generic tick locators and formatters are provided, as well as domain specific custom ones.

Although the locators know nothing about major or minor ticks, they are used by the Axis class to support major and minor tick locating and formatting.

Tick locating

The Locator class is the base class for all tick locators. The locators handle autoscaling of the view limits based on the data limits, and the choosing of tick locations. A useful semi-automatic tick locator is MultipleLocator. It is initialized with a base, e.g., 10, and it picks axis limits and ticks that are multiples of that base.

The Locator subclasses defined here are

AutoLocator

MaxNLocator with simple defaults. This is the default tick locator for most plotting.

MaxNLocator

Finds up to a max number of intervals with ticks at nice locations.

LinearLocator

Space ticks evenly from min to max.

LogLocator

Space ticks logarithmically from min to max.

MultipleLocator

Ticks and range are a multiple of base; either integer or float.

FixedLocator

Tick locations are fixed.

IndexLocator

Locator for index plots (e.g., where \( x = \text{range(len(y))} \)).

NullLocator

No ticks.
SymmetricalLogLocator

Locator for use with the symlog norm; works like LogLocator for the part outside of the threshold and adds 0 if inside the limits.

LogitLocator

Locator for logit scaling.

OldAutoLocator

Choose a MultipleLocator and dynamically reassign it for intelligent ticking during navigation.

AutoMinorLocator

Locator for minor ticks when the axis is linear and the major ticks are uniformly spaced. Subdivides the major tick interval into a specified number of minor intervals, defaulting to 4 or 5 depending on the major interval.

There are a number of locators specialized for date locations - see the dates module.

You can define your own locator by deriving from Locator. You must override the __call__ method, which returns a sequence of locations, and you will probably want to override the autoscale method to set the view limits from the data limits.

If you want to override the default locator, use one of the above or a custom locator and pass it to the x or y axis instance. The relevant methods are:

```python
ax.xaxis.set_major_locator(xmajor_locator)
ax.xaxis.set_minor_locator(xminor_locator)
ax.yaxis.set_major_locator(ymajor_locator)
ax.yaxis.set_minor_locator(yminor_locator)
```

The default minor locator is NullLocator, i.e., no minor ticks on by default.

Note: Locator instances should not be used with more than one Axis or Axes. So instead of:

```python
locator = MultipleLocator(5)
ax.xaxis.set_major_locator(locator)
ax2.xaxis.set_major_locator(locator)
```

do the following instead:

```python
ax.xaxis.set_major_locator(MultipleLocator(5))
ax2.xaxis.set_major_locator(MultipleLocator(5))
```
Tick formatting

Tick formatting is controlled by classes derived from Formatter. The formatter operates on a single tick value and returns a string to the axis.

**NullFormatter**

No labels on the ticks.

**IndexFormatter**

Set the strings from a list of labels.

**FixedFormatter**

Set the strings manually for the labels.

**FuncFormatter**

User defined function sets the labels.

**StrMethodFormatter**

Use string format method.

**FormatStrFormatter**

Use an old-style sprintf format string.

**ScalarFormatter**

Default formatter for scalars: autopick the format string.

**LogFormatter**

Formatter for log axes.

**LogFormatterExponent**

Format values for log axis using \( \text{exponent} = \log_{\text{base}}(\text{value}) \).

**LogFormatterMathtext**

Format values for log axis using \( \text{exponent} = \log_{\text{base}}(\text{value}) \) using Math text.

**LogFormatterSciNotation**

Format values for log axis using scientific notation.

**LogitFormatter**

Probability formatter.

**EngFormatter**

Format labels in engineering notation.

**PercentFormatter**

Format labels as a percentage.
You can derive your own formatter from the Formatter base class by simply overriding the __call__ method. The formatter class has access to the axis view and data limits.

To control the major and minor tick label formats, use one of the following methods:

```python
ax.xaxis.set_major_formatter(xmajor_formatter)
ax.xaxis.set_minor_formatter(xminor_formatter)
ax.yaxis.set_major_formatter(ymajor_formatter)
ax.yaxis.set_minor_formatter(yminor_formatter)
```

In addition to a Formatter instance, set_major_formatter and set_minor_formatter also accept a str or function. str input will be internally replaced with an autogenerated StrMethodFormatter with the input str. For function input, a FuncFormatter with the input function will be generated and used.

See /gallery/ticks_and_spines/major_minor_demo for an example of setting major and minor ticks. See the matplotlib.dates module for more information and examples of using date locators and formatters.

```python
class matplotlib.ticker.AutoLocator
    Bases: matplotlib.ticker.MaxNLocator

    Dynamically find major tick positions. This is actually a subclass of MaxNLocator, with parameters
    nbins = 'auto' and steps = [1, 2, 2.5, 5, 10].

    To know the values of the non-public parameters, please have a look to the defaults of MaxNLocator.

class matplotlib.ticker.AutoMinorLocator(n=None)
    Bases: matplotlib.ticker.Locator

    Dynamically find minor tick positions based on the positions of major ticks. The scale must be linear
    with major ticks evenly spaced.

    n is the number of subdivisions of the interval between major ticks; e.g., n=2 will place a single minor
    tick midway between major ticks.

    If n is omitted or None, it will be set to 5 or 4.

    tick_values (self, vmin, vmax)
        Return the values of the located ticks given vmin and vmax.
```

**Note:** To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

```python
class matplotlib.ticker.EngFormatter(unit='', places=None, sep=' ', use-
tex=None, useMathText=None)
    Bases: matplotlib.ticker.Formatter
```
Format axis values using engineering prefixes to represent powers of 1000, plus a specified unit, e.g., 10 MHz instead of 1e7.

**Parameters**

**unit**

[**str**, default: ""] Unit symbol to use, suitable for use with single-letter representations of powers of 1000. For example, 'Hz' or 'm'.

**places**

[int, default: None] Precision with which to display the number, specified in digits after the decimal point (there will be between one and three digits before the decimal point). If it is None, the formatting falls back to the floating point format '%g', which displays up to 6 significant digits, i.e. the equivalent value for places varies between 0 and 5 (inclusive).

**sep**

[**str**, default: ""] Separator used between the value and the prefix/unit. For example, one get '3.14 mV' if sep is " " (default) and '3.14mV' if sep is "". Besides the default behavior, some other useful options may be:

- sep="" to append directly the prefix/unit to the value;
- sep="\N{THIN SPACE}" (U+2009);
- sep="\N{NARROW NO-BREAK SPACE}" (U+202F);
- sep="\N{NO-BREAK SPACE}" (U+00A0).

**usetex**

[**bool**, default: `rcParams["text.usetex"]` (default: False)] To enable/disable the use of TeX's math mode for rendering the numbers in the formatter.

**useMathText**

[**bool**, default: `rcParams["axes.formatter.use_mathtext"]` (default: False)] To enable/disable the use mathtext for rendering the numbers in the formatter.

**format_eng**(self, num)

Format a number in engineering notation, appending a letter representing the power of 1000 of the original number. Some examples:

```python
>>> format_eng(0)       # for self.places = 0
'0'

>>> format_eng(1000000) # for self.places = 1
'1.0 M'
```
get_useMathText(self)
gusetex(self)
set_useMathText(self, val)
setusetex(self, val)

property useMathText
property usetex

class matplotlib.ticker.FixedFormatter(seq)
Bases: matplotlib.ticker.Formatter

Return fixed strings for tick labels based only on position, not value.

Note: FixedFormatter should only be used together with FixedLocator. Otherwise, the labels may end up in unexpected positions.

Set the sequence seq of strings that will be used for labels.

get_offset(self)

set_offset_string(self, ofs)

class matplotlib.ticker.FixedLocator(locs, nbins=None)
Bases: matplotlib.ticker.Locator

Tick locations are fixed. If nbins is not None, the array of possible positions will be subsampled to keep the number of ticks <= nbins +1. The subsampling will be done so as to include the smallest absolute value; for example, if zero is included in the array of possibilities, then it is guaranteed to be one of the chosen ticks.

set_params(self, nbins=None)
    Set parameters within this locator.

tick_values(self, vmin, vmax)
    Return the locations of the ticks.

Note: Because the values are fixed, vmin and vmax are not used in this method.

class matplotlib.ticker.FormatStrFormatter(fmt)
Bases: matplotlib.ticker.Formatter

Use an old-style ('%' operator) format string to format the tick.

The format string should have a single variable format (%) in it. It will be applied to the value (not the position) of the tick.
Negative numeric values will use a dash not a unicode minus, use mathtext to get a unicode minus by wrapping the format specifier with $ (e.g. "$\%g\$").

```python
class matplotlib.ticker.Formatter
    Bases: matplotlib.ticker.TickHelper

Create a string based on a tick value and location.

    static fix_minus(s)
        Some classes may want to replace a hyphen for minus with the proper unicode symbol (U+2212) for typographical correctness. This is a helper method to perform such a replacement when it is enabled via rcParams['axes.unicode_minus'] (default: True).

    format_data(self, value)
        Return the full string representation of the value with the position unspecified.

    format_data_short(self, value)
        Return a short string version of the tick value.
        Defaults to the position-independent long value.

    format_ticks(self, values)
        Return the tick labels for all the ticks at once.

    get_offset(self)

    locs = []

    set_locs(self, locs)
        Set the locations of the ticks.
        This method is called before computing the tick labels because some formatters need to know all tick locations to do so.
```

```python
class matplotlib.ticker.FuncFormatter(func)
    Bases: matplotlib.ticker.Formatter

Use a user-defined function for formatting.

    The function should take in two inputs (a tick value \( x \) and a position \( \text{pos} \)), and return a string containing the corresponding tick label.

    get_offset(self)

    set_offset_string(self, ofs)
```

```python
class matplotlib.ticker.IndexFormatter(**kwargs)
    Bases: matplotlib.ticker.Formatter

[Deprecated] Format the position \( x \) to the nearest \( i \)-th label where \( i = \text{int}(x + 0.5) \). Positions where \( i < 0 \) or \( i > \text{len}(\text{list}) \) have no tick labels.

    Parameters

    labels
        [list] List of labels.
```
Notes

Deprecated since version 3.3.

```
class matplotlib.ticker.IndexLocator(base, offset)
Bases: matplotlib.ticker.Locator
```

Place a tick on every multiple of some base number of points plotted, e.g., on every 5th point. It is assumed that you are doing index plotting; i.e., the axis is 0, len(data). This is mainly useful for x ticks.

Place ticks every `base` data point, starting at `offset`.

```
set_params(self, base=None, offset=None)
Set parameters within this locator
```

```
tick_values(self, vmin, vmax)
Return the values of the located ticks given `vmin` and `vmax`.
```

---

**Note:** To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

```
class matplotlib.ticker.LinearLocator(numticks=None, presets=None)
Bases: matplotlib.ticker.Locator
```

Determine the tick locations

The first time this function is called it will try to set the number of ticks to make a nice tick partitioning. Thereafter the number of ticks will be fixed so that interactive navigation will be nice

Use presets to set locs based on lom. A dict mapping vmin, vmax->locs

```
property numticks
```

```
set_params(self, numticks=None, presets=None)
Set parameters within this locator.
```

```
tick_values(self, vmin, vmax)
Return the values of the located ticks given `vmin` and `vmax`.
```

---

**Note:** To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```
view_limits(self, vmin, vmax)
Try to choose the view limits intelligently.

class matplotlib.ticker.Locator
Bases: matplotlib.ticker.TickHelper

Determine the tick locations;

Note that the same locator should not be used across multiple Axis because the locator stores references to the Axis data and view limits.

MAXTICKS = 1000

nonsingular(self, v0, v1)
Adjust a range as needed to avoid singularities.

This method gets called during autoscaling, with (v0, v1) set to the data limits on the axes if the axes contains any data, or (-inf, +inf) if not.

- If v0 == v1 (possibly up to some floating point slop), this method returns an expanded interval around this value.
- If (v0, v1) == (-inf, +inf), this method returns appropriate default view limits.
- Otherwise, (v0, v1) is returned without modification.

pan(self, numsteps)
[Deprecated] Pan numticks (can be positive or negative)

Notes

Deprecated since version 3.3.

raise_if_exceeds(self, locs)
Log at WARNING level if locs is longer than Locator.MAXTICKS.

This is intended to be called immediately before returning locs from __call__ to inform users in case their Locator returns a huge number of ticks, causing Matplotlib to run out of memory.

The "strange" name of this method dates back to when it would raise an exception instead of emitting a log.

refresh(self)
[Deprecated] Refresh internal information based on current limits.
Notes

Deprecated since version 3.3.

**set_params**(self, **kwargs)
Do nothing, and raise a warning. Any locator class not supporting the set_params() function will call this.

**tick_values**(self, vmin, vmax)
Return the values of the located ticks given vmin and vmax.

**view_limits**(self, vmin, vmax)
Select a scale for the range from vmin to vmax.
Subclasses should override this method to change locator behaviour.

**zoom**(self, direction)
[Deprecated] Zoom in/out on axis; if direction is >0 zoom in, else zoom out.

Notes

Deprecated since version 3.3.

**class** `matplotlib.ticker.LogFormatter`(base=10.0, labelOnlyBase=False, minor_thresholds=None, linthresh=None)

Bases: `matplotlib.ticker.Formatter`

Base class for formatting ticks on a log or symlog scale.
It may be instantiated directly, or subclassed.

Parameters

**base**
[Float, default: 10.] Base of the logarithm used in all calculations.

**labelOnlyBase**
[bool, default: False] If True, label ticks only at integer powers of base. This is normally True for major ticks and False for minor ticks.

**minor_thresholds**
[(subset, all), default: (1, 0.4)] If labelOnlyBase is False, these two numbers control the labeling of ticks that are not at integer powers of base; normally these are the minor ticks. The controlling parameter is the log of the axis data range. In the typical case where base is 10 it is the number of decades spanned by the axis, so we can call it 'numdec'. If numdec <= all, all minor ticks will be labeled. If all < numdec <= subset, then only a subset of minor ticks will be labeled, so as to avoid crowding. If numdec > subset then no minor ticks will be labeled.

linthresh

[None or float, default: None] If a symmetric log scale is in use, its linthresh parameter must be supplied here.

Notes

The set_locs method must be called to enable the subsetting logic controlled by the minor_thresholds parameter.

In some cases such as the colorbar, there is no distinction between major and minor ticks; the tick locations might be set manually, or by a locator that puts ticks at integer powers of base and at intermediate locations. For this situation, disable the minor_thresholds logic by using minor_thresholds=(np.inf, np.inf), so that all ticks will be labeled.

To disable labeling of minor ticks when 'labelOnlyBase' is False, use minor_thresholds=(0, 0). This is the default for the "classic" style.

Examples

To label a subset of minor ticks when the view limits span up to 2 decades, and all of the ticks when zoomed in to 0.5 decades or less, use minor_thresholds=(2, 0.5).

To label all minor ticks when the view limits span up to 1.5 decades, use minor_thresholds=(1.5, 1.5).

base (self, base)

Change the base for labeling.

Warning: Should always match the base used for LogLocator

format_data (self, value)

Return the full string representation of the value with the position unspecified.

format_data_short (self, value)

Return a short string version of the tick value.

Defaults to the position-independent long value.
**label_minor** *(self, labelOnlyBase)*
Switch minor tick labeling on or off.

**Parameters**

**labelOnlyBase**

* [bool] If True, label ticks only at integer powers of base.

**set_locs** *(self, locs=None)*
Use axis view limits to control which ticks are labeled.

The *locs* parameter is ignored in the present algorithm.

```python
class matplotlib.ticker.LogFormatterExponent (base=10.0, labelOnlyBase=False, minor_thresholds=None, linthresh=None)

Bases: matplotlib.ticker.LogFormatter

Format values for log axis using \(\text{exponent} = \log_{\text{base}}(\text{value})\).
```

```python
class matplotlib.ticker.LogFormatterMathtext (base=10.0, labelOnlyBase=False, minor_thresholds=None, linthresh=None)

Bases: matplotlib.ticker.LogFormatter

Format values for log axis using \(\text{exponent} = \log_{\text{base}}(\text{value})\).
```

```python
class matplotlib.ticker.LogFormatterSciNotation (base=10.0, labelOnlyBase=False, minor_thresholds=None, linthresh=None)

Bases: matplotlib.ticker.LogFormatterMathtext

Format values following scientific notation in a logarithmic axis.
```

```python
class matplotlib.ticker.LogLocator (base=10.0, subs=1.0, numdec=4, numticks=None)

Bases: matplotlib.ticker.Locator

Determine the tick locations for log axes

Place ticks on the locations : \(\text{subs}[j] * \text{base}^\text{i}\)

**Parameters**

**base**

* [float, default: 10.0] The base of the log used, so ticks are placed at \(\text{base}^\text{n}\).

**subs**

* [None or str or sequence of float, default: (1.0,)] Given the multiples of integer powers of the base at which to place ticks. The default places ticks only at integer powers of the base. The permitted string values are 'auto' and 'all', both
of which use an algorithm based on the axis view limits to determine whether
and how to put ticks between integer powers of the base. With 'auto', ticks are
placed only between integer powers; with 'all', the integer powers are included.
A value of None is equivalent to 'auto'.

numticks

[None or int, default: None] The maximum number of ticks to allow on a given
axis. The default of None will try to choose intelligently as long as this Locator
has already been assigned to an axis using get_tick_space, but otherwise
falls back to 9.

base (self, base)
Set the log base (major tick every base**i, i integer).

nonsingular (self, vmin, vmax)
Adjust a range as needed to avoid singularities.

This method gets called during autoscaling, with (v0, v1) set to the data limits on the axes if
the axes contains any data, or (-inf, +inf) if not.

- If v0 == v1 (possibly up to some floating point slop), this method returns an expanded
  interval around this value.
- If (v0, v1) == (-inf, +inf), this method returns appropriate default view limits.
- Otherwise, (v0, v1) is returned without modification.

set_params (self, base=None, subs=None, numdec=None, numticks=None)
Set parameters within this locator.

subs (self, subs)
Set the minor ticks for the log scaling every base**i*subs[j].

tick_values (self, vmin, vmax)
Return the values of the located ticks given vmin and vmax.

Note: To get tick locations with the vmin and vmax values defined automatically for the asso-
ciated axis simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

view_limits (self, vmin, vmax)
Try to choose the view limits intelligently.

class matplotlib.ticker.LogitFormatter(*, use_overline=False,
  one_half='\times\frac{1}{2}', minor=False, minor_threshold=25, minor_number=6)
Bases: matplotlib.ticker.Formatter
Probability formatter (using Math text).

**Parameters**

**use_overline**

[bool, default: False] If $x > 1/2$, with $x = 1-v$, indicate if $x$ should be displayed as $\overline{v}$. The default is to display $1-v$.

**one_half**

[str, default: r"frac{1}{2}"] The string used to represent 1/2.

**minor**

[bool, default: False] Indicate if the formatter is formatting minor ticks or not. Basically minor ticks are not labelled, except when only few ticks are provided, ticks with most space with neighbor ticks are labelled. See other parameters to change the default behavior.

**minor_threshold**

[int, default: 25] Maximum number of locs for labelling some minor ticks. This parameter have no effect if minor is False.

**minor_number**

[int, default: 6] Number of ticks which are labelled when the number of ticks is below the threshold.

**format_data_short** *(self, value)*

Return a short string version of the tick value.

Defaults to the position-independent long value.

**set_locs** *(self, locs)*

Set the locations of the ticks.

This method is called before computing the tick labels because some formatters need to know all tick locations to do so.

**set_minor_number** *(self, minor_number)*

Set the number of minor ticks to label when some minor ticks are labelled.

**Parameters**

**minor_number**

[int] Number of ticks which are labelled when the number of ticks is below the threshold.

**set_minor_threshold** *(self, minor_threshold)*

Set the threshold for labelling minors ticks.

**Parameters**
**minor_threshold**

[int] Maximum number of locations for labelling some minor ticks. This parameter have no effect if minor is False.

**set_one_half** *(self, one_half)*

Set the way one half is displayed.

**one_half**

[str, default: \texttt{r"\frac{1}{2}"}] The string used to represent 1/2.

**use_overline** *(self, use_overline)*

Switch display mode with overline for labelling p>1/2.

**Parameters**

**use_overline**

[bool, default: False] If $x > 1/2$, with $x = 1-v$, indicate if $x$ should be displayed as $\overline{v}$. The default is to display $1-v$.

**class** matplotlib.ticker.LogitLocator *(minor=False, *, nbins='auto')*

Bases: matplotlib.ticker.MaxNLocator

Determine the tick locations for logit axes

Place ticks on the logit locations

**Parameters**

**nbins**

[int or 'auto', optional] Number of ticks. Only used if minor is False.

**minor**

[bool, default: False] Indicate if this locator is for minor ticks or not.

**property** minor

**nonsingular** *(self, vmin, vmax)*

Adjust a range as needed to avoid singularities.

This method gets called during autoscaling, with $(v0, v1)$ set to the data limits on the axes if the axes contains any data, or $(-\infty, +\infty)$ if not.

- If $v0 == v1$ (possibly up to some floating point slop), this method returns an expanded interval around this value.
- If $(v0, v1) == (-\infty, +\infty)$, this method returns appropriate default view limits.
- Otherwise, $(v0, v1)$ is returned without modification.

**set_params** *(self, minor=None, **kwargs)*

Set parameters within this locator.
tick_values (self, vmin, vmax)
Return the values of the located ticks given vmin and vmax.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

class matplotlib.ticker.MaxNLocator(*args, **kwargs)
Bases: matplotlib.ticker.Locator

Find nice tick locations with no more than N being within the view limits. Locations beyond the limits are added to support autoscaling.

Parameters

nbins
[int or 'auto', default: 10] Maximum number of intervals; one less than max number of ticks. If the string 'auto', the number of bins will be automatically determined based on the length of the axis.

steps
[array-like, optional] Sequence of nice numbers starting with 1 and ending with 10; e.g., [1, 2, 4, 5, 10], where the values are acceptable tick multiples. i.e. for the example, 20, 40, 60 would be an acceptable set of ticks, as would 0.4, 0.6, 0.8, because they are multiples of 2. However, 30, 60, 90 would not be allowed because 3 does not appear in the list of steps.

integer
[bool, default: False] If True, ticks will take only integer values, provided at least min_n_ticks integers are found within the view limits.

symmetric
[bool, default: False] If True, autoscaling will result in a range symmetric about zero.

prune
[['lower', 'upper', 'both', None], default: None] Remove edge ticks -- useful for stacked or ganged plots where the upper tick of one axes overlaps with the lower tick of the axes above it, primarily when rcParams["axes.autolimit_mode"] (default: 'data') is 'round_numbers'. If prune=="lower", the smallest tick will be removed. If prune == 'upper', the largest tick will be removed. If prune == 'both', the largest and smallest ticks will be removed. If prune is None, no ticks will be removed.
min_n_ticks

[int, default: 2] Relax nbins and integer constraints if necessary to obtain this minimum number of ticks.

default_params = {'integer': False, 'min_n_ticks': 2, 'nbins': 10, 'prune': None, 'steps': None, 'symmetric': False}

set_params(self, **kwargs)
Set parameters for this locator.

Parameters

nbins
[int or 'auto', optional] see MaxNLocator

steps
[array-like, optional] see MaxNLocator

integer
[bool, optional] see MaxNLocator

symmetric
[bool, optional] see MaxNLocator

prune
[{‘lower’, ‘upper’, ‘both’, None}, optional] see MaxNLocator

min_n_ticks
[int, optional] see MaxNLocator

tick_values(self, vmin, vmax)
Return the values of the located ticks given vmin and vmax.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

view_limits(self, dmin, dmax)
Select a scale for the range from vmin to vmax.

Subclasses should override this method to change locator behaviour.

class matplotlib.ticker.MultipleLocator(base=1.0)
Bases: matplotlib.ticker.Locator

Set a tick on each integer multiple of a base within the view interval.

**set_params** *(self, base)*

Set parameters within this locator.

**tick_values** *(self, vmin, vmax)*

Return the values of the located ticks given vmin and vmax.

---

**Note:** To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

**view_limits** *(self, dmin, dmax)*

Set the view limits to the nearest multiples of base that contain the data.

---

### matplotlib.ticker.NullFormatter

[Bases: matplotlib.ticker.Formatter]

Always return the empty string.

---

### matplotlib.ticker.NullLocator

[Bases: matplotlib.ticker.Locator]

No ticks

**tick_values** *(self, vmin, vmax)*

Return the locations of the ticks.

---

**Note:** Because the values are Null, vmin and vmax are not used in this method.

---

### matplotlib.ticker.OldAutoLocator(*args, **kwargs)

[Bases: matplotlib.ticker.Locator]

[Deprecated] On autoscale this class picks the best MultipleLocator to set the view limits and the tick locs.

---

### Notes

Deprecated since version 3.3.

**get_locator** *(self, d)*

Pick the best locator based on a distance d.

**tick_values** *(self, vmin, vmax)*

Return the values of the located ticks given vmin and vmax.
Note: To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

view_limits(self, vmin, vmax)
Select a scale for the range from vmin to vmax.

Subclasses should override this method to change locator behaviour.

class matplotlib.ticker.OldScalarFormatter(*args, **kwargs)
Bases: matplotlib.ticker.Formatter

[Deprecated] Tick location is a plain old number.

Notes

Deprecated since version 3.3.

class matplotlib.ticker.PercentFormatter(xmax=100, decimals=None, symbol='%', is_latex=False)
Bases: matplotlib.ticker.Formatter

Format numbers as a percentage.

Parameters

xmax

[float] Determines how the number is converted into a percentage. xmax is the data value that corresponds to 100%. Percentages are computed as \( \frac{x}{xmax} \times 100 \). So if the data is already scaled to be percentages, xmax will be 100. Another common situation is where xmax is 1.0.

decimals

[None or int] The number of decimal places to place after the point. If None (the default), the number will be computed automatically.

symbol

[str or None] A string that will be appended to the label. It may be None or empty to indicate that no symbol should be used. LaTeX special characters are escaped in symbol whenever latex mode is enabled, unless is_latex is True.

is_latex

[bool] If False, reserved LaTeX characters in symbol will be escaped.
**convert_to_pct** *(self, x)*

**format_pct** *(self, x, display_range)*

Format the number as a percentage number with the correct number of decimals and adds the percent symbol, if any.

If `self.decimals` is `None`, the number of digits after the decimal point is set based on the `display_range` of the axis as follows:

<table>
<thead>
<tr>
<th>display_range</th>
<th>decimals</th>
<th>sample</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt;50</td>
<td>0</td>
<td>x = 34.5 =&gt; 35%</td>
</tr>
<tr>
<td>&gt;5</td>
<td>1</td>
<td>x = 34.5 =&gt; 34.5%</td>
</tr>
<tr>
<td>&gt;0.5</td>
<td>2</td>
<td>x = 34.5 =&gt; 34.50%</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
<td>...</td>
</tr>
</tbody>
</table>

This method will not be very good for tiny axis ranges or extremely large ones. It assumes that the values on the chart are percentages displayed on a reasonable scale.

**property symbol**

The configured percent symbol as a string.

If LaTeX is enabled via `rcParams["text.usetex"]` (default: False), the special characters {#', '$', '%', '&', '~', '_', '^', '\', '{', '}'} are automatically escaped in the string.

**class** matplotlib.ticker.ScalarFormatter *(useOffset=None, useMathText=None, useLocale=None)*

Bases: matplotlib.ticker.Formatter

Format tick values as a number.

**Parameters**

**useOffset**

[bool or float, default: `rcParams["axes.formatter.useoffset"]` (default: `True`)] Whether to use offset notation. See `set_useOffset`.

**useMathText**

[bool, default: `rcParams["axes.formatter.use_mathtext"]` (default: `False`)] Whether to use fancy math formatting. See `set_useMathText`.

**useLocale**

[bool, default: `rcParams["axes.formatter.use_locale"]` (default: `False`)] Whether to use locale settings for decimal sign and positive sign. See `set_useLocale`.  

18.54. matplotlib.ticker  2833
Notes

In addition to the parameters above, the formatting of scientific vs. floating point representation can be configured via `set_scientific` and `set_powerlimits`.

**Offset notation and scientific notation**

Offset notation and scientific notation look quite similar at first sight. Both split some information from the formatted tick values and display it at the end of the axis.

- The scientific notation splits up the order of magnitude, i.e. a multiplicative scaling factor, e.g. $10^6$.
- The offset notation separates an additive constant, e.g. $+10^6$. The offset notation label is always prefixed with a + or − sign and is thus distinguishable from the order of magnitude label.

The following plot with x limits $1_000_000$ to $1_000_010$ illustrates the different formatting. Note the labels at the right edge of the x axis.

---

```python
format_data(self, value)
    Return the full string representation of the value with the position unspecified.

format_data_short(self, value)
    Return a short string version of the tick value.

    Defaults to the position-independent long value.
```
get_offset (self)
Return scientific notation, plus offset.

get_useLocale (self)
Return whether locale settings are used for formatting.
See also:
ScalarFormatter.set_useLocale

get_useMathText (self)
Return whether to use fancy math formatting.
See also:
ScalarFormatter.set_useMathText

get_useOffset (self)
Return whether automatic mode for offset notation is active.
This returns True if set_useOffset (True); it returns False if an explicit offset was set, e.g.
set_useOffset (1000).
See also:
ScalarFormatter.set_useOffset

set_locs (self, locs)
Set the locations of the ticks.
This method is called before computing the tick labels because some formatters need to know all tick locations to do so.

set_powerlimits (self, lims)
Set size thresholds for scientific notation.
Parameters

lims
[(int, int)] A tuple (min_exp, max_exp) containing the powers of 10 that determine the switchover threshold. For a number representable as $a \times 10^{exp}$ with $1 \leq |a| < 10$, scientific notation will be used if $exp <= \text{min_exp or exp >= max_exp}$.

The default limits are controlled by rcParams["axes.formatter.limits"] (default: [-5, 6]).
In particular numbers with $exp$ equal to the thresholds are written in scientific notation.
Typically, min_exp will be negative and max_exp will be positive.
For example, `formatter.set_powerlimits((-3, 4))` will provide the following formatting: $1 \times 10^{-3}, 9.9 \times 10^{-3}, 0.01, 9999, 1 \times 10^4$.

See also:

`ScalarFormatter.set_scientific`

`set_scientific(self, b)`

Turn scientific notation on or off.

See also:

`ScalarFormatter.set_powerlimits`

`set_useLocale(self, val)`

Set whether to use locale settings for decimal sign and positive sign.

**Parameters**

`val`

[bool or None] `None` resets to `rcParams["axes.formatter.use_locale"]` (default: False).

`set_useMathText(self, val)`

Set whether to use fancy math formatting.

If active, scientific notation is formatted as $1.2 \times 10^3$.

**Parameters**

`val`

[bool or None] `None` resets to `rcParams["axes.formatter.use_mathtext"]` (default: False).

`set_useOffset(self, val)`

Set whether to use offset notation.

When formatting a set numbers whose value is large compared to their range, the formatter can separate an additive constant. This can shorten the formatted numbers so that they are less likely to overlap when drawn on an axis.

**Parameters**

`val`

[bool or float]

- If False, do not use offset notation.
• If True (=automatic mode), use offset notation if it can make the residual numbers significantly shorter. The exact behavior is controlled by `rcParams["axes.formatter.offset_threshold"]` (default: 4).
• If a number, force an offset of the given value.

**Examples**

With active offset notation, the values

```
100_000, 100_002, 100_004, 100_006, 100_008
```

will be formatted as 0, 2, 4, 6, 8 plus an offset $+10^5$, which is written to the edge of the axis.

**property useLocale**

Return whether locale settings are used for formatting.

See also:

* `ScalarFormatter.set_useLocale`

**property useMathText**

Return whether to use fancy math formatting.

See also:

* `ScalarFormatter.set_useMathText`

**property useOffset**

Return whether automatic mode for offset notation is active.

This returns True if `set_useOffset(True)`; it returns False if an explicit offset was set, e.g. `set_useOffset(1000)`.

See also:

* `ScalarFormatter.set_useOffset`

**class matplotlib.ticker.StrMethodFormatter**(fmt)

Bases: `matplotlib.ticker.Formatter`

Use a new-style format string (as used by `str.format`) to format the tick.

The field used for the tick value must be labeled `x` and the field used for the tick position must be labeled `pos`.

**class matplotlib.ticker.SymmetricalLogLocator**(transform=None, subs=None, linthresh=None, base=None)

Bases: `matplotlib.ticker.Locator`

Determine the tick locations for symmetric log axes.
Parameters

transform

[SymmetricalLogTransform, optional] If set, defines the base and linthresh of the symlog transform.

base, linthresh

[float, optional] The base and linthresh of the symlog transform, as documented for SymmetricalLogScale. These parameters are only used if transform is not set.

subs

[sequence of float, default: [1]] The multiples of integer powers of the base where ticks are placed, i.e., ticks are placed at [sub * base**i for i in ... for sub in subs].

Notes

Either transform, or both base and linthresh, must be given.

set_params(self, subs=None, numticks=None)

Set parameters within this locator.

tick_values(self, vmin, vmax)

Return the values of the located ticks given vmin and vmax.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

view_limits(self, vmin, vmax)

Try to choose the view limits intelligently.

class matplotlib.ticker.TickHelper

Bases: object

axis = None

create_dummy_axis(self, **kwargs)

set_axis(self, axis)

set_bounds(self, vmin, vmax)

set_data_interval(self, vmin, vmax)
set_view_interval \( (self, vmin, vmax) \)

18.55 matplotlib.tight_bbox

Helper module for the `bbox_inches` parameter in `Figure.savefig`.

```python
class matplotlib.tight_bbox:
    
    def adjust_bbox(fig, bbox_inches, fixed_dpi=None):
        Temporary adjust the figure so that only the specified area (bbox_inches) is saved.
        
        It modifies fig.bbox, fig.bbox_inches, fig.transFigure._boxout, and fig.patch. While the figure size changes, the scale of the original figure is conserved. A function which restores the original values are returned.
```
A function that needs to be called when figure dpi changes during the drawing (e.g., rasterizing). It recovers the bbox and re-adjust it with the new dpi.

18.56 matplotlib.tight_layout

Routines to adjust subplot params so that subplots are nicely fit in the figure. In doing so, only axis labels, tick labels, axes titles and offsetboxes that are anchored to axes are currently considered.

Internally, this module assumes that the margins (left_margin, etc.) which are differences between ax.get_tightbbox and ax.bbox are independent of axes position. This may fail if Axes.adjustable is datalim. Also, This will fail for some cases (for example, left or right margin is affected by xlabel).

Return a dict of subplot parameters to adjust spacing between subplots or None if resulting axes would have zero height or width.

Note that this function ignores geometry information of subplot itself, but uses what is given by the nrows ncols and num1num2_list parameters. Also, the results could be incorrect if some subplots have adjustable=datalim.

Parameters

nrows ncols
[tuple[int, int]] Number of rows and number of columns of the grid.

num1num2_list
[list[int]] List of numbers specifying the area occupied by the subplot

subplot_list
[list of subplots] List of subplots that will be used to calculate optimal subplot_params.

pad
[float] Padding between the figure edge and the edges of subplots, as a fraction of the font size.

h_pad, w_pad
[float] Padding (height/width) between edges of adjacent subplots, as a fraction of the font size. Defaults to pad.

rect
[tuple[float, float, float, float]] [left, bottom, right, top] in normalized (0, 1) figure coordinates.

```python
matplotlib.tight_layout.get_renderer(fig)
```

```python
matplotlib.tight_layout.get_subplotspec_list(axes_list, grid_spec=None)
```

Return a list of subplotspec from the given list of axes.

For an instance of axes that does not support subplotspec, None is inserted in the list.

If grid_spec is given, None is inserted for those not from the given grid_spec.

```python
matplotlib.tight_layout.get_tight_layout_figure(fig, axes_list, subplotspec_list, renderer, pad=1.08, h_pad=None, w_pad=None, rect=None)
```

Return subplot parameters for tight-layouted-figure with specified padding.

**Parameters**

- `fig`
  
  [Figure]

- `axes_list`
  
  [list of Axes]

- `subplotspec_list`
  
  [list of SubplotSpec] The subplotspecs of each axes.

- `renderer`
  
  [renderer]

- `pad`
  
  [float] Padding between the figure edge and the edges of subplots, as a fraction of the font size.

- `h_pad, w_pad`
  
  [float] Padding (height/width) between edges of adjacent subplots. Defaults to `pad`.

- `rect`
  
  [tuple[float, float, float, float], optional] (left, bottom, right, top) rectangle in normalized figure coordinates that the whole subplots area (including labels) will fit into. Defaults to using the entire figure.

**Returns**

- `subplotspec or None`
subplotspec kwargs to be passed to `Figure.subplots_adjust` or None if `tight_layout` could not be accomplished.

### 18.57 matplotlib.transforms

Matplotlib includes a framework for arbitrary geometric transformations that is used to determine the final position of all elements drawn on the canvas.

Transforms are composed into trees of `TransformNode` objects whose actual value depends on their children. When the contents of children change, their parents are automatically invalidated. The next time an invalidated transform is accessed, it is recomputed to reflect those changes. This invalidation/caching approach prevents unnecessary recomputations of transforms, and contributes to better interactive performance.

For example, here is a graph of the transform tree used to plot data to the graph:
The framework can be used for both affine and non-affine transformations. However, for speed, we want use the backend renderers to perform affine transformations whenever possible. Therefore, it is possible to perform just the affine or non-affine part of a transformation on a set of data. The affine is always assumed to occur after the non-affine. For any transform:

\[
\text{full transform} = \text{non-affine part} + \text{affine part}
\]

The backends are not expected to handle non-affine transformations themselves.
class matplotlib.transforms.Affine2D (matrix=None, **kwargs)
Bases: matplotlib.transforms.Affine2DBase

A mutable 2D affine transformation.

Initialize an Affine transform from a 3x3 numpy float array:

\[
\begin{bmatrix}
a & c & e \\
b & d & f \\
0 & 0 & 1 \\
\end{bmatrix}
\]

If matrix is None, initialize with the identity transform.

__init__ (self, matrix=None, **kwargs)
Initialize an Affine transform from a 3x3 numpy float array:

\[
\begin{bmatrix}
a & c & e \\
b & d & f \\
0 & 0 & 1 \\
\end{bmatrix}
\]

If matrix is None, initialize with the identity transform.

__module__ = 'matplotlib.transforms'

__str__ (self)
Return str(self).

clear (self)
Reset the underlying matrix to the identity transform.

static from_values (a, b, c, d, e, f)
Create a new Affine2D instance from the given values:

\[
\begin{bmatrix}
a & c & e \\
b & d & f \\
0 & 0 & 1 \\
\end{bmatrix}
\]

get_matrix (self)
Get the underlying transformation matrix as a 3x3 numpy array:

\[
\begin{bmatrix}
a & c & e \\
b & d & f \\
0 & 0 & 1 \\
\end{bmatrix}
\]

static identity ()
Return a new Affine2D object that is the identity transform.

Unless this transform will be mutated later on, consider using the faster IdentityTransform class instead.

rotate (self, theta)
Add a rotation (in radians) to this transform in place.
Returns `self`, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

**rotate** (self, x, y, theta)
Add a rotation (in radians) around the point (x, y) in place.

Returns `self`, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

**rotate_deg** (self, degrees)
Add a rotation (in degrees) to this transform in place.

Returns `self`, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

**rotate_deg_around** (self, x, y, degrees)
Add a rotation (in degrees) around the point (x, y) in place.

Returns `self`, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

**scale** (self, sx, sy=None)
Add a scale in place.

If `sy` is None, the same scale is applied in both the x- and y-directions.

Returns `self`, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

**set** (self, other)
Set this transformation from the frozen copy of another `Affine2DBase` object.

**set_matrix** (self, mtx)
Set the underlying transformation matrix from a 3x3 numpy array:

```
| a  c  e |
| b  d  f |
| 0  0  1 |
```

**skew** (self, xShear, yShear)
Add a skew in place.

`xShear` and `yShear` are the shear angles along the x- and y-axes, respectively, in radians.

Returns `self`, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

**skew_deg** (self, xShear, yShear)
Add a skew in place.

`xShear` and `yShear` are the shear angles along the x- and y-axes, respectively, in degrees.

Returns `self`, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.
translate(self, tx, ty)
    Add a translation in place.
    Returns self, so this method can easily be chained with more calls to rotate(), rotate_deg(), translate() and scale().

class matplotlib.transforms.Affine2DBase(*args, **kwargs)
    Bases: matplotlib.transforms.AffineBase
    The base class of all 2D affine transformations.

    2D affine transformations are performed using a 3x3 numpy array:

    
    a c e
    b d f
    0 0 1

    This class provides the read-only interface. For a mutable 2D affine transformation, use Affine2D.

    Subclasses of this class will generally only need to override a constructor and get_matrix() that generates a custom 3x3 matrix.

    Parameters

    shorthand_name
        [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of str(transform) when DEBUG=True.

    __module__ = 'matplotlib.transforms'

    frozen(self)
        Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where copy.deepcopy() might normally be used.

    has_inverse = True

    input_dims = 2

    inverted(self)
        Return the corresponding inverse transformation.
        It holds x == self.inverted().transform(self.transform(x)).

        The return value of this method should be treated as temporary. An update to self does not cause a corresponding update to its inverted copy.

    property is_separable
        bool(x) -> bool

        Returns True when the argument x is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.
output_dims = 2

to_values(self)
    Return the values of the matrix as an (a, b, c, d, e, f) tuple.

transform_affine(self, points)
    Apply only the affine part of this transformation on the given array of values.

    transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

    In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to transform(values).

    Parameters

        values
            [array] The input values as NumPy array of length input_dims or shape (N x input_dims).

    Returns

        array
            The output values as NumPy array of length input_dims or shape (N x output_dims), depending on the input.

class matplotlib.transforms.AffineBase(*args, **kwargs)
Bases: matplotlib.transforms.Transform

    The base class of all affine transformations of any number of dimensions.

    Parameters

        shorthand_name
            [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of str(transform) when DEBUG=True.

__array__(self, *args, **kwargs)
    Array interface to get at this Transform's affine matrix.

__eq__(self, other)
    Return self==value.

__hash__ = None

__init__(self, *args, **kwargs)
    Parameters
shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of str(transform) when DEBUG=True.

__module__ = 'matplotlib.transforms'

get_affine(self)
Get the affine part of this transform.

is_affine = True

transform(self, values)
Apply this transformation on the given array of values.

Parameters

values

[array] The input values as NumPy array of length input_dims or shape (N x input_dims).

Returns

array

The output values as NumPy array of length input_dims or shape (N x output_dims), depending on the input.

transform_affine(self, values)
Apply only the affine part of this transformation on the given array of values.

transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to transform(values).

Parameters

values

[array] The input values as NumPy array of length input_dims or shape (N x input_dims).

Returns

array

The output values as NumPy array of length input_dims or shape (N x output_dims), depending on the input.
**transform_non_affine** *(self, points)*  
Apply only the non-affine part of this transformation.

```
transform(values) is always equivalent to transform_affine(transform_non_affine(values)).
```

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

**Parameters**

- **values**  
  [array] The input values as NumPy array of length `input_dims` or shape `(N x input_dims)`.

**Returns**

- **array**  
  The output values as NumPy array of length `input_dims` or shape `(N x output_dims)`, depending on the input.

**transform_path** *(self, path)*  
Apply the transform to `Path path`, returning a new `Path`.

In some cases, this transform may insert curves into the path that began as line segments.

**transform_path_affine** *(self, path)*  
Apply the affine part of this transform to `Path path`, returning a new `Path`.

```
transform_path(path) is equivalent to transform_path_affine(transform_path_non_affine(path))
```

**transform_path_non_affine** *(self, path)*  
Apply the non-affine part of this transform to `Path path`, returning a new `Path`.

```
transform_path(path) is equivalent to transform_path_affine(transform_path_non_affine(path))
```

class matplotlib.transforms.AffineDeltaTransform(*transform, **kwargs)*  
Bases: `matplotlib.transforms.Affine2DBase`

A transform wrapper for transforming displacements between pairs of points.

This class is intended to be used to transform displacements ("position deltas") between pairs of points (e.g., as the offset_transform of `Collections`): given a transform `t` such that `t = AffineDeltaTransform(t) + offset`, `AffineDeltaTransform` satisfies

```
AffineDeltaTransform(a - b) == AffineDeltaTransform(a) - AffineDeltaTransform(b).
```

This is implemented by forcing the offset components of the transform matrix to zero.

This class is experimental as of 3.3, and the API may change.

**Parameters**

- **transform**  
  The input transform.

- **kwargs**  
  Additional keyword arguments passed to the base transform class.

18.57. *matplotlib.transforms*
shorthand_name

[\text{str}] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of \text{str(transform)} when DEBUG=True.

\_\_init\_\_(self, transform, **kwargs)

Parameters

shorthand_name

[\text{str}] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of \text{str(transform)} when DEBUG=True.

\_\_module\_\_ = 'matplotlib.transforms'

\_\_str\_\_(self)

Return \text{str(self)}.

get_matrix(self)

Get the matrix for the affine part of this transform.

class matplotlib.transforms.Bbox(points, **kwargs)

Bases: matplotlib.transforms.BboxBase

A mutable bounding box.

Examples

Create from known bounds

The default constructor takes the boundary "points" \[[\text{xmin}, \text{ymin}], [\text{xmax}, \text{ymax}]\].

```
>>> Bbox([[1, 1], [3, 7]])
Bbox([[1.0, 1.0], [3.0, 7.0]])
``` 

Alternatively, a Bbox can be created from the flattened points array, the so-called "extents" \((\text{xmin}, \text{ymin}, \text{xmax}, \text{ymax})\).

```
>>> Bbox.from_extents(1, 1, 3, 7)
Bbox([[1.0, 1.0], [3.0, 7.0]])
``` 

or from the "bounds" \((\text{xmin}, \text{ymin}, \text{width}, \text{height})\).

```
>>> Bbox.from_bounds(1, 1, 2, 6)
Bbox([[1.0, 1.0], [3.0, 7.0]])
``` 

Create from collections of points

The "empty" object for accumulating Bboxs is the null bbox, which is a stand-in for the empty set.
Adding points to the null bbox will give you the bbox of those points.

```python
>>> box = Bbox.null()
>>> box.update_from_data_xy([[1, 1]])
>>> box
Bbox([[1.0, 1.0], [1.0, 1.0]])
```

Setting `ignore=True` is equivalent to starting over from a null bbox.

```python
>>> box.update_from_data_xy([[1, 1]], ignore=True)
>>> box
Bbox([[1.0, 1.0], [1.0, 1.0]])
```

**Warning:** It is recommended to always specify `ignore` explicitly. If not, the default value of `ignore` can be changed at any time by code with access to your Bbox, for example using the method `ignore`.

Properties of the ``null`` bbox

**Note:** The current behavior of `Bbox.null()` may be surprising as it does not have all of the properties of the "empty set", and as such does not behave like a "zero" object in the mathematical sense. We may change that in the future (with a deprecation period).

The null bbox is the identity for intersections

```python
>>> Bbox.intersection(Bbox([[1, 1], [3, 7]]), Bbox.null())
Bbox([[1.0, 1.0], [3.0, 7.0]])
```

except with itself, where it returns the full space.

```python
>>> Bbox.intersection(Bbox.null(), Bbox.null())
Bbox([-inf, -inf], [inf, inf])
```

A union containing null will always return the full space (not the other set!)

```python
>>> Bbox.union([Bbox([[0, 0], [0, 0]]), Bbox.null()])
Bbox([-inf, -inf], [inf, inf])
```

**Parameters**

`points`
[ndarray] A 2x2 numpy array of the form \([x_0, y_0], [x_1, y_1]\).

```python
__format__(self, fmt)
    Default object formatter.
```

```python
__init__(self, points, **kwargs)

Parameters
points
    [ndarray] A 2x2 numpy array of the form \([x_0, y_0], [x_1, y_1]\).
```

```python
__module__ = 'matplotlib.transforms'
```

```python
__repr__(self)
    Return repr(self).
```

```python
__str__(self)
    Return str(self).
```

```python
property bounds
    Return \((x_0, y_0, \text{width}, \text{height})\).
```

```python
static from_bounds(x0, y0, width, height)
    Create a new Bbox from \(x_0, y_0, \text{width}\) and \(\text{height}\).
    \(\text{width}\) and \(\text{height}\) may be negative.
```

```python
static from_extents(*args, minpos=None)
    Create a new Bbox from \(\text{left}, \text{bottom}, \text{right}\) and \(\text{top}\).
    The \(y\)-axis increases upwards.

Parameters
left, bottom, right, top
    [float] The four extents of the bounding box.
minpos
    [float or None] If this is supplied, the Bbox will have a minimum positive value set. This is useful when dealing with logarithmic scales and other scales where negative bounds result in floating point errors.
```

```python
get_points(self)
    Get the points of the bounding box directly as a numpy array of the form: \([x_0, y_0], [x_1, y_1]\).
```

```python
ignore(self, value)
    Set whether the existing bounds of the box should be ignored by subsequent calls to update_from_data_xy().
```
value

[bool]

- When True, subsequent calls to `update_from_data_xy()` will ignore the existing bounds of the Bbox.
- When False, subsequent calls to `update_from_data_xy()` will include the existing bounds of the Bbox.

**property intervalx**
The pair of x coordinates that define the bounding box.

This is not guaranteed to be sorted from left to right.

**property intervaly**
The pair of y coordinates that define the bounding box.

This is not guaranteed to be sorted from bottom to top.

**property minpos**
The minimum positive value in both directions within the Bbox.

This is useful when dealing with logarithmic scales and other scales where negative bounds result in floating point errors, and will be used as the minimum extent instead of p0.

**property minposx**
The minimum positive value in the x-direction within the Bbox.

This is useful when dealing with logarithmic scales and other scales where negative bounds result in floating point errors, and will be used as the minimum x-extent instead of x0.

**property minposy**
The minimum positive value in the y-direction within the Bbox.

This is useful when dealing with logarithmic scales and other scales where negative bounds result in floating point errors, and will be used as the minimum y-extent instead of y0.

mutated(self)
Return whether the bbox has changed since init.

mutatedx(self)
Return whether the x-limits have changed since init.

mutatedy(self)
Return whether the y-limits have changed since init.

static null()
Create a new null Bbox from (inf, inf) to (-inf, -inf).

**property p0**
The first pair of (x, y) coordinates that define the bounding box.

This is not guaranteed to be the bottom-left corner (for that, use min).

**property p1**
The second pair of (x, y) coordinates that define the bounding box.
This is not guaranteed to be the top-right corner (for that, use \texttt{max}).

\texttt{set (self, other)}

Set this bounding box from the "frozen" bounds of another \texttt{Bbox}.

\texttt{set_points (self, points)}

Set the points of the bounding box directly from a numpy array of the form: \[[x0, y0],
[x1, y1]\]. No error checking is performed, as this method is mainly for internal use.

\texttt{static unit ()}

Create a new unit \texttt{Bbox} from (0, 0) to (1, 1).

\texttt{update_from_data_xy (self, xy, ignore=None, updatex=True, updatey=True)}

Update the bounds of the \texttt{Bbox} based on the passed in data. After updating, the bounds will have positive \texttt{width} and \texttt{height}; \texttt{x0} and \texttt{y0} will be the minimal values.

\textbf{Parameters}

\texttt{xy}

[ndarray] A numpy array of 2D points.

\texttt{ignore}

[bool, optional]

\begin{itemize}
  \item When \texttt{True}, ignore the existing bounds of the \texttt{Bbox}.
  \item When \texttt{False}, include the existing bounds of the \texttt{Bbox}.
  \item When \texttt{None}, use the last value passed to \texttt{ignore()}.
\end{itemize}

\texttt{updatex, updatey}

[bool, default: \texttt{True}] When \texttt{True}, update the x/y values.

\texttt{update_from_path (self, path, ignore=None, updatex=True, updatey=True)}

Update the bounds of the \texttt{Bbox} to contain the vertices of the provided path. After updating, the bounds will have positive \texttt{width} and \texttt{height}; \texttt{x0} and \texttt{y0} will be the minimal values.

\textbf{Parameters}

\texttt{path}

[\texttt{Path}]

\texttt{ignore}

[bool, optional]

\begin{itemize}
  \item when \texttt{True}, ignore the existing bounds of the \texttt{Bbox}.
  \item when \texttt{False}, include the existing bounds of the \texttt{Bbox}.
  \item when \texttt{None}, use the last value passed to \texttt{ignore()}.
\end{itemize}

\texttt{updatex, updatey}

[bool, default: \texttt{True}] When \texttt{True}, update the x/y values.
property x0
    The first of the pair of x coordinates that define the bounding box.
    
    This is not guaranteed to be less than x1 (for that, use xmin).

property x1
    The second of the pair of x coordinates that define the bounding box.
    
    This is not guaranteed to be greater than x0 (for that, use xmax).

property y0
    The first of the pair of y coordinates that define the bounding box.
    
    This is not guaranteed to be less than y1 (for that, use ymin).

property y1
    The second of the pair of y coordinates that define the bounding box.
    
    This is not guaranteed to be greater than y0 (for that, use ymax).

class matplotlib.transforms.BboxBase (shorthand_name=None)
Bases: matplotlib.transforms.TransformNode

The base class of all bounding boxes.

This class is immutable; Bbox is a mutable subclass.

The canonical representation is as two points, with no restrictions on their ordering. Convenience properties are provided to get the left, bottom, right and top edges and width and height, but these are not stored explicitly.

Parameters

shorthand_name
    [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of str(transform) when DEBUG=True.

__array__ (self, *args, **kwargs)

__module__ = 'matplotlib.transforms'

anchored (self, c, container=None)
    Return a copy of the Bbox shifted to position c within container.

Parameters

    c

    [(float, float) or str] May be either:
    - A sequence (cx, cy) where cx and cy range from 0 to 1, where 0 is left or bottom and 1 is right or top
    - a string: - 'C' for centered - 'S' for bottom-center - 'SE' for bottom-left - 'E' for left - etc.
container

[**bbox**, optional] The box within which the **bbox** is positioned; it defaults to the initial **bbox**.

**property bounds**

Return \((x_0, y_0, width, height)\).

coefs = {'C': (0.5, 0.5), 'E': (1.0, 0.5), 'N': (0.5, 1.0), 'NE': (1.0, 1.0), 'NW': (0, 1.0), 'S': (0.5, 0), 'SE': (1.0, 0), 'SW': (0, 0), 'W': (0, 0.5)}

contains (self, x, y)

Return whether \((x, y)\) is in the bounding box or on its edge.

containsx (self, x)

Return whether \(x\) is in the closed \((x_0, x_1)\) interval.

containsy (self, y)

Return whether \(y\) is in the closed \((y_0, y_1)\) interval.

corners (self)

Return the corners of this rectangle as an array of points.

Specifically, this returns the array \([\[x_0, y_0\], [x_0, y_1], [x_1, y_0], [x_1, y_1]\]\).

count_contains (self, vertices)

Count the number of vertices contained in the **bbox**. Any vertices with a non-finite x or y value are ignored.

**Parameters**

vertices

[Nx2 Numpy array.]

count_overlaps (self, bboxes)

Count the number of bounding boxes that overlap this one.

**Parameters**

bboxxes

[sequence of **bbox**]

expanded (self, sw, sh)

Construct a **bbox** by expanding this one around its center by the factors \(sw\) and \(sh\).

**property extents**

Return \((x_0, y_0, x_1, y_1)\).

frozen (self)

The base class for anything that participates in the transform tree and needs to invalidate its parents or be invalidated. This includes classes that are not really transforms, such as bounding boxes, since some transforms depend on bounding boxes to compute their values.
fully_contains \( (self, x, y) \)
Return whether \( x, y \) is in the bounding box, but not on its edge.

fully_containsx \( (self, x) \)
Return whether \( x \) is in the open \((x_0, x_1)\) interval.

fully_containsexy \( (self, y) \)
Return whether \( y \) is in the open \((y_0, y_1)\) interval.

fully_overlaps \( (self, other) \)
Return whether this bounding box overlaps with the other bounding box, not including the edges.

Parameters

other

[BboxBase]

get_points \( (self) \)

property height
The (signed) height of the bounding box.

static intersection \( (bbox1, bbox2) \)
Return the intersection of \( bbox1 \) and \( bbox2 \) if they intersect, or None if they don't.

property intervalx
The pair of \( x \) coordinates that define the bounding box.
This is not guaranteed to be sorted from left to right.

property intervaly
The pair of \( y \) coordinates that define the bounding box.
This is not guaranteed to be sorted from bottom to top.

inverse_transformed \( (self, transform) \)
[Deprecated] Construct a Bbox by statically transforming this one by the inverse of \( transform \).

Notes

Deprecated since version 3.3.

is_affine = True

is_bbox = True

property max
The top-right corner of the bounding box.

property min
The bottom-left corner of the bounding box.

overlaps \( (self, other) \)
Return whether this bounding box overlaps with the other bounding box.
Parameters

other

[BoxBase]

**property p0**
The first pair of \((x, y)\) coordinates that define the bounding box.

This is not guaranteed to be the bottom-left corner (for that, use \(min\)).

**property p1**
The second pair of \((x, y)\) coordinates that define the bounding box.

This is not guaranteed to be the top-right corner (for that, use \(max\)).

**padded** *(self, p)*
Construct a Box by padding this one on all four sides by \(p\).

**rotated** *(self, radians)*
Return the axes-aligned bounding box that bounds the result of rotating this Box by an angle of radians.

**shrunken** *(self, mx, my)*
Return a copy of the Box, shrunk by the factor \(mx\) in the \(x\) direction and the factor \(my\) in the \(y\) direction. The lower left corner of the box remains unchanged. Normally \(mx\) and \(my\) will be less than 1, but this is not enforced.

**shrunken_to_aspect** *(self, box_aspect, container=None, fig_aspect=1.0)*
Return a copy of the Box, shrunk so that it is as large as it can be while having the desired aspect ratio, \(box\_aspect\). If the box coordinates are relative (i.e. fractions of a larger box such as a figure) then the physical aspect ratio of that figure is specified with \(fig\_aspect\), so that \(box\_aspect\) can also be given as a ratio of the absolute dimensions, not the relative dimensions.

**property size**
The (signed) width and height of the bounding box.

**splitx** *(self, *args)*
Return a list of new Box objects formed by splitting the original one with vertical lines at fractional positions given by \(args\).

**splity** *(self, *args)*
Return a list of new Box objects formed by splitting the original one with horizontal lines at fractional positions given by \(args\).

**transformed** *(self, transform)*
Construct a Box by statically transforming this one by \(transform\).

**translated** *(self, tx, ty)*
Construct a Box by translating this one by \(tx\) and \(ty\).

**static union** *(bboxs)*
Return a Box that contains all of the given bboxs.
**property width**
The (signed) width of the bounding box.

**property x0**
The first of the pair of $x$ coordinates that define the bounding box.

This is not guaranteed to be less than $x1$ (for that, use $xmin$).

**property x1**
The second of the pair of $x$ coordinates that define the bounding box.

This is not guaranteed to be greater than $x0$ (for that, use $xmax$).

**property xmax**
The right edge of the bounding box.

**property xmin**
The left edge of the bounding box.

**property y0**
The first of the pair of $y$ coordinates that define the bounding box.

This is not guaranteed to be less than $y1$ (for that, use $ymin$).

**property y1**
The second of the pair of $y$ coordinates that define the bounding box.

This is not guaranteed to be greater than $y0$ (for that, use $ymax$).

**property ymax**
The top edge of the bounding box.

**property ymin**
The bottom edge of the bounding box.

**class matplotlib.transforms.BboxTransform**(boxin, boxout, **kwargs)

Bases: `matplotlib.transforms.Affine2DBase`

BboxTransform linearly transforms points from one Bbox to another.

Create a new BboxTransform that linearly transforms points from boxin to boxout.

__init__ (self, boxin, boxout, **kwargs)

Create a new BboxTransform that linearly transforms points from boxin to boxout.

__module__ = 'matplotlib.transforms'

__str__ (self)

Return str(self).

get_matrix (self)

Get the matrix for the affine part of this transform.

is_separable = True

**class matplotlib.transforms.BboxTransformFrom**(boxin, **kwargs)

Bases: `matplotlib.transforms.Affine2DBase`

BboxTransformFrom linearly transforms points from a given Bbox to the unit bounding box.
Parameters

**shorthand_name**

[**str**] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

___init___(self, boxin, **kwargs)

Parameters

**shorthand_name**

[**str**] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

___module__ = 'matplotlib.transforms'

___str___(self)

Return `str(self)`.

get_matrix(self)

Get the matrix for the affine part of this transform.

is_separable = True

class matplotlib.transforms.BboxTransformTo(boxout, **kwargs)
Bases: matplotlib.transforms.Affine2DBase

BboxTransformTo is a transformation that linearly transforms points from the unit bounding box to a given Bbox.

Create a new BboxTransformTo that linearly transforms points from the unit bounding box to boxout.

___init___(self, boxout, **kwargs)

Create a new BboxTransformTo that linearly transforms points from the unit bounding box to boxout.

___module__ = 'matplotlib.transforms'

___str___(self)

Return `str(self)`.

get_matrix(self)

Get the matrix for the affine part of this transform.

is_separable = True

class matplotlib.transforms.BboxTransformToMaxOnly(boxout, **kwargs)
Bases: matplotlib.transforms.BboxTransformTo

BboxTransformTo is a transformation that linearly transforms points from the unit bounding box to a given Bbox with a fixed upper left of (0, 0).
Create a new `BboxTransformTo` that linearly transforms points from the unit bounding box to `boxout`.

```python
__module__ = 'matplotlib.transforms'
```

```python
def get_matrix(self):
    Get the matrix for the affine part of this transform.
```

```python
class matplotlib.transforms.BlendedAffine2D(x_transform, y_transform, **kwargs):
    Bases: matplotlib.transforms._BlendedMixin, matplotlib.transforms.Affine2DBase

    A "blended" transform uses one transform for the x-direction, and another transform for the y-direction. This version is an optimization for the case where both child transforms are of type `Affine2DBase`. Create a new "blended" transform using `x_transform` to transform the x-axis and `y_transform` to transform the y-axis.

    Both `x_transform` and `y_transform` must be 2D affine transforms.

    You will generally not call this constructor directly but use the `blended_transform_factory` function instead, which can determine automatically which kind of blended transform to create.

```python
__init__(self, x_transform, y_transform, **kwargs):
    Create a new "blended" transform using `x_transform` to transform the x-axis and `y_transform` to transform the y-axis.

    Both `x_transform` and `y_transform` must be 2D affine transforms.

    You will generally not call this constructor directly but use the `blended_transform_factory` function instead, which can determine automatically which kind of blended transform to create.

```python
__module__ = 'matplotlib.transforms'
```

```python
def get_matrix(self):
    Get the matrix for the affine part of this transform.
```

```python
is_separable = True
```

```python
class matplotlib.transforms.BlendedGenericTransform(x_transform, y_transform, **kwargs):
    Bases: matplotlib.transforms._BlendedMixin, matplotlib.transforms.Transform

    A "blended" transform uses one transform for the x-direction, and another transform for the y-direction. This "generic" version can handle any given child transform in the x- and y-directions. Create a new "blended" transform using `x_transform` to transform the x-axis and `y_transform` to transform the y-axis.

    You will generally not call this constructor directly but use the `blended_transform_factory` function instead, which can determine automatically which kind of blended transform to create.
```
__init__ (self, x_transform, y_transform, **kwargs)
Create a new "blended" transform using x_transform to transform the x-axis and y_transform to transform the y-axis.

You will generally not call this constructor directly but use the blended_transform_factory function instead, which can determine automatically which kind of blended transform to create.

__module__ = 'matplotlib.transforms'

contains_branch (self, other)
Return whether the given transform is a sub-tree of this transform.

This routine uses transform equality to identify sub-trees, therefore in many situations it is object id which will be used.

For the case where the given transform represents the whole of this transform, returns True.

property depth
Return the number of transforms which have been chained together to form this Transform instance.

Note: For the special case of a Composite transform, the maximum depth of the two is returned.

frozen (self)
Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where copy, deepcopy() might normally be used.

get_affine (self)
Get the affine part of this transform.

property has_inverse
bool(x) -> bool

Returns True when the argument x is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

input_dims = 2

inverted (self)
Return the corresponding inverse transformation.

It holds x == self.inverted().transform(self.transform(x)).

The return value of this method should be treated as temporary. An update to self does not cause a corresponding update to its inverted copy.

property is_affine
bool(x) -> bool

Returns True when the argument x is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be
is_separable = True
output_dims = 2
pass_through = True

transform_non_affine(self, points)
Apply only the non-affine part of this transformation.

transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

In non-affine transformations, this is generally equivalent to transform(values). In affine transformations, this is always a no-op.

Parameters

values
[array] The input values as NumPy array of length input_dims or shape (N x input_dims).

Returns

array
The output values as NumPy array of length input_dims or shape (N x output_dims), depending on the input.

class matplotlib.transforms.CompositeAffine2D(a, b, **kwargs)

Bases: matplotlib.transforms.Affine2DBase

A composite transform formed by applying transform a then transform b.

This version is an optimization that handles the case where both a and b are 2D affines.

Create a new composite transform that is the result of applying Affine2DBase a then Affine2DBase b.

You will generally not call this constructor directly but write a + b instead, which will automatically choose the best kind of composite transform instance to create.

__init__(self, a, b, **kwargs)
Create a new composite transform that is the result of applying Affine2DBase a then Affine2DBase b.

You will generally not call this constructor directly but write a + b instead, which will automatically choose the best kind of composite transform instance to create.

__module__ = 'matplotlib.transforms'
__str__(self)
Return str(self).
property depth
Return the number of transforms which have been chained together to form this Transform instance.

Note: For the special case of a Composite transform, the maximum depth of the two is returned.

get_matrix(self)
Get the matrix for the affine part of this transform.

class matplotlib.transforms.CompositeGenericTransform(a, b, **kwargs)
Bases: matplotlib.transforms.Transform
A composite transform formed by applying transform a then transform b.
This "generic" version can handle any two arbitrary transformations.
Create a new composite transform that is the result of applying transform a then transform b.
You will generally not call this constructor directly but write a + b instead, which will automatically choose the best kind of composite transform instance to create.

__eq__(self, other)
Return self==value.

__hash__ = None

__init__(self, a, b, **kwargs)
Create a new composite transform that is the result of applying transform a then transform b.
You will generally not call this constructor directly but write a + b instead, which will automatically choose the best kind of composite transform instance to create.

__module__ = 'matplotlib.transforms'

__str__(self)
Return str(self).

property depth
Return the number of transforms which have been chained together to form this Transform instance.

Note: For the special case of a Composite transform, the maximum depth of the two is returned.

frozen(self)
Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where copy. deepcopy() might normally be used.

get_affine(self)
Get the affine part of this transform.

property has_inverse
bool(x) -> bool
Returns True when the argument x is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

```python
inverted(self)
```
Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to `self` does not cause a corresponding update to its inverted copy.

```python
property is_affine
```

Returns True when the argument x is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

```python
property is_separable
```

Returns True when the argument x is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

```python
pass_through = True
```

```python
transform_affine(self, points)
```
Apply only the affine part of this transformation on the given array of values.

```python
transform(values) is always equivalent to transform_affine(transform_non_affine(values)).
```

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to `transform(values)`.

**Parameters**

```python
values
```
[array] The input values as NumPy array of length `input_dims` or shape (N x `input_dims`).

**Returns**

```python
array
```
The output values as NumPy array of length `input_dims` or shape (N x `output_dims`), depending on the input.

```python
transform_non_affine(self, points)
```
Apply only the non-affine part of this transformation.
transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

In non-affine transformations, this is generally equivalent to transform(values). In affine transformations, this is always a no-op.

**Parameters**

**values**

[array] The input values as NumPy array of length `input_dims` or shape `(N x input_dims)`.

**Returns**

[array]

The output values as NumPy array of length `input_dims` or shape `(N x output_dims)`, depending on the input.

**transform_path_non_affine**(self, path)

Apply the non-affine part of this transform to `Path path`, returning a new `Path`.

**transform_path**(path)

is equivalent to `transform_path_affine(transform_path_non_affine(values))`.

**class** matplotlib.transforms.IdentityTransform(*args, **kwargs)

Bases: `matplotlib.transforms.Affine2DBase`

A special class that does one thing, the identity transform, in a fast way.

**Parameters**

**shorthand_name**

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

**__module__** = 'matplotlib.transforms'

**__str__**(self)

Return `str(self)`.

**frozen**(self)

Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

**get_affine**(self)

Get the affine part of this transform.

**get_matrix**(self)

Get the matrix for the affine part of this transform.
transform (self, points)
Apply this transformation on the given array of values.

Parameters

values
[array] The input values as NumPy array of length input_dims or shape (N x input_dims).

Returns

array
The output values as NumPy array of length input_dims or shape (N x output_dims), depending on the input.

transform_affine (self, points)
Apply only the affine part of this transformation on the given array of values.

transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to transform(values).

Parameters

values
[array] The input values as NumPy array of length input_dims or shape (N x input_dims).

Returns

array
The output values as NumPy array of length input_dims or shape (N x output_dims), depending on the input.

transform_non_affine (self, points)
Apply only the non-affine part of this transformation.

transform(values) is always equivalent to transform_affine(transform_non_affine(values)).
In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

**Parameters**

values

[array] The input values as NumPy array of length `input_dims` or shape (N x `input_dims`).

**Returns**

array

The output values as NumPy array of length `input_dims` or shape (N x `output_dims`), depending on the input.

`transform_path` *(self, path)*

Apply the transform to `Path path`, returning a new `Path`.

In some cases, this transform may insert curves into the path that began as line segments.

`transform_path_affine` *(self, path)*

Apply the affine part of this transform to `Path path`, returning a new `Path`.

`transform_path` *(path)* is equivalent to `transform_path_affine(transform_path_non_affine(path))`.

`transform_path_non_affine` *(self, path)*

Apply the non-affine part of this transform to `Path path`, returning a new `Path`.

`transform_path` *(path)* is equivalent to `transform_path_affine(transform_path_non_affine(path))`.

**class** `matplotlib.transforms.LockableBbox` *(bbox, x0=None, y0=None, x1=None, y1=None, **kwargs)*

Bases: `matplotlib.transforms.BboxBase`

A `Bbox` where some elements may be locked at certain values.

When the child bounding box changes, the bounds of this bbox will update accordingly with the exception of the locked elements.

**Parameters**

bbox

[`Bbox`] The child bounding box to wrap.

x0

[float or None] The locked value for x0, or None to leave unlocked.

y0

[float or None] The locked value for y0, or None to leave unlocked.
x1

[float or None] The locked value for x1, or None to leave unlocked.

y1

[float or None] The locked value for y1, or None to leave unlocked.

__init__ (self, bbox, x0=None, y0=None, x1=None, y1=None, **kwargs)

Parameters

bbox

[Bbox] The child bounding box to wrap.

x0

[float or None] The locked value for x0, or None to leave unlocked.

y0

[float or None] The locked value for y0, or None to leave unlocked.

x1

[float or None] The locked value for x1, or None to leave unlocked.

y1

[float or None] The locked value for y1, or None to leave unlocked.

__module__ = 'matplotlib.transforms'

__str__ (self)

Return str(self).

generate_points (self)

property locked_x0

float or None: The value used for the locked x0.

property locked_x1

float or None: The value used for the locked x1.

property locked_y0

float or None: The value used for the locked y0.

property locked_y1

float or None: The value used for the locked y1.

class matplotlib.transforms.ScaledTranslation (xt, yt, scale_trans, **kwargs)

Bases: matplotlib.transforms.Affine2DBase

A transformation that translates by xt and yt, after xt and yt have been transformed by scale_trans.

Parameters
shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of \texttt{str(transform)} when DEBUG=True.

\_\_init\_\_(self, xt, yt, scale\_trans, **kwargs)

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of \texttt{str(transform)} when DEBUG=True.

\_\_module\_\_ = 'matplotlib.transforms'

\_\_str\_\_(self)

Return \texttt{str(self)}.

get\_matrix(self)

Get the matrix for the affine part of this transform.

class matplotlib.transforms.Transform(shorthand\_name=None)

Bases: matplotlib.transforms.TransformNode

The base class of all TransformNode instances that actually perform a transformation.

All non-affine transformations should be subclasses of this class. New affine transformations should be subclasses of Affine2D.

Subclasses of this class should override the following members (at minimum):

- input\_dims
- output\_dims
- transform()
- inverted() (if an inverse exists)

The following attributes may be overridden if the default is unsuitable:

- is\_separable (defaults to True for 1D -> 1D transforms, False otherwise)
- has\_inverse (defaults to True if \texttt{inverted()} is overridden, False otherwise)

If the transform needs to do something non-standard with \texttt{matplotlib.path.Path} objects, such as adding curves where there were once line segments, it should override:

- transform\_path()
shorthand_name

[\texttt{str}] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of \texttt{str(transform)} when \texttt{DEBUG=True}.

\_\_add\_\_(\textit{self, other})
Compose two transforms together so that \textit{self} is followed by \textit{other}.

A + B returns a transform C so that C.transform(x) == B.transform(A.transform(x)).

\_\_array\_\_(\textit{self, *args, **kwargs})
Array interface to get at this Transform's affine matrix.

classmethod \_\_init\_subclass\_()  
This method is called when a class is subclassed.

The default implementation does nothing. It may be overridden to extend subclasses.

\_\_module\_\_ = 'matplotlib.transforms'

\_\_sub\_\_(\textit{self, other})  
Compose \textit{self} with the inverse of \textit{other}, cancelling identical terms if any:

```python
# In general:
A - B == A + B.inverted()
# (but see note regarding frozen transforms below).

# If A "ends with" B (i.e. A == A' + B for some A') we can cancel
# out B:
(A' + B) - B == A'

# Likewise, if B "starts with" A (B = A + B'), we can cancel out A:
A - (A + B') == B'.inverted() == B'^-1
```

Cancellation (rather than naively returning A + B.inverted()) is important for multiple reasons:

- It avoids floating-point inaccuracies when computing the inverse of B: B - B is guaranteed to cancel out exactly (resulting in the identity transform), whereas B + B.inverted() may differ by a small epsilon.

- B.inverted() always returns a frozen transform: if one computes A + B + B.inverted() and later mutates B, then B.inverted() won't be updated and the last two terms won't cancel out anymore; on the other hand, A + B - B will always be equal to A even if B is mutated.

contains\_branch (\textit{self, other})  
Return whether the given transform is a sub-tree of this transform.

This routine uses transform equality to identify sub-trees, therefore in many situations it is object id which will be used.

For the case where the given transform represents the whole of this transform, returns True.
contains_branch_seperately(self, other_transform)

Return whether the given branch is a sub-tree of this transform on each separate dimension.

A common use for this method is to identify if a transform is a blended transform containing an axes' data transform. e.g.:

```
x_isdata, y_isdata = trans.contains_branch_seperately(ax.transData)
```

property depth

Return the number of transforms which have been chained together to form this Transform instance.

Note: For the special case of a Composite transform, the maximum depth of the two is returned.

get_affine(self)

Get the affine part of this transform.

get_matrix(self)

Get the matrix for the affine part of this transform.

has_inverse = False

True if this transform has a corresponding inverse transform.

input_dims = None

The number of input dimensions of this transform. Must be overridden (with integers) in the subclass.

inverted(self)

Return the corresponding inverse transformation.

It holds \( x == \text{self.inverted().transform(self.transform(x))} \).

The return value of this method should be treated as temporary. An update to \( \text{self} \) does not cause a corresponding update to its inverted copy.

is_separable = False

True if this transform is separable in the x- and y- dimensions.

output_dims = None

The number of output dimensions of this transform. Must be overridden (with integers) in the subclass.

transform(self, values)

Apply this transformation on the given array of values.

Parameters

values

[array] The input values as NumPy array of length \( \text{input_dims} \) or shape (N x \( \text{input_dims} \)).

Returns
array

The output values as NumPy array of length `input_dims` or shape (N x `output_dims`), depending on the input.

**transform_affine** *(self, values)*

Apply only the affine part of this transformation on the given array of values.

*transform(values)* is always equivalent to *transform_affine(transform_non_affine(values)).*

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to *transform(values).*

**Parameters**

values

[array] The input values as NumPy array of length `input_dims` or shape (N x `input_dims`).

**Returns**

array

The output values as NumPy array of length `input_dims` or shape (N x `output_dims`), depending on the input.

**transform_angles** *(self, angles, pts, radians=False, pushoff=1e-05)*

Transform a set of angles anchored at specific locations.

**Parameters**

angles

[(N,) array-like] The angles to transform.

pts

[(N, 2) array-like] The points where the angles are anchored.

radians

[bool, default: False] Whether `angles` are radians or degrees.

pushoff

[float] For each point in `pts` and angle in `angles`, the transformed angle is computed by transforming a segment of length `pushoff` starting at that point and making that angle relative to the horizontal axis, and measuring the angle between the horizontal axis and the transformed segment.

**Returns**

[(N,) array]
**transform_bbox**(self, bbox)
  Transform the given bounding box.

  For smarter transforms including caching (a common requirement in Matplotlib), see TransformedBbox.

**transform_non_affine**(self, values)
  Apply only the non-affine part of this transformation.

  transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

  In non-affine transformations, this is generally equivalent to transform(values). In affine transformations, this is always a no-op.

  **Parameters**

  values
    [array] The input values as NumPy array of length `input_dims` or shape (N x `input_dims`).

  **Returns**

  array
    The output values as NumPy array of length `input_dims` or shape (N x `output_dims`), depending on the input.

**transform_path**(self, path)
  Apply the transform to Path path, returning a new Path.

  In some cases, this transform may insert curves into the path that began as line segments.

**transform_path_affine**(self, path)
  Apply the affine part of this transform to Path path, returning a new Path.

  transform_path(path) is equivalent to transform_path_affine(transform_path_non_affine(path)).

**transform_path_non_affine**(self, path)
  Apply the non-affine part of this transform to Path path, returning a new Path.

  transform_path(path) is equivalent to transform_path_affine(transform_path_non_affine(path)).

**transform_point**(self, point)
  Return a transformed point.

  This function is only kept for backcompatibility; the more general transform method is capable of transforming both a list of points and a single point.

  The point is given as a sequence of length `input_dims`. The transformed point is returned as a sequence of length `output_dims`.

**class** matplotlib.transforms.TransformNode(shorthand_name=None)
  Bases: object
The base class for anything that participates in the transform tree and needs to invalidate its parents or be invalidated. This includes classes that are not really transforms, such as bounding boxes, since some transforms depend on bounding boxes to compute their values.

Parameters

shorthand_name

[std] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of \texttt{str(transform)} when DEBUG=True.

\begin{verbatim}
INVALID = 3
INVALID_AFFINE = 2
INVALID_NON_AFFINE = 1
\end{verbatim}

Parameters

shorthand_name

[std] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of \texttt{str(transform)} when DEBUG=True.

\begin{verbatim}
__module__ = 'matplotlib.transforms'
\end{verbatim}

Parameters

shorthand_name

[std] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of \texttt{str(transform)} when DEBUG=True.
pass_through = False
    If pass_through is True, all ancestors will always be invalidated, even if 'self' is already invalid.

set_children(*children)
    Set the children of the transform, to let the invalidation system know which transforms can invalidate this transform. Should be called from the constructor of any transforms that depend on other transforms.

class matplotlib.transforms.TransformWrapper(child)
    Bases: matplotlib.transforms.Transform

    A helper class that holds a single child transform and acts equivalently to it.

    This is useful if a node of the transform tree must be replaced at run time with a transform of a different type. This class allows that replacement to correctly trigger invalidation.

    TransformWrapper instances must have the same input and output dimensions during their entire lifetime, so the child transform may only be replaced with another child transform of the same dimensions.

    child: A Transform instance. This child may later be replaced with set().

    __eq__(self, other)
        Return self==value.

    __hash__ = None

    __init__(child)
        child: A Transform instance. This child may later be replaced with set().

    __module__ = 'matplotlib.transforms'

    __str__(self)
        Return str(self).

    frozen()
        Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where copy.deepcopy() might normally be used.

    property has_inverse
        bool(x) -> bool

        Returns True when the argument x is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

    property is_affine
        bool(x) -> bool

        Returns True when the argument x is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

    property is_separable
        bool(x) -> bool
Returns True when the argument x is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

```python
pass_through = True
```

```python
set (self, child)
```

Replace the current child of this transform with another one.

The new child must have the same number of input and output dimensions as the current child.

```python
class matplotlib.transforms.TransformedBbox (bbox, transform, **kwargs)
```

Bases: matplotlib.transforms.BboxBase

A `Bbox` that is automatically transformed by a given transform. When either the child bounding box or transform changes, the bounds of this bbox will update accordingly.

**Parameters**

- `bbox`
  - `[Bbox]`
- `transform`
  - `[Transform]`

```python
__init__ (self, bbox, transform, **kwargs)
```

**Parameters**

- `bbox`
  - `[Bbox]`
- `transform`
  - `[Transform]`

```python
__module__ = 'matplotlib.transforms'
```

```python
__str__ (self)
```

Return str(self).

```python
get_points (self)
```

```python
class matplotlib.transforms.TransformedPatchPath (patch)
```

Bases: matplotlib.transforms.TransformedPath

A `TransformedPatchPath` caches a non-affine transformed copy of the `Patch`. This cached copy is automatically updated when the non-affine part of the transform or the patch changes.

**Parameters**

- `patch`
  - `[Patch]`
class matplotlib.transforms.TransformedPath(path, transform)

Bases: matplotlib.transforms.TransformNode

A TransformedPath caches a non-affine transformed copy of the Path. This cached copy is automatically updated when the non-affine part of the transform changes.

**Note:** Paths are considered immutable by this class. Any update to the path’s vertices/codes will not trigger a transform recomputation.

Parameters

- path
  - [Path]
- transform
  - [Transform]

__init__(self, path, transform)
**get_transformed_points_and_affine**(self)

Return a copy of the child path, with the non-affine part of the transform already applied, along with the affine part of the path necessary to complete the transformation. Unlike **get_transformed_path_and_affine()**, no interpolation will be performed.

**matplotlib.transforms.blended_transform_factory**(x_transform, y_transform)

Create a new "blended" transform using x_transform to transform the x-axis and y_transform to transform the y-axis.

A faster version of the blended transform is returned for the case where both child transforms are affine.

**matplotlib.transforms.composite_transform_factory**(a, b)

Create a new composite transform that is the result of applying transform a then transform b.

Shortcut versions of the blended transform are provided for the case where both child transforms are affine, or one or the other is the identity transform.

Composite transforms may also be created using the ‘+’ operator, e.g.:

\[
\text{c} = \text{a} + \text{b}
\]

**matplotlib.transforms.interval_contains**(interval, val)

Check, inclusively, whether an interval includes a given value.

**Parameters**

interval

[(float, float)] The endpoints of the interval.

val

[float] Value to check is within interval.

**Returns**

bool

Whether val is within the interval.

**matplotlib.transforms.interval_contains_open**(interval, val)

Check, excluding endpoints, whether an interval includes a given value.

**Parameters**

interval

[(float, float)] The endpoints of the interval.

val

[float] Value to check is within interval.

**Returns**
Matplotlib, Release 3.4.1

bool

Whether val is within the interval.

matplotlib.transforms.nonsingular(vmin, vmax, expander=0.001, tiny=1e-15, increasing=True)

Modify the endpoints of a range as needed to avoid singularities.

Parameters

vmin, vmax

[float] The initial endpoints.

expander

[float, default: 0.001] Fractional amount by which vmin and vmax are expanded if the original interval is too small, based on tiny.

tiny

[float, default: 1e-15] Threshold for the ratio of the interval to the maximum absolute value of its endpoints. If the interval is smaller than this, it will be expanded. This value should be around 1e-15 or larger; otherwise the interval will be approaching the double precision resolution limit.

increasing

[bool, default: True] If True, swap vmin, vmax if vmin > vmax.

Returns

vmin, vmax

[float] Endpoints, expanded and/or swapped if necessary. If either input is inf or NaN, or if both inputs are 0 or very close to zero, it returns -expander, expander.

matplotlib.transforms.offset_copy(trans, fig=None, x=0.0, y=0.0, units='inches')

Return a new transform with an added offset.

Parameters

trans

[Transform subclass] Any transform, to which offset will be applied.

fig

[Figure, default: None] Current figure. It can be None if units are 'dots'.

x, y

[float, default: 0.0] The offset to apply.

units

[{'inches', 'points', 'dots'}, default: 'inches'] Units of the offset.
Returns

Transform subclass

Transform with applied offset.

18.58 matplotlib.tri

Unstructured triangular grid functions.

class matplotlib.tri.Triangulation(x, y, triangles=None, mask=None)

An unstructured triangular grid consisting of npoints points and ntri triangles. The triangles can either be specified by the user or automatically generated using a Delaunay triangulation.

Parameters

x, y

[(npoints,) array-like] Coordinates of grid points.

triangles

[(ntri, 3) array-like of int, optional] For each triangle, the indices of the three points that make up the triangle, ordered in an anticlockwise manner. If not specified, the Delaunay triangulation is calculated.

mask

[(ntri,) array-like of bool, optional] Which triangles are masked out.

Notes

For a Triangulation to be valid it must not have duplicate points, triangles formed from colinear points, or overlapping triangles.

Attributes

triangles

[(ntri, 3) array of int] For each triangle, the indices of the three points that make up the triangle, ordered in an anticlockwise manner. If you want to take the mask into account, use get_masked_triangles instead.

mask

[(ntri, 3) array of bool] Masked out triangles.

is_delaunay

[bool] Whether the Triangulation is a calculated Delaunay triangulation (where triangles was not specified) or not.
calculate_plane_coefficients (self, z)

Calculate plane equation coefficients for all unmasked triangles from the point (x, y) coordinates and specified z-array of shape (npoints). The returned array has shape (npoints, 3) and allows z-value at (x, y) position in triangle tri to be calculated using $z = \text{array}[\text{tri}, 0] \times x + \text{array}[\text{tri}, 1] \times y + \text{array}[\text{tri}, 2]$.

property edges

Return integer array of shape (nedges, 2) containing all edges of non-masked triangles.

Each row defines an edge by it’s start point index and end point index. Each edge appears only once, i.e. for an edge between points $i$ and $j$, there will only be either $(i, j)$ or $(j, i)$.

get_cpp_triangulation (self)

Return the underlying C++ Triangulation object, creating it if necessary.

static get_from_args_and_kwags (*args, **kwargs)

Return a Triangulation object from the args and kwargs, and the remaining args and kwargs with the consumed values removed.

There are two alternatives: either the first argument is a Triangulation object, in which case it is returned, or the args and kwargs are sufficient to create a new Triangulation to return. In the latter case, see Triangulation.__init__ for the possible args and kwargs.

get_masked_triangles (self)

Return an array of triangles that are not masked.

get_trifinder (self)

Return the default matplotlib.tri.TriFinder of this triangulation, creating it if necessary. This allows the same TriFinder object to be easily shared.

property neighbors

Return integer array of shape (ntri, 3) containing neighbor triangles.

For each triangle, the indices of the three triangles that share the same edges, or -1 if there is no such neighboring triangle. neighbors[i, j] is the triangle that is the neighbor to the edge from point index triangles[i, j] to point index triangles[i, (j+i)%3].

set_mask (self, mask)

Set or clear the mask array.

Parameters

mask

[None or bool array of length ntri]

class matplotlib.tri.TriContourSet (ax, *args, **kwargs)

Bases: matplotlib.contour.ContourSet

Create and store a set of contour lines or filled regions for a triangular grid.

This class is typically not instantiated directly by the user but by tricontour and tricontourf.

Attributes
ax

[Axes] The Axes object in which the contours are drawn.

collections

[silent_list of LineCollections or PathCollections] The Artists representing the contour. This is a list of LineCollections for line contours and a list of PathCollections for filled contours.

levels

[array] The values of the contour levels.

layers

[array] Same as levels for line contours; half-way between levels for filled contours. See ContourSet._process_colors.

Draw triangular grid contour lines or filled regions, depending on whether keyword arg 'filled' is False (default) or True.

The first argument of the initializer must be an axes object. The remaining arguments and keyword arguments are described in the docstring of tricontour.

class matplotlib.tri.TriFinder(triangulation)

Abstract base class for classes used to find the triangles of a Triangulation in which (x, y) points lie.

Rather than instantiate an object of a class derived from TriFinder, it is usually better to use the function Triangulation.get_trifinder.

Derived classes implement __call__(x, y) where x and y are array-like point coordinates of the same shape.

class matplotlib.tri.TrapezoidMapTriFinder(triangulation)

Bases: matplotlib.tri.trifinder.TriFinder

The triangulation must be valid, i.e. it must not have duplicate points, triangles formed from colinear points, or overlapping triangles. The algorithm has some tolerance to triangles formed from colinear points, but this should not be relied upon.

class matplotlib.tri.TriInterpolator(triangulation, z, trifinder=None)

Abstract base class for classes used to interpolate on a triangular grid.

Derived classes implement the following methods:

• __call__(x, y), where x, y are array-like point coordinates of the same shape, and that returns a masked array of the same shape containing the interpolated z-values.

• gradient(x, y), where x, y are array-like point coordinates of the same shape, and that returns a list of 2 masked arrays of the same shape containing the 2 derivatives of the interpolator (derivatives of interpolated z values with respect to x and y).
class matplotlib.tri.LinearTriInterpolator(triangulation, z, trifinder=None)
Bases: matplotlib.tri.triinterpolate.TriInterpolator

Linear interpolator on a triangular grid.
Each triangle is represented by a plane so that an interpolated value at point (x, y) lies on the plane of the triangle containing (x, y). Interpolated values are therefore continuous across the triangulation, but their first derivatives are discontinuous at edges between triangles.

Parameters

triangulation

[Triangulation] The triangulation to interpolate over.

z

[(npoints,) array-like] Array of values, defined at grid points, to interpolate between.

trifinder

[TriFinder, optional] If this is not specified, the Triangulation's default TriFinder will be used by calling Triangulation.get_trifinder.

Methods

`__call__` (x, y)
(Returns interpolated values at (x, y) points.)

`gradient` (x, y)
(Returns interpolated derivatives at (x, y) points.)

gradient (self, x, y)

Returns a list of 2 masked arrays containing interpolated derivatives at the specified (x, y) points.

Parameters

x, y

[array-like] x and y coordinates of the same shape and any number of dimensions.

Returns

dzdx, dzdy

[np.ma.array] 2 masked arrays of the same shape as x and y; values corresponding to (x, y) points outside of the triangulation are masked out. The first returned array contains the values of $\frac{\partial z}{\partial x}$ and the second those of $\frac{\partial z}{\partial y}$.

class matplotlib.tri.CubicTriInterpolator(triangulation, z, kind='min_E', trifinder=None, dz=None)
Bases: matplotlib.tri.triinterpolate.TriInterpolator

Cubic interpolator on a triangular grid.
In one-dimension - on a segment - a cubic interpolating function is defined by the values of the function and its derivative at both ends. This is almost the same in 2D inside a triangle, except that the values of the function and its 2 derivatives have to be defined at each triangle node.

The CubicTriInterpolator takes the value of the function at each node - provided by the user - and internally computes the value of the derivatives, resulting in a smooth interpolation. (As a special feature, the user can also impose the value of the derivatives at each node, but this is not supposed to be the common usage.)

**Parameters**

**triangulation**

[Triangulation] The triangulation to interpolate over.

**z**

[(npoints,) array-like] Array of values, defined at grid points, to interpolate between.

**kind**

[{‘min_E’, ‘geom’, ‘user’}, optional] Choice of the smoothing algorithm, in order to compute the interpolant derivatives (defaults to ‘min_E’):

- if 'min_E': (default) The derivatives at each node is computed to minimize a bending energy.
- if 'geom': The derivatives at each node is computed as a weighted average of relevant triangle normals. To be used for speed optimization (large grids).
- if 'user': The user provides the argument dz, no computation is hence needed.

**trifinder**

[TriFinder, optional] If not specified, the Triangulation's default TriFinder will be used by calling Triangulation.get_trifinder.

**dz**

[tuple of array-likes (dzdx, dzdy), optional] Used only if kind = 'user'. In this case dz must be provided as (dzdx, dzdy) where dzdx, dzdy are arrays of the same shape as z and are the interpolant first derivatives at the triangulation points.

**Notes**

This note is a bit technical and details how the cubic interpolation is computed.

The interpolation is based on a Clough-Tocher subdivision scheme of the triangulation mesh (to make it clearer, each triangle of the grid will be divided in 3 child-triangles, and on each child triangle the interpolated function is a cubic polynomial of the 2 coordinates). This technique originates from FEM (Finite Element Method) analysis; the element used is a reduced Hsieh-Clough-Tocher (HCT) element. Its shape functions are described in [R0be0c58fd53f-1]. The assembled function is guaranteed to be
C1-smooth, i.e. it is continuous and its first derivatives are also continuous (this is easy to show inside the triangles but is also true when crossing the edges).

In the default case \(\text{kind} = \text{min}_E\), the interpolant minimizes a curvature energy on the functional space generated by the HCT element shape functions - with imposed values but arbitrary derivatives at each node. The minimized functional is the integral of the so-called total curvature (implementation based on an algorithm from [R0be0c58fd53f-2] - PCG sparse solver):

\[
E(z) = \frac{1}{2} \int_{\Omega} \left( \left( \frac{\partial^2 z}{\partial x^2} \right)^2 + \left( \frac{\partial^2 z}{\partial y^2} \right)^2 + 2 \left( \frac{\partial^2 z}{\partial y \partial x} \right)^2 \right) dx \, dy
\]

If the case \(\text{kind} = \text{geom}\) is chosen by the user, a simple geometric approximation is used (weighted average of the triangle normal vectors), which could improve speed on very large grids.

References

[R0be0c58fd53f-1], [R0be0c58fd53f-2]

Methods

````
def __call__(self, x, y):
    return interpolated values at (x, y) points.

def gradient(self, x, y):
    return list of 2 masked arrays containing interpolated derivatives at (x, y) points.
```

\texttt{gradient} \(\text{(self, x, y)}\)

Returns a list of 2 masked arrays containing interpolated derivatives at the specified \((x, y)\) points.

Parameters

\(x, y\)

[array-like] \(x\) and \(y\) coordinates of the same shape and any number of dimensions.

Returns

\(dzdx, dzdy\)

[np.ma.array] 2 masked arrays of the same shape as \(x\) and \(y\); values corresponding to \((x, y)\) points outside of the triangulation are masked out. The first returned array contains the values of \(\frac{\partial z}{\partial x}\) and the second those of \(\frac{\partial z}{\partial y}\).

\texttt{class} \texttt{matplotlib.tri.TriRefiner} \(\text{(triangulation)}\)

Abstract base class for classes implementing mesh refinement.

A \texttt{TriRefiner} encapsulates a \texttt{Triangulation} object and provides tools for mesh refinement and interpolation.

Derived classes must implement:
• `refine_triangulation(return_tri_index=False, **kwargs)` , where the optional keyword arguments `kwargs` are defined in each TriRefiner concrete implementation, and which returns:
  – a refined triangulation,
  – optionally (depending on `return_tri_index`), for each point of the refined triangulation: the index of the initial triangulation triangle to which it belongs.

• `refine_field(z, triInterpolator=None, **kwargs)` , where:
  – `z` array of field values (to refine) defined at the base triangulation nodes,
  – `triInterpolator` is an optional `TriInterpolator`,
  – the other optional keyword arguments `kwargs` are defined in each TriRefiner concrete implementation;

and which returns (as a tuple) a refined triangular mesh and the interpolated values of the field at the refined triangulation nodes.

```python
class matplotlib.tri.UniformTriRefiner(triangulation):
    Bases: matplotlib.tri.trirefine.TriRefiner

    Uniform mesh refinement by recursive subdivisions.

    Parameters

    triangulation

        [Triangulation] The encapsulated triangulation (to be refined)

    refine_field(self, z, triInterpolator=None, subdiv=3)

    Refine a field defined on the encapsulated triangulation.

    Parameters

    z

        [(npoints,) array-like] Values of the field to refine, defined at the nodes of the encapsulated triangulation. (n_points is the number of points in the initial triangulation)

    triInterpolator

        [TriInterpolator, optional] Interpolator used for field interpolation. If not specified, a CubicTriInterpolator will be used.

    subdiv

        [int, default: 3] Recursion level for the subdivision. Each triangle is divided into 4**subdiv child triangles.

    Returns
```

18.58. matplotlib.tri
refi_tri

[Triangulation] The returned refined triangulation.

refi_z

[1D array of length: refi_tri node count] The returned interpolated field (at refi_tri nodes).

refine_triangle (self, return_tri_index=False, subdiv=3)

Compute an uniformly refined triangulation refi_triangle of the encapsulated triangulation.

This function refines the encapsulated triangulation by splitting each father triangle into 4 child sub-triangles built on the edges midside nodes, recursing subdiv times. In the end, each triangle is hence divided into $4^{**\text{subdiv}}$ child triangles.

Parameters

return_tri_index

[bool, default: False] Whether an index table indicating the father triangle index of each point is returned.

subdiv

[int, default: 3] Recursion level for the subdivision. Each triangle is divided into $4^{**\text{subdiv}}$ child triangles; hence, the default results in 64 refined sub-triangles for each triangle of the initial triangulation.

Returns

refi_triangle

[Triangulation] The refined triangulation.

found_index

[int array] Index of the initial triangulation containing triangle, for each point of refi_triangle. Returned only if return_tri_index is set to True.

class matplotlib.tri.TriAnalyzer(triangulation)

Define basic tools for triangular mesh analysis and improvement.

A TriAnalyzer encapsulates a Triangulation object and provides basic tools for mesh analysis and mesh improvement.

Parameters

triangulation

[Triangulation] The encapsulated triangulation to analyze.

Attributes
**scale_factors**

Factors to rescale the triangulation into a unit square.

**circle_ratios** (*self*, *rescale=True*)

Return a measure of the triangulation triangles flatness.

The ratio of the incircle radius over the circumcircle radius is a widely used indicator of a triangle flatness. It is always $\leq 0.5$ and $== 0.5$ only for equilateral triangles. Circle ratios below 0.01 denote very flat triangles.

To avoid unduly low values due to a difference of scale between the 2 axis, the triangular mesh can first be rescaled to fit inside a unit square with *scale_factors* (Only if *rescale* is True, which is its default value).

**Parameters**

- **rescale**
  
  [bool, default: True] If True, internally rescale (based on *scale_factors*), so that the (unmasked) triangles fit exactly inside a unit square mesh.

**Returns**

- **masked array**
  
  Ratio of the incircle radius over the circumcircle radius, for each 'rescaled' triangle of the encapsulated triangulation. Values corresponding to masked triangles are masked out.

**get_flat_tri_mask** (*self*, *min_circle_ratio=0.01*, *rescale=True*)

Eliminate excessively flat border triangles from the triangulation.

Returns a mask *new_mask* which allows to clean the encapsulated triangulation from its border-located flat triangles (according to their *circle_ratios()*). This mask is meant to be subsequently applied to the triangulation using *Triangulation.set_mask*. *new_mask* is an extension of the initial triangulation mask in the sense that an initially masked triangle will remain masked.

The *new_mask* array is computed recursively; at each step flat triangles are removed only if they share a side with the current mesh border. Thus no new holes in the triangulated domain will be created.

**Parameters**

- **min_circle_ratio**
  
  [float, default: 0.01] Border triangles with incircle/circumcircle radii ratio $r/R$ will be removed if $r/R < min\_circle\_ratio$.

- **rescale**
  
  [bool, default: True] If True, first, internally rescale (based on *scale_factors*) so that the (unmasked) triangles fit exactly inside a
unit square mesh. This rescaling accounts for the difference of scale which might exist between the 2 axis.

Returns

array of bool

Mask to apply to encapsulated triangulation. All the initially masked triangles remain masked in the new_mask.

Notes

The rationale behind this function is that a Delaunay triangulation - of an unstructured set of points - sometimes contains almost flat triangles at its border, leading to artifacts in plots (especially for high-resolution contouring). Masked with computed new_mask, the encapsulated triangulation would contain no more unmasked border triangles with a circle ratio below min_circle_ratio, thus improving the mesh quality for subsequent plots or interpolation.

property scale_factors

Factors to rescale the triangulation into a unit square.

Returns

(float, float)

Scaling factors (kx, ky) so that the triangulation [triangulation.x * kx, triangulation.y * ky] fits exactly inside a unit square.

18.59 matplotlib.type1font

A class representing a Type 1 font.

This version reads pfa and pfb files and splits them for embedding in pdf files. It also supports SlantFont and ExtendFont transformations, similarly to pdfTeX and friends. There is no support yet for subsetting.

Usage:

```python
>>> font = Type1Font(filename)
>>> clear_part, encrypted_part, finale = font.parts
>>> slanted_font = font.transform({'slant': 0.167})
>>> extended_font = font.transform({'extend': 1.2})
```

Sources:

- Adobe Technical Note #5040, Supporting Downloadable PostScript Language Fonts.
class matplotlib.type1font.Type1Font(input)
    
    Bases: object

    A class representing a Type-1 font, for use by backends.

    Attributes

    parts
        [tuple] A 3-tuple of the cleartext part, the encrypted part, and the finale of zeros.

    prop
        [dict[str, Any]] A dictionary of font properties.

    Initialize a Type-1 font.

    Parameters

    input
        [str or 3-tuple] Either a pfb file name, or a 3-tuple of already-decoded Type-1 font parts.

    parts

    prop

    transform(self, effects)
        Return a new font that is slanted and/or extended.

    Parameters

    effects
        [dict] A dict with optional entries:

        • 'slant'
            [float, default: 0] Tangent of the angle that the font is to be slanted to the right. Negative values slant to the left.

        • 'extend'
            [float, default: 1] Scaling factor for the font width. Values less than 1 condense the glyphs.

    Returns

    Type1Font
18.60 matplotlib.units

The classes here provide support for using custom classes with Matplotlib, e.g., those that do not expose the array interface but know how to convert themselves to arrays. It also supports classes with units and units conversion. Use cases include converters for custom objects, e.g., a list of datetime objects, as well as for objects that are unit aware. We don't assume any particular units implementation; rather a units implementation must provide the register with the Registry converter dictionary and a ConversionInterface. For example, here is a complete implementation which supports plotting with native datetime objects:

```python
import matplotlib.units as units
import matplotlib.dates as dates
import matplotlib.ticker as ticker
import datetime

class DateConverter(units.ConversionInterface):
    @staticmethod
    def convert(value, unit, axis):
        'Convert a datetime value to a scalar or array'
        return dates.date2num(value)

    @staticmethod
    def axisinfo(unit, axis):
        'Return major and minor tick locators and formatters'
        if unit != 'date': return None
        majloc = dates.AutoDateLocator()
        majfmt = dates.AutoDateFormatter(majloc)
        return AxisInfo(majloc=majloc,
                         majfmt=majfmt,
                         label='date')

    @staticmethod
    def default_units(x, axis):
        'Return the default unit for x or None'
        return 'date'

# Finally we register our object type with the Matplotlib units registry.
units.registry[datetime.date] = DateConverter()
```

class matplotlib.units.AxisInfo(majloc=None, minloc=None, majfmt=None, minfmt=None, label=None, default_limits=None)

Bases: object

Information to support default axis labeling, tick labeling, and limits.

An instance of this class must be returned by ConversionInterface.axisinfo.

Parameters

- majloc, minloc
  [Locator, optional] Tick locators for the major and minor ticks.
**Notes**

If any of the above are `None`, the axis will simply use the default value.

**exception** matplotlib.units.ConversionError

Bases: TypeError

class matplotlib.units.ConversionInterface

Bases: object

The minimal interface for a converter to take custom data types (or sequences) and convert them to values Matplotlib can use.

**static axisinfo**(unit, axis)

Return an `AxisInfo` for the axis with the specified units.

**static convert**(obj, unit, axis)

Convert `obj` using `unit` for the specified `axis`.

If `obj` is a sequence, return the converted sequence. The output must be a sequence of scalars that can be used by the numpy array layer.

**static default_units**(x, axis)

Return the default unit for `x` or `None` for the given axis.

**static is_numlike**(x)

The Matplotlib datalim, autoscaling, locators etc work with scalars which are the units converted to floats given the current unit. The converter may be passed these floats, or arrays of them, even when units are set.

class matplotlib.units.DecimalConverter

Bases: matplotlib.units.ConversionInterface

Converter for decimal.Decimal data to float.

**static axisinfo**(unit, axis)

Return an `AxisInfo` for the axis with the specified units.

**static convert**(value, unit, axis)

Convert Decimals to floats.

The `unit` and `axis` arguments are not used.
value

[decimal.Decimal or iterable] Decimal or list of Decimal need to be converted

static default_units \((x, \text{axis})\)

Return the default unit for \(x\) or None for the given axis.

class matplotlib.units.Registry

Bases: dict

Register types with conversion interface.

get_converter \((self, x)\)

Get the converter interface instance for \(x\), or None.

18.61 matplotlib.widgets
18.61.1 GUI neutral widgets

Widgets that are designed to work for any of the GUI backends. All of these widgets require you to predefine a `matplotlib.axes.Axes` instance and pass that as the first parameter. Matplotlib doesn't try to be too smart with respect to layout -- you will have to figure out how wide and tall you want your Axes to be to accommodate your widget.

```python
class matplotlib.widgets.AxesWidget(ax)
    Bases: matplotlib.widgets.Widget

    Widget connected to a single `Axes`.

    To guarantee that the widget remains responsive and not garbage-collected, a reference to the object should be maintained by the user.

    This is necessary because the callback registry maintains only weak-refs to the functions, which are member functions of the widget. If there are no references to the widget object it may be garbage collected which will disconnect the callbacks.

    Attributes

    ax
        [Axes] The parent axes for the widget.

    canvas
        [FigureCanvasBase] The parent figure canvas for the widget.

    active
        [bool] Is the widget active?

    property cids

    connect_event(self, event, callback)
        Connect a callback function with an event.

        This should be used in lieu of figure.canvas.mpl_connect since this function stores callback ids for later clean up.

    disconnect_events(self)
        Disconnect all events created by this widget.
```

```python
class matplotlib.widgets.Button(ax, label, image=None, color='0.85', hover_color='0.95')
    Bases: matplotlib.widgets.AxesWidget

    A GUI neutral button.

    For the button to remain responsive you must keep a reference to it. Call `on_clicked` to connect to the button.

    Attributes

    ax
```
The \texttt{matplotlib.axes.Axes} the button renders into.

\textbf{label}

A \texttt{matplotlib.text.Text} instance.

\textbf{color}

The color of the button when not hovering.

\textbf{hovercolor}

The color of the button when hovering.

**Parameters**

\textbf{ax}

\begin{verbatim}[Axes] \end{verbatim}
The \texttt{Axes} instance the button will be placed into.

\textbf{label}

\begin{verbatim}[str] \end{verbatim}
The button text.

\textbf{image}

\begin{verbatim}[array-like or PIL Image] \end{verbatim}
The image to place in the button, if not \texttt{None}. The parameter is directly forwarded to \texttt{imshow}.

\textbf{color}

\begin{verbatim}[color] \end{verbatim}
The color of the button when not activated.

\textbf{hovercolor}

\begin{verbatim}[color] \end{verbatim}
The color of the button when the mouse is over it.

**property cnt**

\textbf{disconnect} \begin{verbatim}(self, cid) \end{verbatim}
Remove the callback function with connection id \texttt{cid}.

**property observers**

\textbf{on_clicked} \begin{verbatim}(self, func) \end{verbatim}
Connect the callback function \texttt{func} to button click events.

Returns a connection id, which can be used to disconnect the callback.

**class matplotlib.widgets.CheckButtons** \begin{verbatim}(ax, labels, actives=None) \end{verbatim}
\texttt{Bases: matplotlib.widgets.AxesWidget}

A GUI neutral set of check buttons.

For the check buttons to remain responsive you must keep a reference to this object.

Connect to the CheckButtons with the \texttt{on_clicked} method.

**Attributes**
ax

    [Axes] The parent axes for the widget.

labels

    [list of Text]

rectangles

    [list of Rectangle]

lines

    [list of (Line2D, Line2D) pairs] List of lines for the x's in the check boxes. These lines exist for each box, but have set_visible(False) when its box is not checked.

Add check buttons to matplotlib.axes.Axes instance ax.

Parameters

    ax

        [Axes] The parent axes for the widget.

    labels

        [list of str] The labels of the check buttons.

    actives

        [list of bool, optional] The initial check states of the buttons. The list must have the same length as labels. If not given, all buttons are unchecked.

property cnt

    disconnect (self, cid)

        Remove the observer with connection id cid.

    get_status (self)

        Return a tuple of the status (True/False) of all of the check buttons.

property observers

    on_clicked (self, func)

        Connect the callback function func to button click events.

        Returns a connection id, which can be used to disconnect the callback.

    set_active (self, index)

        Toggle (activate or deactivate) a check button by index.

        Callbacks will be triggered if eventson is True.

    Parameters
index

[int] Index of the check button to toggle.

Raises

ValueError

If index is invalid.

class matplotlib.widgets.Cursor(ax, horizOn=True, vertOn=True, useblit=False, **lineprops)

Bases: matplotlib.widgets.AxesWidget

A crosshair cursor that spans the axes and moves with mouse cursor.
For the cursor to remain responsive you must keep a reference to it.

Parameters

ax

[matplotlib.axes.Axes] The Axes to attach the cursor to.

horizOn

[bool, default: True] Whether to draw the horizontal line.

vertOn

[bool, default: True] Whether to draw the vertical line.

useblit

[bool, default: False] Use blitting for faster drawing if supported by the backend.

Other Parameters

**lineprops

Line2D properties that control the appearance of the lines. See also axhline.

Examples

See /gallery/widgets/cursor.

clear(self, event)

Internal event handler to clear the cursor.

onmove(self, event)

Internal event handler to draw the cursor when the mouse moves.
class matplotlib.widgets.EllipseSelector(ax, onselect, drawtype='box',
minspanx=0, minspany=0, useblit=False, lineprops=None, rectprops=None,
spancoords='data', button=None, maxdist=10, markerprops=None, interactive=False,
state_modifier_keys=None)

Bases: matplotlib.widgets.RectangleSelector

Select an elliptical region of an axes.

For the cursor to remain responsive you must keep a reference to it.

Example usage:

```python
import numpy as np
import matplotlib.pyplot as plt
from matplotlib.widgets import EllipseSelector

def onselect(eclick, erelease):
    """eclick and erelease are matplotlib events at press and release."""
    print('startposition: (%f, %f)' % (eclick.xdata, eclick.ydata))
    print('endposition : (%f, %f)' % (erelease.xdata, erelease.ydata))
    print('used button : ', eclick.button)

def toggle_selector(event):
    print('Key pressed."
    if event.key in ['Q', 'q'] and toggle_selector.ES.active:
        print('EllipseSelector deactivated.')
        toggle_selector.RS.set_active(False)
    if event.key in ['A', 'a'] and not toggle_selector.ES.active:
        print('EllipseSelector activated.')
        toggle_selector.ES.set_active(True)

x = np.arange(100.) / 99
y = np.sin(x)
fig, ax = plt.subplots()
ax.plot(x, y)
toggle_selector.ES = EllipseSelector(ax, onselect, drawtype='line')
fig.canvas.mpl_connect('key_press_event', toggle_selector)
plt.show()
```

Parameters

- **ax**

  [Axes] The parent axes for the widget.

- **onselect**

  [function] A callback function that is called after a selection is completed. It must have the signature:
```python
def onselect(eclick: MouseEvent, erelease: MouseEvent)
```

where `eclick` and `erelease` are the mouse click and release `MouseEvent` that start and complete the selection.

**drawtype**

```py
["box", "line", "none"], default: "box"] Whether to draw the full rectangle box, the diagonal line of the rectangle, or nothing at all.
```

**minspanx**

[float, default: 0] Selections with an x-span less than `minspanx` are ignored.

**minspany**

[float, default: 0] Selections with an y-span less than `minspany` are ignored.

**useblit**

[bool, default: False] Whether to use blitting for faster drawing (if supported by the backend).

**lineprops**

[dict, optional] Properties with which the line is drawn, if `drawtype` == "line". Default:

```py
dict(color="black", linestyle="-", linewidth=2, alpha=0.5)
```

**rectprops**

[dict, optional] Properties with which the rectangle is drawn, if `drawtype` == "box". Default:

```py
dict(facecolor="red", edgecolor="black", alpha=0.2, fill=True)
```

**spancoords**

["data", "pixels"], default: "data"] Whether to interpret `minspanx` and `minspany` in data or in pixel coordinates.

**button**

[`MouseButton`, list of `MouseButton`, default: all buttons] Button(s) that trigger rectangle selection.

**maxdist**

[float, default: 10] Distance in pixels within which the interactive tool handles can be activated.

**marker_props**

[dict] Properties with which the interactive handles are drawn. Currently not implemented and ignored.
interactive

[bool, default: False] Whether to draw a set of handles that allow interaction with the widget after it is drawn.

state_modifier_keys

[dict, optional] Keyboard modifiers which affect the widget's behavior. Values amend the defaults.
- "move": Move the existing shape, default: no modifier.
- "clear": Clear the current shape, default: "escape".
- "square": Makes the shape square, default: "shift".
- "center": Make the initial point the center of the shape, default: "ctrl".

"square" and "center" can be combined.

draw_shape (self, extents)

class matplotlib.widgets.Lasso(ax, xy, callback=None, useblit=True)
Bases: matplotlib.widgets.AxesWidget
Selection curve of an arbitrary shape.
The selected path can be used in conjunction with contains_point to select data points from an image.
Unlike LassoSelector, this must be initialized with a starting point xy, and the Lasso events are destroyed upon release.

Parameters

ax

[Axes] The parent axes for the widget.

xy

[(float, float)] Coordinates of the start of the lasso.

callback

[callable] Whenever the lasso is released, the callback function is called and passed the vertices of the selected path.

onmove (self, event)

onrelease (self, event)

class matplotlib.widgets.LassoSelector(ax, onselect=None, useblit=True, lineprops=None, button=None)
Bases: matplotlib.widgets._SelectorWidget
Selection curve of an arbitrary shape.
For the selector to remain responsive you must keep a reference to it.
The selected path can be used in conjunction with `contains_point` to select data points from an image.

In contrast to `Lasso`, `LassoSelector` is written with an interface similar to `RectangleSelector` and `SpanSelector`, and will continue to interact with the axes until disconnected.

Example usage:

```python
ax = plt.subplot()
ax.plot(x, y)

def onselect(verts):
    print(verts)
lasso = LassoSelector(ax, onselect)
```

**Parameters**

`ax`
- `[Axes]` The parent axes for the widget.

`onselect`
- [function] Whenever the lasso is released, the `onselect` function is called and passed the vertices of the selected path.

`button`
- `[MouseButton or list of MouseButton, optional]` The mouse buttons used for rectangle selection. Default is `None`, which corresponds to all buttons.

`onpress` (self, event)
`onrelease` (self, event)

**class** `matplotlib.widgets.LockDraw`

Bases: `object`

Some widgets, like the cursor, draw onto the canvas, and this is not desirable under all circumstances, like when the toolbar is in zoom-to-rect mode and drawing a rectangle. To avoid this, a widget can acquire a canvas' lock with `canvas.widgetlock(widget)` before drawing on the canvas; this will prevent other widgets from doing so at the same time (if they also try to acquire the lock first).

`available` (self, o)
- Return whether drawing is available to `o`.

`isowner` (self, o)
- Return whether `o` owns this lock.

`locked` (self)
- Return whether the lock is currently held by an owner.

`release` (self, o)
- Release the lock from `o`. 
class matplotlib.widgets.MultiCursor(canvas, axes, useblit=True, horizOn=False, vertOn=True, **lineprops)

Bases: matplotlib.widgets.Widget

Provide a vertical (default) and/or horizontal line cursor shared between multiple axes.

For the cursor to remain responsive you must keep a reference to it.

Example usage:

```python
from matplotlib.widgets import MultiCursor
import matplotlib.pyplot as plt
import numpy as np

fig, (ax1, ax2) = plt.subplots(nrows=2, sharex=True)
t = np.arange(0.0, 2.0, 0.01)
ax1.plot(t, np.sin(2*np.pi*t))
ax2.plot(t, np.sin(4*np.pi*t))

multi = MultiCursor(fig.canvas, (ax1, ax2), color='r', lw=1, horizOn=False, vertOn=True)
plt.show()
```

clear (self, event)

Clear the cursor.

connect (self)

Connect events.

disconnect (self)

Disconnect events.

onmove (self, event)

class matplotlib.widgets.PolygonSelector(ax, onselect, useblit=False, lineprops=None, markerprops=None, vertex_select_radius=15)

Bases: matplotlib.widgets._SelectorWidget

Select a polygon region of an axes.

Place vertices with each mouse click, and make the selection by completing the polygon (clicking on the first vertex). Hold the `ctrl` key and click and drag a vertex to reposition it (the `ctrl` key is not necessary if the polygon has already been completed). Hold the `shift` key and click and drag anywhere in the axes to move all vertices. Press the `esc` key to start a new polygon.

For the selector to remain responsive you must keep a reference to it.

Parameters

ax

[Axes] The parent axes for the widget.

onselect
When a polygon is completed or modified after completion, the \textit{onselect} function is called and passed a list of the vertices as \((xdata, ydata)\) tuples.

\begin{verbatim}
useblit
[bool, default: False]

lineprops
[dict, default: \texttt{dict(color='k', linestyle='-', linewidth=2, alpha=0.5)}.] Artist properties for the line representing the edges of the polygon.

markerprops
[dict, default: \texttt{dict(marker='o', markersize=7, mec='k', mfc='k', alpha=0.5)}.] Artist properties for the markers drawn at the vertices of the polygon.

vertex_select_radius
[float, default: 15px] A vertex is selected (to complete the polygon or to move a vertex) if the mouse click is within \textit{vertex_select_radius} pixels of the vertex.
\end{verbatim}

**Examples**

```
/gallery/widgets/polygon_selector_demo
```

\textbf{onmove} \((self, event)\)

Cursor move event handler and validator.

\textbf{property verts}

The polygon vertices, as a list of \((x, y)\) pairs.

\begin{verbatim}
class matplotlib.widgets.RadioButtons \((ax, labels, active=0, activecolor='blue')\)
Bases: \texttt{matplotlib.widgets.AxesWidget}
```

A GUI neutral radio button.

For the buttons to remain responsive you must keep a reference to this object.

Connect to the RadioButtons with the \texttt{on_clicked} method.

\begin{verbatim}
Attributes

ax
[\texttt{Axes}] The parent axes for the widget.

activecolor
[\texttt{color}] The color of the selected button.

labels
[list of \texttt{Text}] The button labels.
\end{verbatim}
circles

[list of Circle] The buttons.

value_selected

[Str] The label text of the currently selected button.

Add radio buttons to an Axes.

Parameters

ax

[Axes] The axes to add the buttons to.

labels

[list of str] The button labels.

active

[int] The index of the initially selected button.

activecolor

[color] The color of the selected button.

property cnt

disconnect (self, cid)

Remove the observer with connection id cid.

property observers

on_clicked (self, func)

Connect the callback function func to button click events.

Returns a connection id, which can be used to disconnect the callback.

set_active (self, index)

Select button with number index.

Callbacks will be triggered if eventson is True.

class matplotlib.widgets.RangeSlider (ax, label, valmin, valmax, valinit=None, valfmt=None, closedmin=True, closedmax=True, dragging=True, valstep=None, orientation='horizontal', **kwargs)

Bases: matplotlib.widgets.SliderBase

A slider representing a range of floating point values. Defines the min and max of the range via the val attribute as a tuple of (min, max).

Create a slider that defines a range contained within [valmin, valmax] in axes ax. For the slider to remain responsive you must maintain a reference to it. Call on_changed() to connect to the slider event.
Attributes

val

[tuple of float] Slider value.

Parameters

ax

[Axes] The Axes to put the slider in.

label

[any] Slider label.

valmin

[float] The minimum value of the slider.

valmax

[float] The maximum value of the slider.

valinit

[tuple of float or None, default: None] The initial positions of the slider. If None the initial positions will be at the 25th and 75th percentiles of the range.

valfmt

[any, default: None] %-format string used to format the slider values. If None, a ScalarFormatter is used instead.

closedmin

[bool, default: True] Whether the slider interval is closed on the bottom.

closedmax

[bool, default: True] Whether the slider interval is closed on the top.

dragging

[bool, default: True] If True the slider can be dragged by the mouse.

valstep

[float, default: None] If given, the slider will snap to multiples of valstep.

orientation

[{'horizontal', 'vertical'}, default: 'horizontal'] The orientation of the slider.
Notes

Additional kwargs are passed on to `self.poly` which is the `Rectangle` that draws the slider knob. See the `Rectangle` documentation for valid property names (facecolor, edgecolor, alpha, etc.).

`on_changed`(self, func)

Connect `func` as callback function to changes of the slider value.

Parameters

func

[callback] Function to call when slider is changed. The function must accept a numpy array with shape (2,) as its argument.

Returns

int

Connection id (which can be used to disconnect `func`).

`set_max`(self, max)

Set the lower value of the slider to `max`.

Parameters

max

[float]

`set_min`(self, min)

Set the lower value of the slider to `min`.

Parameters

min

[float]

`set_val`(self, val)

Set slider value to `val`.

Parameters

val

[tuple or array-like of float]
class matplotlib.widgets.RectangleSelector(ax, onselect, drawtype='box',
minspanx=0, minspany=0, useblit=False, lineprops=None, rectprops=None, spancoords='data',
button=None, maxdist=10, marker_props=None, interactive=False, state_modifier_keys=None)

Bases: matplotlib.widgets._SelectorWidget

Select a rectangular region of an axes.

For the cursor to remain responsive you must keep a reference to it.

Examples

/gallery/widgets/rectangle_selector

Parameters

- ax

  [Axes] The parent axes for the widget.

- onselect

  [function] A callback function that is called after a selection is completed. It must
  have the signature:

  ```python
def onselect(eclick: MouseEvent, erelease: MouseEvent)
```

  where `eclick` and `erelease` are the mouse click and release `MouseEvent`
  that start and complete the selection.

- drawtype

  [{"box", "line", "none"}, default: "box"] Whether to draw the full rectangle box,
  the diagonal line of the rectangle, or nothing at all.

- minspanx

  [float, default: 0] Selections with an x-span less than `minspanx` are ignored.

- minspany

  [float, default: 0] Selections with an y-span less than `minspany` are ignored.

- useblit

  [bool, default: False] Whether to use blitting for faster drawing (if supported by
  the backend).

- lineprops

  [linePropCollection] Line properties for drawing the line during
  the selection.
dict, optional] Properties with which the line is drawn, if `drawtype == "line"`. Default:

```python
dict(color="black", linestyle="--", linewidth=2, alpha=0.5)
```

**rectprops**

dict, optional] Properties with which the rectangle is drawn, if `drawtype == "box"`. Default:

```python
dict(facecolor="red", edgecolor="black", alpha=0.2, ... fill=True)
```

**spancoords**

["data", "pixels"], default: "data"] Whether to interpret `minspanx` and `minspany` in data or in pixel coordinates.

**button**

`MouseButton, list of MouseButton, default: all buttons] Button(s) that trigger rectangle selection.

**maxdist**

[float, default: 10] Distance in pixels within which the interactive tool handles can be activated.

**marker_props**

[dict] Properties with which the interactive handles are drawn. Currently not implemented and ignored.

**interactive**

[bool, default: False] Whether to draw a set of handles that allow interaction with the widget after it is drawn.

**state_modifier_keys**

[dict, optional] Keyboard modifiers which affect the widget’s behavior. Values amend the defaults.

- "move": Move the existing shape, default: no modifier.
- "clear": Clear the current shape, default: "escape".
- "square": Makes the shape square, default: "shift".
- "center": Make the initial point the center of the shape, default: "ctrl".

"square" and "center" can be combined.

**property center**

Center of rectangle.
property corners
    Corners of rectangle from lower left, moving clockwise.

draw_shape (self, extents)

property edge_centers
    Midpoint of rectangle edges from left, moving anti-clockwise.

property extents
    Return (xmin, xmax, ymin, ymax).

property geometry
    Return an array of shape (2, 5) containing the x (RectangleSelector.geometry[1, :])
    and y (RectangleSelector.geometry[0, :]) coordinates of the four corners of the
    rectangle starting and ending in the top left corner.

class matplotlib.widgets.Slider (ax, label, valmin, valmax, valinit=0.5, valfmt=None,
    closedmin=True, closedmax=True, slidermin=None, slidemax=None, dragging=True, valstep=None,
    orientation='horizontal', *, initcolor='r', **kwargs)

Bases: matplotlib.widgets.SliderBase

A slider representing a floating point range.

Create a slider from valmin to valmax in axes ax. For the slider to remain responsive you must maintain
a reference to it. Call on_changed() to connect to the slider event.

Attributes

    val
        [float] Slider value.

Parameters

    ax
        [Axes] The Axes to put the slider in.
    label
        [str] Slider label.
    valmin
        [float] The minimum value of the slider.
    valmax
        [float] The maximum value of the slider.
    valinit
        [float, default: 0.5] The slider initial position.
    valfmt
        [float] The slider initial position.
[str, default: None] %-format string used to format the slider value. If None, a `ScalarFormatter` is used instead.

closedmin
[bool, default: True] Whether the slider interval is closed on the bottom.

closedmax
[bool, default: True] Whether the slider interval is closed on the top.

slidermin
[Slider, default: None] Do not allow the current slider to have a value less than the value of the Slider `slidermin`.

slidermax
[Slider, default: None] Do not allow the current slider to have a value greater than the value of the Slider `slidermax`.

dragging
[bool, default: True] If True the slider can be dragged by the mouse.

valstep
[float or array-like, default: None] If a float, the slider will snap to multiples of `valstep`. If an array the slider will snap to the values in the array.

orientation
[{'horizontal', 'vertical'}, default: 'horizontal'] The orientation of the slider.

initcolor
[color, default: 'r'] The color of the line at the `valinit` position. Set to 'none' for no line.

Notes

Additional kwargs are passed on to `self.poly` which is the `Rectangle` that draws the slider knob. See the `Rectangle` documentation for valid property names (`facecolor`, `edgecolor`, `alpha`, etc.).

property cnt

property observers

on_changed (`self`, `func`)  
Connect `func` as callback function to changes of the slider value.

Parameters

func
[callable] Function to call when slider is changed. The function must accept a single float as its arguments.

Returns

int

Connection id (which can be used to disconnect `func`).

```python
set_val(self, val)
```

Set slider value to `val`.

Parameters

val

[float]

```python
class matplotlib.widgets.SliderBase(ax, orientation, closedmin, closedmax, valmin, valmax, valfmt, dragging, valstep)
```

Bases: `matplotlib.widgets.AxesWidget`

The base class for constructing Slider widgets. Not intended for direct usage.

For the slider to remain responsive you must maintain a reference to it.

```python
disconnect(self, cid)
```

Remove the observer with connection id `cid`.

Parameters

cid

[int] Connection id of the observer to be removed.

```python
reset(self)
```

Reset the slider to the initial value.

```python
class matplotlib.widgets.SpanSelector(ax, onselect, direction, minspan=None, useblit=False, rectprops=None, onmove_callback=None, span_stays=False, button=None)
```

Bases: `matplotlib.widgets._SelectorWidget`

Visually select a min/max range on a single axis and call a function with those values.

To guarantee that the selector remains responsive, keep a reference to it.

In order to turn off the SpanSelector, set `span_selector.active` to False. To turn it back on, set it to True.

Parameters
ax

    [matplotlib.axes.Axes]

onselect

    [func(min, max), min/max are floats]

direction

    [{"horizontal", "vertical"}] The direction along which to draw the span selector.

minspan

    [float, default: None] If selection is less than minspan, do not call onselect.

useblit

    [bool, default: False] If True, use the backend-dependent blitting features for faster canvas updates.

rectprops

onmove_callback

    [func(min, max), min/max are floats, default: None] Called on mouse move while the span is being selected.

span_stays

    [bool, default: False] If True, the span stays visible after the mouse is released.

button

    [MouseButton or list of MouseButton] The mouse buttons which activate the span selector.

Examples

>>> import matplotlib.pyplot as plt
>>> import matplotlib.widgets as mwidgets
>>> fig, ax = plt.subplots()
>>> ax.plot([1, 2, 3], [10, 50, 100])
>>> def onselect(vmin, vmax):
...     print(vmin, vmax)
>>> rectprops = dict(facecolor='blue', alpha=0.5)
>>> span = mwidgets.SpanSelector(ax, onselect, 'horizontal',
...                               rectprops=rectprops)
>>> fig.show()

See also: /gallery/widgets/span_selector

ignore (self, event)

    Return whether event should be ignored.
This method should be called at the beginning of any event callback.

```python
new_axes(self, ax)
```
Set SpanSelector to operate on a new Axes.

```python
class matplotlib.widgets.SubplotTool(targetfig, toolfig)
Bases: matplotlib.widgets.Widget
```
A tool to adjust the subplot params of a `matplotlib.figure.Figure`.

**Parameters**

- **targetfig**
  
  `[Figure]` The figure instance to adjust.

- **toolfig**
  
  `[Figure]` The figure instance to embed the subplot tool into.

**property axbottom**

- **property axhspan**

- **property axleft**

- **property axright**

- **property axtop**

- **property axwspace**

```python
funcbottom(self, val)

[Deprecated]
```

**Notes**

Deprecated since version 3.3:

```python
funchspace(self, val)

[Deprecated]
```

**Notes**

Deprecated since version 3.3:

```python
funcleft(self, val)

[Deprecated]
```
Notes

Deprecated since version 3.3:

**funcright**(self, val)

[Deprecated]

Notes

Deprecated since version 3.3:

**funcwspace**(self, val)

[Deprecated]

Notes

Deprecated since version 3.3:

### `class matplotlib.widgets.TextBox(ax, label, initial='', color='.95', hovercolor='1', label_pad=0.01)`

Bases: `matplotlib.widgets.AxesWidget`

A GUI neutral text input box.

For the text box to remain responsive you must keep a reference to it.

Call `on_text_change` to be updated whenever the text changes.

Call `on_submit` to be updated whenever the user hits enter or leaves the text entry field.

Attributes

- `ax`
  - *[Axes]* The parent axes for the widget.

- `label`
  - *[Text]*

- `color`
  - [color] The color of the text box when not hovering.

- `hovercolor`
  - [color] The color of the text box when hovering.
Parameters

ax
    [Axes] The Axes instance the button will be placed into.

label
    [str] Label for this text box.

initial
    [str] Initial value in the text box.

color
    [color] The color of the box.

hovercolor
    [color] The color of the box when the mouse is over it.

label_pad
    [float] The distance between the label and the right side of the textbox.

begin_typing (self, x)

property change_observers

property cnt

disconnect (self, cid)
    Remove the observer with connection id cid.

on_submit (self, func)
    When the user hits enter or leaves the submission box, call this func with event.

    A connection id is returned which can be used to disconnect.

on_text_change (self, func)
    When the text changes, call this func with event.

    A connection id is returned which can be used to disconnect.

property params_to_disable

position_cursor (self, x)

set_val (self, val)

stop_typing (self)

property submit_observers

property text

class matplotlib.widgets.ToolHandles (ax, x, y, marker='o', marker_props=None, useblit=True)
Control handles for canvas tools.

**Parameters**

- `ax`
  - `[matplotlib.axes.Axes]` Matplotlib axes where tool handles are displayed.

- `x, y`
  - `[1D arrays]` Coordinates of control handles.

- `marker`
  - `[str]` Shape of marker used to display handle. See `matplotlib.pyplot.plot`.

- `marker_props`
  - `[dict]` Additional marker properties. See `matplotlib.lines.Line2D`.

- `closest (self, x, y)`
  - Return index and pixel distance to closest index.

- `set_animated (self, val)`

- `set_data (self, pts, y=None)`
  - Set x and y positions of handles.

- `set_visible (self, val)`

**Properties**

- `property x`
- `property y`

**class** matplotlib.widgets.Widget

Bases: `object`

Abstract base class for GUI neutral widgets.

- `property active`
  - Is the widget active?

- `drawon = True`

- `eventson = True`

- `get_active (self)`
  - Get whether the widget is active.

- `ignore (self, event)`
  - Return whether event should be ignored.
  - This method should be called at the beginning of any event callback.

- `set_active (self, active)`
  - Set whether the widget is active.
18.62 matplotlib._api

Helper functions for managing the Matplotlib API.

This documentation is only relevant for Matplotlib developers, not for users.

matplotlib._api.check_getitem(_mapping, **kwargs)

  *kwargs must consist of a single key, value pair. If key is in _mapping, return _mapping[value];
  else, raise an appropriate ValueError.

Examples

```python
>>> _api.check_getitem({"foo": "bar"}, arg=arg)
```

matplotlib._api.check_in_list(_values, *_, print_supported_values=True, **kwargs)

  For each key, value pair in kwargs, check that value is in _values.

Parameters

  _values
    [iterable] Sequence of values to check on.

  _print_supported_values
    [bool, default: True] Whether to print _values when raising ValueError.

  **kwargs
    [dict] key, value pairs as keyword arguments to find in _values.

Raises

  ValueError
    If any value in kwargs is not found in _values.

Examples

```python
>>> _api.check_in_list(["foo", "bar"], arg=arg, other_arg=other_arg)
```

matplotlib._api.check_isinstance(_types, **kwargs)

  For each key, value pair in kwargs, check that value is an instance of one of _types; if not, raise an appropriate TypeError.

    As a special case, a None entry in _types is treated as NoneType.
Examples

```python
>>> _api.check_isinstance((SomeClass, None), arg=arg)
```

```python
matplotlib._api.check_shape(_shape, **kwargs)
```

For each key, value pair in kwargs, check that value has the shape _shape, if not, raise an appropriate ValueError.

*None* in the shape is treated as a "free" size that can have any length. e.g. (None, 2) -> (N, 2)

The values checked must be numpy arrays.

Examples

To check for (N, 2) shaped arrays

```python
>>> _api.check_shape((None, 2), arg=arg, other_arg=other_arg)
```

class matplotlib._api.classproperty (fget, fset=None, fdel=None, doc=None)

Bases: object

Like *property*, but also triggers on access via the class, and it is the *class* that's passed as argument.

Examples

```python
class C:
    @classproperty
    def foo(cls):
        return cls.__name__

assert C.foo == "C"
```

property fget

```python
matplotlib._api.warn_external(message, category=None)
```

```python
warnings.warn wrapper that sets stacklevel to "outside Matplotlib".
```

The original emitter of the warning can be obtained by patching this function back to warnings.warn, i.e. `_api.warn_external = warnings.warn (or functools.partial (warnings.warn, stacklevel=2), etc.).

```
```

Helper functions for deprecating parts of the Matplotlib API.

This documentation is only relevant for Matplotlib developers, not for users.

exception matplotlib._api.deprecation_MATplotlibDeprecationWarning

Bases: UserWarning

A class for issuing deprecation warnings for Matplotlib users.
In light of the fact that Python builtin DeprecationWarnings are ignored by default as of Python 2.7 (see link below), this class was put in to allow for the signaling of deprecation, but via UserWarnings which are not ignored by default.

https://docs.python.org/dev/whatsnew/2.7.html#the-future-for-python-2-x

matplotlib._api.deprecation.delete_parameter(since, name, func=None, **kwargs)

Decorator indicating that parameter name of func is being deprecated.

The actual implementation of func should keep the name parameter in its signature, or accept a **kwargs argument (through which name would be passed).

Parameters that come after the deprecated parameter effectively become keyword-only (as they cannot be passed positionally without triggering the DeprecationWarning on the deprecated parameter), and should be marked as such after the deprecation period has passed and the deprecated parameter is removed.

Parameters other than since, name, and func are keyword-only and forwarded to warn_deprecated.

Examples

```python
@_api.delete_parameter("3.1", "unused")
def func(used_arg, other_arg, unused, more_args): ...
```

matplotlib._api.deprecation.deprecate_method_override(method, obj, *, allow_empty=False, **kwargs)

Return obj.method with a deprecation if it was overridden, else None.

Parameters

method

An unbound method, i.e. an expression of the form Class.method_name. Remember that within the body of a method, one can always use __class__ to refer to the class that is currently being defined.

obj

Either an object of the class where method is defined, or a subclass of that class.

allow_empty

[bool, default: False] Whether to allow overrides by "empty" methods without emitting a warning.

**kwargs

Additional parameters passed to warn_deprecated to generate the deprecation warning; must at least include the "since" key.
class matplotlib._api.deprecation.deprecate_privatize_attribute(*args, **kwargs)

Bases: object

Helper to deprecate public access to an attribute.

This helper should only be used at class scope, as follows:

```python
class Foo:
    attr = _deprecate_privatize_attribute(*args, **kwargs)
```

where all parameters are forwarded to `deprecated`. This form makes `attr` a property which forwards access to `self._attr` (same name but with a leading underscore), with a deprecation warning. Note that the attribute name is derived from the name this helper is assigned to.

matplotlib._api.deprecation.deprecated(since, *, message='', name='', alternative='', pending=False, obj_type=None, addendum='', removal='')

Decorator to mark a function, a class, or a property as deprecated.

When deprecating a class method, a static method, or a property, the `@deprecated` decorator should go under `@classmethod` and `@staticmethod` (i.e., `deprecated` should directly decorate the underlying callable), but over `@property`.

When deprecating a class `C` intended to be used as a base class in a multiple inheritance hierarchy, `C` must define an `__init__` method (if `C` instead inherited its `__init__` from its own base class, then `@deprecated` would mess up `__init__` inheritance when installing its own (deprecation-emitting) `C.__init__`).

**Parameters**

- `since`
  - `[str]` The release at which this API became deprecated.

- `message`
  - `[str, optional]` Override the default deprecation message. The `%(<since>s, %(<name>s, %(<alternative>s, %(<obj_type>s, %(<addendum>s, %(<removal>s format specifiers will be replaced by the values of the respective arguments passed to this function.

- `name`
  - `[str, optional]` The name used in the deprecation message; if not provided, the name is automatically determined from the deprecated object.

- `alternative`
  - `[str, optional]` An alternative API that the user may use in place of the deprecated API. The deprecation warning will tell the user about this alternative if provided.

- `pending`
  - `[bool, optional]` If True, uses a PendingDeprecationWarning instead of a DeprecationWarning. Cannot be used together with `removal`. 

---

18.62. matplotlib._api 2921
**obj_type**

[str, optional] The object type being deprecated; by default, ‘class’ if decorating a class, ‘attribute’ if decorating a property, ‘function’ otherwise.

**addendum**

[str, optional] Additional text appended directly to the final message.

**removal**

[str, optional] The expected removal version. With the default (an empty string), a removal version is automatically computed from *since*. Set to other Falsy values to not schedule a removal date. Cannot be used together with *pending*.

---

**Examples**

Basic example:

```python
@deprecated('1.4.0')
def the_function_to_deprecate():
    pass
```

**matplotlib._api.deprecation.make_keyword_only**(*since*, *name*, *func=None*)

Decorator indicating that passing parameter *name* (or any of the following ones) positionally to *func* is being deprecated.

**matplotlib._api.deprecation.mplDeprecation**

alias of **matplotlib._api.deprecation.MatplotlibDeprecationWarning**

**matplotlib._api.deprecation.rename_parameter**(*since*, *old*, *new*, *func=None*)

Decorator indicating that parameter *old* of *func* is renamed to *new*.

The actual implementation of *func* should use *new*, not *old*. If *old* is passed to *func*, a DeprecationWarning is emitted, and its value is used, even if *new* is also passed by keyword (this is to simplify pyplot wrapper functions, which always pass *new* explicitly to the Axes method). If *new* is also passed but positionally, a TypeError will be raised by the underlying function during argument binding.

---

**Examples**

```python
@api.rename_parameter("3.1", "bad_name", "good_name")
def func(good_name): ...
```

**matplotlib._api.deprecation.suppress_matplotlib_deprecation_warning**()

**matplotlib._api.deprecation.warn_deprecated**(*since*, *_, message='', name='', alternative='', pending=False, obj_type='', addendum='', removal='')

Display a standardized deprecation.

**Parameters**
since

[str] The release at which this API became deprecated.

message

[str, optional] Override the default deprecation message. The %(since)s, %(name)s, %(alternative)s, %(obj_type)s, %(addendum)s, and %(removal)s format specifiers will be replaced by the values of the respective arguments passed to this function.

name

[str, optional] The name of the deprecated object.

alternative

[str, optional] An alternative API that the user may use in place of the deprecated API. The deprecation warning will tell the user about this alternative if provided.

pending

[bool, optional] If True, uses a PendingDeprecationWarning instead of a DeprecationWarning. Cannot be used together with removal.

obj_type

[str, optional] The object type being deprecated.

addendum

[str, optional] Additional text appended directly to the final message.

removal

[str, optional] The expected removal version. With the default (an empty string), a removal version is automatically computed from since. Set to other Falsy values to not schedule a removal date. Cannot be used together with pending.

Examples

Basic example:

```python
# To warn of the deprecation of "matplotlib.name_of_module"
warn_deprecated('1.4.0', name='matplotlib.name_of_module',
                 obj_type='module')
```
**18.63 matplotlib._enums**

Enums representing sets of strings that Matplotlib uses as input parameters.

Matplotlib often uses simple data types like strings or tuples to define a concept; e.g. the line capstyle can be specified as one of 'butt', 'round', or 'projecting'. The classes in this module are used internally and serve to document these concepts formally.

As an end-user you will not use these classes directly, but only the values they define.

```python
class matplotlib._enums.JoinStyle(value)
    Define how the connection between two line segments is drawn.
```

For a visual impression of each JoinStyle, view these docs online, or run `JoinStyle.demo`.

Lines in Matplotlib are typically defined by a 1D `Path` and a finite linewidth, where the underlying 1D `Path` represents the center of the stroked line.

By default, `GraphicsContextBase` defines the boundaries of a stroked line to simply be every point within some radius, `linewidth/2`, away from any point of the center line. However, this results in corners appearing "rounded", which may not be the desired behavior if you are drawing, for example, a polygon or pointed star.

**Supported values:**

- **'miter'**
  - the "arrow-tip" style. Each boundary of the filled-in area will extend in a straight line parallel to the tangent vector of the centerline at the point it meets the corner, until they meet in a sharp point.

- **'round'**
  - stokes every point within a radius of `linewidth/2` of the center lines.

- **'bevel'**
  - the "squared-off" style. It can be thought of as a rounded corner where the "circular" part of the corner has been cut off.

**Note:** Very long miter tips are cut off (to form a bevel) after a backend-dependent limit called the "miter limit", which specifies the maximum allowed ratio of miter length to line width. For example, the PDF backend uses the default value of 10 specified by the PDF standard, while the SVG backend does not even specify the miter limit, resulting in a default value of 4 per the SVG specification. Matplotlib does not currently allow the user to adjust this parameter.

A more detailed description of the effect of a miter limit can be found in the Mozilla Developer Docs.

```python
static demo()
    Demonstrate how each JoinStyle looks for various join angles.
```

```python
class matplotlib._enums.CapStyle(value)
    Define how the two endpoints (caps) of an unclosed line are drawn.
```
How to draw the start and end points of lines that represent a closed curve (i.e. that end in a `CLOSE-POLY`) is controlled by the line's `JoinStyle`. For all other lines, how the start and end points are drawn is controlled by the `CapStyle`.

For a visual impression of each `CapStyle`, view these docs online or run `CapStyle.demo`.

Supported values:

'butt'
the line is squared off at its endpoint.

'projecting'
the line is squared off as in `butt`, but the filled in area extends beyond the endpoint a distance of `linewidth/2`.

'round'
like `butt`, but a semicircular cap is added to the end of the line, of radius `linewidth/2`.
static demo()
    Demonstrate how each CapStyle looks for a thick line segment.
Toolkits are collections of application-specific functions that extend Matplotlib. The following toolkits are included:

19.1 Toolkits

Toolkits are collections of application-specific functions that extend Matplotlib.

19.1.1 mplot3d

mpl_toolkits.mplot3d provides some basic 3D plotting (scatter, surf, line, mesh) tools. Not the fastest or most feature complete 3D library out there, but it ships with Matplotlib and thus may be a lighter weight solution for some use cases. Check out the mplot3d tutorial for more information.
mplot3d

Matplotlib mplot3d toolkit

The mplot3d toolkit adds simple 3D plotting capabilities to matplotlib by supplying an axes object that can create a 2D projection of a 3D scene. The resulting graph will have the same look and feel as regular 2D plots.

See the mplot3d tutorial for more information on how to use this toolkit.

The interactive backends also provide the ability to rotate and zoom the 3D scene. One can rotate the 3D scene by simply clicking-and-dragging the scene. Zooming is done by right-clicking the scene and dragging the mouse up and down. Note that one does not use the zoom button like one would use for regular 2D plots.

mplot3d FAQ

How is mplot3d different from Mayavi?

Mayavi is a very powerful and featureful 3D graphing library. For advanced 3D scenes and excellent rendering capabilities, it is highly recommended to use Mayavi.

mplot3d was intended to allow users to create simple 3D graphs with the same "look-and-feel" as matplotlib's 2D plots. Furthermore, users can use the same toolkit that they are already familiar with to generate both
their 2D and 3D plots.

**My 3D plot doesn't look right at certain viewing angles**

This is probably the most commonly reported issue with mplot3d. The problem is that -- from some viewing angles -- a 3D object would appear in front of another object, even though it is physically behind it. This can result in plots that do not look "physically correct."

Unfortunately, while some work is being done to reduce the occurrence of this artifact, it is currently an intractable problem, and can not be fully solved until matplotlib supports 3D graphics rendering at its core.

The problem occurs due to the reduction of 3D data down to 2D + z-order scalar. A single value represents the 3rd dimension for all parts of 3D objects in a collection. Therefore, when the bounding boxes of two collections intersect, it becomes possible for this artifact to occur. Furthermore, the intersection of two 3D objects (such as polygons or patches) can not be rendered properly in matplotlib's 2D rendering engine.

This problem will likely not be solved until OpenGL support is added to all of the backends (patches are greatly welcomed). Until then, if you need complex 3D scenes, we recommend using MayaVi.

**I don't like how the 3D plot is laid out, how do I change that?**

Historically, mplot3d has suffered from a hard-coding of parameters used to control visuals such as label spacing, tick length, and grid line width. Work is being done to eliminate this issue. For matplotlib v1.1.0, there is a semi-official manner to modify these parameters. See the note in the mplot3d.axis3d section of the mplot3d API documentation for more information.

### 19.1.2 Matplotlib axes_grid1 Toolkit

The matplotlib [mpl_toolkits.axes_grid1](#) toolkit is a collection of helper classes to ease displaying multiple images in matplotlib. While the aspect parameter in matplotlib adjust the position of the single axes, axes_grid1 toolkit provides a framework to adjust the position of multiple axes according to their aspects.

See [What is axes_grid1 toolkit?](#) for a guide on the usage of axes_grid1.

The submodules of the axes_grid1 API are:
### axes_grid1.anchored_artists

- **axes_grid1.axes_divider**
  Helper classes to adjust the positions of multiple axes at drawing time.

- **axes_grid1.axes_grid**
- **axes_grid1.axes_rgb**
- **axes_grid1.axes_size**
  Provides classes of simple units that will be used with AxesDivider class (or others) to determine the size of each axes.

- **axes_grid1.inset_locator**
  A collection of functions and objects for creating or placing inset axes.

- **axes_grid1.mpl_axes**
- **axes_grid1.parasite_axes**

### mpl_toolkits.axes_grid1.anchored_artists

#### Classes

- **AnchoredAuxTransformBox**
  An anchored container with transformed coordinates.

- **AnchoredDirectionArrows**
  Draw two perpendicular arrows to indicate directions.

- **AnchoredDrawingArea**
  An anchored container with a fixed size and fillable DrawingArea.

- **AnchoredEllipse**
  Draw an anchored ellipse of a given size.

- **AnchoredSizeBar**
  Draw a horizontal scale bar with a center-aligned label underneath.

### mpl_toolkits.axes_grid1.anchored_artists.AnchoredAuxTransformBox

#### class mpl_toolkits.axes_grid1.anchored_artists.AnchoredAuxTransformBox

- **class** mpl_toolkits.axes_grid1.anchored_artists.AnchoredAuxTransformBox
  (transform, loc[, ...])

- **AnchoredAuxTransformBox**
  An anchored container with transformed coordinates.

- **AnchoredAuxTransformBox**
  Artists added to the drawing_area are scaled according to the coordinates of the transformation used.
The dimensions of this artist will scale to contain the artists added.

**Parameters**

`transform`

- `[matplotlib.transforms.Transform] The transformation object for the coordinate system in use, i.e., matplotlib.axes.Axes.transData.

`loc`

- `[int] Location of this artist. Valid location codes are:
  - 'upper right' : 1,
  - 'upper left' : 2,
  - 'lower left' : 3,
  - 'lower right' : 4,
  - 'right' : 5,
  - 'center left' : 6,
  - 'center right' : 7,
  - 'lower center' : 8,
  - 'upper center' : 9,
  - 'center' : 10

`pad`

- `[float, default: 0.4] Padding around the child objects, in fraction of the font size.

`borderpad`

- `[float, default: 0.5] Border padding, in fraction of the font size.

`prop`

`frameon`

- `[bool, default: True] If True, draw a box around this artists.

**kwargs

Keyworded arguments to pass to `matplotlib.offsetbox.AnchoredOffsetbox`.

**Examples**

To display an ellipse in the upper left, with a width of 0.1 and height of 0.4 in data coordinates:

```python
>>> box = AnchoredAuxTransformBox(ax.transData, loc='upper left')
>>> el = Ellipse((0, 0), width=0.1, height=0.4, angle=30)
>>> box.drawing_area.add_artist(el)
>>> ax.add_artist(box)
```
Attributes

```python

drawing_area

[matplotlib.offsetbox.AuxTransformBox] A container for artists to display.
```

```python
__init__(self, transform, loc, pad=0.4, borderpad=0.5, prop=None, frameon=True, **kwargs)
```

An anchored container with transformed coordinates.

Artists added to the `drawing_area` are scaled according to the coordinates of the transformation used. The dimensions of this artist will scale to contain the artists added.

Parameters

```python
transform

```

```python
loc

[int] Location of this artist. Valid location codes are:
```

```python

<table>
<thead>
<tr>
<th>Location</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>upper right</td>
<td>1</td>
</tr>
<tr>
<td>upper left</td>
<td>2</td>
</tr>
<tr>
<td>lower left</td>
<td>3</td>
</tr>
<tr>
<td>lower right</td>
<td>4</td>
</tr>
<tr>
<td>right</td>
<td>5</td>
</tr>
<tr>
<td>center left</td>
<td>6</td>
</tr>
<tr>
<td>center right</td>
<td>7</td>
</tr>
<tr>
<td>lower center</td>
<td>8</td>
</tr>
<tr>
<td>upper center</td>
<td>9</td>
</tr>
<tr>
<td>center</td>
<td>10</td>
</tr>
</tbody>
</table>
```

```python

pad

[float, default: 0.4] Padding around the child objects, in fraction of the font size.
```

```python

borderpad

[float, default: 0.5] Border padding, in fraction of the font size.
```

```python

prop

```

```python

frameon

[bool, default: True] If True, draw a box around this artists.
```

```python

**kwargs

Keyworded arguments to pass to matplotlib.offsetbox.AnchoredOffsetbox.
Examples

To display an ellipse in the upper left, with a width of 0.1 and height of 0.4 in data coordinates:

```python
>>> box = AnchoredAuxTransformBox(ax.transData, loc='upper left')
>>> el = Ellipse((0, 0), width=0.1, height=0.4, angle=30)
>>> box.drawing_area.add_artist(el)
>>> ax.add_artist(box)
```

Attributes

```python
drawing_area
```

[matplotlib.offsetbox.AuxTransformBox] A container for artists to display.

```
__module__ = 'mpl_toolkits.axes_grid1.anchored_artists'
```

Examples using mpl_toolkits.axes_grid1.anchored_artists.

- sphx_glr_gallery_userdemo_anchored_box03.py
**mpl_toolkits.axes_grid1.anchored_artists.AnchoredDirectionArrows**

class mpl_toolkits.axes_grid1.anchored_artists.AnchoredDirectionArrows(transform, label_x, label_y, length=0.15, fontsize=0.08, loc=2, angle=0, aspect_ratio=1, pad=0.4, border_pad=0.4, frameon=False, color='w', alpha=1, sep_x=0.01, sep_y=0, font_properties=None, back_length=0.15, head_width=10, head_length=15, tail_width=2, text_props=None, arrow_props=None, **kwargs)

Bases: matplotlib.offsetbox.AnchoredOffsetbox

Draw two perpendicular arrows to indicate directions.

**Parameters**

- **transform**
  - [matplotlib.transforms.Transform] The transformation object for the coordinate system in use, i.e., matplotlib.axes.Axes.transAxes.

- **label_x**, **label_y**
[str] Label text for the x and y arrows

**length**

[float, default: 0.15] Length of the arrow, given in coordinates of *transform*.

**fontsize**

[float, default: 0.08] Size of label strings, given in coordinates of *transform*.

**loc**

[int, default: 2] Location of the direction arrows. Valid location codes are:

<table>
<thead>
<tr>
<th>Location</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>upper right</td>
<td>1</td>
</tr>
<tr>
<td>upper left</td>
<td>2</td>
</tr>
<tr>
<td>lower left</td>
<td>3</td>
</tr>
<tr>
<td>lower right</td>
<td>4</td>
</tr>
<tr>
<td>right</td>
<td>5</td>
</tr>
<tr>
<td>center left</td>
<td>6</td>
</tr>
<tr>
<td>center right</td>
<td>7</td>
</tr>
<tr>
<td>lower center</td>
<td>8</td>
</tr>
<tr>
<td>upper center</td>
<td>9</td>
</tr>
<tr>
<td>center</td>
<td>10</td>
</tr>
</tbody>
</table>

**angle**

[float, default: 0] The angle of the arrows in degrees.

**aspect_ratio**

[float, default: 1] The ratio of the length of arrow_x and arrow_y. Negative numbers can be used to change the direction.

**pad**

[float, default: 0.4] Padding around the labels and arrows, in fraction of the font size.

**borderpad**

[float, default: 0.4] Border padding, in fraction of the font size.

**frameon**

[bool, default: False] If True, draw a box around the arrows and labels.

**color**

[str, default: 'white'] Color for the arrows and labels.

**alpha**

[float, default: 1] Alpha values of the arrows and labels

**sep_x, sep_y**

[float, default: 0.01 and 0 respectively] Separation between the arrows and labels in coordinates of *transform*.
fontproperties
back_length
   [float, default: 0.15] Fraction of the arrow behind the arrow crossing.
head_width
   [float, default: 10] Width of arrow head, sent to ArrowStyle.
head_length
   [float, default: 15] Length of arrow head, sent to ArrowStyle.
tail_width
   [float, default: 2] Width of arrow tail, sent to ArrowStyle.
text_props, arrow_props
**kwargs
   Keyworded arguments to pass to matplotlib.offsetbox.AnchoredOffsetbox.

Notes

If prop is passed as a keyword argument, but fontproperties is not, then prop is be assumed to be the intended fontproperties. Using both prop and fontproperties is not supported.

Examples

```python
>>> import matplotlib.pyplot as plt
>>> import numpy as np
>>> from mpl_toolkits.axes_grid1.anchored_artists import AnchoredDirectionArrows
...       AnchoredDirectionArrows)
>>> fig, ax = plt.subplots()
>>> ax.imshow(np.random.random((10, 10)))
>>> arrows = AnchoredDirectionArrows(ax.transAxes, '111', '110')
>>> ax.add_artist(arrows)
>>> fig.show()
```

Using several of the optional parameters, creating downward pointing arrow and high contrast text labels.
>>> import matplotlib.font_manager as fm
>>> fontprops = fm.FontProperties(family='monospace')
>>> arrows = AnchoredDirectionArrows(ax.transAxes, 'East', 'South',
... loc='lower left', color='k',
... aspect_ratio=-1, sep_x=0.02,
... sep_y=-0.01,
... text_props={'ec':'w', 'fc':'k'},
... fontproperties=fontprops)

Attributes

arrow_x, arrow_y

[matplotlib.patches.FancyArrowPatch] Arrow x and y
text_path_x, text_path_y

[matplotlib.textpath.TextPath] Path for arrow labels
p_x, p_y

[matplotlib.patches.PathPatch] Patch for arrow labels
box

[matplotlib.offsetbox.AuxTransformBox] Container for the arrows and labels.

__init__ (self, transform, label_x, label_y, length=0.15, fontsize=0.08, loc=2, angle=0,
aspect_ratio=1, pad=0.4, borderpad=0.4, frameon=False, color='w', alpha=1,
sep_x=0.01, sep_y=0, fontproperties=None, back_length=0.15, head_length=15,
tail_width=2, text_props=None, arrow_props=None, **kwargs)

Draw two perpendicular arrows to indicate directions.

Parameters

transform

label_x, label_y

[st] Label text for the x and y arrows

length

[float, default: 0.15] Length of the arrow, given in coordinates of transform.

fontsize

[float, default: 0.08] Size of label strings, given in coordinates of transform.
loc

[int, default: 2] Location of the direction arrows. Valid location codes are:

<table>
<thead>
<tr>
<th>Code</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>'upper right'</td>
<td>1,</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2,</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3,</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4,</td>
</tr>
<tr>
<td>'right'</td>
<td>5,</td>
</tr>
<tr>
<td>'center left'</td>
<td>6,</td>
</tr>
<tr>
<td>'center right'</td>
<td>7,</td>
</tr>
<tr>
<td>'lower center'</td>
<td>8,</td>
</tr>
<tr>
<td>'upper center'</td>
<td>9,</td>
</tr>
<tr>
<td>'center'</td>
<td>10</td>
</tr>
</tbody>
</table>

angle

[float, default: 0] The angle of the arrows in degrees.

aspect_ratio

[float, default: 1] The ratio of the length of arrow_x and arrow_y. Negative numbers can be used to change the direction.

pad

[float, default: 0.4] Padding around the labels and arrows, in fraction of the font size.

borderpad

[float, default: 0.4] Border padding, in fraction of the font size.

frameon

[bool, default: False] If True, draw a box around the arrows and labels.

color

[str, default: 'white'] Color for the arrows and labels.

alpha

[float, default: 1] Alpha values of the arrows and labels.

sep_x, sep_y

[float, default: 0.01 and 0 respectively] Separation between the arrows and labels in coordinates of transform.

fontproperties

back_length

[float, default: 0.15] Fraction of the arrow behind the arrow crossing.
head_width
[default: 10] Width of arrow head, sent to ArrowStyle.

head_length
[default: 15] Length of arrow head, sent to ArrowStyle.

tail_width
[default: 2] Width of arrow tail, sent to ArrowStyle.

text_props, arrow_props

**kwargs
Keyworded arguments to pass to matplotlib.offsetbox.AnchoredOffsetbox.

Notes
If prop is passed as a keyword argument, but fontproperties is not, then prop is be assumed to be the intended fontproperties. Using both prop and fontproperties is not supported.

Examples

```
>>> import matplotlib.pyplot as plt
>>> import numpy as np
>>> from mpl_toolkits.axes_grid1.anchored_artists import AnchoredDirectionArrows

>>> fig, ax = plt.subplots()
>>> ax.imshow(np.random.random((10, 10)))
>>> arrows = AnchoredDirectionArrows(ax.transAxes, '111', '110')
>>> ax.add_artist(arrows)
>>> fig.show()
```

Using several of the optional parameters, creating downward pointing arrow and high contrast text labels.

```
>>> import matplotlib.font_manager as fm
>>> fontprops = fm.FontProperties(family='monospace')
>>> arrows = AnchoredDirectionArrows(ax.transAxes, 'East', 'South',

   ...   loc='lower left', color='k',
   ...   aspect_ratio=-1, sep_x=0.02,
   ...   sep_y=-0.01,
   ...   text_props={'ec':'w', 'fc':'k'},
   ...   fontproperties=fontprops)
```

Attributes
arrow_x, arrow_y

[matplotlib.patches.FancyArrowPatch] Arrow x and y

text_path_x, text_path_y

[matplotlib.textpath.TextPath] Path for arrow labels

p_x, p_y

[matplotlib.patches.PathPatch] Patch for arrow labels

box

[matplotlib.offsetbox.AuxTransformBox] Container for the arrows and labels.

__module__ = 'mpl_toolkits.axes_grid1.anchored_artists'

Examples using mpl_toolkits.axes_grid1.anchored_artists.AnchoredDirectionArrows

- sphx_glr_gallery_axes_grid1_demo_anchored_direction_arrows.py

mpl_toolkits.axes_grid1.anchored_artists.AnchoredDrawingArea

class mpl_toolkits.axes_grid1.anchored_artists.AnchoredDrawingArea:

Bases: matplotlib.offsetbox.ArchoredOffsetbox

An anchored container with a fixed size and fillable DrawingArea.

Artists added to the drawing_area will have their coordinates interpreted as pixels. Any transformations set on the artists will be overridden.

Parameters
width, height
[ float ] width and height of the container, in pixels.

xdescent, ydescent
[ float ] descent of the container in the x- and y- direction, in pixels.

loc
[ int ] Location of this artist. Valid location codes are:

<table>
<thead>
<tr>
<th>Location</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>upper right</td>
<td>1</td>
</tr>
<tr>
<td>upper left</td>
<td>2</td>
</tr>
<tr>
<td>lower left</td>
<td>3</td>
</tr>
<tr>
<td>lower right</td>
<td>4</td>
</tr>
<tr>
<td>right</td>
<td>5</td>
</tr>
<tr>
<td>center left</td>
<td>6</td>
</tr>
<tr>
<td>center right</td>
<td>7</td>
</tr>
<tr>
<td>lower center</td>
<td>8</td>
</tr>
<tr>
<td>upper center</td>
<td>9</td>
</tr>
<tr>
<td>center</td>
<td>10</td>
</tr>
</tbody>
</table>

pad
[ float, default: 0.4 ] Padding around the child objects, in fraction of the font size.

borderpad
[ float, default: 0.5 ] Border padding, in fraction of the font size.

prop

frameon
[ bool, default: True ] If True, draw a box around this artists.

**kwargs
Keyworeed arguments to pass to matplotlib.offsetbox.AnchoredOffsetbox.

Examples

To display blue and red circles of different sizes in the upper right of an axes ax:

```python
>>> ada = AnchoredDrawingArea(20, 20, 0, 0,
...     loc='upper right', frameon=False)
>>> ada.drawing_area.add_artist(Circle((10, 10), 10, fc="b"))
>>> ada.drawing_area.add_artist(Circle((30, 10), 5, fc="r"))
>>> ax.add_artist(ada)
```

Attributes
drawing_area

[matplotlib.offsetbox.DrawingArea] A container for artists to display.

__init__ (self, width, height, xdescent, ydescent, loc, pad=0.4, borderpad=0.5, prop=None, frameon=True, **kwargs)

An anchored container with a fixed size and fillable DrawingArea.

Artists added to the drawing_area will have their coordinates interpreted as pixels. Any transformations set on the artists will be overridden.

Parameters

width, height

[float] width and height of the container, in pixels.

xdescent, ydescent

[float] descent of the container in the x- and y- direction, in pixels.

loc

[int] Location of this artist. Valid location codes are:

<table>
<thead>
<tr>
<th>Location Code</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>upper right</td>
<td>1</td>
</tr>
<tr>
<td>upper left</td>
<td>2</td>
</tr>
<tr>
<td>lower left</td>
<td>3</td>
</tr>
<tr>
<td>lower right</td>
<td>4</td>
</tr>
<tr>
<td>right</td>
<td>5</td>
</tr>
<tr>
<td>center left</td>
<td>6</td>
</tr>
<tr>
<td>center right</td>
<td>7</td>
</tr>
<tr>
<td>lower center</td>
<td>8</td>
</tr>
<tr>
<td>upper center</td>
<td>9</td>
</tr>
<tr>
<td>center</td>
<td>10</td>
</tr>
</tbody>
</table>

pad

[float, default: 0.4] Padding around the child objects, in fraction of the font size.

borderpad

[float, default: 0.5] Border padding, in fraction of the font size.

prop

frameon

[bool, default: True] If True, draw a box around this artists.

**kwargs

Keyworded arguments to pass to matplotlib.offsetbox.AnchoredOffsetbox.
Examples

To display blue and red circles of different sizes in the upper right of an axes `ax`:

```python
>>> ada = AnchoredDrawingArea(20, 20, 0, 0,
...                            loc='upper right', frameon=False)
>>> ada.drawing_area.add_artist(Circle((10, 10), 10, fc="b"))
>>> ada.drawing_area.add_artist(Circle((30, 10), 5, fc="r"))
>>> ax.add_artist(ada)
```

Attributes

drawing_area

[matplotlib.offsetbox.DrawingArea] A container for artists to display.

```python
__module__ = 'mpl_toolkits.axes_grid1.anchored_artists'
```

Examples using mpl_toolkits.axes_grid1.anchored_artists.AnchoredDrawingArea

- sphx_glr_gallery_axes_grid1_simple_anchored_artists.py
- sphx_glr_gallery_userdemo_anchored_box02.py

mpl_toolkits.axes_grid1.anchored_artists.AnchoredEllipse
class mpl_toolkits.axes_grid1.anchored_artists.AnchoredEllipse(transform, width, height, angle, loc, pad=0.1, borderpad=0.1, prop=None, frameon=True, **kwargs)

Bases: matplotlib.offsetbox.AnchoredOffsetbox

Draw an anchored ellipse of a given size.

Parameters

transform
The transformation object for the coordinate system in use, i.e., matplotlib.axes.Axes.transData.

**width, height**

[float] Width and height of the ellipse, given in coordinates of transform.

**angle**

[float] Rotation of the ellipse, in degrees, anti-clockwise.

**loc**

[int] Location of this size bar. Valid location codes are:

```plaintext
'upper right' : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4,
'right'        : 5,
'center left'  : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center'       : 10
```

**pad**

[float, optional] Padding around the ellipse, in fraction of the font size. Defaults to 0.1.

**borderpad**

[float, default: 0.1] Border padding, in fraction of the font size.

**frameon**

[bool, default: True] If True, draw a box around the ellipse.

**prop**

**kwargs**

Keyworded arguments to pass to matplotlib.offsetbox.AnchoredOffsetbox.

**Attributes**

**ellipse**

__init__ (self, transform, width, height, angle, loc, pad=0.1, borderpad=0.1, prop=None, frameon=True, **kwargs)

Draw an anchored ellipse of a given size.

Parameters

transform

width, height

[float] Width and height of the ellipse, given in coordinates of transform.

angle

[float] Rotation of the ellipse, in degrees, anti-clockwise.

loc

[int] Location of this size bar. Valid location codes are:

<table>
<thead>
<tr>
<th>Location</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>upper right</td>
<td>1</td>
</tr>
<tr>
<td>upper left</td>
<td>2</td>
</tr>
<tr>
<td>lower left</td>
<td>3</td>
</tr>
<tr>
<td>lower right</td>
<td>4</td>
</tr>
<tr>
<td>right</td>
<td>5</td>
</tr>
<tr>
<td>center left</td>
<td>6</td>
</tr>
<tr>
<td>center right</td>
<td>7</td>
</tr>
<tr>
<td>lower center</td>
<td>8</td>
</tr>
<tr>
<td>upper center</td>
<td>9</td>
</tr>
<tr>
<td>center</td>
<td>10</td>
</tr>
</tbody>
</table>

pad

[float, optional] Padding around the ellipse, in fraction of the font size. Defaults to 0.1.

borderpad

[float, default: 0.1] Border padding, in fraction of the font size.

frameon

[bool, default: True] If True, draw a box around the ellipse.

prop

**kwargs

Keyworded arguments to pass to matplotlib.offsetbox.AnchoredOffsetbox.
ellipse

__module__ = 'mpl_toolkits.axes_grid1.anchored_artists'

Examples using matplotlib.axes_grid1.anchored_artists.AnchoredEllipse

- sphx_glr_gallery_axes_grid1_simple_anchored_artists.py

mpl_toolkits.axes_grid1.anchored_artists.AnchoredSizeBar
class mpl_toolkits.axes_grid1.anchored_artists.AnchoredSizeBar(transform, size, label, loc, pad=0.1, borderpad=0.1, sep=2, frameon=True, size_vertical=0, color='black', label_top=False, fontproperties=None, fill_bar=None, **kwargs)

Bases: matplotlib.offsetbox.AnchoredOffsetbox

Draw a horizontal scale bar with a center-aligned label underneath.

Parameters

transform

size

[float] Horizontal length of the size bar, given in coordinates of transform.

label

[str] Label to display.
loc

[int] Location of this size bar. Valid location codes are:

<table>
<thead>
<tr>
<th>Location</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>upper right</td>
<td>1</td>
</tr>
<tr>
<td>upper left</td>
<td>2</td>
</tr>
<tr>
<td>lower left</td>
<td>3</td>
</tr>
<tr>
<td>lower right</td>
<td>4</td>
</tr>
<tr>
<td>right</td>
<td>5</td>
</tr>
<tr>
<td>center left</td>
<td>6</td>
</tr>
<tr>
<td>center right</td>
<td>7</td>
</tr>
<tr>
<td>lower center</td>
<td>8</td>
</tr>
<tr>
<td>upper center</td>
<td>9</td>
</tr>
<tr>
<td>center</td>
<td>10</td>
</tr>
</tbody>
</table>

pad

[float, default: 0.1] Padding around the label and size bar, in fraction of the font size.

borderpad

[float, default: 0.1] Border padding, in fraction of the font size.

sep

[float, default: 2] Separation between the label and the size bar, in points.

frameon

[bool, default: True] If True, draw a box around the horizontal bar and label.

size_vertical

[float, default: 0] Vertical length of the size bar, given in coordinates of transform.

color

[str, default: 'black'] Color for the size bar and label.

label_top

[bool, default: False] If True, the label will be over the size bar.

fontproperties

fill_bar

[bool, optional] If True and if size_vertical is nonzero, the size bar will be filled in with the color specified by the size bar. Defaults to True if size_vertical is greater than zero and False otherwise.

**kwargs

Keyworded arguments to pass to matplotlib.offsetbox.AnchoredOffsetbox.
Notes

If `prop` is passed as a keyworded argument, but `fontproperties` is not, then `prop` is be assumed to be the intended `fontproperties`. Using both `prop` and `fontproperties` is not supported.

Examples

```python
>>> import matplotlib.pyplot as plt
>>> import numpy as np
>>> from mpl_toolkits.axes_grid1.anchored_artists import (...
... AnchoredSizeBar)
>>> fig, ax = plt.subplots()
>>> ax.imshow(np.random.random((10, 10)))
>>> bar = AnchoredSizeBar(ax.transData, 3, '3 data units', 4)
>>> ax.add_artist(bar)
>>> fig.show()
```

Using all the optional parameters

```python
>>> import matplotlib.font_manager as fm
>>> fontprops = fm.FontProperties(size=14, family='monospace')
>>> bar = AnchoredSizeBar(ax.transData, 3, '3 units', 4, pad=0.5, ...
... size_vertical=0.5, color='white', ...
... fontproperties=fontprops)
```

Attributes

- **size_bar**

  `[matplotlib.offsetbox.AuxTransformBox]` Container for the size bar.

- **txt_label**

  `[matplotlib.offsetbox.TextArea]` Container for the label of the size bar.

  __init__ *(self, transform, size, label, loc, pad=0.1, borderpad=0.1, sep=2, frameon=True, size_vertical=0, color='black', label_top=False, fontproperties=None, fill_bar=None, **kwargs)*

  Draw a horizontal scale bar with a center-aligned label underneath.

Parameters

- **transform**

2948 Chapter 19. Toolkits
size

[float] Horizontal length of the size bar, given in coordinates of transform.

label

[str] Label to display.

loc

[int] Location of this size bar. Valid location codes are:

<table>
<thead>
<tr>
<th>Location Code</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>'upper right'</td>
<td>1</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4</td>
</tr>
<tr>
<td>'right'</td>
<td>5</td>
</tr>
<tr>
<td>'center left'</td>
<td>6</td>
</tr>
<tr>
<td>'center right'</td>
<td>7</td>
</tr>
<tr>
<td>'lower center'</td>
<td>8</td>
</tr>
<tr>
<td>'upper center'</td>
<td>9</td>
</tr>
<tr>
<td>'center'</td>
<td>10</td>
</tr>
</tbody>
</table>

pad

[float, default: 0.1] Padding around the label and size bar, in fraction of the font size.

borderpad

[float, default: 0.1] Border padding, in fraction of the font size.

sep

[float, default: 2] Separation between the label and the size bar, in points.

frameon

[bool, default: True] If True, draw a box around the horizontal bar and label.

size_vertical

[float, default: 0] Vertical length of the size bar, given in coordinates of transform.

color

[str, default: 'black'] Color for the size bar and label.

label_top

[bool, default: False] If True, the label will be over the size bar.

fontproperties

fill_bar

[bool, optional] If True and if size_vertical is nonzero, the size bar will be filled in with the color specified by the size bar. Defaults to True if size_vertical is greater than zero and False otherwise.

**kwargs

Keyworded arguments to pass to matplotlib.offsetbox.AncoredOffsetbox.

Notes

If prop is passed as a keyworded argument, but fontproperties is not, then prop is be assumed to be the intended fontproperties. Using both prop and fontproperties is not supported.

Examples

```python
>>> import matplotlib.pyplot as plt
>>> import numpy as np
>>> from mpl_toolkits.axes_grid1.anchored_artists import (...
... AnchoredSizeBar)
>>> fig, ax = plt.subplots()
>>> ax.imshow(np.random.random((10, 10)))
>>> bar = AnchoredSizeBar(ax.transData, 3, '3 data units', 4)
>>> ax.add_artist(bar)
>>> fig.show()
```

Using all the optional parameters

```python
>>> import matplotlib.font_manager as fm
>>> fontprops = fm.FontProperties(size=14, family='monospace')
>>> bar = AnchoredSizeBar(ax.transData, 3, '3 units', 4, pad=0.5, ...
... sep=5, borderpad=0.5, frameon=False,
... size_vertical=0.5, color='white',
... fontproperties=fontprops)
```

Attributes

size_bar

[matplotlib.offsetbox.AuxTransformBox] Container for the size bar.

txt_label

[matplotlib.offsetbox.TextArea] Container for the label of the size bar.

**mpl_toolkits.axes_grid1.axes_divider.AxesDivider**

```python
class mpl_toolkits.axes_grid1.axes_divider.AxesDivider(axes, xref=None, yref=None):
    Bases: mpl_toolkits.axes_grid1.axes_divider.Divider
    Divider based on the pre-existing axes.
```

**Parameters**

- `axes` [Axes]
- `xref`
- `yref`

```python
__init__(self, axes, xref=None, yref=None)
```

**Parameters**

- `axes` [Axes]
- `xref`
- `yref`
axes

[Axes]
xref
yref

__module__ = 'mpl_toolkits.axes_grid1.axes_divider'

append_axes (self, position, size, pad=None, add_to_figure=True, **kwargs)
Create an axes at the given position with the same height (or width) of the main axes.

position
['left'/'right'/'bottom'/'top']

size and pad should be axes_grid.axes_size compatible.

get_anchor (self)
Return the anchor.

get_aspect (self)
Return aspect.

get_position (self)
Return the position of the rectangle.

get_subplotspec (self)

new_horizontal (self, size, pad=None, pack_start=False, **kwargs)
Add a new axes on the right (or left) side of the main axes.

Parameters

size
[axes_size or float or str] A width of the axes. If float or string is given, from_any function is used to create the size, with ref_size set to AxesX instance of the current axes.

pad
[axes_size or float or str] Pad between the axes. It takes same argument as size.

pack_start
[bool] If False, the new axes is appended at the end of the list, i.e., it became the right-most axes. If True, it is inserted at the start of the list, and becomes the left-most axes.

**kwargs
All extra keywords arguments are passed to the created axes. If axes_class is given, the new axes will be created as an instance of the given class. Otherwise, the same class of the main axes will be used.
**new_vertical** *(self, size, pad=None, pack_start=False, **kwargs)*

Add a new axes on the top (or bottom) side of the main axes.

**Parameters**

**size**

[axes_size or float or str] A height of the axes. If float or string is given, *from_any* function is used to create the size, with *ref_size* set to AxesX instance of the current axes.

**pad**

[axes_size or float or str] Pad between the axes. It takes same argument as size.

**pack_start**

[bool] If False, the new axes is appended at the end of the list, i.e., it became the right-most axes. If True, it is inserted at the start of the list, and becomes the left-most axes.

**kwargs**

All extra keywords arguments are passed to the created axes. If *axes_class* is given, the new axes will be created as an instance of the given class. Otherwise, the same class of the main axes will be used.

**Examples using** **mpl_toolkits.axes_grid1.axes_divider.AxesDivider**

- sphx_glr_gallery_axes_grid1_demo_colorbar_with_axes_divider.py
- sphx_glr_gallery_axes_grid1_make_room_for_ylabel_using_axesgrid.py
- sphx_glr_gallery_axes_grid1_scatter_hist_locatable_axes.py
- sphx_glr_gallery_axes_grid1_simple_colorbar.py
- *Tight Layout guide*

**mpl_toolkits.axes_grid1.axes_divider.AxesLocator**

**class** **mpl_toolkits.axes_grid1.axes_divider.AxesLocator** *(axes_divider, nx, ny, nx1=None, ny1=None)*

Bases: **object**

A simple callable object, initialized with AxesDivider class, returns the position and size of the given cell.

**Parameters**
axes_divider

[AxesDivider]

nx, nx1

[int] Integers specifying the column-position of the cell. When nx1 is None, a single nx-th column is specified. Otherwise location of columns spanning between nx to nx1 (but excluding nx1-th column) is specified.

ny, ny1

[int] Same as nx and nx1, but for row positions.

__call__ (self, axes, renderer)
Call self as a function.

__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axes_grid1.axes_divider', '__doc__': '
 A simple callable object, ... <attribute '__dict__' of 'AxesLocator' objects>, '__weakref__': <attribute '__weakref__' of 'AxesLocator' objects>})

__init__ (self, axes_divider, nx, ny, nx1=None, ny1=None)

Parameters

axes_divider

[AxesDivider]

nx, nx1

[int] Integers specifying the column-position of the cell. When nx1 is None, a single nx-th column is specified. Otherwise location of columns spanning between nx to nx1 (but excluding nx1-th column) is specified.

ny, ny1

[int] Same as nx and nx1, but for row positions.

__module__ = 'mpl_toolkits.axes_grid1.axes_divider'

__weakref__
list of weak references to the object (if defined)

gold_subplotspec (self)

Examples using mpl_toolkits.axes_grid1.axes_divider.AxesLocator

mpl_toolkits.axes_grid1.axes_divider.Divider

class mpl_toolkits.axes_grid1.axes_divider.Divider (fig, pos, horizontal, vertical, aspect=None, anchor='C')

Bases: object

An Axes positioning class.
The divider is initialized with lists of horizontal and vertical sizes ([mpl_toolkits.axes_grid1.axes_size]) based on which a given rectangular area will be divided.

The `new_locator` method then creates a callable object that can be used as the `axes_locator` of the axes.

**Parameters**

```python
fig
    [Figure]
pos
    [tuple of 4 floats] Position of the rectangle that will be divided.
horizontal
    [list of axes_size] Sizes for horizontal division.
vertical
    [list of axes_size] Sizes for vertical division.
aspect
    [bool] Whether overall rectangular area is reduced so that the relative part of the horizontal and vertical scales have the same scale.
anchor
    [{'C', 'SW', 'S', 'SE', 'E', 'NE', 'N', 'NW', 'W'}] Placement of the reduced rectangle, when `aspect` is True.
```

__dict__ = mappingproxy({'
__module__': 'mpl_toolkits.axes_grid1.axes_divider',
__init__ (self, fig, pos, horizontal, vertical, aspect=None, anchor='C')

**Parameters**

```python
fig
    [Figure]
pos
    [tuple of 4 floats] Position of the rectangle that will be divided.
horizontal
    [list of axes_size] Sizes for horizontal division.
vertical
    [list of axes_size] Sizes for vertical division.
aspect
    [bool] Whether overall rectangular area is reduced so that the relative part of the horizontal and vertical scales have the same scale.
anchor

[{'C', 'SW', 'S', 'SE', 'E', 'NE', 'N', 'NW', 'W'}] Placement of the reduced rectangle, when aspect is True.

__module__ = 'mpl_toolkits.axes_grid1.axes_divider'

__weakref__

list of weak references to the object (if defined)

add_auto_adjustable_area (self, use_axes, pad=0.1, adjust_dirs=\None)

append_size (self, position, size)

get_anchor (self)

Return the anchor.

get_aspect (self)

Return aspect.

get_horizontal (self)

Return horizontal sizes.

get_horizontal_sizes (self, renderer)

get_locator (self)

get_position (self)

Return the position of the rectangle.

get_position_runtime (self, ax, renderer)

get_vertical (self)

Return vertical sizes.

get_vertical_sizes (self, renderer)

get_vsize_hsize (self)

locate (self, nx, ny, nx1=\None, ny1=\None, axes=\None, renderer=\None)

Parameters

nx, nx1

[int] Integers specifying the column-position of the cell. When nx1 is None, a single nx-th column is specified. Otherwise location of columns spanning between nx to nx1 (but excluding nx1-th column) is specified.

ny, ny1

[int] Same as nx and nx1, but for row positions.

axes

renderer
new_locator (self, nx, ny, nx1=None, ny1=None)
Return a new AxesLocator for the specified cell.

Parameters

nx, nx1
[int] Integers specifying the column-position of the cell. When nx1 is None, a single nx-th column is specified. Otherwise location of columns spanning between nx to nx1 (but excluding nx1-th column) is specified.

ny, ny1
[int] Same as nx and nx1, but for row positions.

set_anchor (self, anchor)

Parameters

anchor

<table>
<thead>
<tr>
<th>value</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'C'</td>
<td>Center</td>
</tr>
<tr>
<td>'SW'</td>
<td>bottom left</td>
</tr>
<tr>
<td>'S'</td>
<td>bottom</td>
</tr>
<tr>
<td>'SE'</td>
<td>bottom right</td>
</tr>
<tr>
<td>'E'</td>
<td>right</td>
</tr>
<tr>
<td>'NE'</td>
<td>top right</td>
</tr>
<tr>
<td>'N'</td>
<td>top</td>
</tr>
<tr>
<td>'NW'</td>
<td>top left</td>
</tr>
<tr>
<td>'W'</td>
<td>left</td>
</tr>
</tbody>
</table>

set_aspect (self, aspect=False)

Parameters

aspect
[bool]

set_horizontal (self, h)

Parameters

h
[list of axes_size] sizes for horizontal division
**set_locator** *(self, _locator)*

Set the position of the rectangle.

**Parameters**

*pos*

[tuple of 4 floats] position of the rectangle that will be divided

**set_vertical** *(self, v)*

**Parameters**

*v*

[list of *axes_size*] sizes for vertical division

---

**Examples using mpl_toolkits.axes_grid1.axes_divider.Divider**

**mpl_toolkits.axes_grid1.axes_divider.HBoxDivider**

**class** mpl_toolkits.axes_grid1.axes_divider.HBoxDivider *(fig, *args, horizontal=None, vertical=None, aspect=None, anchor='C')*

**Bases:** mpl_toolkits.axes_grid1.axes_divider.SubplotDivider

**Parameters**

*fig*

[matplotlib.figure.Figure]

*args*

[tuple (nrows, ncols, index) or int] The array of subplots in the figure has dimensions (nrows, ncols), and *index* is the index of the subplot being created. *index* starts at 1 in the upper left corner and increases to the right.

If *nrows, ncols, and index* are all single digit numbers, then *args* can be passed as a single 3-digit number (e.g. 234 for (2, 3, 4)).

**__module__ = 'mpl_toolkits.axes_grid1.axes_divider'**

**locate** *(self, nx, ny, nxl=None, nyl=None, axes=None, renderer=None)*

**Parameters**
axes_divider

[AxesDivider]

nx, nx1

[int] Integers specifying the column-position of the cell. When nx1 is None, a single nx-th column is specified. Otherwise location of columns spanning between nx to nx1 (but excluding nx1-th column) is specified.

ny, ny1

[int] Same as nx and nx1, but for row positions.

axes

renderer

new_locator (self, nx, nx1=None)

Create a new AxesLocator for the specified cell.

Parameters

nx, nx1

[int] Integers specifying the column-position of the cell. When nx1 is None, a single nx-th column is specified. Otherwise location of columns spanning between nx to nx1 (but excluding nx1-th column) is specified.

ny, ny1

[int] Same as nx and nx1, but for row positions.

Examples using mpl_toolkits.axes_grid1.axes_divider.HBoxDivider

- sphx_glr_gallery_axes_grid1_demo_axes_hbox_divider.py

mpl_toolkits.axes_grid1.axes_divider.SubplotDivider

class mpl_toolkits.axes_grid1.axes_divider.SubplotDivider (fig, *args, horizon-
tal=None, verti-
cal=None, aspect=None, anchor='C')

Bases: mpl_toolkits.axes_grid1.axes_divider.Divider

The Divider class whose rectangle area is specified as a subplot geometry.

Parameters
fig

```python
[matplotlib.figure.Figure]
```

*args

[tuple (nrows, ncols, index) or int] The array of subplots in the figure has dimensions (nrows, ncols), and index is the index of the subplot being created. index starts at 1 in the upper left corner and increases to the right.

If nrows, ncols, and index are all single digit numbers, then args can be passed as a single 3-digit number (e.g. 234 for (2, 3, 4)).

```python
__init__(self, fig, *args, horizontal=None, vertical=None, aspect=None, anchor='C')
```

Parameters

fig

[matplotlib.figure.Figure]

*args

[tuple (nrows, ncols, index) or int] The array of subplots in the figure has dimensions (nrows, ncols), and index is the index of the subplot being created. index starts at 1 in the upper left corner and increases to the right.

If nrows, ncols, and index are all single digit numbers, then args can be passed as a single 3-digit number (e.g. 234 for (2, 3, 4)).

```python
__module__ = 'mpl_toolkits.axes_grid1.axes_divider'
```

```python
change_geometry(self, numrows, numcols, num)
    [Deprecated] Change subplot geometry, e.g., from (1, 1, 1) to (2, 2, 3).
```

Notes

Deprecated since version 3.4.

```python
property figbox
```

```python
get_geometry(self)
    [Deprecated] Get the subplot geometry, e.g., (2, 2, 3).
```
Notes

Deprecated since version 3.4.

get_position(self)
    Return the bounds of the subplot box.

get_subplotspec(self)
    Get the SubplotSpec instance.

set_subplotspec(self, subplotspec)
    Set the SubplotSpec instance.

update_params(self)
    [Deprecated]

Notes

Deprecated since version 3.4:

Examples using mpl_toolkits.axes_grid1.axes_divider.SubplotDivider

mpl_toolkits.axes_grid1.axes_divider.VBoxDivider

class mpl_toolkits.axes_grid1.axes_divider.VBoxDivider(fig, *args, horizontal=None, vertical=None, aspect=None, anchor='C')

Bases: mpl_toolkits.axes_grid1.axes_divider.HBoxDivider

The Divider class whose rectangle area is specified as a subplot geometry.

Parameters

fig
    [matplotlib.figure.Figure]

*args
    [tuple (nrows, ncols, index) or int] The array of subplots in the figure has di-
    mensions (nrows, ncols), and index is the index of the subplot being created.
    index starts at 1 in the upper left corner and increases to the right.
    If nrows, ncols, and index are all single digit numbers, then args can be passed as
    a single 3-digit number (e.g. 234 for (2, 3, 4)).

__module__ = 'mpl_toolkits.axes_grid1.axes_divider'

locate(self, nx, ny, nx1=None, ny1=None, axes=None, renderer=None)
Parameters

axes_divider

[AxesDivider]

nx, nx1

[int] Integers specifying the column-position of the cell. When nx1 is None, a single nx-th column is specified. Otherwise location of columns spanning between nx to nx1 (but excluding nx1-th column) is specified.

ny, ny1

[int] Same as nx and nx1, but for row positions.

axes

renderer

new_locator (self, ny, ny1=None)
Create a new AxesLocator for the specified cell.

Parameters

ny, ny1

[int] Integers specifying the row-position of the cell. When ny1 is None, a single ny-th row is specified. Otherwise location of rows spanning between ny to ny1 (but excluding ny1-th row) is specified.

Examples using mpl_toolkits.axes_grid1.axes_divider.VBoxDivider

Functions

mpl_toolkits.axes_grid1.axes_grid.AxesGrid

mpl_toolkits.axes_grid1.axes_grid.AxesGrid
    alias of mpl_toolkits.axes_grid1.axes_grid.ImageGrid

mpl_toolkits.axes_grid1.axes_grid.CbarAxes

class mpl_toolkits.axes_grid1.axes_grid.CbarAxes(*args, orientation, **kwargs)
    __module__ = 'mpl_toolkits.axes_grid1.axes_grid'

Examples using mpl_toolkits.axes_grid1.axes_grid.CbarAxes

mpl_toolkits.axes_grid1.axes_grid.CbarAxesBase

class mpl_toolkits.axes_grid1.axes_grid.CbarAxesBase(*args, orientation, **kwargs)
    Bases: object
    __dict__ = mappingproxy({'__module__': 'mpl_toolkits.axes_grid1.axes_grid', '__init__': <function CbarAxesBase.__init__>, ... of 'CbarAxesBase' objects>, '__weakref__': <attribute '__weakref__' of 'CbarAxesBase' objects>, '__doc__': None})
    __init__ (self, *args, orientation, **kwargs)
        Initialize self. See help(type(self)) for accurate signature.
    __module__ = 'mpl_toolkits.axes_grid1.axes_grid'
    __weakref__
        list of weak references to the object (if defined)
    property cbid
    cla (self)
    colorbar (self, mappable, *, ticks=None, **kwargs)
    property locator
    toggle_label (self, b)
Examples using `mpl_toolkits.axes_grid1.axes_grid.CbarAxesBase`

`mpl_toolkits.axes_grid1.axes_grid.Grid`

class `mpl_toolkits.axes_grid1.axes_grid1.Grid(fig, rect, nrows_ncols, ngrids=None, direction='row', axes_pad=0.02, add_all=<deprecated parameter>, share_all=False, share_x=True, share_y=True, label_mode='L', axes_class=None, *, aspect=False)`

Bases: `object`

A grid of Axes.

In Matplotlib, the axes location (and size) is specified in normalized figure coordinates. This may not be ideal for images that needs to be displayed with a given aspect ratio; for example, it is difficult to display multiple images of a same size with some fixed padding between them. AxesGrid can be used in such case.

**Parameters**

- **fig**
  
  `[Figure]` The parent figure.

- **rect**
  
  `[(float, float, float, float) or int]` The axes position, as a `(left, bottom, width, height)` tuple or as a three-digit subplot position code (e.g., "121").

- **nrows_ncols**
  
  `[(int, int)]` Number of rows and columns in the grid.

- **ngrids**
  
  `[int or None, default: None]` If not None, only the first `ngrids` axes in the grid are created.

- **direction**
  
  `[{"row", "column"}, default: "row"]` Whether axes are created in row-major ("row by row") or column-major order ("column by column").

- **axes_pad**
  
  `[float or (float, float), default: 0.02]` Padding or (horizontal padding, vertical padding) between axes, in inches.

- **add_all**
  
  `[bool, default: True]` Whether to add the axes to the figure using `Figure.add_axes`. This parameter is deprecated.
share_all
  [bool, default: False] Whether all axes share their x- and y-axis. Overrides share_x
  and share_y.

share_x
  [bool, default: True] Whether all axes of a column share their x-axis.

share_y
  [bool, default: True] Whether all axes of a row share their y-axis.

label_mode
  [{"L", "1", "all"}, default: "L"] Determines which axes will get tick labels:
  • "L": All axes on the left column get vertical tick labels; all axes on the bottom
    row get horizontal tick labels.
  • "1": Only the bottom left axes is labelled.
  • "all": all axes are labelled.

axes_class
  [subclass of matplotlib.axes.Axes, default: None]

aspect
  [bool, default: False] Whether the axes aspect ratio follows the aspect ratio of the
  data limits.

__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axes_grid1.axes_grid', '__doc__': '
 A grid of Axes.

 In ... '__dict__': <attribute '__dict__' of 'Grid' objects>, '__weakref__': <attribute '__weakref__' of 'Grid' objects>})

__getitem__ (self, i)

__init__ (self, fig, rect, nrows_ncols, ngrids=None, direction='row', axes_pad=0.02,
  add_all=<deprecated parameter>, share_all=False, share_x=True, share_y=True, label_mode='L', axes_class=None, *, aspect=False)

Parameters

fig
  [Figure] The parent figure.

rect
  [(float, float, float, float) or int] The axes position, as a (left, bottom, width, height) tuple or as a three-digit subplot position code (e.g., "121").

nrows_ncols
  [(int, int)] Number of rows and columns in the grid.

ngrids
  [int or None, default: None] If not None, only the first ngrids axes in the grid are created.
**direction**

{{"row", "column"}, default: "row"} Whether axes are created in row-major ("row by row") or column-major order ("column by column").

**axes_pad**

[flow or (float, float), default: 0.02] Padding or (horizontal padding, vertical padding) between axes, in inches.

**add_all**

[bool, default: True] Whether to add the axes to the figure using Figure.

**add_axes**. This parameter is deprecated.

**share_all**

[bool, default: False] Whether all axes share their x- and y-axis. Overrides share_x and share_y.

**share_x**

[bool, default: True] Whether all axes of a column share their x-axis.

**share_y**

[bool, default: True] Whether all axes of a row share their y-axis.

**label_mode**

{{"L", "1", "all"}, default: "L"} Determines which axes will get tick labels:

- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": all axes are labelled.

**axes_class**

[subclass of matplotlib.axes.Axes, default: None]

**aspect**

[bool, default: False] Whether the axes aspect ratio follows the aspect ratio of the data limits.

**__len__(self)**

**__module__** = 'mpl_toolkits.axes_grid1.axes_grid'

**__weakref__**

list of weak references to the object (if defined)

**get_aspect(self)**

Return the aspect of the SubplotDivider.

**get_axes_locator(self)**
get_axes_pad(self)
    Return the axes padding.

    Returns

    hpad, vpad
        Padding (horizontal pad, vertical pad) in inches.

get_divider(self)
get_geometry(self)
    Return the number of rows and columns of the grid as (nrows, ncols).

get_vsize_hsize(self)

set_aspect(self, aspect)
    Set the aspect of the SubplotDivider.

set_axes_locator(self, locator)

set_axes_pad(self, axes_pad)
    Set the padding between the axes.

    Parameters

    axes_pad
        [(float, float)] The padding (horizontal pad, vertical pad) in inches.

set_label_mode(self, mode)
    Define which axes have tick labels.

    Parameters

    mode
        ["L", "1", "all"] The label mode:

        • "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.

        • "1": Only the bottom left axes is labelled.

        • "all": all axes are labelled.

class `mpl_toolkits.axes_grid1.axes_grid.ImageGrid(fig, rect, nrows_ncols, ngrids=None, direction='row', axes_pad=0.02, add_all=<deprecated parameter>, share_all=False, aspect=True, label_mode='L', cbar_mode=None, cbar_location='right', cbar_pad=None, cbar_size='5%', cbar_set_cax=True, axes_class=None)`

Bases: `mpl_toolkits.axes_grid1.axes_grid.Grid`

Parameters

**fig**

*Figure* The parent figure.

**rect**

[(float, float, float, float) or int] The axes position, as a (left, bottom, width, height) tuple or as a three-digit subplot position code (e.g., "121").

**nrows_ncols**

[(int, int)] Number of rows and columns in the grid.

**ngrids**

[int or None, default: None] If not None, only the first ngrids axes in the grid are created.

**direction**

["row", "column"], default: "row"] Whether axes are created in row-major ("row by row") or column-major order ("column by column"). This also affects the order in which axes are accessed using indexing (grid[index]).

**axes_pad**

[float or (float, float), default: 0.02in] Padding or (horizontal padding, vertical padding) between axes, in inches.

**add_all**
[bool, default: True] Whether to add the axes to the figure using `Figure.add_axes`. This parameter is deprecated.

share_all
[bool, default: False] Whether all axes share their x- and y-axis.

aspect
[bool, default: True] Whether the axes aspect ratio follows the aspect ratio of the data limits.

label_mode
[{"L", "1", "all"}, default: "L"] Determines which axes will get tick labels:
- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": all axes are labelled.

cbar_mode
[{"each", "single", "edge", None}, default: None] Whether to create a colorbar for "each" axes, a "single" colorbar for the entire grid, colorbars only for axes on the "edge" determined by cbar_location, or no colorbars. The colorbars are stored in the cbar_axes attribute.

cbar_location
[{"left", "right", "bottom", "top"}, default: "right"]

cbar_pad
[float, default: None] Padding between the image axes and the colorbar axes.

cbar_size
[size specification (see `Size.from_any`), default: "5%"] Colorbar size.

cbar_set_cax
[bool, default: True] If True, each axes in the grid has a `cax` attribute that is bound to associated cbar_axes.

axes_class
[subclass of `matplotlib.axes.Axes`, default: None]

**__init__** (self, fig, rect, nrows_ncols, ngrids=None, direction='row', axes_pad=0.02, add_all=<deprecated parameter>, share_all=False, aspect=True, label_mode='L', cbar_mode=None, cbar_location='right', cbar_pad=None, cbar_size='5%', cbar_set_cax=True, axes_class=None)

Parameters
fig

[Figure] The parent figure.

rect

[(float, float, float, float) or int] The axes position, as a (left, bottom, width, height) tuple or as a three-digit subplot position code (e.g., "121").

nrows_ncols

[(int, int)] Number of rows and columns in the grid.

ngrids

[int or None, default: None] If not None, only the first ngrids axes in the grid are created.

direction

["row", "column"]; default: "row"] Whether axes are created in row-major ("row by row") or column-major order ("column by column"). This also affects the order in which axes are accessed using indexing (grid[index]).

axes_pad

[float or (float, float), default: 0.02in] Padding or (horizontal padding, vertical padding) between axes, in inches.

add_all

[bool, default: True] Whether to add the axes to the figure using Figure.add_axes. This parameter is deprecated.

share_all

[bool, default: False] Whether all axes share their x- and y-axis.

aspect

[bool, default: True] Whether the axes aspect ratio follows the aspect ratio of the data limits.

label_mode

["L", "1", "all"]; default: "L"] Determines which axes will get tick labels:

- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": all axes are labelled.

ncbar_mode

["each", "single", "edge", None], default: None] Whether to create a colorbar for "each" axes, a "single" colorbar for the entire grid, colorbars only for axes on the "edge" determined by cbar_location, or no colorbars. The colorbars are stored in the cbar_axes attribute.
**Matplotlib, Release 3.4.1**

**cbar_location**

[["left", "right", "bottom", "top"], default: "right"]

**cbar_pad**

[float, default: None] Padding between the image axes and the colorbar axes.

**cbar_size**

[size specification (see `Size.from_any`), default: "5%"] Colorbar size.

**cbar_set_cax**

[bool, default: True] If True, each axes in the grid has a `cax` attribute that is bound to associated `cbar_axes`.

**axes_class**

[subclass of `matplotlib.axes.Axes`, default: None]

__module__ = 'mpl_toolkits.axes_grid1.axes_grid'

**Examples using `mpl_toolkits.axes_grid1.axes_grid.ImageGrid`**

**mpl_toolkits.axes_grid1.axes_grid.RGBAxes**

**Classes**

<table>
<thead>
<tr>
<th>RGBAaxes(*args[, pad, add_all])</th>
<th>4-panel imshow (RGB, R, G, B).</th>
</tr>
</thead>
<tbody>
<tr>
<td>RGBAaxesBase(*args[, pad, add_all])</td>
<td>[Deprecated]</td>
</tr>
</tbody>
</table>

**mpl_toolkits.axes_grid1.axes_grid.RGBAxes**

**class** mpl_toolkits.axes_grid1.axes_grid.RGBAxes(*args, pad=0, add_all=<deprecated parameter>, **kwargs)

Bases: object

4-panel imshow (RGB, R, G, B).

Layout:

```
RGB  R
   G
   B
```

Subclasses can override the `_defaultAxesClass` attribute.

**Attributes**
RGB

[_defaultAxesClass] The axes object for the three-channel imshow.

R

[_defaultAxesClass] The axes object for the red channel imshow.

G

[_defaultAxesClass] The axes object for the green channel imshow.

B

[_defaultAxesClass] The axes object for the blue channel imshow.

Parameters

pad

[float, default: 0] fraction of the axes height to put as padding.

add_all

[bool, default: True] Whether to add the {rgb, r, g, b} axes to the figure. This parameter is deprecated.

axes_class

[matplotlib.axes.Axes]

*args

Unpacked into axes_class() init for RGB

**kwargs

Unpacked into axes_class() init for RGB, R, G, B axes

__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axes_grid1.axes_rgb', '__doc__': None, '__weakref__': None})

__init__(self, *args, pad=0, add_all=<deprecated parameter>, **kwargs)

Parameters

pad

[float, default: 0] fraction of the axes height to put as padding.

add_all

[bool, default: True] Whether to add the {rgb, r, g, b} axes to the figure. This parameter is deprecated.

axes_class

[matplotlib.axes.Axes]
*args
Unpacked into axes_class() init for RGB

**kwargs
Unpacked into axes_class() init for RGB, R, G, B axes

__module__ = 'mpl_toolkits.axes_grid1.axes_rgb'

__weakref__
list of weak references to the object (if defined)

add_RGB_to_figure(self)
[Deprecated] Add red, green and blue axes to the RGB composite's axes figure.

**Notes**

Deprecated since version 3.3.

imshow_rgb(self, r, g, b, **kwargs)
Create the four images {rgb, r, g, b}.

Parameters

r, g, b
[array-like] The red, green, and blue arrays.

kwargs
[imshow kwargs] kwargs get unpacked into the imshow calls for the four images.

Returns

rgb
[matplotlib.image.AxesImage]

r
[matplotlib.image.AxesImage]

g
[matplotlib.image.AxesImage]

b
[matplotlib.image.AxesImage]
Examples using `mpl_toolkits.axes_grid1.axes_rgb.RGBAxes`

- sphx_glr_gallery_pyplots_whats_new_99_axes_grid.py
- sphx_glr_gallery_axes_grid1_demo_axes_rgb.py

`mpl_toolkits.axes_grid1.axes_rgb.RGBAxesBase`

class `mpl_toolkits.axes_grid1.axes_rgb.RGBAxesBase`(*args, pad=0, add_all=<deprecated parameter>, **kwargs)

Bases: `mpl_toolkits.axes_grid1.axes_rgb.RGBAxes`

[Deprecated]

Notes

Deprecated since version 3.3:

Parameters

- pad
  [float, default: 0] fraction of the axes height to put as padding.

- add_all
  [bool, default: True] Whether to add the {rgb, r, g, b} axes to the figure. This parameter is deprecated.

- axes_class
  [matplotlib.axes.Axes]

- *args
  Unpacked into axes_class() init for RGB

- **kwargs
  Unpacked into axes_class() init for RGB, R, G, B axes

__init__ (self, *args, pad=0, add_all=<deprecated parameter>, **kwargs)

Parameters

- pad
  [float, default: 0] fraction of the axes height to put as padding.

- add_all
  [bool, default: True] Whether to add the {rgb, r, g, b} axes to the figure. This parameter is deprecated.

</table>
Examples using `mpl_toolkits.axes_grid1.axes_rgb.make_rgb_axes`

- sphx_glr_gallery_axes_grid1_demo_axes_rgb.py

`mpl_toolkits.axes_grid1.axes_size`

Provides classes of simple units that will be used with AxesDivider class (or others) to determine the size of each axes. The unit classes define `get_size` method that returns a tuple of two floats, meaning relative and absolute sizes, respectively.

Note that this class is nothing more than a simple tuple of two floats. Take a look at the Divider class to see how these two values are used.

```python
class mpl_toolkits.axes_grid1.axes_size.MaxWidth(artist_list)
    Bases: mpl_toolkits.axes_grid1.axes_size.MaxExtent

    Size whose absolute part is the largest width of the given artist_list.

    __init__(self, artist_list)
        Initialize self. See help(type(self)) for accurate signature.

    __module__ = 'mpl_toolkits.axes_grid1.axes_size'
```
Examples using `mpl_toolkits.axes_grid1.axes_size.MaxWidth`

`mpl_toolkits.axes_grid1.axes_size.Padded`

class `mpl_toolkits.axes_grid1.axes_size.Padded(size, pad)`
    Bases: `mpl_toolkits.axes_grid1.axes_size._Base`

    Return a instance where the absolute part of `size` is increase by the amount of `pad`.

    __init__(self, size, pad)
        Initialize self. See help(type(self)) for accurate signature.

    __module__ = 'mpl_toolkits.axes_grid1.axes_size'

    get_size(self, renderer)

Examples using `mpl_toolkits.axes_grid1.axes_size.Padded`

`mpl_toolkits.axes_grid1.axes_size.Scalable`

`mpl_toolkits.axes_grid1.axes_size.Scalable`
    alias of `mpl_toolkits.axes_grid1.axes_size.Scaled`

`mpl_toolkits.axes_grid1.axes_size.Scaled`

class `mpl_toolkits.axes_grid1.axes_size.Scaled(scalable_size)`
    Bases: `mpl_toolkits.axes_grid1.axes_size._Base`

    Simple scaled(?) size with absolute part = 0 and relative part = `scalable_size`.

    __init__(self, scalable_size)
        Initialize self. See help(type(self)) for accurate signature.

    __module__ = 'mpl_toolkits.axes_grid1.axes_size'

    get_size(self, renderer)

Examples using `mpl_toolkits.axes_grid1.axes_size.Scaled`

- sphx_glr_gallery_axes_grid1_demo_axes_hbox_divider.py
- sphx_glr_gallery_axes_grid1_demo_fixed_size_axes.py
- sphx_glr_gallery_axes_grid1_simple_axes_divider1.py
mpl_toolkits.axes_grid1.axes_size.SizeFromFunc

```python
class mpl_toolkits.axes_grid1.axes_size.SizeFromFunc(func)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base

    __init__(self, func)
        Initialize self. See help(type(self)) for accurate signature.

    __module__ = 'mpl_toolkits.axes_grid1.axes_size'

get_size(self, renderer)
```

**Examples using `mpl_toolkits.axes_grid1.axes_size.SizeFromFunc`**

**Functions**

| from_any(size[, fraction_ref]) | Create a Fixed unit when the first argument is a float, or a Fraction unit if that is a string that ends with %. |

**mpl_toolkits.axes_grid1.axes_size.from_any**

```python
mpl_toolkits.axes_grid1.axes_size.from_any(size, fraction_ref=None)
    Create a Fixed unit when the first argument is a float, or a Fraction unit if that is a string that ends with %. The second argument is only meaningful when Fraction unit is created.
```

```python
>>> a = Size.from_any(1.2)  # => Size.Fixed(1.2)
>>> Size.from_any("50\%", a)  # => Size.Fraction(0.5, a)
```

**Examples using `mpl_toolkits.axes_grid1.axes_size.from_any`**

**mpl_toolkits.axes_grid1.inset_locator**

A collection of functions and objects for creating or placing inset axes.

**Classes**

```python
AnchoredLocatorBase(bbox_to_anchor, ...[, Parameters
...
])
```

**mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase**

```python
class mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase (bbox_to_anchor, offset_box, loc, borderpad=0.5, bbox_transform=None)
```

**Parameters**

- **loc**
  - [str] The box location. Supported values:
    - 'upper right'
    - 'upper left'
    - 'lower left'
    - 'lower right'
    - 'center left'
    - 'center right'
    - 'lower center'
    - 'upper center'
    - 'center'

For backward compatibility, numeric values are accepted as well. See the parameter **loc** of *Legend* for details.
pad
[Float, default: 0.4] Padding around the child as fraction of the fontsize.

borderpad
[Float, default: 0.5] Padding between the offsetbox frame and the bbox_to_anchor.

child
[OffsetBox] The box that will be anchored.

prop
[FontProperties] This is only used as a reference for paddings. If not given, rcParams["legend.fontsize"] (default: 'medium') is used.

frameon
[Bool] Whether to draw a frame around the box.

bbox_to_anchor
[Box, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with loc.

bbox_transform
[None or matplotlib.transforms.Transform] The transform for the bounding box (bbox_to_anchor).

**kwargs
All other parameters are passed on to OffsetBox.

Notes

See Legend for a detailed description of the anchoring mechanism.

__call__ (self, ax, renderer)
Call self as a function.

__init__ (self, bbox_to_anchor, offsetbox, loc, borderpad=0.5, bbox_transform=None)

Parameters

loc
[str] The box location. Supported values:
- 'upper right'
- 'upper left'
- 'lower left'
- 'lower right'
- 'center left'
• 'center right'
• 'lower center'
• 'upper center'
• 'center'

For backward compatibility, numeric values are accepted as well. See the parameter loc of Legend for details.

**pad**

[float, default: 0.4] Padding around the child as fraction of the fontsize.

**borderpad**

[float, default: 0.5] Padding between the offsetbox frame and the bbox_to_anchor.

**child**

[OffsetBox] The box that will be anchored.

**prop**

[FontProperties] This is only used as a reference for paddings. If not given, rcParams["legend.fontsize"] (default: 'medium') is used.

**frameon**

[bool] Whether to draw a frame around the box.

**bbox_to_anchor**

[BboxBase, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with loc.

**bbox_transform**

[None or matplotlib.transforms.Transform] The transform for the bounding box (bbox_to_anchor).

**kwargs**

All other parameters are passed on to OffsetBox.

**Notes**

See Legend for a detailed description of the anchoring mechanism.

__module__ = 'mpl_toolkits.axes_grid1.inset_locator'

draw(self, renderer)

Update the location of children if necessary and draw them to the given renderer.
Examples using `mpl_toolkits.axes_grid1.inset_locator.AnchoredSizeLocator`

`mpl_toolkits.axes_grid1.inset_locator.AnchoredSizeLocator`  

class `mpl_toolkits.axes_grid1.inset_locator.AnchoredSizeLocator`(bbox_to_anchor, x_size, y_size, loc, borderpad=0.5, bbox_transform=None)

Bases: `mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase`

Parameters

- **loc**
  - [str] The box location. Supported values:
    - 'upper right'
    - 'upper left'
    - 'lower left'
    - 'lower right'
    - 'center left'
    - 'center right'
    - 'lower center'
    - 'upper center'
    - 'center'
  
  For backward compatibility, numeric values are accepted as well. See the parameter `loc` of `Legend` for details.

- **pad**
  - [float, default: 0.4] Padding around the child as fraction of the fontsize.

- **borderpad**
  - [float, default: 0.5] Padding between the offsetbox frame and the `bbox_to_anchor`.

- **child**
  - [OffsetBox] The box that will be anchored.

- **prop**
  - [FontProperties] This is only used as a reference for paddings. If not given, `rcParams['legend.fontsize']` (default: 'medium') is used.
frameon

[bool] Whether to draw a frame around the box.

bbox_to_anchor

[BboxBase, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with loc.

bbox_transform

[None or matplotlib.transforms.Transform] The transform for the bounding box (bbox_to_anchor).

**kwargs

All other parameters are passed on to OffsetBox.

Notes

See Legend for a detailed description of the anchoring mechanism.

__init__ (self, bbox_to_anchor, x_size, y_size, loc, borderpad=0.5, bbox_transform=None)

Parameters

loc

[st] The box location. Supported values:

- 'upper right'
- 'upper left'
- 'lower left'
- 'lower right'
- 'center left'
- 'center right'
- 'lower center'
- 'upper center'
- 'center'

For backward compatibility, numeric values are accepted as well. See the parameter loc of Legend for details.

pad

[float, default: 0.4] Padding around the child as fraction of the fontsize.

borderpad

[float, default: 0.5] Padding between the offsetbox frame and the bbox_to_anchor.
child

[OffsetBox] The box that will be anchored.

prop

[FontProperties] This is only used as a reference for paddings. If not given, rcParams["legend.fontsize"] (default: 'medium') is used.

frameon

[bool] Whether to draw a frame around the box.

bbox_to_anchor

[BboxBase, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with loc.

bbox_transform

[None or matplotlib.transforms.Transform] The transform for the bounding box (bbox_to_anchor).

**kwargs

All other parameters are passed on to OffsetBox.

Notes

See Legend for a detailed description of the anchoring mechanism.

__module__ = 'mpl_toolkits.axes_grid1.inset_locator'

get_extent (self, renderer)

Return the extent of the box as (width, height, x, y).

This is the extent of the child plus the padding.

Examples using mpl_toolkits.axes_grid1.inset_locator.AnchoredSizeLocator

mpl_toolkits.axes_grid1.inset_locator.AnchoredZoomLocator

class mpl_toolkits.axes_grid1.inset_locator.AnchoredZoomLocator (parent_axes, zoom, loc, borderpad=0.5, bbox_to_anchor=None, bbox_transform=None)

Bases: mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase

Parameters

19.1. Toolkits
**loc**

[str] The box location. Supported values:

- 'upper right'
- 'upper left'
- 'lower left'
- 'lower right'
- 'center left'
- 'center right'
- 'lower center'
- 'upper center'
- 'center'

For backward compatibility, numeric values are accepted as well. See the parameter `loc` of `Legend` for details.

**pad**

[float, default: 0.4] Padding around the child as fraction of the fontsize.

**borderpad**

[float, default: 0.5] Padding between the offsetbox frame and the `bbox_to_anchor`.

**child**

[OffsetBox] The box that will be anchored.

**prop**

[FontProperties] This is only used as a reference for paddings. If not given, `rcParams['legend.fontsize']` (default: 'medium') is used.

**frameon**

[bool] Whether to draw a frame around the box.

**bbox_to_anchor**

[BboxBase, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with `loc`.

**bbox_transform**

[None or matplotlib.transforms.Transform] The transform for the bounding box (`bbox_to_anchor`).

**kwargs**

All other parameters are passed on to OffsetBox.
Notes

See *Legend* for a detailed description of the anchoring mechanism.

```python
__init__(self, parent_axes, zoom, loc, borderpad=0.5, bbox_to_anchor=None, bbox_transform=None)
```

**Parameters**

- `loc`  
  [str] The box location. Supported values:
  - 'upper right'
  - 'upper left'
  - 'lower left'
  - 'lower right'
  - 'center left'
  - 'center right'
  - 'center'

  For backward compatibility, numeric values are accepted as well. See the parameter `loc` of *Legend* for details.

- `pad`  
  [float, default: 0.4] Padding around the child as fraction of the fontsize.

- `borderpad`  
  [float, default: 0.5] Padding between the offsetbox frame and the `bbox_to_anchor`.

- `child`  
  [OffsetBox] The box that will be anchored.

- `prop`  
  [FontProperties] This is only used as a reference for paddings. If not given, `rcParams["legend.fontsize"]` (default: 'medium') is used.

- `frameon`  
  [bool] Whether to draw a frame around the box.

- `bbox_to_anchor`  
  [BboxBase, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with `loc`. 

19.1. Toolkits
bbox_transform

[None or matplotlib.transforms.Transform] The transform for the bounding box (bbox_to_anchor).

**kwargs

All other parameters are passed on to OffsetBox.

Notes

See Legend for a detailed description of the anchoring mechanism.

__module__ = 'mpl_toolkits.axes_grid1.inset_locator'

get_extent (self, renderer)

Return the extent of the box as (width, height, x, y).

This is the extent of the child plus the padding.

Examples using mpl_toolkits.axes_grid1.inset_locator.AnchoredZoomLocator

mpl_toolkits.axes_grid1.inset_locator.BboxConnector

class mpl_toolkits.axes_grid1.inset_locator.BboxConnector (bbox1, bbox2, loc1, loc2=None, **kwargs)

Bases: matplotlib.patches.Patch

Connect two bboxes with a straight line.

Parameters

bbox1, bbox2

loc1

[1, 2, 3, 4]} Corner of bbox1 to draw the line. Valid values are:

<table>
<thead>
<tr>
<th>Corner</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>upper right</td>
<td>1</td>
</tr>
<tr>
<td>upper left</td>
<td>2</td>
</tr>
<tr>
<td>lower left</td>
<td>3</td>
</tr>
<tr>
<td>lower right</td>
<td>4</td>
</tr>
</tbody>
</table>

loc2

[1, 2, 3, 4}, optional] Corner of bbox2 to draw the line. If None, defaults to loc1. Valid values are:
**kwargs

Patch properties for the line drawn. Valid arguments include:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agg_filter</td>
<td>a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array</td>

<tr>
<td>zorder</td>
<td>float</td>
</tr>
</tbody>
</table>

__init__ (self, bbox1, bbox2, loc1, loc2=None, **kwargs)

Connect two bboxes with a straight line.

Parameters

bbox1, bbox2

**loc1**

[{1, 2, 3, 4}] Corner of bbox1 to draw the line. Valid values are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4
```

**loc2**

[{1, 2, 3, 4}, optional] Corner of bbox2 to draw the line. If None, defaults to loc1. Valid values are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4
```

**kwargs

Patch properties for the line drawn. Valid arguments include:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>

__module__ = 'mpl_toolkits.axes_grid1.inset_locator'

**static connect_bbox (bbox1, bbox2, loc1, loc2=None)**

Helper function to obtain a Path from one bbox to another.

**Parameters**

bbox1, bbox2

loc1

[{1, 2, 3, 4}] Corner of bbox1 to use. Valid values are:

| 'upper right' | 1 |
| 'upper left'  | 2 |
| 'lower left'  | 3 |
| 'lower right' | 4 |

loc2

[{1, 2, 3, 4}, optional] Corner of bbox2 to use. If None, defaults to loc1. Valid values are:

| 'upper right' | 1 |
| 'upper left'  | 2 |
| 'lower left'  | 3 |
| 'lower right' | 4 |

**Returns**

path

[matplotlib.path.Path] A line segment from the loc1 corner of bbox1 to the loc2 corner of bbox2.

**static get_bbox_edge_pos (bbox, loc)**

Helper function to obtain the location of a corner of a bbox

**Parameters**
bbox

[matplotlib.transforms.Bbox]

loc

[{1, 2, 3, 4}] Corner of bbox. Valid values are:

<table>
<thead>
<tr>
<th>Corner</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>'upper right'</td>
<td>1</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4</td>
</tr>
</tbody>
</table>

Returns

x, y

[float] Coordinates of the corner specified by loc.

get_path(self)

Return the path of this patch.

Examples using mpl_toolkits.axes_grid1.inset_locator.BboxConnector

- sphx_glr_gallery_subplots_axes_and_figures_axes_zoom_effect.py

mpl_toolkits.axes_grid1.inset_locator.BboxConnectorPatch

class mpl_toolkits.axes_grid1.inset_locator.BboxConnectorPatch (bbox1, bbox2, loc1a, loc2a, loc1b, loc2b, **kwargs)

Bases: mpl_toolkits.axes_grid1.inset_locator.BboxConnector

Connect two bboxes with a quadrilateral.

The quadrilateral is specified by two lines that start and end at corners of the bboxes. The four sides of the quadrilateral are defined by the two lines given, the line between the two corners specified in bbox1 and the line between the two corners specified in bbox2.

Parameters

bbox1, bbox2

loc1a, loc2a

[{1, 2, 3, 4}] Corners of bbox1 and bbox2 to draw the first line. Valid values are:

| 'upper right' | 1 |
| 'upper left'  | 2 |
| 'lower left'  | 3 |
| 'lower right' | 4 |

loc1b, loc2b

[{1, 2, 3, 4}] Corners of bbox1 and bbox2 to draw the second line. Valid values are:

| 'upper right' | 1 |
| 'upper left'  | 2 |
| 'lower left'  | 3 |
| 'lower right' | 4 |

**kwargs

Patch properties for the line drawn:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agg_filter</td>
<td>a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array</td>

`__init__(self, bbox1, bbox2, loc1a, loc2a, loc1b, loc2b, **kwargs)`

Connect two bboxes with a quadrilateral.

The quadrilateral is specified by two lines that start and end at corners of the bboxes. The four sides of the quadrilateral are defined by the two lines given, the line between the two corners specified in `bbox1` and the line between the two corners specified in `bbox2`.

**Parameters**

bbox1, bbox2

loc1a, loc2a

  `[1, 2, 3, 4] Corners of `bbox1` and `bbox2` to draw the first line. Valid values are:

  ```
  'upper right' : 1,
  'upper left' : 2,
  'lower left' : 3,
  'lower right' : 4
  ```

loc1b, loc2b

  `[1, 2, 3, 4] Corners of `bbox1` and `bbox2` to draw the second line. Valid values are:

  ```
  'upper right' : 1,
  'upper left' : 2,
  'lower left' : 3,
  'lower right' : 4
  ```

**kwargs

Patch properties for the line drawn:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agg_filter</td>
<td>a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array</td>

__module__ = 'mpl_toolkits.axes_grid1.inset_locator'

get_path(self)

Return the path of this patch.
Examples using `mpl_toolkits.axes_grid1.inset_locator.BboxPatch`

- sphx_glr_gallery_subplots_axes_and_figures_axes_zoom_effect.py

`mpl_toolkits.axes_grid1.inset_locator.InsetPosition`

class `mpl_toolkits.axes_grid1.inset_locator.InsetPosition` *(parent, lbwh)*

Bases: `object`

An object for positioning an inset axes.

This is created by specifying the normalized coordinates in the axes, instead of the figure.

Parameters

parent

lbwh

[iterable of four floats] The left edge, bottom edge, width, and height of the inset axes, in units of the normalized coordinate of the `parent` axes.

See also:

`matplotlib.axes.Axes.set_axes_locator()`

Examples

The following bounds the inset axes to a box with 20% of the parent axes's height and 40% of the width. The size of the axes specified ((0, 0, 1, 1)) ensures that the axes completely fills the bounding box:

```python
>>> parent_axes = plt.gca()
>>> ax_ins = plt.axes([0, 0, 1, 1])
>>> ip = InsetPosition(ax, [0.5, 0.1, 0.4, 0.2])
>>> ax_ins.set_axes_locator(ip)
```
parent

lbwh

[iterable of four floats] The left edge, bottom edge, width, and height of the inset axes, in units of the normalized coordinate of the parent axes.

See also:

matplotlib.axes.Axes.set_axes_locator()

Examples

The following bounds the inset axes to a box with 20% of the parent axes's height and 40% of the width. The size of the axes specified ([0, 0, 1, 1]) ensures that the axes completely fills the bounding box:

```python
>>> parent_axes = plt.gca()
>>> ax_ins = plt.axes([0, 0, 1, 1])
>>> ip = InsetPosition(ax, [0.5, 0.1, 0.4, 0.2])
>>> ax_ins.set_axes_locator(ip)
```

__module__ = 'mpl_toolkits.axes_grid1.inset_locator'

__weakref__

list of weak references to the object (if defined)

Examples using mpl_toolkits.axes_grid1.inset_locator.InsetPosition

Functions

| inset_axes | Create an inset axes with a given width and height. |
| mark_inset | Draw a box to mark the location of an area represented by an inset axes. |
| zoomed_inset_axes | Create an anchored inset axes by scaling a parent axes. |
mpl_toolkits.axes_grid1.inset_locator.inset_axes

Create an inset axes with a given width and height. Both sizes used can be specified either in inches or percentage. For example:

```python
inset_axes(parent_axes, width='40%', height='30%', loc=3)
```

creates an inset axes in the lower left corner of `parent_axes` which spans over 30% in height and 40% in width of the `parent_axes`. Since the usage of `inset_axes` may become slightly tricky when exceeding such standard cases, it is recommended to read the examples.

**Parameters**

**parent_axes**

`[matplotlib.axes.Axes]` Axes to place the inset axes.

**width, height**

[float or str] Size of the inset axes to create. If a float is provided, it is the size in inches, e.g. `width=1.3`. If a string is provided, it is the size in relative units, e.g. `width='40%'`. By default, i.e. if neither `bbox_to_anchor` nor `bbox_transform` are specified, those are relative to the parent_axes. Otherwise they are to be understood relative to the bounding box provided via `bbox_to_anchor`.

**loc**

[int or str, default: 1] Location to place the inset axes. The valid locations are:

- 'upper right': 1,
- 'upper left': 2,
- 'lower left': 3,
- 'lower right': 4,
- 'right': 5,
- 'center left': 6,
- 'center right': 7,
- 'lower center': 8,
- 'upper center': 9,
- 'center': 10

**bbox_to_anchor**

[tuple or `matplotlib.transforms.BboxBase`, optional] Bbox that the inset axes will be anchored to. If None, a tuple of (0, 0, 1, 1) is used if `bbox_transform` is set to `parent_axes.transAxes` or `parent_axes.figure.transFigure`. 
Otherwise, `parent_axes.bbox` is used. If a tuple, can be either [left, bottom, width, height], or [left, bottom]. If the kwargs `width` and/or `height` are specified in relative units, the 2-tuple [left, bottom] cannot be used. Note that, unless `bbox_transform` is set, the units of the bounding box are interpreted in the pixel coordinate. When using `bbox_to_anchor` with tuple, it almost always makes sense to also specify a `bbox_transform`. This might often be the axes transform `parent_axes.transAxes`.

**bbox_transform**

```
[matplotlib.transforms.Transform, optional] Transformation for
the bbox that contains the inset axes. If None, a transforms.
IdentityTransform is used. The value of `bbox_to_anchor` (or the return
value of its get_points method) is transformed by the `bbox_transform` and then
interpreted as points in the pixel coordinate (which is dpi dependent). You may
provide `bbox_to_anchor` in some normalized coordinate, and give an appropriate
transform (e.g., `parent_axes.transAxes`).
```

**axes_class**

```
[matplotlib.axes.Axes type, optional] If specified, the inset axes created
will be created with this class's constructor.
```

**axes_kwargs**

```
[dict, optional] Keyworded arguments to pass to the constructor of the inset axes.
Valid arguments include:
```

**borderpad**

[0.5] Padding between inset axes and the bbox_to_anchor. The units are axes font size, i.e. for a default font size of 10 points borderpad = 0.5 is equivalent to a padding of 5 points.

**Returns**

**inset_axes**

[axes_class] Inset axes object created.
Notes

The meaning of `bbox_to_anchor` and `bbox_to_transform` is interpreted differently from that of legend. The value of `bbox_to_anchor` (or the return value of its `get_points` method; the default is `parent_axes.bbox`) is transformed by the `bbox_transform` (the default is Identity transform) and then interpreted as points in the pixel coordinate (which is dpi dependent).

Thus, following three calls are identical and creates an inset axes with respect to the `parent_axes`:

```python
axins = inset_axes(parent_axes, "30\%", "40\%")
axins = inset_axes(parent_axes, "30\%", "40\%",
                      bbox_to_anchor=parent_axes.bbox)
axins = inset_axes(parent_axes, "30\%", "40\%",
                      bbox_to_anchor=(0, 0, 1, 1),
                      bbox_transform=parent_axes.transAxes)
```

Examples using `mpl_toolkits.axes_grid1.inset_locator.inset_axes`

- sphx_glr_gallery_axes_grid1_demo_colorbar_of_inset_axes.py

- Overview of axes_grid1 toolkit

`mpl_toolkits.axes_grid1.inset_locator.mark_inset`

```
mpl_toolkits.axes_grid1.inset_locator.mark_inset(parent_axes, inset_axes, loc1, loc2, **kwargs)
```

Draw a box to mark the location of an area represented by an inset axes.

This function draws a box in `parent_axes` at the bounding box of `inset_axes`, and shows a connection with the inset axes by drawing lines at the corners, giving a "zoomed in" effect.

Parameters

- **parent_axes**
  - `[matplotlib.axes.Axes]` Axes which contains the area of the inset axes.

- **inset_axes**

- **loc1, loc2**
  - `[{1, 2, 3, 4}]` Corners to use for connecting the inset axes and the area in the parent axes.

- **kwargs**
  - Patch properties for the lines and box drawn:
<table>

</tbody>
</table>

**Returns**

pp

```
[matplotlib.patches.Patch] The patch drawn to represent the area of the inset axes.
```

p1, p2

```
```
**Examples using** `mpl_toolkits.axes_grid1.inset_locator.mark_inset`

- sphx_glr_gallery_axes_grid1_inset_locator_demo2.py

### `mpl_toolkits.axes_grid1.inset_locator.zoomed_inset_axes`

```python
mpl_toolkits.axes_grid1.inset_locator.zoomed_inset_axes(parent_axes, zoom, loc='upper right', bbox_to_anchor=None, bbox_transform=None, axes_class=None, axes_kwargs=None, borderpad=0.5)
```

Create an anchored inset axes by scaling a parent axes. For usage, also see the examples.

**Parameters**

- **parent_axes**
  
  `[matplotlib.axes.Axes]` Axes to place the inset axes.

- **zoom**
  
  [float] Scaling factor of the data axes. `zoom > 1` will enlarge the coordinates (i.e., "zoomed in"), while `zoom < 1` will shrink the coordinates (i.e., "zoomed out").

- **loc**
  
  [int or str, default: 'upper right'] Location to place the inset axes. The valid locations are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4,
'right'      : 5,
'center left' : 6,
'center right': 7,
'lower center': 8,
'upper center': 9,
'center'     : 10
```

- **bbox_to_anchor**
  
  [tuple or `matplotlib.transforms.BboxBase`, optional] Bbox that the inset axes will be anchored to. If None, `parent_axes.bbox` is used. If a tuple, can be either [left, bottom, width, height], or [left, bottom]. If the kwargs `width` and/or `height` are specified in relative units, the 2-tuple [left, bottom] cannot be used. Note that the units of the bounding box are determined through the transform in
use. When using `bbox_to_anchor` it almost always makes sense to also specify a `bbox_transform`. This might often be the axes transform `parent_axes.transAxes`.

**bbox_transform**

```python
[matplotlib.transforms.Transform, optional] Transformation for the bbox that contains the inset axes. If None, a `transforms.IdentityTransform` is used (i.e. pixel coordinates). This is useful when not providing any argument to `bbox_to_anchor`. When using `bbox_to_anchor` it almost always makes sense to also specify a `bbox_transform`. This might often be the axes transform `parent_axes.transAxes`. Inversely, when specifying the axes- or figure-transform here, be aware that not specifying `bbox_to_anchor` will use `parent_axes.bbox`, the units of which are in display (pixel) coordinates.
```

**axes_class**

```python
[matplotlib.axes.Axes type, optional] If specified, the inset axes created will be created with this class's constructor.
```

**axes_kwargs**

```python
[dict, optional] Keywored arguments to pass to the constructor of the inset axes. Valid arguments include:
```

**borderpad**

[Float, default: 0.5] Padding between inset axes and the bbox_to_anchor. The units are axes font size, i.e. for a default font size of 10 points borderpad = 0.5 is equivalent to a padding of 5 points.

**Returns**

**inset_axes**

[axes_class] Inset axes object created.
Examples using `mpl_toolkits.axes_grid1.inset_locator.zoomed_inset_axes`

- `sphx_glr_gallery_axes_grid1_demo_colorbar_of_inset_axes.py`
- `sphx_glr_gallery_axes_grid1_inset_locator_demo2.py`

`mpl_toolkits.axes_grid1.mpl_axes`

**Classes**

```python
Axes(fig, rect, *[, facecolor, frameon, ...])
```

Build an axes in a figure.

```python
SimpleAxisArtist(axis, axisnum, spine)
```

```python
SimpleChainedObjects(objects)
```

`mpl_toolkits.axes_grid1.mpl_axes.Axes`

```python
class mpl_toolkits.axes_grid1.mpl_axes.Axes(fig, rect, *, facecolor=None, frameon=True, sharex=None, sharey=None, label='', xscale=None, yscale=None, box_aspect=None, **kwargs)
```

Bases: `matplotlib.axes._axes.Axes`

Build an axes in a figure.

**Parameters**

- `fig`
  - `[Figure] The axes is build in the Figure fig.`

- `rect`
  - `[[left, bottom, width, height]] The axes is build in the rectangle rect. rect is in Figure coordinates.`

- `sharex, sharey`
  - `[Axes, optional] The x or y axis is shared with the x or y axis in the input Axes.`

- `frameon`
  - `[bool, default: True] Whether the axes frame is visible.`

- `box_aspect`
  - `[float, optional] Set a fixed aspect for the axes box, i.e. the ratio of height to width. See set_box_aspect for details.`

- `**kwargs`
Other optional keyword arguments:

Returns

**Axes**

The new Axes object.

```python
class AxisDict(axes)
Bases: dict

__call__(self, *v, **kwargs)
    Call self as a function.

__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axes_grid1.mpl_axes', ...

__getitem__(self, k)
    x.__getitem__(y) <==> x[y]

__init__(self, axes)
    Initialize self. See help(type(self)) for accurate signature.

__module__ = 'mpl_toolkits.axes_grid1.mpl_axes'

__weakref__
    list of weak references to the object (if defined)

__module__ = 'mpl_toolkits.axes_grid1.mpl_axes'

@property axis
    Convenience method to get or set some axis properties.

Call signatures:

xmin, xmax, ymin, ymax = axis()
xmin, xmax, ymin, ymax = axis([xmin, xmax, ymin, ymax])
xmin, xmax, ymin, ymax = axis(option)
xmin, xmax, ymin, ymax = axis(**kwargs)
```

Parameters

```
xmin, xmax, ymin, ymax
```
The axis limits to be set. This can also be achieved using

```python
ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))
```

**option**

[bool or str] If a bool, turns axis lines and labels on or off. If a string, possible values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'on'</td>
<td>Turn on axis lines and labels. Same as True.</td>
</tr>
<tr>
<td>'off'</td>
<td>Turn off axis lines and labels. Same as False.</td>
</tr>
<tr>
<td>'equal'</td>
<td>Set equal scaling (i.e., make circles circular) by changing axis limits. This is the same as <code>ax.set_aspect('equal', adjustable='datalim')</code>. Explicit data limits may not be respected in this case.</td>
</tr>
<tr>
<td>'scaled'</td>
<td>Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box. This is the same as <code>ax.set_aspect('equal', adjustable='box', anchor='C')</code>. Additionally, further autoscaling will be disabled.</td>
</tr>
<tr>
<td>'tight'</td>
<td>Set limits just large enough to show all data, then disable further autoscaling.</td>
</tr>
<tr>
<td>'auto'</td>
<td>Automatic scaling (fill plot box with data).</td>
</tr>
<tr>
<td>'image'</td>
<td>'scaled' with axis limits equal to data limits.</td>
</tr>
<tr>
<td>'square'</td>
<td>Square plot; similar to 'scaled', but initially forcing ( xmax-xmin = ymax-ymin ).</td>
</tr>
</tbody>
</table>

**emit**

[bool, default: True] Whether observers are notified of the axis limit change. This option is passed on to `set_xlim` and `set_ylim`.

**Returns**

\( xmin, xmax, ymin, ymax \)

[float] The axis limits.

**See also:**

- `matplotlib.axes.Axes.set_xlim`
- `matplotlib.axes.Axes.set_ylim`

**cla***(self)***

Clear the axes.
Examples using `mpl_toolkits.axes_grid1.mpl_axes.Axes`

- sphx_glr_gallery_axes_grid1_demo_axes_divider.py
- sphx_glr_gallery_axes_grid1_demo_axes_grid2.py

`mpl_toolkits.axes_grid1.mpl_axes.SimpleAxisArtist`

class `mpl_toolkits.axes_grid1.mpl_axes.SimpleAxisArtist`(axis, axisnum, spine)

Bases: `matplotlib.artist.Artist`

__init__ (self, axis, axisnum, spine)

Initialize self. See help(type(self)) for accurate signature.

__module__ = 'mpl_toolkits.axes_grid1.mpl_axes'

property label

property major_ticklabels

property major_ticks

set_label (self, txt)

Set a label that will be displayed in the legend.

Parameters

s

[object] s will be converted to a string by calling `str`.

set_visible (self, b)

Set the artist's visibility.

Parameters

b

[bool]

toggle (self, all=None, ticks=None, ticklabels=None, label=None)
Examples using `mpl_toolkits.axes_grid1.mpl_axes.SimpleAxisArtist`

`mpl_toolkits.axes_grid1.mpl_axes.SimpleChainedObjects`

class `mpl_toolkits.axes_grid1.mpl_axes.SimpleChainedObjects`(*objects*)  
Bases: `object`  

__call__(*self*, *args*, **kwargs*)  
Call self as a function.

__dict__ = `mappingproxy`({  
'__module__': 'mpl_toolkits.axes_grid1.mpl_axes',  
'__init__': `<function ... objects>`,  
'__weakref__': `<attribute '__weakref__' of 'SimpleChainedObjects' objects>`,  
'__doc__': None})

__getattr__(*self*, *k*)

__init__(*self*, *objects*)  
Initialize self. See help(type(self)) for accurate signature.

__module__ = 'mpl_toolkits.axes_grid1.mpl_axes'

__weakref__
list of weak references to the object (if defined)

Examples using `mpl_toolkits.axes_grid1.mpl_axes.SimpleChainedObjects`

cla(self)

draw(self, renderer)

get_aux_axes(self, tr=None,
viewlim_mode='equal',
axes_class=<class
'mpl_toolkits.axes_grid1.mpl_axes.Axes'>)

Add a parasite axes to this host.

Despite this method's name, this should actually be thought of as an add_parasite_axes
method.

tr may be Transform, in which case the following relation will hold: parasite.
transData = tr + host.transData. Alternatively, it may be None (the default),
no special relationship will hold between the parasite's and the host's transData.

get_tightbbox(self, renderer,
call_axes_locator=True, bbox_extra_artists=None)

pick(self, mouseevent)

twin(self, aux_trans=None,
axes_class=None)

Create a twin of Axes with no shared axis.

While self will have ticks on the left and bottom axis, the returned axes will have ticks on the top
and right axis.

twinx(self, axes_class=None)

Create a twin of Axes with a shared x-axis but independent y-axis.

The y-axis of self will have ticks on the left and the returned axes will have ticks on the right.

twiny(self, axes_class=None)

Create a twin of Axes with a shared y-axis but independent x-axis.

The x-axis of self will have ticks on the bottom and the returned axes will have ticks on the top.

`mpl_toolkits.axes_grid1.parasite_axes.host_axes`

`mpl_toolkits.axes_grid1.parasite_axes.host_axes(*args, axes_class=<class 'mpl_toolkits.axes_grid1.mpl_axes.Axes'>, figure=None, **kwargs)`

Create axes that can act as a hosts to parasitic axes.

Parameters

- `figure`
  - `[matplotlib.figure.Figure]` Figure to which the axes will be added. Defaults to the current figure `pyplot.gcf()`.

- `*args, **kwargs`
  - Will be passed on to the underlying `Axes` object creation.

Examples using `mpl_toolkits.axes_grid1.parasite_axes.host_axes`

mpl_toolkits.axes_grid1.parasite_axes.host_subplot(*args,
axes_class=mpl_toolkits.axes_grid1.mpl_axes.Axes,
figure=None,
**kwargs)

Create a subplot that can act as a host to parasitic axes.

Parameters

figure

[matplotlib.figure.Figure] Figure to which the subplot will be added. Defaults to the current figure pyplot.gcf().

*args, **kwargs

Will be passed on to the underlying Axes object creation.

Examples using mpl_toolkits.axes_grid1.parasite_axes.host_subplot

19.1.3 Matplotlib axisartist Toolkit

The `axisartist` namespace includes a derived Axes implementation (`mpl_toolkits.axisartist.Axes`). The biggest difference is that the artists that are responsible for drawing axis lines, ticks, ticklabels, and axis labels are separated out from the mpl's Axis class. This change was strongly motivated to support curvilinear grid.

You can find a tutorial describing usage of axisartist at the `axisartist` user guide.

The submodules of the `axisartist` API are:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

**mpl_toolkits.axisartist.angle_helper.ExtremeFinderCycle**

```python
class mpl_toolkits.axisartist.angle_helper.ExtremeFinderCycle(nx, ny, lon_cycle, lat_cycle=360.0,
                                                                  lon_minmax=None,
                                                                  lat_minmax=-90, 90)
```

**Bases:** `mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple`

This subclass handles the case where one or both coordinates should be taken modulo 360, or be restricted to not exceed a specific range.

**Parameters**

- `nx, ny`
  - [int] The number of samples in each direction.

- `lon_cycle, lat_cycle`
  - [360 or None] If not None, values in the corresponding direction are taken modulo `lon_cycle` or `lat_cycle`; in theory this can be any number but the implementation actually assumes that it is 360 (if not None); other values give nonsensical results.
This is done by "unwrapping" the transformed grid coordinates so that jumps are less than a half-cycle; then normalizing the span to no more than a full cycle.

For example, if values are in the union of the [0, 2] and [358, 360] intervals (typically, angles measured modulo 360), the values in the second interval are normalized to [-2, 0] instead so that the values now cover [-2, 2]. If values are in a range of [5, 1000], this gets normalized to [5, 365].

lon_minmax, lat_minmax

[(float, float) or None] If not None, the computed bounding box is clipped to the given range in the corresponding direction.

__call__(self, transform_xy, x1, y1, x2, y2)
Compute an approximation of the bounding box obtained by applying transform_xy to the box delimited by (x1, y1, x2, y2).

The intended use is to have (x1, y1, x2, y2) in axes coordinates, and have transform_xy be the transform from axes coordinates to data coordinates; this method then returns the range of data coordinates that span the actual axes.

The computation is done by sampling nx * ny equispaced points in the (x1, y1, x2, y2) box and finding the resulting points with extremal coordinates; then adding some padding to take into account the finite sampling.

As each sampling step covers a relative range of 1/nx or 1/ny, the padding is computed by expanding the span covered by the extremal coordinates by these fractions.

__init__(self, nx, ny, lon_cycle=360.0, lat_cycle=None, lon_minmax=None, lat_minmax=-90, 90)
This subclass handles the case where one or both coordinates should be taken modulo 360, or be restricted to not exceed a specific range.

Parameters

nx, ny
[int] The number of samples in each direction.

lon_cycle, lat_cycle
[360 or None] If not None, values in the corresponding direction are taken modulo lon_cycle or lat_cycle; in theory this can be any number but the implementation actually assumes that it is 360 (if not None); other values give nonsensical results.

This is done by "unwrapping" the transformed grid coordinates so that jumps are less than a half-cycle; then normalizing the span to no more than a full cycle.

For example, if values are in the union of the [0, 2] and [358, 360] intervals (typically, angles measured modulo 360), the values in the second interval are normalized to [-2, 0] instead so that the values now cover [-2, 2]. If values are in a range of [5, 1000], this gets normalized to [5, 365].
lon_minmax, lat_minmax

[(float, float) or None] If not None, the computed bounding box is clipped to the
given range in the corresponding direction.

ImageGrid(fig, rect, nrows_ncols[, ngrids, ...])
```

Parameters

### `mpl_toolkits.axisartist.axes_grid.AxesGrid`

alias of `mpl_toolkits.axisartist.axes_grid.ImageGrid`

### `mpl_toolkits.axisartist.axes_grid.CbarAxes`

class `mpl_toolkits.axisartist.axes_grid.CbarAxes(*args, orientation, **kwargs)`

__module__ = 'mpl_toolkits.axisartist.axes_grid'

### Examples using `mpl_toolkits.axisartist.axes_grid.CbarAxes`

### `mpl_toolkits.axisartist.axes_grid.Grid`

class `mpl_toolkits.axisartist.axes_grid.Grid(fig, rect, nrows_ncols, ngrids=None, direction='row', axes_pad=0.02, add_all=<deprecated parameter>, share_all=False, share_x=True, share_y=True, label_mode='L', axes_class=None, *, aspect=False)`

Bases: `mpl_toolkits.axes_grid1.axes_grid.Grid`

Parameters

```
fig

[Figure] The parent figure.
```

```
rect

[<float, float, float, float> or int] The axes position, as a (left, bottom, width, height) tuple or as a three-digit subplot position code (e.g., "121").
```
nrows_ncols

[(int, int)] Number of rows and columns in the grid.

ngrids

[int or None, default: None] If not None, only the first ngrids axes in the grid are created.

direction

[{"row", "column"}, default: "row"] Whether axes are created in row-major ("row by row") or column-major order ("column by column").

axes_pad

[float or (float, float), default: 0.02] Padding or (horizontal padding, vertical padding) between axes, in inches.

add_all

[bool, default: True] Whether to add the axes to the figure using Figure.add_axes. This parameter is deprecated.

share_all

[bool, default: False] Whether all axes share their x- and y-axis. Overrides share_x and share_y.

share_x

[bool, default: True] Whether all axes of a column share their x-axis.

share_y

[bool, default: True] Whether all axes of a row share their y-axis.

label_mode

[{"L", "1", "all"}, default: "L"] Determines which axes will get tick labels:

- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": all axes are labelled.

axes_class

[subclass of matplotlib.axes.Axes, default: None]

aspect

[bool, default: False] Whether the axes aspect ratio follows the aspect ratio of the data limits.

__module__ = 'mpl_toolkits.axisartist.axes_grid'
Examples using `mpl_toolkits.axisartist.axislines.Grid`

`mpl_toolkits.axisartist.axislines.ImageGrid`

class `mpl_toolkits.axisartist.axislines.ImageGrid`:

```python
mpl_toolkits.axisartist.axislines.ImageGrid(fig, rect, nrows_ncols,
nrows_ncols=nrows_ncols, ngrids=ngrids, direction='row',
axes_pad=0.02, add_all=add_all, share_all=share_all,
aspect=True, label_mode=label_mode, cbar_mode=cbar_mode,
cbar_location=cbar_location, cbar_pad=cbar_pad,
cbar_size=cbar_size, cbar_set_cax=cbar_set_cax,
axes_class=axes_class)
```

Parameters

- **fig**
  - *Figure* The parent figure.

- **rect**
  - [(float, float, float, float) or int] The axes position, as a (left, bottom, width, height) tuple or as a three-digit subplot position code (e.g., "121").

- **nrows_ncols**
  - [(int, int)] Number of rows and columns in the grid.

- **ngrids**
  - [int or None, default: None] If not None, only the first `ngrids` axes in the grid are created.

- **direction**
  - [{"row", "column"}, default: "row"] Whether axes are created in row-major ("row by row") or column-major order ("column by column"). This also affects the order in which axes are accessed using indexing (grid[index]).

- **axes_pad**
  - [float or (float, float), default: 0.02in] Padding or (horizontal padding, vertical padding) between axes, in inches.

- **add_all**
  - [deprecated parameter]
[bool, default: True] Whether to add the axes to the figure using Figure.

add_axes. This parameter is deprecated.

share_all

[bool, default: False] Whether all axes share their x- and y-axis.

aspect

[bool, default: True] Whether the axes aspect ratio follows the aspect ratio of the
data limits.

label_mode

{{"L", "1", "all"}, default: "L"} Determines which axes will get tick labels:

• "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.

• "1": Only the bottom left axes is labelled.

• "all": all axes are labelled.

cbar_mode

{{"each", "single", "edge", None}, default: None} Whether to create a colorbar for "each" axes, a "single" colorbar for the entire grid, colorbars only for axes on the "edge" determined by cbar_location, or no colorbars. The colorbars are stored in the cbar_axes attribute.

cbar_location

{{"left", "right", "bottom", "top"}, default: "right"}

cbar_pad

[float, default: None] Padding between the image axes and the colorbar axes.

cbar_size

[size specification (see Size.from_any), default: "5%"] Colorbar size.

cbar_set_cax

[bool, default: True] If True, each axes in the grid has a cax attribute that is bound to associated cbar_axes.

axes_class

[subclass of matplotlib.axes.Axes, default: None]
Examples using `mpl_toolkits.axisartist.axes_grid.ImageGrid`

`mpl_toolkits.axisartist.axes_rgb`

Classes

```python
RGBAxes(*args[, pad, add_all])
```

**Parameters**

- **pad**
  
  [float, default: 0] fraction of the axes height to put as padding.

- **add_all**
  
  [bool, default: True] Whether to add the {rgb, r, g, b} axes to the figure. This parameter is deprecated.

- **axes_class**
  
  [matplotlib.axes.Axes]

- **args**
  
  Unpacked into axes_class() init for RGB

- **kwargs**
  
  Unpacked into axes_class() init for RGB, R, G, B axes

- **__module__** = `'mpl_toolkits.axisartist.axes_rgb'`
Examples using `mpl_toolkits.axisartist.axes_rgb.RGBAxes`

`mpl_toolkits.axisartist.axis_artist`

The `axis_artist` module implements custom artists to draw axis elements (axis lines and labels, tick lines and labels, grid lines).

Axis lines and labels and tick lines and labels are managed by the `AxisArtist` class; grid lines are managed by the `GridlinesCollection` class.

There is one `AxisArtist` per Axis; it can be accessed through the `axis` dictionary of the parent Axes (which should be a `mpl_toolkits.axislines.Axes`), e.g. `ax.axis["bottom"]`.

Children of the `AxisArtist` are accessed as attributes: `.line` and `.label` for the axis line and label, `.major_ticks`, `.major_ticklabels`, `.minor_ticks`, `.minor_ticklabels` for the tick lines and labels (e.g. `ax.axis["bottom"]).line`).

Children properties (colors, fonts, line widths, etc.) can be set using setters, e.g.

```python
# Make the major ticks of the bottom axis red.
ax.axis["bottom"].major_ticks.set_color("red")
```

However, things like the locations of ticks, and their ticklabels need to be changed from the side of the `grid_helper`.

`axis_direction`

`AxisArtist`, `AxisLabel`, `TickLabels` have an `axis_direction` attribute, which adjusts the location, angle, etc. The `axis_direction` must be one of "left", "right", "bottom", "top", and follows the Matplotlib convention for rectangular axis.

For example, for the `bottom` axis (the left and right is relative to the direction of the increasing coordinate),

- ticklabels and axislabel are on the right
- ticklabels and axislabel have text angle of 0
- ticklabels are baseline, center-aligned
- axislabel is top, center-aligned

The text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>left</th>
<th>bottom</th>
<th>right</th>
<th>top</th>
</tr>
</thead>
<tbody>
<tr>
<td>ticklabels location</td>
<td>left</td>
<td>right</td>
<td>right</td>
<td>left</td>
</tr>
<tr>

<td>right</td>
<td>center</td>
<td>right</td>
<td>center</td>
</tr>
<tr>
<td>axislabel ha</td>
<td>right</td>
<td>center</td>
<td>right</td>
<td>center</td>
</tr>
</tbody>
</table>

Ticks are by default direct opposite side of the ticklabels. To make ticks to the same side of the ticklabels,

```python
ax.axis["bottom"].major_ticks.set_tick_out(True)
```

The following attributes can be customized (use the `set_xxx` methods):

- **Ticks**: ticksize, tick_out
- **TickLabels**: pad
- **AxisLabel**: pad

**Classes**

```python
AttributeCopier()
AxisArtist(axes, helper[, offset, ...]) An artist which draws axis (a line along which the n-th axes coord is constant) line, ticks, ticklabels, and axis label.

AxisLabel(*args[, axis_direction, axis]) Axis Label.
GridlinesCollection(*args[, which, axis])

Parameters

LabelBase(*args, **kwargs) A base class for AxisLabel and TickLabels.
TickLabels(*[, axis_direction]) Tick Labels.
Ticks(ticksize[, tick_out, axis]) Ticks are derived from Line2D, and note that ticks themselves are markers.
```
mpl_toolkits.axisartist.axis_artist.AttributeCopier

class mpl_toolkits.axisartist.axis_artist.AttributeCopier
Bases: object

__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axisartist.axis_artist',
                         '__weakref__': <attribute '__weakref__' of 'AttributeCopier' objects>,
                         '__doc__': None})

__module__ = 'mpl_toolkits.axisartist.axis_artist'
__weakref__
list of weak references to the object (if defined)

get_attribute_from_ref_artist (self, attr_name)

get_ref_artist (self)
    Return the underlying artist that actually defines some properties (e.g., color) of this artist.

Examples using mpl_toolkits.axisartist.axis_artist.AttributeCopier

mpl_toolkits.axisartist.axis_artist.AxisArtist

class mpl_toolkits.axisartist.axis_artist.AxisArtist (axes, helper, offset=None, axis_direction='bottom', **kwargs)
Bases: matplotlib.artist.Artist

An artist which draws axis (a line along which the n-th axes coord is constant) line, ticks, ticklabels, and axis label.

Parameters

axes
    [mpl_toolkits.axisartist.axislines.Axes]

helper
    [AxisArtistHelper]

property LABELPAD
ZORDER = 2.5

__init__ (self, axes, helper, offset=None, axis_direction='bottom', **kwargs)
Parameters

axes
    [mpl_toolkits.axisartist.axislines.Axes]
helper

[AxisArtistHelper]

__module__ = 'mpl_toolkits.axisartist.axis_artist'

property dpi_transform
draw(self, renderer)
    Draw the Artist (and its children) using the given renderer.
    This has no effect if the artist is not visible (Artist.get_visible returns False).

    Parameters

    renderer
        [RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

get_axisline_style(self)
    Return the current axisline style.

get_helper(self)
    Return axis artist helper instance.

get_tightbbox(self, renderer)
    Like Artist.get_window_extent, but includes any clipping.

    Parameters

    renderer
        [RendererBase subclass] renderer that will be used to draw the figures (i.e.
        fig.canvas.get_renderer())

    Returns

    Bbox
        The enclosing bounding box (in figure pixel coordinates).

get_transform(self)
    Return the Transform instance used by this artist.

invert_ticklabel_direction(self)

set_axis_direction(self, axis_direction)
    Adjust the direction, text angle, text alignment of ticklabels, labels following the matplotlib convention for the rectangle axes.
The *axis_direction* must be one of [left, right, bottom, top].

<table>
<thead>
<tr>
<th>property</th>
<th>left</th>
<th>bottom</th>
<th>right</th>
<th>top</th>
</tr>
</thead>
<tbody>
<tr>
<td>ticklabels location</td>
<td>&quot;-&quot;</td>
<td>&quot;+&quot;</td>
<td>&quot;+&quot;</td>
<td>&quot;-&quot;</td>
</tr>
<tr>
<td>axislabel location</td>
<td>&quot;-&quot;</td>
<td>&quot;+&quot;</td>
<td>&quot;+&quot;</td>
<td>&quot;-&quot;</td>
</tr>
<tr>
<td>ticklabels angle</td>
<td>90</td>
<td>0</td>
<td>-90</td>
<td>180</td>
</tr>
<tr>
<td>ticklabel va</td>
<td>center</td>
<td>baseline</td>
<td>center</td>
<td>baseline</td>
</tr>
<tr>
<td>ticklabel ha</td>
<td>right</td>
<td>center</td>
<td>right</td>
<td>center</td>
</tr>
<tr>
<td>axislabel angle</td>
<td>180</td>
<td>0</td>
<td>0</td>
<td>180</td>
</tr>
<tr>
<td>axislabel va</td>
<td>center</td>
<td>top</td>
<td>center</td>
<td>bottom</td>
</tr>
<tr>
<td>axislabel ha</td>
<td>right</td>
<td>center</td>
<td>right</td>
<td>center</td>
</tr>
</tbody>
</table>

Note that the direction "+" and 
"-" are relative to the direction of the increasing coordinate. Also, the text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

**set_axislabel_direction**(self, label_direction)
Adjust the direction of the axislabel.

Note that the *label_directions* '+' and '-' are relative to the direction of the increasing coordinate.

**Parameters**

- **label_direction**
  
  ["+", 
  \"-"]

**set_axisline_style**(self, axisline_style=None, **kwargs)
Set the axisline style.

The new style is completely defined by the passed attributes. Existing style attributes are forgotten.

**Parameters**

- **axisline_style**
  
  [str or None] The line style, e.g. 
  
  
  \'->\', optionally followed by a comma-separated list of attributes. Alternatively, the attributes can be provided as keywords.

  If *None* this returns a string containing the available styles.
Examples

The following two commands are equal: >>> set_axisline_style("->,size=1.5") >>> set_axisline_style("->", size=1.5)

set_label (self, s)
Set a label that will be displayed in the legend.

Parameters

s

[object] s will be converted to a string by calling str.

set_ticklabel_direction (self, tick_direction)
Adjust the direction of the ticklabel.

Note that the label_directions '+' and '-' are relative to the direction of the increasing coordinate.

Parameters

tick_direction

[['+', '-']]

toggle (self, all=None, ticks=None, ticklabels=None, label=None)
Toggle visibility of ticks, ticklabels, and (axis) label. To turn all off,

axis.toggle(all=False)

To turn all off but ticks on

axis.toggle(all=False, ticks=True)

To turn all on but (axis) label off

axis.toggle(all=True, label=False)

zorder = 2.5

Examples using mpl_toolkits.axisartist.axis_artist.AxisArtist

mpl_toolkits.axisartist.axis_artist.AxisLabel

class mpl_toolkits.axisartist.axis_artist.AxisLabel (*args,

axis_direction='bottom',

axis=None,

**kwargs)

Bases: mpl_toolkits.axisartist.axis_artist.AttributeCopier,

mpl_toolkits.axisartist.axis_artist.LabelBase
Axis Label. Derived from Text. The position of the text is updated in the fly, so changing text position has no effect. Otherwise, the properties can be changed as a normal Text.

To change the pad between ticklabels and axis label, use set_pad.

__init__ (self, *args, axis_direction='bottom', axis=None, **kwargs)
Initialize self. See help(type(self)) for accurate signature.

__module__ = 'mpl_toolkits.axisartist.axis_artist'
draw (self, renderer)
Draw the Artist (and its children) using the given renderer.
This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters

renderer
[RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

get_color (self)
Return the color of the text.

get_pad (self)
Return the internal pad in points.
See set_pad for more details.

get_ref_artist (self)
Return the underlying artist that actually defines some properties (e.g., color) of this artist.

get_text (self)
Return the text string.

get_window_extent (self, renderer)
Return the Bbox bounding the text, in display units.
In addition to being used internally, this is useful for specifying clickable regions in a png file on a web page.

Parameters

renderer
[Renderer, optional] A renderer is needed to compute the bounding box. If the artist has already been drawn, the renderer is cached; thus, it is only necessary to pass this argument when calling get_window_extent before the first draw. In practice, it is usually easier to trigger a draw first (e.g. by saving the figure).
dpi

[float, optional] The dpi value for computing the bbox, defaults to self.
figure.dpi (not the renderer dpi); should be set e.g. if to match regions
with a figure saved with a custom dpi value.

```python
set_axis_direction(self, d)
```

Adjust the text angle and text alignment of axis label according to the matplotlib convention.

<table>
<thead>
<tr>
<th>property</th>
<th>left</th>
<th>bottom</th>
<th>right</th>
<th>top</th>
</tr>
</thead>
<tbody>
<tr>
<td>axislabel angle</td>
<td>180</td>
<td>0</td>
<td>0</td>
<td>180</td>
</tr>
<tr>
<td>axislabel va</td>
<td>center</td>
<td>top</td>
<td>center</td>
<td>bottom</td>
</tr>
<tr>
<td>axislabel ha</td>
<td>right</td>
<td>center</td>
<td>right</td>
<td>center</td>
</tr>
</tbody>
</table>

Note that the text angles are actually relative to (90 + angle of the direction to the ticklabel),
which gives 0 for bottom axis.

```python
set_default_alignment(self, d)
```

```python
set_default_angle(self, d)
```

```python
set_pad(self, pad)
```

Set the internal pad in points.

The actual pad will be the sum of the internal pad and the external pad (the latter is set automat-
ically by the AxisArtist).

Examples using `mpl_toolkits.axisartist.axis_artist.AxisLabel`

```python
mpl_toolkits.axisartist.axis_artist.GridlinesCollection
class mpl_toolkits.axisartist.axis_artist.GridlinesCollection(*args,
which='major',
axis='both',
**kwargs)
```

Bases: `matplotlib.collections.LineCollection`

Parameters

`which`

['major', 'minor']

`axis`

['both', 'x', 'y']

```python
__init__(self, *args, which='major', axis='both', **kwargs)
```

Parameters
which

[['"major", "minor"]]

axis

[['"both", "x", "y"]]

__module__ = 'mpl_toolkits.axisartist.axis_artist'

draw (self, renderer)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters

renderer

[RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

set_axis (self, axis)

set_grid_helper (self, grid_helper)

set_which (self, which)

Examples using mpl_toolkits.axisartist.axis_artist.GridlinesCollection

mpl_toolkits.axisartist.axis_artist.LabelBase

class mpl_toolkits.axisartist.axis_artist.LabelBase (*args, **kwargs)

Bases: matplotlib.text.Text

A base class for AxisLabel and TickLabels. The position and angle of the text are calculated by to offset_ref_angle, text_ref_angle, and offset_radius attributes.

Create a Text instance at x, y with string text.

Valid keyword arguments are:

<table>

<tbody>
<tr>
<td>y</td>
<td>float</td>
</tr>
<tr>
<td>zorder</td>
<td>float</td>
</tr>
</tbody>
</table>

```python
__module__ = 'mpl_toolkits.axisartist.axis_artist'

draw(self, renderer)
    Draw the Artist (and its children) using the given renderer.

    This has no effect if the artist is not visible (Artist.get_visible returns False).

    Parameters

    renderer

        [RendererBase subclass.]

    Notes

    This method is overridden in the Artist subclasses.

get_window_extent(self, renderer)
    Return the Bbox bounding the text, in display units.

    In addition to being used internally, this is useful for specifying clickable regions in a png file on
    a web page.

    Parameters

    renderer

        [Renderer, optional] A renderer is needed to compute the bounding box. If the
        artist has already been drawn, the renderer is cached; thus, it is only necessary to
        pass this argument when calling get_window_extent before the first draw.
        In practice, it is usually easier to trigger a draw first (e.g. by saving the figure).

dpi

        [float, optional] The dpi value for computing the bbox, defaults to self.
        figure.dpi (not the renderer dpi); should be set e.g. if to match regions
        with a figure saved with a custom dpi value.
```
Examples using `mpl_toolkits.axisartist.axis_artist.LabelBase`

`mpl_toolkits.axisartist.axis_artist.TickLabels`

class `mpl_toolkits.axisartist.axis_artist.TickLabels`(*,  
    axis_direction='bottom',  
    **kwargs)

    Bases: `mpl_toolkits.axisartist.axis_artist.AxisLabel`

Tick Labels. While derived from Text, this single artist draws all ticklabels. As in AxisLabel, the position of the text is updated in the fly, so changing text position has no effect. Otherwise, the properties can be changed as a normal Text. Unlike the ticklabels of the mainline matplotlib, properties of single ticklabel alone cannot modified.

To change the pad between ticks and ticklabels, use `set_pad`.

    __init__ (self, *, axis_direction='bottom', **kwargs)
    Initialize self. See help(type(self)) for accurate signature.

    __module__ = 'mpl_toolkits.axisartist.axis_artist'

draw (self, renderer)

    Draw the Artist (and its children) using the given renderer.

    This has no effect if the artist is not visible (`Artist.get_visible` returns False).

    Parameters

    renderer

        [RendererBase subclass.]

    Notes

    This method is overridden in the Artist subclasses.

    get_ref_artist (self)

        Return the underlying artist that actually defines some properties (e.g., color) of this artist.

    get_texts_widths_heights_descents (self, renderer)

        Return a list of (width, height, descent) tuples for ticklabels.

        Empty labels are left out.

    get_window_extents (self, renderer)

    invert_axis_direction (self)

    set_axis_direction (self, label_direction)

        Adjust the text angle and text alignment of ticklabels according to the matplotlib convention.

        The `label_direction` must be one of [left, right, bottom, top].
<table>
<thead>
<tr>
<th>property</th>
<th>left</th>
<th>bottom</th>
<th>right</th>
<th>top</th>
</tr>
</thead>
<tbody>
<tr>
<td>ticklabels angle</td>
<td>90</td>
<td>0</td>
<td>-90</td>
<td>180</td>
</tr>
<tr>
<td>ticklabel va</td>
<td>center</td>
<td>baseline</td>
<td>center</td>
<td>baseline</td>
</tr>
<tr>
<td>ticklabel ha</td>
<td>right</td>
<td>center</td>
<td>right</td>
<td>center</td>
</tr>
</tbody>
</table>

Note that the text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

`set_locs_angles_labels(self, locs_angles_labels)`

**Examples using `mpl_toolkits.axisartist.axis_artist.TickLabels`**

**`mpl_toolkits.axisartist.axis_artist.Ticks`**

```python
class mpl_toolkits.axisartist.axis_artist.Ticks(ticksize, tick_out=False, *, axis=None, **kwargs)
```

Bases: `mpl_toolkits.axisartist.axis_artist.AttributeCopier`, `matplotlib.lines.axisartist.axis_artist.AxisArtist`, `matplotlib.axis.AxisArtist`, `mpl_toolkits.axisartist.axis_artist.Artist`, `matplotlib.artist.Artist`, `matplotlib.collections.Collection`, `matplotlib.figure.Figure`, 

Ticks are derived from Line2D, and note that ticks themselves are markers. Thus, you should use set_mec, set_mew, etc.

To change the tick size (length), you need to use set_ticksize. To change the direction of the ticks (ticks are in opposite direction of ticklabels by default), use set_tick_out(False).

```python
__init__(self, ticksize, tick_out=False, *, axis=None, **kwargs)
```

Initialize self. See help(type(self)) for accurate signature.

```python
__module__ = 'mpl_toolkits.axisartist.axis_artist'
```

```python
draw(self, renderer)
```

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

**Parameters**

- `renderer`

  [RendererBase subclass.]
Notes

This method is overridden in the Artist subclasses.

\textbf{get\_color}(self)
Return the line color.

See also \textit{set\_color}.

\textbf{get\_markeredgecolor}(self)
Return the marker edge color.

See also \textit{set\_markeredgecolor}.

\textbf{get\_markeredgewidth}(self)
Return the marker edge width in points.

See also \textit{set\_markeredgewidth}.

\textbf{get\_ref\_artist}(self)
Return the underlying artist that actually defines some properties (e.g., color) of this artist.

\textbf{get\_tick\_out}(self)
Return whether ticks are drawn inside or outside the axes.

\textbf{get\_ticksiz}(self)
Return length of the ticks in points.

\textbf{set\_locs\_angles}(self, locs\_angles)

\textbf{set\_tick\_out}(self, b)
Set whether ticks are drawn inside or outside the axes.

\textbf{set\_ticksiz}(self, ticksiz)
Set length of the ticks in points.

\textbf{Examples using \texttt{mpl\_toolkits.axisartist.axis\_artist.Ticks}}

\textbf{mpl\_toolkits.axisartist.axisline\_style}

\textbf{Classes}

<table>
<thead>
<tr>
<th>\textbf{AxislineStyle}(stylename, **kw)</th>
<th>A container class which defines style classes for AxisArtists.</th>
</tr>
</thead>
</table>

19.1. Toolkits
mpl_toolkits.axisartist.axisline_style.AxislineStyle

class mpl_toolkits.axisartist.axisline_style.AxislineStyle(stylename, **kw)

Bases: matplotlib.patches._Style

A container class which defines style classes for AxisArtists.

An instance of any axisline style class is an callable object, whose call signature is

```
__call__(self, axis_artist, path, transform)
```

When called, this should return an Artist with the following methods:

```
def set_path(self, path):
    # set the path for axisline.
def set_line_mutation_scale(self, scale):
    # set the scale
def draw(self, renderer):
    # draw
```

Return the instance of the subclass with the given style name.

class FilledArrow(size=1)

Bases: mpl_toolkits.axisartist.axisline_style.AxislineStyle, mpl_toolkits.axisartist.axisline_style.SimpleArrow

Parameters

size

[float] Size of the arrow as a fraction of the ticklabel size.

ArrowAxisClass

alias of _FancyAxislineStyle.FilledArrow

__module__ = 'mpl_toolkits.axisartist.axisline_style'

class SimpleArrow(size=1)

Bases: mpl_toolkits.axisartist.axisline_style.AxislineStyle._Base

A simple arrow.

Parameters

size

[float] Size of the arrow as a fraction of the ticklabel size.

ArrowAxisClass

alias of _FancyAxislineStyle.SimpleArrow

__init__(self, size=1)
Parameters

size

[float] Size of the arrow as a fraction of the ticklabel size.

__module__ = 'mpl_toolkits.axisartist.axisline_style'

new_line(self, axis_artist, transform)

__module__ = 'mpl_toolkits.axisartist.axisline_style'

Examples using mpl_toolkits.axisartist.axisline_style.AxislineStyle

mpl_toolkits.axisartist.axislines

Axislines includes modified implementation of the Axes class. The biggest difference is that the artists responsible for drawing the axis spine, ticks, ticklabels and axis labels are separated out from Matplotlib's Axis class. Originally, this change was motivated to support curvilinear grid. Here are a few reasons that I came up with a new axes class:

- "top" and "bottom" x-axis (or "left" and "right" y-axis) can have different ticks (tick locations and labels). This is not possible with the current Matplotlib, although some twin axes trick can help.
- Curvilinear grid.
- angled ticks.

In the new axes class, xaxis and yaxis is set to not visible by default, and new set of artist (AxisArtist) are defined to draw axis line, ticks, ticklabels and axis label. Axes.axis attribute serves as a dictionary of these artists, i.e., ax.axis["left"] is a AxisArtist instance responsible to draw left y-axis. The default Axes.axis contains "bottom", "left", "top" and "right".

AxisArtist can be considered as a container artist and has following children artists which will draw ticks, labels, etc.

- line
- major_ticks, major_ticklabels
- minor_ticks, minor_ticklabels
- offsetText
- label

Note that these are separate artists from matplotlib.axis.Axis, thus most tick-related functions in Matplotlib won't work. For example, color and markerwidth of the ax.axis["bottom"].major_ticks will follow those of Axes.xaxis unless explicitly specified.

In addition to AxisArtist, the Axes will have gridlines attribute, which obviously draws grid lines. The gridlines needs to be separated from the axis as some gridlines can never pass any axis.
## Matplotlib, Release 3.4.1

### Classes

### mpl_toolkits.axisartist.axislines.Axes

```python
class mpl_toolkits.axisartist.axislines.Axes(*args, grid_helper=None, **kwargs)
```

**Bases:** matplotlib.axes._axes.Axes

Build an axes in a figure.

**Parameters**

- **fig**
  - `[Figure]` The axes is build in the Figure `fig`.

- **rect**
  - `[[left, bottom, width, height]]` The axes is build in the rectangle `rect`. `rect` is in Figure coordinates.

- **sharex, sharey**
  - `[Axes, optional]` The x or y axis is shared with the x or y axis in the input Axes.

- **frameon**
  - `[bool, default: True]` Whether the axes frame is visible.

- **box_aspect**
  - `[float, optional]` Set a fixed aspect for the axes box, i.e. the ratio of height to width. See `set_box_aspect` for details.

**kwargs**

Other optional keyword arguments:

Returns

**Axes**

The new *Axes* object.

__call__ (self, *args, **kwargs)

Call self as a function.

__init__ (self, *args, grid_helper=None, **kwargs)

Build an axes in a figure.

Parameters

fig

[Figure] The axes is build in the *Figure* fig.

rect

[[left, bottom, width, height]] The axes is build in the rectangle rect. rect is in Figure coordinates.

sharex, sharey

[Axes, optional] The x or y axis is shared with the x or y axis in the input Axes.

frameon

[bool, default: True] Whether the axes frame is visible.

box_aspect

[float, optional] Set a fixed aspect for the axes box, i.e. the ratio of height to width. See set_box_aspect for details.

**kwargs

Other optional keyword arguments:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>

**Returns**

**Axes**

The new *Axes* object.

```
__module__ = 'mpl_toolkits.axisartist.axislines'
```

**property axis**

Convenience method to get or set some axis properties.

Call signatures:

- `xmin, xmax, ymin, ymax = axis()`
- `xmin, xmax, ymin, ymax = axis([xmin, xmax, ymin, ymax])`
- `xmin, xmax, ymin, ymax = axis(option)`
- `xmin, xmax, ymin, ymax = axis(**kwargs)`

**Parameters**

- `xmin, xmax, ymin, ymax`
  
  [float, optional] The axis limits to be set. This can also be achieved using

  ```python
  ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))
  ```

- `option`
  
  [bool or str] If a bool, turns axis lines and labels on or off. If a string, possible values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'on'</td>
<td>Turn on axis lines and labels. Same as True.</td>
</tr>
<tr>
<td>'off'</td>
<td>Turn off axis lines and labels. Same as False.</td>
</tr>
<tr>
<td>'equal'</td>
<td>Set equal scaling (i.e., make circles circular) by changing axis limits. This is the same as ax.set_aspect('equal', adjustable='datalim'). Explicit data limits may not be respected in this case.</td>
</tr>
<tr>
<td>'scaled'</td>
<td>Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box. This is the same as ax.set_aspect('equal', adjustable='box', anchor='C'). Additionally, further autoscaling will be disabled.</td>
</tr>
<tr>
<td>'tight'</td>
<td>Set limits just large enough to show all data, then disable further autoscaling.</td>
</tr>
<tr>
<td>'auto'</td>
<td>Automatic scaling (fill plot box with data).</td>
</tr>
<tr>
<td>'image'</td>
<td>'scaled' with axis limits equal to data limits.</td>
</tr>
<tr>
<td>'square'</td>
<td>Square plot; similar to 'scaled', but initially forcing xmax-xmin == ymax-ymin.</td>
</tr>
</tbody>
</table>

**emit**

[bool, default: True] Whether observers are notified of the axis limit change. This option is passed on to `set_xlim` and `set_ylim`.

**Returns**

`xmin, xmax, ymin, ymax`

[float] The axis limits.

**See also:**

- `matplotlib.axes.Axes.set_xlim`
- `matplotlib.axes.Axes.set_ylim`

**cla** *(self)*

Clear the axes.

**get_children** *(self)*

Return a list of the child Artists of this Artist.

**get_grid_helper** *(self)*

**grid** *(self, b=None, which='major', axis='both', **kwargs)*

Toggle the gridlines, and optionally set the properties of the lines.

**invalidate_grid_helper** *(self)*

[Deprecated]
Notes

Deprecated since version 3.4:

new_fixed_axis (self, loc, offset=None)
new_floating_axis (self, nth_coord, value, axis_direction='bottom')
new_gridlines (self, grid_helper=None)

Create and return a new GridlineCollection instance.

which : "major" or "minor" axis : "both", "x" or "y"
toggle_axisline (self, b=None)

Examples using mpl_toolkits.axisartist.axislines.Axes

mpl_toolkits.axisartist.axislines.AxesZero

class mpl_toolkits.axisartist.axislines.AxesZero (*args, grid_helper=None, **kwargs)

Bases: mpl_toolkits.axisartist.axislines.Axes

Build an axes in a figure.

Parameters

fig

[Figure] The axes is build in the Figure fig.

rect

[[left, bottom, width, height]] The axes is build in the rectangle rect. rect is in Figure coordinates.

sharex, sharey

[Axes, optional] The x or y axis is shared with the x or y axis in the input Axes.

frameon

[bool, default: True] Whether the axes frame is visible.

box_aspect

[float, optional] Set a fixed aspect for the axes box, i.e. the ratio of height to width.
See set_box_aspect for details.

**kwargs

Other optional keyword arguments:

Returns

Axes

The new Axes object.

__module__ = 'mpl_toolkits.axisartist.axislines'

Examples using mpl_toolkits.axisartist.axislines.AxesZero

mpl_toolkits.axisartist.axislines.AxisArtistHelper

class mpl_toolkits.axisartist.axislines.AxisArtistHelper
    Bases: object

AxisArtistHelper should define following method with given APIs. Note that the first axes argument will be axes attribute of the caller artist:

```python
# LINE (spinal line?)

def get_line(self, axes):
    # path : Path
    return path

def get_line_transform(self, axes):
    # ...
    # trans : transform
    return trans

# LABEL

def get_label_pos(self, axes):
    # x, y : position
    return (x, y), trans

def get_label_offset_transform(self, axes, pad_points, fontprops, renderer, bbox, ...
```

(continues on next page)
def get_tick_transform(self, axes):
    return trans

def get_tick_iterators(self, axes):
    # iter : iterable object that yields (c, angle, l) where
    #      c, angle, l is position, tick angle, and label
    return iter_major, iter_minor

class Fixed(loc, nth_coord=None):
    Bases: mpl_toolkits.axisartist.axislines.AxisArtistHelper._Base
    Helper class for a fixed (in the axes coordinate) axis.
    nth_coord = along which coordinate value varies in 2D, nth_coord = 0 -> x axis, nth_coord = 1
              -> y axis
    __init__(self, loc, nth_coord=None)
    nth_coord = along which coordinate value varies in 2D, nth_coord = 0 -> x axis, nth_coord
               = 1 -> y axis
    __module__ = 'mpl_toolkits.axisartist.axislines'

    get_axislabel_pos_angle(self, axes)
    Return the label reference position in transAxes.
    get_axislabel_transform(self, axes)
    get_line(self, axes)
    get_line_transform(self, axes)
    get_nth_coord(self)
    get_tick_transform(self, axes)

class Floating(nth_coord, value):
    Bases: mpl_toolkits.axisartist.axislines.AxisArtistHelper._Base
    __init__(self, nth_coord, value)
    Initialize self. See help(type(self)) for accurate signature.
    __module__ = 'mpl_toolkits.axisartist.axislines'
    get_line(self, axes)
get_nth_coord(self)
__dict__ = mappingproxy({ '__module__': 'mpl_toolkits.axisartist.axislines', '__doc__': '
AxisArtistHelper should...

__module__ = 'mpl_toolkits.axisartist.axislines'

Examples using mpl_toolkits.axisartist.axislines.AxisArtistHelper

mpl_toolkits.axisartist.axislines.AxisArtistHelperRectlinear
class mpl_toolkits.axisartist.axislines.AxisArtistHelperRectlinear
Bases: object
class Fixed(axes, loc, nth_coord=None)
Bases: mpl_toolkits.axisartist.axislines.AxisArtistHelper.Fixed

nth_coord = along which coordinate value varies in 2D, nth_coord = 0 -> x axis, nth_coord = 1 -> y axis
__init__(self, axes, loc, nth_coord=None)
nth_coord = along which coordinate value varies in 2D, nth_coord = 0 -> x axis, nth_coord = 1 -> y axis
__module__ = 'mpl_toolkits.axisartist.axislines'

get_tick_iterators(self, axes)
tick_loc, tick_angle, tick_label
class Floating(axes, nth_coord, passingthrough_point, axis_direction='bottom')
Bases: mpl_toolkits.axisartist.axislines.AxisArtistHelper.Floating
Floating

__init__(self, axes, nth_coord, passingthrough_point, axis_direction='bottom')
Initialize self. See help(type(self)) for accurate signature.
__module__ = 'mpl_toolkits.axisartist.axislines'

get_axislabel_pos_angle(self, axes)
Return the label reference position in transAxes.

get_axislabel_transform(self, axes)

get_line(self, axes)

get_line_transform(self, axes)

get_tick_iterators(self, axes)
tick_loc, tick_angle, tick_label

get_tick_transform(self, axes)
Examples using `mpl_toolkits.axisartist.axislines.AxisArtistHelperRectlinear`

```
class mpl_toolkits.axisartist.axislines.GridHelperBase
    Bases: object
    __dict__ = mappingproxy({'
    __module__ = 'mpl_toolkits.axisartist.axislines'
    __weakref__ = list of weak references to the object (if defined)

    get_gridlines(self, which, axis)
        Return list of grid lines as a list of paths (list of points).
        which : "major" or "minor" axis : "both", "x" or "y"

    invalidate(self)
        [Deprecated]

    new_gridlines(self, ax)
        Create and return a new GridlineCollection instance.
        which : "major" or "minor" axis : "both", "x" or "y"

    update_lim(self, axes)

    valid(self)
        [Deprecated]
```

Notes

Deprecated since version 3.4:

```
new_gridlines(self, ax)
    Create and return a new GridlineCollection instance.
    which : "major" or "minor" axis : "both", "x" or "y"
```

```
valid(self)
    [Deprecated]
```
Notes

19.1. Toolkits
**mpl_toolkits.axisartist.floating_axes.ExtremeFinderFixed**

**class** mpl_toolkits.axisartist.floating_axes.ExtremeFinderFixed(*extremes*)

**Bases:** mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple

This subclass always returns the same bounding box.

**Parameters**

- **extremes**
  
  [(float, float, float, float)] The bounding box that this helper always returns.

**__call__**(self, transform_xy, x1, y1, x2, y2)

Compute an approximation of the bounding box obtained by applying transform_xy to the box delimited by (x1, y1, x2, y2).

The intended use is to have (x1, y1, x2, y2) in axes coordinates, and have transform_xy be the transform from axes coordinates to data coordinates; this method then returns the range of data coordinates that span the actual axes.

The computation is done by sampling nx \* ny equispaced points in the (x1, y1, x2, y2) box and finding the resulting points with extremal coordinates; then adding some padding to take into account the finite sampling.

As each sampling step covers a relative range of 1/nx or 1/ny, the padding is computed by expanding the span covered by the extremal coordinates by these fractions.

**__init__**(self, extremes)

This subclass always returns the same bounding box.

**Parameters**

- **extremes**
  
  [(float, float, float, float)] The bounding box that this helper always returns.

**__module__** = 'mpl_toolkits.axisartist.floating_axes'

**Examples using mpl_toolkits.axisartist.floating_axes.ExtremeFinderFixed**

**mpl_toolkits.axisartist.floating_axes.FixedAxisArtistHelper**

**class** mpl_toolkits.axisartist.floating_axes.FixedAxisArtistHelper(*grid_helper, side, nth_coord_ticks=None*)

**Bases:** mpl_toolkits.axisartist.grid_helper_curvelinear.FloatingAxisArtistHelper

nth_coord = along which coordinate value varies.

nth_coord = 0 -> x axis, nth_coord = 1 -> y axis
__init__(self, grid_helper, side, nth_coord_ticks=None)

nth_coord = along which coordinate value varies.

### mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple

**class** mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple(nx, ny)

**Bases:** object

- A helper class to figure out the range of grid lines that need to be drawn.
- **Parameters**
  - **nx, ny**
    - [int] The number of samples in each direction.
- **__call__** (self, transform_xy, x1, y1, x2, y2)
  - Compute an approximation of the bounding box obtained by applying `transform_xy` to the box delimited by `(x1, y1, x2, y2)`. |
The intended use is to have \((x_1, y_1, x_2, y_2)\) in axes coordinates, and have \(\text{transform}_{xy}\) be the transform from axes coordinates to data coordinates; this method then returns the range of data coordinates that span the actual axes.

The computation is done by sampling \(nx \times ny\) equispaced points in the \((x_1, y_1, x_2, y_2)\) box and finding the resulting points with extremal coordinates; then adding some padding to take into account the finite sampling.

As each sampling step covers a relative range of \(1/nx\) or \(1/ny\), the padding is computed by expanding the span covered by the extremal coordinates by these fractions.

```python
__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axisartist.grid_finder', '__doc__': '
 A helper class to figure out ... '__dict__' of 'ExtremeFinderSimple' objects>, '__weakref__': <attribute '__weakref__' of 'ExtremeFinderSimple' objects>})
__init__(self, nx, ny)
Parameters

nx, ny
[int] The number of samples in each direction.

__module__ = 'mpl_toolkits.axisartist.grid_finder'
__weakref__
list of weak references to the object (if defined)
```

Examples using `mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple`

- sphx_glr_gallery_axisartist_demo_axis_direction.py
- sphx_glr_gallery_axisartist_demo_curvelinear_grid.py
- sphx_glr_gallery_axisartist_demo_curvelinear_grid2.py
- sphx_glr_gallery_axisartist_demo_floating_axis.py
- sphx_glr_gallery_axisartist_simple_axis_pad.py

`mpl_toolkits.axisartist.grid_finder.FixedLocator`

```python
class mpl_toolkits.axisartist.grid_finder.FixedLocator(locs)
Bases: object
__call__(self, v1, v2)
Call self as a function.
__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axisartist.grid_finder', '__init__': <function ... of 'FixedLocator' objects>, '__weakref__': <attribute '__weakref__' of 'FixedLocator' objects>, '__doc__': None})
__init__(self, locs)
Initialize self. See help(type(self)) for accurate signature.
__module__ = 'mpl_toolkits.axisartist.grid_finder'
```
__weakref__
  list of weak references to the object (if defined)

set_factor (self, f)
  [Deprecated]

Notes

Deprecated since version 3.3:

Examples using mpl_toolkits.axisartist.grid_finder.FixedLocator

- sphx_glr_gallery_axisartist_demo_floating_axes.py

mpl_toolkits.axisartist.grid_finder.FormatterPrettyPrint

class mpl_toolkits.axisartist.grid_finder.FormatterPrettyPrint (useMathText=True)
  Bases: object
  __call__ (self, direction, factor, values)
    Call self as a function.
  __dict__ = mappingproxy({'
    __module__': 'mpl_toolkits.axisartist.grid_finder',
  __init__ (self, useMathText=True)
    Initialize self. See help(type(self)) for accurate signature.
  __module__ = 'mpl_toolkits.axisartist.grid_finder'
  __weakref__
    list of weak references to the object (if defined)

Examples using mpl_toolkits.axisartist.grid_finder.FormatterPrettyPrint

mpl_toolkits.axisartist.grid_finder.GridFinder

class mpl_toolkits.axisartist.grid_finder.GridFinder (transform, extreme_finder=None,
  grid_locator1=None, grid_locator2=None,
  tick_formatter1=None, tick_formatter2=None)
  Bases: object
  transform : transform from the image coordinate (which will be the transData of the axes to the world coordinate.
  or transform = (transform_xy, inv_transform_xy)
locator1, locator2 : grid locator for 1st and 2nd axis.

```python
__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axisartist.grid_finder',
                        '__init__': <function GridFinder.__init__>, ... '__dict__' of 'GridFinder' objects>,
                        '__weakref__': <attribute '__weakref__' of 'GridFinder' objects>,
                        '__doc__': None})
```

```python
__init__(self, transform, extreme_finder=None, grid_locator1=None, grid_locator2=None, 
tick_formatter1=None, tick_formatter2=None)
```

transform : transform from the image coordinate (which will be the transData of the axes to the 
world coordinate.

or transform = (transform_xy, inv_transform_xy)

locator1, locator2 : grid locator for 1st and 2nd axis.

```python
__module__ = 'mpl_toolkits.axisartist.grid_finder'
__weakref__
```

```python
get_grid_info(self, x1, y1, x2, y2)

lon_values, lat_values

[list of grid values. if integer is given,] rough number of grids in each direction.
```

```python
inv_transform_xy(self, x, y)

transform_xy(self, x, y)
```

```python
update(self, **kw)

update_transform(self, aux_trans)
```

**Examples using** `mpl_toolkits.axisartist.grid_finder.GridFinder`

```python
mpl_toolkits.axisartist.grid_finder.MaxNLocator
```

class `mpl_toolkits.axisartist.grid_finder.MaxNLocator` (nbins=10,
steps=None, 
trim=True, integer=False, symmetric=False, prune=None)

Bases: `matplotlib.ticker.MaxNLocator`

**Parameters**

nbins

[int or 'auto', default: 10] Maximum number of intervals; one less than max num-
ber of ticks. If the string 'auto', the number of bins will be automatically deter-
mined based on the length of the axis.

steps
[array-like, optional] Sequence of nice numbers starting with 1 and ending with 10; e.g., [1, 2, 4, 5, 10], where the values are acceptable tick multiples. i.e. for the example, 20, 40, 60 would be an acceptable set of ticks, as would 0.4, 0.6, 0.8, because they are multiples of 2. However, 30, 60, 90 would not be allowed because 3 does not appear in the list of steps.

**integer**

[bool, default: False] If True, ticks will take only integer values, provided at least $min_n_ticks$ integers are found within the view limits.

**symmetric**

[bool, default: False] If True, autoscaling will result in a range symmetric about zero.

**prune**

[['lower', 'upper', 'both', None], default: None] Remove edge ticks -- useful for stacked or ganged plots where the upper tick of one axes overlaps with the lower tick of the axes above it, primarily when rcParams['axes.autolimit_mode'] (default: 'data') is 'round_numbers'. If prune='lower', the smallest tick will be removed. If prune == 'upper', the largest tick will be removed. If prune == 'both', the largest and smallest ticks will be removed. If prune is None, no ticks will be removed.

**min_n_ticks**

[int, default: 2] Relax nbins and integer constraints if necessary to obtain this minimum number of ticks.

```
__call__(self, v1, v2)
```

Return the locations of the ticks.

```
__init__(self, nbins=10, steps=None, trim=True, integer=False, symmetric=False, prune=None)
```

**Parameters**

**nbins**

[int or 'auto', default: 10] Maximum number of intervals; one less than max number of ticks. If the string 'auto', the number of bins will be automatically determined based on the length of the axis.

**steps**

[array-like, optional] Sequence of nice numbers starting with 1 and ending with 10; e.g., [1, 2, 4, 5, 10], where the values are acceptable tick multiples. i.e. for the example, 20, 40, 60 would be an acceptable set of ticks, as would 0.4, 0.6, 0.8, because they are multiples of 2. However, 30, 60, 90 would not be allowed because 3 does not appear in the list of steps.

**integer**
[bool, default: False] If True, ticks will take only integer values, provided at least 
\texttt{min\_n\_ticks} integers are found within the view limits.

**symmetric**

[bool, default: False] If True, autoscaling will result in a range symmetric about 
zero.

**prune**

[['lower', 'upper', 'both', None], default: None] Remove edge ticks -- use-
ful for stacked or ganged plots where the upper tick of one axes overlaps 
with the lower tick of the axes above it, primarily when 
\texttt{rcParams["axes.autolimit_mode"]} (default: 'data') is 'round_numbers'. If 
\texttt{prune='lower'}, the smallest tick will be removed. If \texttt{prune = 'up-
per'}, the largest tick will be removed. If \texttt{prune == 'both'}, the largest and 
smallest ticks will be removed. If \texttt{prune is None}, no ticks will be removed.

**min\_n\_ticks**

[int, default: 2] Relax \texttt{nbins} and \texttt{integer} constraints if necessary to obtain this 
minimum number of ticks.

__module__ = 'mpl_toolkits.axisartist.grid_helper_curvelinear'

get_gridlines (self, which='major', axis='both')

Return list of grid lines as a list of paths (list of points).

which : "major" or "minor" axis : "both", "x" or "y"

get_tick_iterator (self, nth_coord, axis_side, minor=False)

new_fixed_axis (self, loc, nth_coord=None, axis_direction=None, offset=None, axes=None)

new_floating_axis (self, nth_coord, value, axes=None, axis_direction='bottom')

update_grid_finder (self, aux_trans=None, **kw)

Examples using mpl_toolkits.axisartist.grid_helper_curvelinear.

mpl_toolkits.axisartist.parasite_axes

19.1.4 Matplotlib axes_grid Toolkit

Note: AxesGrid toolkit has been a part of matplotlib since v 0.99. Originally, the toolkit had a single namespace of axes_grid. In more recent version, the toolkit has divided into two separate namespace (axes_grid1 and axisartist). While axes_grid namespace is maintained for the backward compatibility, use of axes_grid1 and axisartist is recommended. For the documentation on axes_grid, see the previous version of the docs.
Matplotlib axes_grid1 Toolkit

The matplotlib mpl_toolkits.axes_grid1 toolkit is a collection of helper classes to ease displaying multiple images in matplotlib. While the aspect parameter in matplotlib adjust the position of the single axes, axes_grid1 toolkit provides a framework to adjust the position of multiple axes according to their aspects.

See What is axes_grid1 toolkit? for a guide on the usage of axes_grid1.

The submodules of the axes_grid1 API are:

- `axes_grid1.anchored_artists`: Helper classes to adjust the positions of multiple axes at drawing time.
- `axes_grid1.axes_divider`: Helper classes to adjust the positions of multiple axes at drawing time.
- `axes_grid1.axes_grid`: Provides classes of simple units that will be used with AxesDivider class (or others) to determine the size of each axes.
- `axes_grid1.inset_locator`: A collection of functions and objects for creating or placing inset axes.
- `axes_grid1.mpl_axes`
- `axes_grid1.parasite_axes`

Matplotlib axisartist Toolkit

The axisartist namespace includes a derived Axes implementation (mpl_toolkits.axisartist.Axes). The biggest difference is that the artists that are responsible for drawing axis lines, ticks, ticklabels, and axis labels are separated out from the mpl's Axis class. This change was strongly motivated to support curvilinear grid.

You can find a tutorial describing usage of axisartist at the axisartist user guide.

The submodules of the axisartist API are:

- `axisartist.angle_helper`
- `axisartist.axes_divider`
- `axisartist.axes_grid`
- `axisartist.axes_rgb`

19.2 mplot3d API

Note: `pyplot` cannot be used to add content to 3D plots, because its function signatures are strictly 2D and cannot handle the additional information needed for 3D. Instead, use the explicit API by calling the respective methods on the `Axes3D` object.

19.2.1 axes3d

Note: 3D plotting in Matplotlib is still not as mature as the 2D case. Please report any functions that do not behave as expected as a bug. In addition, help and patches would be greatly appreciated!

```python
axes3d.Axes3D(fig[, rect, azim, elev, ...]) 3D axes object.
```

`mpl_toolkits.mplot3d.axes3d.Axes3D`

```python
class mpl_toolkits.mplot3d.axes3d.Axes3D(fig, rect=None, *args, azim=-60, elev=30, sharez=None, proj_type='persp', box_aspect=None, **kwargs)
```

Bases: `matplotlib.axes._axes.Axes`

3D axes object.

Parameters

- `fig`
  - [Figure] The parent figure.
rect

[(float, float, float, float)] The (left, bottom, width, height) axes position.

azim

elev

[float, default: 30] Elevation viewing angle.

sharez

[Axes3D, optional] Other axes to share z-limits with.

proj_type

[{‘persp’, ‘ortho’}] The projection type, default ‘persp’.

auto_add_to_figure

[bool, default: True] Prior to Matplotlib 3.4 Axes3D would add themselves to their host Figure on init. Other Axes class do not do this.

This behavior is deprecated in 3.4, the default will change to False in 3.5. The keyword will be undocumented and a non-False value will be an error in 3.6.

**kwargs

Other optional keyword arguments:

<table>

### Notes

New in version 1.2.1: The `sharez` parameter.

#### __init__

```python
__init__(self, fig, rect=None, *args, azim=-60, elev=30, sharez=None, proj_type='persp', box_aspect=None, **kwargs)
```

**Parameters**

- **fig**
  - [Figure] The parent figure.
- **rect**
  - [(float, float, float, float)] The (left, bottom, width, height) axes position.
- **azim**
  - [float, default: -60] Azimuthal viewing angle.
- **elev**
  - [float, default: 30] Elevation viewing angle.
- **sharez**
  - [Axes3D, optional] Other axes to share z-limits with.
- **proj_type**
  - [{'persp', 'ortho'}] The projection type, default 'persp'.
- **auto_add_to_figure**
  - [bool, default: True] Prior to Matplotlib 3.4 Axes3D would add themselves to their host Figure on init. Other Axes class do not do this.

This behavior is deprecated in 3.4, the default will change to False in 3.5. The keyword will be undocumented and a non-False value will be an error in 3.6.

Notes

New in version 1.2.1: The sharez parameter.

```
__module__ = 'mpl_toolkits.mplot3d.axes3d'
```

```
add_collection3d(self, col, zs=0, zdir='z')
```

Add a 3D collection object to the plot.

2D collection types are converted to a 3D version by modifying the object and adding z coordinate information.

Supported are:
- PolyCollection
- LineCollection
- PatchCollection

```
add_contour_set (self, cset, extend3d=False, stride=5, zdir='z', offset=None)
```

```
add_contourf_set (self, cset, zdir='z', offset=None)
```

```
apply_aspect (self, position=None)
```

Adjust the Axes for a specified data aspect ratio.

Depending on get_adjustable this will modify either the Axes box (position) or the view limits. In the former case, get_anchor will affect the position.
See also:

```python
matplotlib.axes.Axes.set_aspect
```
For a description of aspect ratio handling.

```python
matplotlib.axes.Axes.set_adjustable
```
Set how the Axes adjusts to achieve the required aspect ratio.

```python
matplotlib.axes.Axes.set_anchor
```
Set the position in case of extra space.

## Notes

This is called automatically when each Axes is drawn. You may need to call it yourself if you need to update the Axes position and/or view limits before the Figure is drawn.

```python
auto_scale_xyz(self, X, Y, Z=None, had_data=None)
```

```python
autoscale(self, enable=True, axis='both', tight=None)
```
Convenience method for simple axis view autoscaling. See `matplotlib.axes.Axes.autoscale()` for full explanation. Note that this function behaves the same, but for all three axes. Therefore, 'z' can be passed for `axis`, and 'both' applies to all three axes.

New in version 1.1.0.

```python
autoscale_view(self, tight=None, scalex=True, scaley=True, scalez=True)
```
Autoscale the view limits using the data limits. See `matplotlib.axes.Axes.autoscale_view()` for documentation. Note that this function applies to the 3D axes, and as such adds the `scalez` to the function arguments.

Changed in version 1.1.0: Function signature was changed to better match the 2D version. `tight` is now explicitly a kwarg and placed first.

Changed in version 1.2.1: This is now fully functional.

```python
bar(self, left, height, zs=0, zdir='z', *args, **kwargs)
```
Add 2D bar(s).

### Parameters

- `left`
  - [1D array-like] The x coordinates of the left sides of the bars.

- `height`
  - [1D array-like] The height of the bars.

- `zs`
  - [float or 1D array-like] Z coordinate of bars; if a single value is specified, it will be used for all bars.
zdir

[{'x', 'y', 'z'}, default: 'z'] When plotting 2D data, the direction to use as z ('x', 'y
or 'z').

**kwargs

Other arguments are forwarded to matplotlib.axes.Axes.bar.

Returns

mpl_toolkits.mplot3d.art3d.Patch3DCollection

bar3d (self, x, y, z, dx, dy, dz, color=None, zsort='average', shade=True, lightsource=None,
*args, **kwargs)

Generate a 3D barplot.

This method creates three dimensional barplot where the width, depth, height, and color of the
bars can all be uniquely set.

Parameters

x, y, z

[array-like] The coordinates of the anchor point of the bars.

dx, dy, dz

[float or array-like] The width, depth, and height of the bars, respectively.

color

[sequence of colors, optional] The color of the bars can be specified globally or
individually. This parameter can be:

• A single color, to color all bars the same color.
• An array of colors of length N bars, to color each bar independently.
• An array of colors of length 6, to color the faces of the bars similarly.
• An array of colors of length 6 * N bars, to color each face independently.

When coloring the faces of the boxes specifically, this is the order of the coloring:

1. -Z (bottom of box)
2. +Z (top of box)
3. -Y
4. +Y
5. -X
6. +X
zsort

[ str, optional] The z-axis sorting scheme passed onto Poly3DCollection

shade

[ bool, default: True] When true, this shades the dark sides of the bars (relative to the plot’s source of light).

lightsource

[ LightSource] The lightsource to use when shade is True.

**kwargs

Any additional keyword arguments are passed onto Poly3DCollection.

Returns

collection

[ Poly3DCollection] A collection of three dimensional polygons representing the bars.

can_pan ( self )

Return whether this axes supports the pan/zoom button functionality.

3D axes objects do not use the pan/zoom button.

can_zoom ( self )

Return whether this axes supports the zoom box button functionality.

3D axes objects do not use the zoom box button.

cla ( self )

Clear the axes.

clabel ( self, *args, **kwargs )

Currently not implemented for 3D axes, and returns None.

contour ( self, X, Y, Z, *args, extend3d=False, stride=5, zdir='z', offset=None, **kwargs )

Create a 3D contour plot.

Parameters

X, Y, Z

[ array-like] Input data.

extend3d

[ bool, default: False] Whether to extend contour in 3D.

stride

[ int] Step size for extending contour.
zdir
    [{‘x’, ‘y’, ‘z’}, default: ‘z’] The direction to use.

offset
    [float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

*args, **kwargs
    Other arguments are forwarded to `matplotlib.axes.Axes.contour`.

Returns

    `matplotlib.contour.QuadContourSet`

`contour3D` (self, X, Y, Z, *args, extend3d=False, stride=5, zdir=’z’, offset=None, **kwargs)
Create a 3D contour plot.

Parameters

    X, Y, Z
        [array-like] Input data.

    extend3d
        [bool, default: False] Whether to extend contour in 3D.

    stride
        [int] Step size for extending contour.

    zdir
        [{‘x’, ‘y’, ‘z’}, default: ‘z’] The direction to use.

    offset
        [float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

*args, **kwargs
    Other arguments are forwarded to `matplotlib.axes.Axes.contour`.

Returns

    `matplotlib.contour.QuadContourSet`

`contourf` (self, X, Y, Z, *args, zdir=’z’, offset=None, **kwargs)
Create a 3D filled contour plot.

Parameters
X, Y, Z
[array-like] Input data.

zdir
[{'x', 'y', 'z'}, default: 'z'] The direction to use.

offset
[float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

*args, **kwargs
Other arguments are forwarded to matplotlib.axes.Axes.contourf.

Returns

matplotlib.contour.QuadContourSet

Notes

New in version 1.1.0: The zdir and offset parameters.

contourf3D (self, X, Y, Z, *args, zdir=’z’, offset=None, **kwargs)
Create a 3D filled contour plot.

Parameters

X, Y, Z
[array-like] Input data.

zdir
[{'x', 'y', 'z'}, default: 'z'] The direction to use.

offset
[float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

*args, **kwargs
Other arguments are forwarded to matplotlib.axes.Axes.contourf.

Returns

matplotlib.contour.QuadContourSet
Notes

New in version 1.1.0: The `zdir` and `offset` parameters.

```python
convert_zunits(self, z)
```
For artists in an axes, if the zaxis has units support, convert `z` using zaxis unit type

New in version 1.2.1.

```python
disable_mouse_rotation(self)
```
Disable mouse buttons for 3D rotation and zooming.

```python
draw(self, renderer)
```
Draw the Artist (and its children) using the given renderer.
This has no effect if the artist is not visible (`Artist.get_visible` returns False).

Parameters

```python
renderer

[RendererBase subclass.]
```

Notes

This method is overridden in the Artist subclasses.

```python
errorbar(self, x, y, z, zerr=None, yerr=None, xerr=None, fmt='', barsabove=False, errorevery=1, ecolor=None,elinewidth=None, capsize=None, capthick=None, xlolims=False, xuplims=False, ylolims=False, yuplims=False, zlolims=False, zulimns=False, **kwargs)
```
Plot lines and/or markers with errorbars around them.

`x/y/z` define the data locations, and `xerr/yerr/zerr` define the errorbar sizes. By default, this draws the data markers/lines as well the errorbars. Use `fmt='none'` to draw errorbars only.

Parameters

```python
x, y, z

[ float or array-like] The data positions.
```

```python
xerr, yerr, zerr

[ float or array-like, shape (N,) or (2, N), optional] The errorbar sizes:
```
- scalar: Symmetric +/- values for all data points.
- shape(N,): Symmetric +/-values for each data point.
- shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- `None`: No errorbar.

Note that all error arrays should have positive values.
fmt

[ str, default: ""] The format for the data points / data lines. See plot for details. Use 'none' (case insensitive) to plot errorbars without any data markers.

ecolor

[ color, default: None ] The color of the errorbar lines. If None, use the color of the line connecting the markers.

elinewidth

[ float, default: None ] The linewidth of the errorbar lines. If None, the linewidth of the current style is used.

capsize

[ float, default: \texttt{rcParams["errorbar.capsize"]} (default: \texttt{0.0}) ] The length of the error bar caps in points.

capthick

[ float, default: None ] An alias to the keyword argument markeredgewidth (a.k.a. mew). This setting is a more sensible name for the property that controls the thickness of the error bar cap in points. For backwards compatibility, if mew or markeredgewidth are given, then they will over-ride capthick. This may change in future releases.

barsabove

[ bool, default: False ] If True, will plot the errorbars above the plot symbols. Default is below.

xlolims, ylolims, zlolims

[ bool, default: False ] These arguments can be used to indicate that a value gives only lower limits. In that case a caret symbol is used to indicate this. \texttt{lims-arguments} may be scalars, or array-likes of the same length as the errors. To use limits with inverted axes, \texttt{set_xlim} or \texttt{set_ylim} must be called before errorbar(). Note the tricky parameter names: setting e.g. ylolims to True means that the y-value is a lower limit of the True value, so, only an upward-pointing arrow will be drawn!

xuplims, yuplims, zuplims

[ bool, default: False ] Same as above, but for controlling the upper limits.

errorevery

[ int or (int, int), default: 1 ] draws error bars on a subset of the data. errorevery =N draws error bars on the points (x[:N], y[:N], z[:N]). errorevery =\texttt{(start, N)} draws error bars on the points (x[start::N], y[start::N], z[start::N]). e.g. errorevery =\texttt{(6, 3)} adds error bars to the data at (x[6], x[9], x[12], x[15], ...). Used to avoid overlapping error bars when two series share x-axis values.

Returns
errlines

[list] List of `Line3DCollection` instances each containing an errorbar line.

caplines

[list] List of `Line3D` instances each containing a capline object.

limmarks

[list] List of `Line3D` instances each containing a marker with an upper or lower limit.

Other Parameters

**kwargs

All other keyword arguments for styling errorbar lines are passed `Line3DCollection`.

Examples

```
format_coord(self, xd, yd)
```

Given the 2D view coordinates attempt to guess a 3D coordinate. Looks for the nearest edge to
the point and then assumes that the point is at the same z location as the nearest point on the edge.

**format_zdata**(self, z)
Return z string formatted. This function will use the fmt_zdata attribute if it is callable, else will fall back on the zaxis major formatter

**get_autoscale_on**(self)
Get whether autoscaling is applied for all axes on plot commands

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

**get_autoscalez_on**(self)
Get whether autoscaling for the z-axis is applied on plot commands

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

**get_axis_position**(self)

**get_frame_on**(self)
Get whether the 3D axes panels are drawn.

**get_proj**(self)
Create the projection matrix from the current viewing position.

**get_tightbbox**(self, renderer, call_axes_locator=True, bbox_extra_artists=None, *, for_layout_only=False)
Return the tight bounding box of the axes, including axis and their decorators (xlabel, title, etc).

Artists that have artist.set_in_layout(False) are not included in the bbox.

**Parameters**

**renderer**

[RendererBase subclass] renderer that will be used to draw the figures (i.e. fig.canvas.get_renderer())

**bbox_extra_artists**

[list of Artist or None] List of artists to include in the tight bounding box. If None (default), then all artist children of the axes are included in the tight bounding box.

**call_axes_locator**

[bool, default: True] If call_axes_locator is False, it does not call the _axes_locator attribute, which is necessary to get the correct bounding box. call_axes_locator=False can be used if the caller is only interested in the relative size of the tightbbox compared to the axes bbox.

**for_layout_only**

[default: False] The bounding box will not include the x-extent of the title and the xlabel, or the y-extent of the ylabel.

**Returns**
**BboxBase**

Bounding box in figure pixel coordinates.

See also:

- `matplotlib.axes.Axes.get_window_extent`
- `matplotlib.axis.Axis.get_tightbbox`
- `matplotlib.spines.Spine.get_window_extent`

```python
get_w_lims(self)
Get 3D world limits.
```

```python
get_xlim(self)
Alias for `get_xlim3d`.
```

```python
get_xlim3d(self)
Return the x-axis view limits.
```

Returns

- `left, right`

  `[(float, float)]` The current x-axis limits in data coordinates.

See also:

- `set_xlim`
- `set_xbound, get_xbound`
- `invert_xaxis, xaxis_inverted`

Notes

The x-axis may be inverted, in which case the `left` value will be greater than the `right` value.

Changed in version 1.1.0: This function now correctly refers to the 3D x-limits

```python
get_ylim(self)
Alias for `get_ylim3d`.
```

```python
get_ylim3d(self)
Return the y-axis view limits.
```

Returns

- `bottom, top`

  `[(float, float)]` The current y-axis limits in data coordinates.

See also:
set_ylim

set_ybound, get_ybound
invert_yaxis, yaxis_inverted

Notes

The y-axis may be inverted, in which case the bottom value will be greater than the top value.

Changed in version 1.1.0: This function now correctly refers to the 3D y-limits.

get_zaxis (self)
Return the ZAxis (Axis) instance.

get_zbound (self)
Return the lower and upper z-axis bounds, in increasing order.

New in version 1.1.0.

get_zgridlines (self)
Return the zaxis' grid lines as a list of Line2D.

get_zlabel (self)
Get the z-label text string.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

get_zlim (self)
Alias for get_zlim3d.

get_zlim3d (self)
Get 3D z limits.

get_zmajor ticklabels (self)
Return the zaxis' major tick labels, as a list of Text.

get_zminor ticklabels (self)
Return the zaxis' minor tick labels, as a list of Text.

get_zscale (self)

get_zticklabels (self, minor=False, which=None)
Get the zaxis' tick labels.

Parameters

minor
[bool] Whether to return the minor or the major ticklabels.

which
[None, ('minor', 'major', 'both')] Overrides minor.

Selects which ticklabels to return
Returns

list of `Text`

Notes

The tick label strings are not populated until a `draw` method has been called.

See also: `draw` and `draw`.

`get_zticklines(self, minor=False)`
Return the zaxis' tick lines as a list of `Line2D`s.

`get_zticks(self, *, minor=False)`
Return the zaxis' tick locations in data coordinates.

`grid(self, b=True, **kwargs)`
Set / unset 3D grid.

Note: Currently, this function does not behave the same as `matplotlib.axes.Axes.grid()`, but it is intended to eventually support that behavior.

New in version 1.1.0.

`invert_zaxis(self)`
Invert the z-axis.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`locator_params(self, axis='both', tight=None, **kwargs)`
Convenience method for controlling tick locators.

See `matplotlib.axes.Axes.locator_params()` for full documentation. Note that this is for Axes3D objects, therefore, setting `axis` to 'both' will result in the parameters being set for all three axes. Also, `axis` can also take a value of 'z' to apply parameters to the z axis.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`margins(self, *margins, x=None, y=None, z=None, tight=True)`
Convenience method to set or retrieve autoscaling margins.

Call signatures:

```
margins()
margins(margin)
margins(x=xmargin, y=ymargin, z=zmargin)
margins(x=xmargin, y=ymargin, z=zmargin)
```

(continues on next page)
margins(..., tight=False)

All forms above set the xmargin, ymargin and zmargin parameters. All keyword parameters are optional. A single positional argument specifies xmargin, ymargin and zmargin. Passing both positional and keyword arguments for xmargin, ymargin, and/or zmargin is invalid.

The `tight` parameter is passed to `autoscale_view()`, which is executed after a margin is changed; the default here is `True`, on the assumption that when margins are specified, no additional padding to match tick marks is usually desired. Setting `tight` to `None` will preserve the previous setting.

Specifying any margin changes only the autoscaling; for example, if `xmargin` is not None, then `xmargin` times the X data interval will be added to each end of that interval before it is used in autoscaling.

New in version 1.1.0.

```python
mouse_init(self, rotate_btn=1, zoom_btn=3)
```

Set the mouse buttons for 3D rotation and zooming.

**Parameters**

rotate_btn

[int or list of int, default: 1] The mouse button or buttons to use for 3D rotation of the axes.

zoom_btn

[int or list of int, default: 3] The mouse button or buttons to use to zoom the 3D axes.

```python
name = '3d'
```

```python
plot(self, xs, ys, *args, zdir='z', **kwargs)
```

Plot 2D or 3D data.

**Parameters**

xs

[1D array-like] x coordinates of vertices.

ys

[1D array-like] y coordinates of vertices.

zs

[Float or 1D array-like] z coordinates of vertices; either one for all points or one for each point.
zdir

[{'x', 'y', 'z'}, default: 'z'] When plotting 2D data, the direction to use as z ('x', 'y' or 'z').

**kwargs

Other arguments are forwarded to `matplotlib.axes.Axes.plot`.

`plot3D(self, xs, ys, *args, zdir='z', **kwargs)`

Plot 2D or 3D data.

**Parameters**

xs

[1D array-like] x coordinates of vertices.

ys

[1D array-like] y coordinates of vertices.

zs

[float or 1D array-like] z coordinates of vertices; either one for all points or one for each point.

zdir

[{'x', 'y', 'z'}, default: 'z'] When plotting 2D data, the direction to use as z ('x', 'y' or 'z').

**kwargs

Other arguments are forwarded to `matplotlib.axes.Axes.plot`.

`plot_surface(self, X, Y, Z, *args, norm=None, vmin=None, vmax=None, light-source=None, **kwargs)`

Create a surface plot.

By default it will be colored in shades of a solid color, but it also supports colormapping by supplying the `cmap` argument.

**Note:** The `rcount` and `ccount` kwargs, which both default to 50, determine the maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points.

**Note:** To maximize rendering speed consider setting `rstride` and `cstride` to divisors of the number of rows minus 1 and columns minus 1 respectively. For example, given 51 rows rstride can be any of the divisors of 50.
Similarly, a setting of `rstride` and `cstride` equal to 1 (or `rcount` and `ccount` equal the number of rows and columns) can use the optimized path.

---

**Parameters**

- **X, Y, Z**
  - [2D arrays] Data values.

- **rcount, ccount**
  - [int] Maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points. Defaults to 50.
  - New in version 2.0.

- **rstride, cstride**
  - [int] Downsampling stride in each direction. These arguments are mutually exclusive with `rcount` and `ccount`. If only one of `rstride` or `cstride` is set, the other defaults to 10.
  - 'classic' mode uses a default of `rstride = cstride = 10` instead of the new default of `rcount = ccount = 50`.

- **color**
  - [color-like] Color of the surface patches.

- **cmap**
  - [Colormap] Colormap of the surface patches.

- **facecolors**
  - [array-like of colors.] Colors of each individual patch.

- **norm**
  - [Normalize] Normalization for the colormap.

- **vmin, vmax**
  - [float] Bounds for the normalization.

- **shade**
  - [bool, default: True] Whether to shade the facecolors. Shading is always disabled when `cmap` is specified.

- **lightsource**
  - [LightSource] The lightsource to use when `shade` is True.

- ****kwargs**
  - Other arguments are forwarded to `Poly3DCollection`.  

---

Chapter 19. Toolkits
plot_trisurf(self, *args, color=None, norm=None, vmin=None, vmax=None, lightsource=None, **kwargs)

Plot a triangulated surface.

The (optional) triangulation can be specified in one of two ways; either:

```
plot_trisurf(triangulation, ...)
```

where triangulation is a `Triangulation` object, or:

```
plot_trisurf(X, Y, ...)
plot_trisurf(X, Y, triangles, ...)
plot_trisurf(X, Y, triangles=triangles, ...)
```

in which case a Triangulation object will be created. See `Triangulation` for a explanation of these possibilities.

The remaining arguments are:

```
plot_trisurf(..., Z)
```

where `Z` is the array of values to contour, one per point in the triangulation.

**Parameters**

`X, Y, Z`

[array-like] Data values as 1D arrays.

`color`

Color of the surface patches.

`cmap`

A colormap for the surface patches.

`norm`

[Normalize] An instance of Normalize to map values to colors.

`vmin, vmax`

[float, default: None] Minimum and maximum value to map.

`shade`

[bool, default: True] Whether to shade the facecolors. Shading is always disabled when `cmap` is specified.

`lightsource`

[LightSource] The lightsource to use when `shade` is True.

`**kwargs`

All other arguments are passed on to `Poly3DCollection`
Examples

New in version 1.2.0.

```python
plot_wireframe(self, X, Y, Z, *args, **kwargs)
```

Plot a 3D wireframe.

**Note:** The `rcount` and `ccount` kwargs, which both default to 50, determine the maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points.

**Parameters**

- **X, Y, Z**
  - [2D arrays] Data values.

- **rcount, ccount**
  - [int] Maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points. Setting a count to zero causes the data to be not sampled in the corresponding direction, producing a 3D line plot rather than a wireframe plot. Defaults to 50.
New in version 2.0.

**rstride, cstride**

[int] Downsampling stride in each direction. These arguments are mutually exclusive with *rcount* and *ccount*. If only one of *rstride* or *cstride* is set, the other defaults to 1. Setting a stride to zero causes the data to be not sampled in the corresponding direction, producing a 3D line plot rather than a wireframe plot.

'classic' mode uses a default of *rstride = cstride = 1* instead of the new default of *rcount = ccount = 50*.

**kwargs**

Other arguments are forwarded to *Line3DCollection*.

**quiver**(*X, Y, Z, U, V, W, /, length=1, arrow_length_ratio=0.3, pivot='tail', normalize=False, **kwargs*)

Plot a 3D field of arrows.

The arguments could be array-like or scalars, so long as they they can be broadcast together. The arguments can also be masked arrays. If an element in any of argument is masked, then that corresponding quiver element will not be plotted.

**Parameters**

**X, Y, Z**

[array-like] The x, y and z coordinates of the arrow locations (default is tail of arrow; see *pivot* kwarg).

**U, V, W**

[array-like] The x, y and z components of the arrow vectors.
length

[default: 1] The length of each quiver.

arrow_length_ratio

[default: 0.3] The ratio of the arrow head with respect to the quiver.

pivot

{['tail', 'middle', 'tip'], default: 'tail'} The part of the arrow that is at the grid point; the arrow rotates about this point, hence the name pivot.

normalize

[default: False] Whether all arrows are normalized to have the same length, or keep the lengths defined by $u$, $v$, and $w$.

**kwargs

Any additional keyword arguments are delegated to LineCollection

```python
quiver3D(X, Y, Z, U, V, W, /, length=1, arrow_length_ratio=0.3, pivot='tail', normalize=False, **kwargs)
```

Plot a 3D field of arrows.

The arguments could be array-like or scalars, so long as they can be broadcast together. The arguments can also be masked arrays. If an element in any of argument is masked, then that corresponding quiver element will not be plotted.

**Parameters**

- **X, Y, Z**
  - [array-like] The x, y and z coordinates of the arrow locations (default is tail of arrow; see pivot kwarg).

- **U, V, W**
  - [array-like] The x, y and z components of the arrow vectors.

- **length**
  - [default: 1] The length of each quiver.

- **arrow_length_ratio**
  - [default: 0.3] The ratio of the arrow head with respect to the quiver.

- **pivot**
  - {['tail', 'middle', 'tip'], default: 'tail'} The part of the arrow that is at the grid point; the arrow rotates about this point, hence the name pivot.

- **normalize**
  - [default: False] Whether all arrows are normalized to have the same length, or keep the lengths defined by $u$, $v$, and $w$. 
**kwargs

Any additional keyword arguments are delegated to LineCollection.

`scatter (self, xs, ys, zs=0, zdir='z', s=20, c=None, depthshade=True, *args, **kwargs)`

Create a scatter plot.

**Parameters**

- **xs, ys**
  
  [array-like] The data positions.

- **zs**

  [float or array-like, default: 0] The z-positions. Either an array of the same length as xs and ys or a single value to place all points in the same plane.

- **zdir**

  [{'x', 'y', 'z', '-x', '-y', '-z'}, default: 'z'] The axis direction for the zs. This is useful when plotting 2D data on a 3D Axes. The data must be passed as xs, ys. Setting zdir to 'y' then plots the data to the x-z-plane.

  See also /gallery/mplot3d/2dcollections3d.

- **s**

  [float or array-like, default: 20] The marker size in points**2. Either an array of the same length as xs and ys or a single value to make all markers the same size.

- **c**

  [color, sequence, or sequence of colors, optional] The marker color. Possible values:
  
  - A single color format string.
  
  - A sequence of colors of length n.
  
  - A sequence of n numbers to be mapped to colors using cmap and norm.
  
  - A 2D array in which the rows are RGB or RGBA.

  For more details see the c argument of scatter.

- **depthshade**

  [bool, default: True] Whether to shade the scatter markers to give the appearance of depth. Each call to scatter() will perform its depthshading independently.

**kwargs

All other arguments are passed on to scatter.

**Returns**
Create a scatter plot.

**Parameters**

- **xs**, **ys**
  - [array-like] The data positions.

- **zs**
  - [float or array-like, default: 0] The z-positions. Either an array of the same length as xs and ys or a single value to place all points in the same plane.

- **zdir**
  - [{‘x’, ‘y’, ‘z’, ‘-x’, ‘-y’, ‘-z’}, default: ‘z’] The axis direction for the zs. This is useful when plotting 2D data on a 3D Axes. The data must be passed as xs, ys. Setting zdir to ‘y’ then plots the data to the x-z-plane.

See also /gallery/mplot3d/2dcollections3d.

- **s**
  - [float or array-like, default: 20] The marker size in points**2. Either an array of the same length as xs and ys or a single value to make all markers the same size.

- **c**
  - [color, sequence, or sequence of colors, optional] The marker color. Possible values:
    - A single color format string.
    - A sequence of colors of length n.
    - A sequence of n numbers to be mapped to colors using cmap and norm.
    - A 2D array in which the rows are RGB or RGBA.

For more details see the c argument of scatter.

- **depthshade**
  - [bool, default: True] Whether to shade the scatter markers to give the appearance of depth. Each call to scatter() will perform its depthshading independently.

**Returns**
paths

[PathCollection]

**set_anchor** *(self, anchor, share=False)*

Define the anchor location.

The actual drawing area (active position) of the Axes may be smaller than the Bbox (original position) when a fixed aspect is required. The anchor defines where the drawing area will be located within the available space.

**Parameters**

**anchor**

[2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}] The anchor position may be either:

- a sequence \((cx, cy)\). \(cx\) and \(cy\) may range from 0 to 1, where 0 is left or bottom and 1 is right or top.
- a string using cardinal directions as abbreviation:
  - 'C' for centered
  - 'S' (south) for bottom-center
  - 'SW' (south west) for bottom-left
  - etc.

Here is an overview of the possible positions:

```
'NW' 'N' 'NE'
'W'  'C' 'E'
'SW' 'S' 'SE'
```

**share**

[bool, default: False] If True, apply the settings to all shared Axes.

See also:

```
matplotlib.axes.Axes.set_aspect
```

for a description of aspect handling.

**set_aspect** *(self, aspect, adjustable=None, anchor=None, share=False)*

Set the aspect ratios.

Axes 3D does not currently support any aspect but 'auto' which fills the axes with the data limits.

To simulate having equal aspect in data space, set the ratio of your data limits to match the value of `get_box_aspect`. To control box aspect ratios use `set_box_aspect`.

**Parameters**
aspect

[{'auto'}] Possible values:

<table>
<thead>
<tr>
<th>value</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'auto'</td>
<td>automatic; fill the position rectangle with data.</td>
</tr>
</tbody>
</table>

adjustable

[None] Currently ignored by Axes3D

If not None, this defines which parameter will be adjusted to meet the required aspect. See set_adjustable for further details.

anchor

[None or str or 2-tuple of float, optional] If not None, this defines where the Axes will be drawn if there is extra space due to aspect constraints. The most common way to to specify the anchor are abbreviations of cardinal directions:

<table>
<thead>
<tr>
<th>value</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'C'</td>
<td>centered</td>
</tr>
<tr>
<td>'SW'</td>
<td>lower left corner</td>
</tr>
<tr>
<td>'S'</td>
<td>middle of bottom edge</td>
</tr>
<tr>
<td>'SE'</td>
<td>lower right corner</td>
</tr>
<tr>
<td>etc.</td>
<td></td>
</tr>
</tbody>
</table>

See set_anchor for further details.

share

[bool, default: False] If True, apply the settings to all shared Axes.

See also:

mpl_toolkits.mplot3d.axes3d.Axes3D.set_box_aspect

set_autoscale_on(self, b)

Set whether autoscaling is applied on plot commands

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

Parameters

b

[bool]

set_autoscalez_on(self, b)

Set whether autoscaling for the z-axis is applied on plot commands

New in version 1.1.0.
**set_axis_off** *(self)*

Turn the x- and y-axis off.

This affects the axis lines, ticks, ticklabels, grid and axis labels.

**set_axis_on** *(self)*

Turn the x- and y-axis on.

This affects the axis lines, ticks, ticklabels, grid and axis labels.

**set_box_aspect** *(self, aspect, *, zoom=1)*

Set the axes box aspect.

The box aspect is the ratio of height to width in display units for each face of the box when viewed perpendicular to that face. This is not to be confused with the data aspect (which for Axes3D is always ‘auto’). The default ratios are 4:4:3 (x:y:z).

To simulate having equal aspect in data space, set the box aspect to match your data range in each dimension.

*zoom* controls the overall size of the Axes3D in the figure.

**Parameters**

- **aspect**
  - [3-tuple of floats or None] Changes the physical dimensions of the Axes3D, such that the ratio of the axis lengths in display units is x:y:z.
  - If None, defaults to 4:4:3

- **zoom**
  - [float] Control overall size of the Axes3D in the figure.

**set_frame_on** *(self, b)*

Set whether the 3D axes panels are drawn.

**Parameters**

- **b**
  - [bool]

**set_proj_type** *(self, proj_type)*

Set the projection type.

**Parameters**
set_title (self, label, fontdict=None, loc='center', **kwargs)

Set a title for the Axes.

Set one of the three available Axes titles. The available titles are positioned above the Axes in the center, flush with the left edge, and flush with the right edge.

Parameters

label

[ str ] Text to use for the title

fontdict

[ dict ] A dictionary controlling the appearance of the title text, the default fontdict is:

```python
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'color': rcParams['axes.titlecolor'],
 'verticalalignment': 'baseline',
 'horizontalalignment': loc}
```

loc

[ { 'center', 'left', 'right' }, default: rcParams["axes.titlelocation"]
(default: 'center')] Which title to set.

y

[ float, default: rcParams["axes.titley"] (default: None)] Vertical Axes location for the title (1.0 is the top). If None (the default), y is determined automatically to avoid decorators on the Axes.

pad

[ float, default: rcParams["axes.titlepad"] (default: 6.0)] The offset of the title from the top of the Axes, in points.

Returns

Text

The matplotlib text instance representing the title

Other Parameters

**kwargs

[ Text properties ] Other keyword arguments are text properties, see Text for a list of valid text properties.
```python
def set_top_view(self)
def set_xlim(self, left=None, right=None, emit=True, auto=False, *, xmin=None, xmax=None)
    Alias for set_xlim3d.

def set_xlim3d(self, left=None, right=None, emit=True, auto=False, *, xmin=None, xmax=None)
    Set 3D x limits.
    See matplotlib.axes.Axes.set_xlim() for full documentation.

def set_xmargin(self, m)
    Set padding of X data limits prior to autoscaling.
    
    m times the data interval will be added to each end of that interval before it is used in autoscaling.
    For example, if your data is in the range [0, 2], a factor of m = 0.1 will result in a range [-0.2, 2.2].
    Negative values -0.5 < m < 0 will result in clipping of the data range. I.e. for a data range [0, 2],
    a factor of m = -0.1 will result in a range [0.2, 1.8].

    Parameters
    
    m
    
    [float greater than -0.5]

    def set_xscale(self, value, **kwargs)
    Set the x-axis scale.

    Parameters
    
    value
    
    ["linear"] The axis scale type to apply. 3D axes currently only support linear
    scales; other scales yield nonsensical results.

    **kwargs
    
    Keyword arguments are nominally forwarded to the scale class, but none of them
    is applicable for linear scales.

    def set_ylim(self, bottom=None, top=None, emit=True, auto=False, *, ymin=None, ymax=None)
    Alias for set_ylim3d.

    def set_ylim3d(self, bottom=None, top=None, emit=True, auto=False, *, ymin=None, ymax=None)
    Set 3D y limits.
    See matplotlib.axes.Axes.set_ylim() for full documentation.

    def set_ymargin(self, self, m)
    Set padding of Y data limits prior to autoscaling.
```

Set padding of Z data limits prior to autoscaling.

\[ m \text{ times the data interval will be added to each end of that interval before it is used in autoscaling.} \]

For example, if your data is in the range \([0, 2]\), a factor of \( m = 0.1 \) will result in a range \([-0.2, 2.2]\).

Negative values \(-0.5 < m < 0\) will result in clipping of the data range. I.e. for a data range \([0, 2]\), a factor of \( m = -0.1 \) will result in a range \([0.2, 1.8]\).

**Parameters**

\[ m \]

[\text{float greater than -0.5}]

**set_yscale** (self, value, **kwargs)

Set the y-axis scale.

**Parameters**

\[ value \]

[\{"linear"\}] The axis scale type to apply. 3D axes currently only support linear scales; other scales yield nonsensical results.

**kwargs

Keyword arguments are nominally forwarded to the scale class, but none of them is applicable for linear scales.

**set_zbound** (self, lower=None, upper=None)

Set the lower and upper numerical bounds of the z-axis.

This method will honor axes inversion regardless of parameter order. It will not change the autoscaling setting (**get_autoscalez_on()**).

New in version 1.1.0.

**set_zlabel** (self, zlabel, fontdict=None, labelpad=None, **kwargs)

Set zlabel. See doc for **set_ylabel** for description.

**set_zlim** (self, bottom=None, top=None, emit=True, auto=False, *, zmin=None, zmax=None)

Alias for **set_zlim3d**.

**set_zlim3d** (self, bottom=None, top=None, emit=True, auto=False, *, zmin=None, zmax=None)

Set 3D z limits.

See **matplotlib.axes.Axes.set_ylim()** for full documentation

**set_zmargin** (self, m)

Set padding of Z data limits prior to autoscaling.

\[ m \text{ times the data interval will be added to each end of that interval before it is used in autoscaling.} \]

accepts: float in range 0 to 1

New in version 1.1.0.
**set_zscale** *(self, value, **kwargs)*

Set the z-axis scale.

**Parameters**

value

["linear"] The axis scale type to apply. 3D axes currently only support linear scales; other scales yield nonsensical results.

**kwargs

Keyword arguments are nominally forwarded to the scale class, but none of them is applicable for linear scales.

**set_zticklabels** *(self, labels, *, fontdict=None, minor=False, **kwargs)*

Set the zaxis' labels with list of string labels.

**Warning:** This method should only be used after fixing the tick positions using **Axes3D.set_zticks**. Otherwise, the labels may end up in unexpected positions.

**Parameters**

labels

[list of str] The label texts.

fontdict

[dict, optional] A dictionary controlling the appearance of the ticklabels. The default fontdict is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'verticalalignment': 'baseline',
 'horizontalalignment': 'loc'}
```

minor

[bool, default: False] Whether to set the minor ticklabels rather than the major ones.

**Returns**

list of **Text**

The labels.

**Other Parameters**
**kwargs

[Text properties.]

**set_zticks** *(self, ticks, *, minor=False)*

Set the zaxis' tick locations.

If necessary, the view limits of the Axis are expanded so that all given ticks are visible.

**Parameters**

**ticks**

[list of floats] List of tick locations.

**minor**

[bool, default: False] If False, set the major ticks; if True, the minor ticks.

**Notes**

The mandatory expansion of the view limits is an intentional design choice to prevent the surprise of a non-visible tick. If you need other limits, you should set the limits explicitly after setting the ticks.

**stem** *(self, x, y, z, *, linefmt='C0-', markerfmt='C0o', basefmt='C3-', bottom=0, label=None, orientation='z')*

Create a 3D stem plot.

A stem plot draws lines perpendicular to a baseline, and places markers at the heads. By default, the baseline is defined by x and y, and stems are drawn vertically from bottom to z.

**Parameters**

**x, y, z**

[array-like] The positions of the heads of the stems. The stems are drawn along the orientation-direction from the baseline at bottom (in the orientation-coordinate) to the heads. By default, the x and y positions are used for the baseline and z for the head position, but this can be changed by orientation.

**linefmt**

[str, default: 'C0-'] A string defining the properties of the vertical lines. Usually, this will be a color or a color and a linestyle:

<table>
<thead>
<tr>
<th>Character</th>
<th>Line Style</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-'</td>
<td>solid line</td>
</tr>
<tr>
<td>'---'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'---'</td>
<td>dash-dot line</td>
</tr>
<tr>
<td>':'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>
Note: While it is technically possible to specify valid formats other than color or color and linestyle (e.g. 'rx' or '-.'), this is beyond the intention of the method and will most likely not result in a reasonable plot.

**markerfmt**

[str, default: 'C0o'] A string defining the properties of the markers at the stem heads.

**basefmt**

[str, default: 'C3-'] A format string defining the properties of the baseline.

**bottom**

[float, default: 0] The position of the baseline, in orientation-coordinates.

**label**

[str, default: None] The label to use for the stems in legends.

**orientation**

[{‘x’, ‘y’, ‘z’}, default: ‘z’] The direction along which stems are drawn.

**Returns**

*StemContainer*

The container may be treated like a tuple (markerline, stemlines, baseline)

**Examples**

```python
stem3D(self, x, y, z, *, linefmt='C0-', markerfmt='C0o', basefmt='C3-', bottom=0, label=None, orientation='z')
```

Create a 3D stem plot.

A stem plot draws lines perpendicular to a baseline, and places markers at the heads. By default, the baseline is defined by x and y, and stems are drawn vertically from bottom to z.

**Parameters**

*x, y, z*

[array-like] The positions of the heads of the stems. The stems are drawn along the orientation-direction from the baseline at bottom (in the orientation-coordinate) to the heads. By default, the x and y positions are used for the baseline and z for the head position, but this can be changed by orientation.

**linefmt**

[str, default: 'C0-'] A string defining the properties of the vertical lines. Usually, this will be a color or a color and a linestyle:
Note: While it is technically possible to specify valid formats other than color or color and linestyle (e.g. 'rx' or '-.'), this is beyond the intention of the method and will most likely not result in a reasonable plot.

**markerfmt**

[ str, default: 'C0o' ] A string defining the properties of the markers at the stem heads.

**basefmt**

[ str, default: 'C3-' ] A format string defining the properties of the baseline.

**bottom**

[ float, default: 0 ] The position of the baseline, in orientation-coordinates.

**label**
[str, default: None] The label to use for the stems in legends.

**orientation**

[{'x', 'y', 'z'}, default: 'z'] The direction along which stems are drawn.

**Returns**

*StemContainer*

The container may be treated like a tuple *(markerline, stemlines, baseline)*

**Examples**

**text** *(self, x, y, z, s, zdir=None, **kwargs)*

Add text to the plot. kwargs will be passed on to Axes.text, except for the *zdir* keyword, which sets the direction to be used as the *z* direction.

**text2D** *(self, x, y, s, fontdict=None, **kwargs)*

Add text to the Axes.

Add the text *s* to the Axes at location *x*, *y* in data coordinates.

**Parameters**
x, y

[Float] The position to place the text. By default, this is in data coordinates. The coordinate system can be changed using the transform parameter.

s

[str] The text.

fontdict

[dict, default: None] A dictionary to override the default text properties. If fontdict is None, the defaults are determined by rcParams.

Returns

Text

The created Text instance.

Other Parameters

**kwargs

[Text properties.] Other miscellaneous text parameters.

**Examples**

Individual keyword arguments can be used to override any given parameter:

```python
>>> text(x, y, s, fontsize=12)
```

The default transform specifies that text is in data coords, alternatively, you can specify text in axis coords ((0, 0) is lower-left and (1, 1) is upper-right). The example below places text in the center of the Axes:

```python
>>> text(0.5, 0.5, 'matplotlib', horizontalalignment='center',
...       verticalalignment='center', transform=ax.transAxes)
```

You can put a rectangular box around the text instance (e.g., to set a background color) by using the keyword `bbox`. `bbox` is a dictionary of `Rectangle` properties. For example:

```python
>>> text(x, y, s, bbox=dict(facecolor='red', alpha=0.5))
```

`text3D` (self, x, y, z, s, zdir=None, **kwargs)
Add text to the plot. kwargs will be passed on to Axes.text, except for the zdir keyword, which sets the direction to be used as the z direction.

**tick_params** *(self, axis='both', **kwargs)*
Convenience method for changing the appearance of ticks and tick labels.

See `matplotlib.axes.Axes.tick_params()` for more complete documentation.

The only difference is that setting `axis` to 'both' will mean that the settings are applied to all three axes. Also, the `axis` parameter also accepts a value of 'z', which would mean to apply to only the z-axis.

Also, because of how Axes3D objects are drawn very differently from regular 2D axes, some of these settings may have ambiguous meaning. For simplicity, the 'z' axis will accept settings as if it was like the 'y' axis.

**Note:** Axes3D currently ignores some of these settings.

New in version 1.1.0.

**tricontour** *(self, *args, extend3d=False, stride=5, zdir='z', offset=None, **kwargs)*
Create a 3D contour plot.

Changed in version 1.3.0: Added support for custom triangulations
Note: This method currently produces incorrect output due to a longstanding bug in 3D Poly-Collection rendering.

Parameters

- **X, Y, Z**
  [array-like] Input data.

- **extend3d**
  [bool, default: False] Whether to extend contour in 3D.

- **stride**
  [int] Step size for extending contour.

- **zdir**
  [{'x', 'y', 'z'}, default: 'z'] The direction to use.

- **offset**
  [float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.
*args, **kwargs

Other arguments are forwarded to `matplotlib.axes.Axes.tricontour`.

Returns

`matplotlib.tri.tricontour.TriContourSet`

`tricontourf` *(self, *args, zdir='z', offset=None, **kwargs)*

Create a 3D filled contour plot.

---

**Note:** This method currently produces incorrect output due to a longstanding bug in 3D PolyCollection rendering.

---

**Parameters**

**X, Y, Z**

[array-like] Input data.

**zdir**

[{'x', 'y', 'z'}, default: 'z'] The direction to use.

**offset**

[float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

*args, **kwargs

Other arguments are forwarded to `matplotlib.axes.Axes.tricontourf`.

Returns

`matplotlib.tri.tricontour.TriContourSet`

**Notes**

New in version 1.1.0: The `zdir` and `offset` parameters.

Changed in version 1.3.0: Added support for custom triangulations

`tunit_cube` *(self, vals=None, M=None)*

`tunit_edges` *(self, vals=None, M=None)*

`unit_cube` *(self, vals=None)*
update_datalim(self, xys, **kwargs)
    Extend the dataLim Bbox to include the given points.

    If no data is set currently, the Bbox will ignore its limits and set the bound to be the bounds of
    the xydata (xys). Otherwise, it will compute the bounds of the union of its current data and the
    data in xys.

    Parameters

    xys
        [2D array-like] The points to include in the data limits Bbox. This can be either
        a list of (x, y) tuples or a Nx2 array.

    update, updatey
        [bool, default: True] Whether to update the x/y limits.

view_init(self, elev=None, azim=None)
    Set the elevation and azimuth of the axes in degrees (not radians).

    This can be used to rotate the axes programmatically.

    'elev' stores the elevation angle in the z plane (in degrees). 'azim' stores the azimuth angle in the
    (x, y) plane (in degrees).

    if 'elev' or 'azim' are None (default), then the initial value is used which was specified in the
    Axes3D constructor.

voxels([x, y, z], filled, facecolors=None, edgecolors=None, **kwargs)
    Plot a set of filled voxels

    All voxels are plotted as 1x1x1 cubes on the axis, with filled[0, 0, 0] placed with its
    lower corner at the origin. Occluded faces are not plotted.

    New in version 2.1.

    Parameters

    filled
        [3D np.array of bool] A 3D array of values, with truthy values indicating which
        voxels to fill

    x, y, z
        [3D np.array, optional] The coordinates of the corners of the voxels. This should
        broadcast to a shape one larger in every dimension than the shape of filled. These
        can be used to plot non-cubic voxels.

        If not specified, defaults to increasing integers along each axis, like those re-
        turned by indices(). As indicated by the / in the function signature, these
        arguments can only be passed positionally.

    facecolors, edgecolors
The color to draw the faces and edges of the voxels. Can only be passed as keyword arguments. These parameters can be:

- A single color value, to color all voxels the same color. This can be either a string, or a 1D rgb/rgba array.
- `None`, the default, to use a single color for the faces, and the style default for the edges.
- A 3D numpy array of color names, with each item the color for the corresponding voxel. The size must match the voxels.
- A 4D numpy array of rgb/rgba data, with the components along the last axis.

**shade**

[bool, default: True] Whether to shade the facecolors. Shading is always disabled when `cmap` is specified.

New in version 3.1.

**lightsource**

[LightSource] The lightsource to use when `shade` is True.

New in version 3.1.

**kwargs**

Additional keyword arguments to pass onto `Poly3DCollection`.

**Returns**

**faces**

A dictionary indexed by coordinate, where `faces[i, j, k]` is a `Poly3DCollection` of the faces drawn for the voxel `filled[i, j, k]`. If no faces were drawn for a given voxel, either because it was not asked to be drawn, or it is fully occluded, then `(i, j, k)` not in `faces`.

**Examples**

**property w_xaxis**

**property w_yaxis**

**property w_zaxis**

**zaxis_date** *(self, tz=None)*

Set up axis ticks and labels to treat data along the zaxis as dates.

**Parameters**

`tz`
zaxis_inverted(self)
Returns True if the z-axis is inverted.
New in version 1.1.0.

Examples using mpl_toolkits.mplot3d.axes3d.Axes3D

19.2.2 axis3d

Note: See mpl_toolkits.mplot3d.axis3d._axinfo for a dictionary containing constants that may be modified for controlling the look and feel of mplot3d axes (e.g., label spacing, font colors and panel
colors). Historically, axis3d has suffered from having hard-coded constants that precluded user adjustments, and this dictionary was implemented in version 1.1 as a stop-gap measure.

```python
axis3d.Axes(adir, v_intervalx, d_intervalx, ...) An Axis class for the 3D plots.
```

```python
mpl_toolkits.mplot3d.axis3d.Axes

class mpl_toolkits.mplot3d.axis3d.Axes(adir, v_intervalx, d_intervalx, axes, *args,
rotate_label=None, **kwargs)

Bases: matplotlib.axis.XAxis
An Axis class for the 3D plots.

Parameters

axes

pickradius

[float] The acceptance radius for containment tests. See also Axis.contains.

__init__(self, adir, v_intervalx, d_intervalx, axes, *args, rotate_label=None, **kwargs)
```
Notes

This method is overridden in the Artist subclasses.

draw_pane (self, renderer)

get_major_ticks (self, numticks=None)
    Return the list of major Ticks.

get_minor_ticks (self, numticks=None)
    Return the list of minor Ticks.

get_rotate_label (self, text)

get_tightbbox (self, renderer, *, for_layout_only=False)
    Return a bounding box that encloses the axis. It only accounts tick labels, axis label, and offset-Text.

    If for_layout_only is True, then the width of the label (if this is an x-axis) or the height of the label (if this is a y-axis) is collapsed to near zero. This allows tight/constrained_layout to ignore too-long labels when doing their layout.

init3d (self)

set_pane_color (self, color)
    Set pane color to a RGBA tuple.
set_pane_pos (self, xys)

set_rotate_label (self, val)
   Whether to rotate the axis label: True, False or None. If set to None the label will be rotated if longer than 4 chars.

property v_interval

Examples using mpl_toolkits.mplot3d.axis3d.Axis

19.2.3 art3d

    art3d.Line3D(xs, ys, zs, *args, **kwargs) 3D line object.
    art3d.Line3DCollection(segments, *args[, zorder]) A collection of 3D lines.
    art3d.Patch3D(*args[, zs, zdir]) 3D patch object.
    art3d.Patch3DCollection(*args[, zs, zdir, ...]) A collection of 3D patches.
    art3d.Path3DCollection(*args[, zs, zdir, ...]) A collection of 3D paths.

**mpl_toolkits.mplot3d.art3d.Line3D**

```python
class mpl_toolkits.mplot3d.art3d.Line3D(xs, ys, zs, *args, **kwargs)
    Bases: matplotlib.lines.Line2D

    3D line object.

    Keyword arguments are passed onto Line2D().

    __init__(self, xs, ys, zs, *args, **kwargs)
        Keyword arguments are passed onto Line2D().

    __module__ = 'mpl_toolkits.mplot3d.art3d'

draw(self, renderer)
    Draw the Artist (and its children) using the given renderer.

    This has no effect if the artist is not visible (Artist.get_visible returns False).

    Parameters

        renderer
            [RendererBase subclass.]
```
Notes

This method is overridden in the Artist subclasses.

g**et_data_3d** (*self*)
Get the current data

Returns

**verts3d**
[length-3 tuple or array-like] The current data as a tuple or array-like.

**set_3d_properties** (*self*, *zs=0, zdir=z*)

**set_data_3d** (*self*, *args*)
Set the x, y and z data

Parameters

**x**
[array-like] The x-data to be plotted.

**y**
[array-like] The y-data to be plotted.

**z**
[array-like] The z-data to be plotted.

Notes

Accepts x, y, z arguments or a single array-like (x, y, z)

Examples using mpl_toolkits.mplot3d.art3d.Line3D

- sphx_glr_gallery_mplot3d_stem3d_demo.py

mpl_toolkits.mplot3d.art3d.Line3DCollection

class mpl_toolkits.mplot3d.art3d.Line3DCollection(*segments, **args, zorder=2, **kwargs*)

Bases: matplotlib.collections.LineCollection

A collection of 3D lines.

Parameters
segments

[list of array-like] A sequence of \((line0, line1, line2)\), where:

\[
\text{linen} = (x0, y0), (x1, y1), \ldots (xm, ym)
\]

or the equivalent numpy array with two columns. Each line can have a different number of segments.

linwidths

[float or list of float, default: `rcParams["lines.linewidth"]` (default: 1.5)] The width of each line in points.

colors

[color or list of color, default: `rcParams["lines.color"]` (default: 'C0')] A sequence of RGBA tuples (e.g., arbitrary color strings, etc, not allowed).

antialiaseds

[bool or list of bool, default: `rcParams["lines.antialiased"]` (default: True)] Whether to use antialiasing for each line.

zorder

[int, default: 2] zorder of the lines once drawn.

facecolors

[color or list of color, default: 'none'] When setting facecolors, each line is interpreted as a boundary for an area, implicitly closing the path from the last point to the first point. The enclosed area is filled with facecolor. In order to manually specify what should count as the "interior" of each line, please use PathCollection instead, where the "interior" can be specified by appropriate usage of CLOSEPOLY.

**kwargs

Forwarded to Collection.

__module__ = 'mpl_toolkits.mplot3d.art3d'

do_3d_projection (self, renderer=<deprecated parameter>)

Project the points according to renderer matrix.

draw (self, renderer, project=<deprecated parameter>)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters

renderer

[RendererBase subclass.]
Notes

This method is overridden in the Artist subclasses.

```
set_segments(self, segments)
```
Set 3D segments.

```
set_sort_zpos(self, val)
```
Set the position to use for z-sorting.

**Examples using** `mpl_toolkits.mplot3d.art3d.Line3DCollection`

- sphx_glr_gallery_mplot3d_stem3d_demo.py

**mpl_toolkits.mplot3d.art3d.Patch3D**

```
class mpl_toolkits.mplot3d.art3d.Patch3D(*args, zs=(), zdir='z', **kwargs)
```

3D patch object.

do_3d_projection(self, renderer=<deprecated parameter>)

get_path(self)
    Return the path of this patch.

set_3d_properties(self, verts, zs=0, zdir='z')

Examples using mpl_toolkits.mplot3d.art3d.Patch3D

mpl_toolkits.mplot3d.art3d.Patch3DCollection

class mpl_toolkits.mplot3d.art3d.Patch3DCollection(*args, zs=0, zdir='z',
    depthshade=True, **kwargs)

Bases: matplotlib.collections.PatchCollection

A collection of 3D patches.

Create a collection of flat 3D patches with its normal vector pointed in zdir direction, and located at zs on the zdir axis. 'zs' can be a scalar or an array-like of the same length as the number of patches in the collection.

Constructor arguments are the same as for PatchCollection. In addition, keywords zs=0 and zdir='z' are available.

Also, the keyword argument depthshade is available to indicate whether or not to shade the patches in order to give the appearance of depth (default is True). This is typically desired in scatter plots.

__init__(self, *args, zs=0, zdir='z', depthshade=True, **kwargs)

Create a collection of flat 3D patches with its normal vector pointed in zdir direction, and located at zs on the zdir axis. 'zs' can be a scalar or an array-like of the same length as the number of patches in the collection.

Constructor arguments are the same as for PatchCollection. In addition, keywords zs=0 and zdir='z' are available.

Also, the keyword argument depthshade is available to indicate whether or not to shade the patches in order to give the appearance of depth (default is True). This is typically desired in scatter plots.

__module__ = 'mpl_toolkits.mplot3d.art3d'

do_3d_projection(self, renderer=<deprecated parameter>)

get_depthshade(self)

get_edgecolor(self)

get_facecolor(self)

set_3d_properties(self, zs, zdir)
**set_depthshade** *(self, depthshade)*

Set whether depth shading is performed on collection members.

**Parameters**

*depthshade*  
[bool] Whether to shade the patches in order to give the appearance of depth.

**set_sort_zpos** *(self, val)*

Set the position to use for z-sorting.

---

**Examples using mpl_toolkits.mplot3d.art3d.Path3DCollection**

**mpl_toolkits.mplot3d.art3d.Path3DCollection**

```python
class mpl_toolkits.mplot3d.art3d.Path3DCollection(*args, zs=0, zdir='z', depthshade=True, **kwargs)
```

Bases: `matplotlib.collections.PathCollection`

A collection of 3D paths.

Create a collection of flat 3D paths with its normal vector pointed in \(zdir\) direction, and located at \(zs\) on the \(zdir\) axis. \('zs'\) can be a scalar or an array-like of the same length as the number of paths in the collection.

Constructor arguments are the same as for `PathCollection`. In addition, keywords \(zs=0\) and \(zdir='z'\) are available.

Also, the keyword argument `depthshade` is available to indicate whether or not to shade the patches in order to give the appearance of depth (default is `True`). This is typically desired in scatter plots.

**__init__** *(self, *args, zs=0, zdir='z', depthshade=True, **kwargs)*

Create a collection of flat 3D paths with its normal vector pointed in \(zdir\) direction, and located at \(zs\) on the \(zdir\) axis. \('zs'\) can be a scalar or an array-like of the same length as the number of paths in the collection.

Constructor arguments are the same as for `PathCollection`. In addition, keywords \(zs=0\) and \(zdir='z'\) are available.

Also, the keyword argument `depthshade` is available to indicate whether or not to shade the patches in order to give the appearance of depth (default is `True`). This is typically desired in scatter plots.

**__module__** = `'mpl_toolkits.mplot3d.art3d'`

**do_3d_projection** *(self, renderer=<deprecated parameter>)*

**draw** *(self, renderer)*

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns `False`).
Parameters

renderer

[RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

get_depthshade (self)
get_edgecolor (self)
get_facecolor (self)
set_3d_properties (self, zs, zdir)
set_depthshade (self, depthshade)

Set whether depth shading is performed on collection members.

Parameters

depthshade

[bool] Whether to shade the patches in order to give the appearance of depth.

set_linewidth (self, lw)

Set the linewidth(s) for the collection. lw can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence.

Parameters

lw

[float or list of floats]

set_sizes (self, sizes, dpi=72.0)

Set the sizes of each member of the collection.

Parameters

sizes

[ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

dpi

[float, default: 72] The dpi of the canvas.

set_sort_zpos (self, val)

Set the position to use for z-sorting.
Examples using `mpl_toolkits.mplot3d.art3d.Path3DCollection`

`mpl_toolkits.mplot3d.art3d.PathPatch3D`

```python
class mpl_toolkits.mplot3d.art3d.PathPatch3D(path, *, zs=(), zdir='z', **kwargs)

Bases: mpl_toolkits.mplot3d.art3d.Patch3D

3D PathPatch object.

`mpl_toolkits.mplot3d.art3d.Poly3DCollection`

class `mpl_toolkits.mplot3d.art3d.Poly3DCollection`(verts, *args, zsort='average', **kwargs)

Bases: `matplotlib.collections.PolyCollection`

A collection of 3D polygons.

**Note:** Filling of 3D polygons

There is no simple definition of the enclosed surface of a 3D polygon unless the polygon is planar. In practice, Matplotlib fills the 2D projection of the polygon. This gives a correct filling appearance only for planar polygons. For all other polygons, you’ll find orientations in which the edges of the polygon intersect in the projection. This will lead to an incorrect visualization of the 3D area.

If you need filled areas, it is recommended to create them via `plot_trisurf`, which creates a triangulation and thus generates consistent surfaces.

**Parameters**

verts

[list of (N, 3) array-like] Each element describes a polygon as a sequence of $N_i$ points $(x, y, z)$.

zsort

[{'average', 'min', 'max'}, default: 'average'] The calculation method for the z-order. See `set_zsort` for details.

*args, **kwargs

All other parameters are forwarded to `PolyCollection`.

**Notes**

Note that this class does a bit of magic with the _facecolors and _edgecolors properties.
[list of (N, 3) array-like] Each element describes a polygon as a sequence of \(N_i\) points \((x, y, z)\).

\textbf{zsort}

[{‘average’, ‘min’, ‘max’}, default: ‘average’] The calculation method for the z-order. See \texttt{set_zsort} for details.

\*\*\args, \**\kwargs

All other parameters are forwarded to \texttt{PolyCollection}.

\section*{Notes}

Note that this class does a bit of magic with the \texttt{_facecolors} and \texttt{_edgecolors} properties.

\texttt{__module__} = \texttt{‘mpl_toolkits.mplot3d.art3d’}

d\texttt{o\_3d\_projection} (self, renderer=<deprecated parameter>)

Perform the 3D projection for this object.

\texttt{get\_edgecolor} (self)

\texttt{get\_facecolor} (self)

\texttt{get\_vector} (self, segments3d)

Optimize points for projection.

\texttt{set\_3d\_properties} (self)

\texttt{set\_alpha} (self, alpha)

Set the alpha value used for blending - not supported on all backends.

\begin{description}
\item[\textbf{Parameters}]
\item[\textbf{alpha}]

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

\texttt{set\_edgecolor} (self, colors)

Set the edgecolor(s) of the collection.

\begin{description}
\item[\textbf{Parameters}]
\item[c]

[color or list of colors or ‘face’] The collection edgecolor(s). If a sequence, the patches cycle through it. If ‘face’, match the facecolor.

\texttt{set\_facecolor} (self, colors)

Set the facecolor(s) of the collection. \(c\) can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

\begin{itemize}
\item If \(c\) is ‘none’, the patch will not be filled.
\end{itemize}
Parameters

c
[color or list of colors]

**set_sort_zpos** *(self, val)*
Set the position to use for z-sorting.

**set_verts** *(self, verts, closed=True)*
Set 3D vertices.

**set_verts_and_codes** *(self, verts, codes)*
Set 3D vertices with path codes.

**set_zsort** *(self, zsort)*
Set the calculation method for the z-order.

Parameters

zsort

[{'average', 'min', 'max'}] The function applied on the z-coordinates of the vertices in the viewer's coordinate system, to determine the z-order.

Examples using **mpl_toolkits.mplot3d.art3d.Poly3DCollection**

- sphx_glr_gallery_mplot3d_surface3d.py
- sphx_glr_gallery_mplot3d_surface3d_3.py

**mpl_toolkits.mplot3d.art3d.Text3D**

class mpl_toolkits.mplot3d.art3d.Text3D*(x=0, y=0, z=0, text='', zdir='z', **kwargs)*

Bases: matplotlib.text.Text

Text object with 3D position and direction.

Parameters
x, y, z

The position of the text.

text

[str] The text string to display.

zdir

[{'x', 'y', 'z', None, 3-tuple}] The direction of the text. See get_dir_vector for a description of the values.

Other Parameters

**kwargs

All other parameters are passed on to Text.

Create a Text instance at x, y with string text.

Valid keyword arguments are:

__module__ = 'mpl_toolkits.mplot3d.art3d'

draw(self, renderer)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters

renderer

[RendererBase subclass.]
Notes

This method is overridden in the Artist subclasses.

get_position_3d(self)
Return the (x, y, z) position of the text.

get_tightbbox(self, renderer)
Like Artist.get_window_extent, but includes any clipping.

Parameters

renderer
[RendererBase subclass] renderer that will be used to draw the figures (i.e. fig.canvas.get_renderer())

Returns

Bbox
The enclosing bounding box (in figure pixel coordinates).

set_3d_properties(self, z=0, zdir='z')
set_position_3d(self, xyz, zdir=None)
Set the (x, y, z) position of the text.

Parameters

xyz
[(float, float, float)] The position in 3D space.

zdir
[{'x', 'y', 'z', None, 3-tuple}] The direction of the text. If unspecified, the zdir will not be changed.

set_z(self, z)
Set the z position of the text.

Parameters

z
[fail]
Examples using `mpl_toolkits.mplot3d.art3d.Text3D`

`mpl_toolkits.mplot3d.art3d.get_dir_vector`

`mpl_toolkits.mplot3d.art3d.get_dir_vector(zdir)`

Return a direction vector.

**Parameters**

`zdir`

[{'x', 'y', 'z', None, 3-tuple}] The direction. Possible values are:

- 'x': equivalent to (1, 0, 0)
- 'y': equivalent to (0, 1, 0)
- 'z': equivalent to (0, 0, 1)
- `None`: equivalent to (0, 0, 0)
- an iterable (x, y, z) is converted to a NumPy array, if not already

**Returns**

`x, y, z`

[array-like] The direction vector.

Examples using `mpl_toolkits.mplot3d.art3d.get_dir_vector`

`mpl_toolkits.mplot3d.art3d.juggle_axes`

`mpl_toolkits.mplot3d.art3d.juggle_axes(xs, ys, zs, zdir)`

Reorder coordinates so that 2D xs, ys can be plotted in the plane orthogonal to zdir. zdir is normally x, y or z. However, if zdir starts with a '-' it is interpreted as a compensation for rotate_axes.

Examples using `mpl_toolkits.mplot3d.art3d.juggle_axes`

`mpl_toolkits.mplot3d.art3d.line_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.line_2d_to_3d(line, zs=0, zdir='z')`

Convert a 2D line to 3D.
Examples using `mpl_toolkits.mplot3d.art3d.line_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.line_2d_to_3d`

```
mpl_toolkits.mplot3d.art3d.line_2d_to_3d(col, zs=0, zdir='z')
```

Convert a LineCollection to a Line3DCollection object.

Examples using `mpl_toolkits.mplot3d.art3d.line_collection_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.line_collection_2d_to_3d`

```
mpl_toolkits.mplot3d.art3d.line_collection_2d_to_3d(col, zs=0, zdir='z')
```

Parameters

- **za**
  
The location or locations to place the patches in the collection along the zdir axis. Default: 0.

- **zdir**
  
The axis in which to place the patches. Default: "z".

- **depthshade**
  
Whether to shade the patches to give a sense of depth. Default: True.

Examples using `mpl_toolkits.mplot3d.art3d.patch_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.patch_2d_to_3d`

```
mpl_toolkits.mplot3d.art3d.patch_2d_to_3d(patch, z=0, zdir='z')
```

Convert a Patch to a Patch3D object.

Examples using `mpl_toolkits.mplot3d.art3d.patch_collection_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.patch_collection_2d_to_3d`

```
mpl_toolkits.mplot3d.art3d.patch_collection_2d_to_3d(col, zs=0, zdir='z', depthshade=True)
```

Convert a PatchCollection into a Patch3DCollection object (or a PathCollection into a Path3DCollection object).

Parameters

- **za**
  
The location or locations to place the patches in the collection along the zdir axis. Default: 0.

- **zdir**
  
The axis in which to place the patches. Default: "z".

- **depthshade**
  
Whether to shade the patches to give a sense of depth. Default: True.

Examples using `mpl_toolkits.mplot3d.art3d.pathpatch_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.pathpatch_2d_to_3d`

```
mpl_toolkits.mplot3d.art3d.pathpatch_2d_to_3d(pathpatch, z=0, zdir='z')
```

Convert a PathPatch to a PathPatch3D object.
Examples using `mpl_toolkits.mplot3d.art3d.pathpatch_2d_to_3d`

- `sphx_glr_gallery_mplot3d_pathpatch3d.py`

`mpl_toolkits.mplot3d.art3d.poly_collection_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.poly_collection_2d_to_3d(col, zs=0, zdir='z')`
Convert a PolyCollection to a Poly3DCollection object.

Examples using `mpl_toolkits.mplot3d.art3d.poly_collection_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.rotate_axes`

`mpl_toolkits.mplot3d.art3d.rotate_axes(xs, ys, zs, zdir)`
Reorder coordinates so that the axes are rotated with zdir along the original z axis. Prepending the axis with a '-' does the inverse transform, so zdir can be x, -x, y, -y, z or -z.

Examples using `mpl_toolkits.mplot3d.art3d.rotate_axes`

`mpl_toolkits.mplot3d.art3d.text_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.text_2d_to_3d(obj, z=0, zdir='z')`
Convert a Text to a Text3D object.

Examples using `mpl_toolkits.mplot3d.art3d.text_2d_to_3d`

19.2.4 proj3d

```
proj3d.inv_transform(xs, ys, zs, M)
proj3d.persp_transformation(zfront, zback)
proj3d.proj_points(points, M)
proj3d.proj_trans_points(points, M)
proj3d.proj_transform(xs, ys, zs, M)  # Transform the points by the projection matrix
proj3d.proj_transform_clip(xs, ys, zs, M)  # Transform the points by the projection matrix and return the clipping result returns txs, tys, tzs, tis
proj3d.rot_x(V, alpha)
proj3d.transform(xs, ys, zs, M)  # Transform the points by the projection matrix
proj3d.view_transformation(E, R, V)
proj3d.world_transformation(xmin, xmax, ...)  # Produce a matrix that scales homogeneous coords in the specified ranges to [0, 1], or [0, pb_aspect[i]] if the plotbox aspect ratio is specified.
```
mpl_toolkits.mplot3d.proj3d.inv_transform

mpl_toolkits.mplot3d.proj3d.inv_transform(xs, ys, zs, M)

Examples using mpl_toolkits.mplot3d.proj3d.inv_transform

mpl_toolkits.mplot3d.proj3d.persp_transformation

mpl_toolkits.mplot3d.proj3d.persp_transformation(zfront, zback)

Examples using mpl_toolkits.mplot3d.proj3d.persp_transformation

mpl_toolkits.mplot3d.proj3d.proj_points

mpl_toolkits.mplot3d.proj3d.proj_points(points, M)

Examples using mpl_toolkits.mplot3d.proj3d.proj_points

mpl_toolkits.mplot3d.proj3d.proj_trans_points

mpl_toolkits.mplot3d.proj3d.proj_trans_points(points, M)

Examples using mpl_toolkits.mplot3d.proj3d.proj_trans_points

mpl_toolkits.mplot3d.proj3d.proj_transform

mpl_toolkits.mplot3d.proj3d.proj_transform(xs, ys, zs, M)
    Transform the points by the projection matrix

Examples using mpl_toolkits.mplot3d.proj3d.proj_transform

mpl_toolkits.mplot3d.proj3d.proj_transform_clip

mpl_toolkits.mplot3d.proj3d.proj_transform_clip(xs, ys, zs, M)
    Transform the points by the projection matrix and return the clipping result returns txs, tys, tzs, tis
Examples using `mpl_toolkits.mplot3d.proj3d.proj_transform_clip`

`mpl_toolkits.mplot3d.proj3d.rot_x`

`mpl_toolkits.mplot3d.proj3d.rot_x(V, alpha)`

Examples using `mpl_toolkits.mplot3d.proj3d.rot_x`

`mpl_toolkits.mplot3d.proj3d.transform`

`mpl_toolkits.mplot3d.proj3d.transform(xs, ys, zs, M)`

Transform the points by the projection matrix

Examples using `mpl_toolkits.mplot3d.proj3d.transform`

`mpl_toolkits.mplot3d.proj3d.view_transformation`

`mpl_toolkits.mplot3d.proj3d.view_transformation(E, R, V)`

Examples using `mpl_toolkits.mplot3d.proj3d.view_transformation`

`mpl_toolkits.mplot3d.proj3d.world_transformation`

`mpl_toolkits.mplot3d.proj3d.world_transformation(xmin, xmax, ymin, ymax, zmin, zmax, pb_aspect=None)`

Produce a matrix that scales homogeneous coords in the specified ranges to [0, 1], or [0, pb_aspect[i]] if the plotbox aspect ratio is specified.

Examples using `mpl_toolkits.mplot3d.proj3d.world_transformation`

19.3 Matplotlib axes_grid Toolkit

**Note:** AxesGrid toolkit has been a part of matplotlib since v 0.99. Originally, the toolkit had a single namespace of `axes_grid`. In more recent version, the toolkit has divided into two separate namespace (`axes_grid1` and `axisartist`). While `axes_grid` namespace is maintained for the backward compatibility, use of `axes_grid1` and `axisartist` is recommended. For the documentation on `axes_grid`, see the previous version of the docs.

Part V

Third party packages
Several external packages that extend or build on Matplotlib functionality are listed below. They are maintained and distributed separately from Matplotlib and thus need to be installed individually.

Please submit an issue or pull request on GitHub if you have created a package that you would like to have included. We are also happy to host third party packages within the Matplotlib GitHub Organization.
23.1 Basemap

*Basemap* plots data on map projections, with continental and political boundaries.
23.2 Cartopy

Cartopy builds on top of Matplotlib to provide object oriented map projection definitions and close integration with Shapely for powerful yet easy-to-use vector data processing tools. An example plot from the Cartopy gallery:

![US States which intersect the track of Hurricane Katrina (2005)](image)

23.3 Geoplot

Geoplot builds on top of Matplotlib and Cartopy to provide a "standard library" of simple, powerful, and customizable plot types. An example plot from the Geoplot gallery:
23.4 Ridge Map

ridge_map uses Matplotlib, SRTM.py, NumPy, and scikit-image to make ridge plots of your favorite ridges.
THE WHITE MOUNTAINS
24.1 ggplot

`ggplot` is a port of the R `ggplot2` package to python based on Matplotlib.

24.2 holoviews

`holoviews` makes it easier to visualize data interactively, especially in a Jupyter notebook, by providing a set of declarative plotting objects that store your data and associated metadata. Your data is then immediately visualizable alongside or overlaid with other data, either statically or with automatically provided widgets for parameter exploration.
24.3 plotnine

plotnine implements a grammar of graphics, similar to R’s ggplot2. The grammar allows users to compose plots by explicitly mapping data to the visual objects that make up the plot.
25.1 Broken Axes

`brokenaxes` supplies an axes class that can have a visual break to indicate a discontinuous range.
25.2 DeCiDa

DeCiDa is a library of functions and classes for electron device characterization, electronic circuit design and general data visualization and analysis.

25.3 matplotlib-scalebar

matplotlib-scalebar provides a new artist to display a scale bar, aka micron bar. It is particularly useful when displaying calibrated images plotted using plt.imshow(...).

25.4 Matplotlib-Venn

Matplotlib-Venn provides a set of functions for plotting 2- and 3-set area-weighted (or unweighted) Venn diagrams.
25.5 mpl-probscale

`mpl-probscale` is a small extension that allows Matplotlib users to specify probability scales. Simply importing the `probscale` module registers the scale with Matplotlib, making it accessible via e.g., `ax.set_xscale('prob')` or `plt.yscale('prob')`.

![Probability Scales](image)

25.6 mpl-scatter-density

`mpl-scatter-density` is a small package that makes it easy to make scatter plots of large numbers of points using a density map. The following example contains around 13 million points and the plotting (excluding reading in the data) took less than a second on an average laptop:
When used in interactive mode, the density map is downsampled on-the-fly while panning/zooming in order to provide a smooth interactive experience.

### 25.7 mplstereonet

mplstereonet provides stereonets for plotting and analyzing orientation data in Matplotlib.

### 25.8 Natgrid

mpl_toolkits.natgrid is an interface to the natgrid C library for gridding irregularly spaced data.

### 25.9 pyUpSet

pyUpSet is a static Python implementation of the UpSet suite by Lex et al. to explore complex intersections of sets and data frames.
25.10 seaborn

seaborn is a high level interface for drawing statistical graphics with Matplotlib. It aims to make visualization a central part of exploring and understanding complex datasets.

25.11 WCSAxes

The Astropy core package includes a submodule called WCSAxes (available at astropy.visualization.wcsaxes) which adds Matplotlib projections for Astronomical image data. The following is an example of a plot made with WCSAxes which includes the original coordinate system of the image and an overlay of a different coordinate system:
25.12 Windrose

**Windrose** is a Python Matplotlib, Numpy library to manage wind data, draw windroses (also known as polar rose plots), draw probability density functions and fit Weibull distributions.

25.13 Yellowbrick

**Yellowbrick** is a suite of visual diagnostic tools for machine learning that enables human steering of the model selection process. Yellowbrick combines scikit-learn with matplotlib using an estimator-based API called the **Visualizer**, which wraps both sklearn models and matplotlib Axes. **Visualizer** objects fit neatly into the machine learning workflow allowing data scientists to integrate visual diagnostic and model interpretation tools into experimentation without extra steps.
26.1 animatplot

animatplot is a library for producing interactive animated plots with the goal of making production of animated plots almost as easy as static ones.

For an animated version of the above picture and more examples, see the animatplot gallery.
26.2 gif

gif is an ultra lightweight animated gif API.

26.3 numpngw

numpngw provides functions for writing NumPy arrays to PNG and animated PNG files. It also includes the class AnimatedPNGWriter that can be used to save a Matplotlib animation as an animated PNG file. See the example on the PyPI page or at the numpngw github repository.
27.1 mplcursors

mplcursors provides interactive data cursors for Matplotlib.

27.2 MplDataCursor

MplDataCursor is a toolkit written by Joe Kington to provide interactive "data cursors" (clickable annotation boxes) for Matplotlib.

27.3 mpl_interactions

mpl_interactions makes it easy to create interactive plots controlled by sliders and other widgets. It also provides several handy capabilities such as manual image segmentation, comparing cross-sections of arrays, and using the scroll wheel to zoom.
28.1 mplcairo

mplcairo is a cairo backend for Matplotlib, with faster and more accurate marker drawing, support for a wider selection of font formats and complex text layout, and various other features.

28.2 gr

gr is a framework for cross-platform visualisation applications, which can be used as a high-performance Matplotlib backend.
29.1 wxmplot

WXMPlot provides advanced wxPython widgets for plotting and image display of numerical data based on Matplotlib.
30.1 adjustText

`adjustText` is a small library for automatically adjusting text position in Matplotlib plots to minimize overlaps between them, specified points and other objects.
30.2 iTerm2 terminal backend

`matplotlib_iterm2` is an external Matplotlib backend using the iTerm2 nightly build inline image display feature.
30.3 mpl-template

mpl-template provides a customizable way to add engineering figure elements such as a title block, border, and logo.
30.4 figpager

figpager provides customizable figure elements such as text, lines and images and subplot layout control for single or multi page output.
30.5 blume

blume provides a replacement for the Matplotlib table module. It fixes a number of issues with the existing table. See the blume github repository for more details.

30.6 DNA Features Viewer

DNA Features Viewer provides methods to plot annotated DNA sequence maps (possibly along other Matplotlib plots) for Bioinformatics and Synthetic Biology applications.
GUI APPLICATIONS

31.1 sviewgui

sviewgui is a PyQt-based GUI for visualisation of data from csv files or pandas.DataFrame. Main features:

- Scatter, line, density, histogram, and box plot types
- Settings for the marker size, line width, number of bins of histogram, colormap (from cmocean)
- Save figure as editable PDF
- Code of the plotted graph is available so that it can be reused and modified outside of sviewgui
Part VI

The Matplotlib Developers' Guide
Thank you for your interest in helping to improve Matplotlib! There are various ways to contribute to Matplotlib. All of them are super valuable but don't necessarily require writing code at all. For example:

- contributing to the documentation
- opening new issues for bugs
- requesting new features
- asking for clarification on things you find unclear
- fixing bugs

If you have any questions on the process or how to fix something feel free to ask on gitter for short questions and on discourse for longer questions.
CONTRIBUTING

This project is a community effort, and everyone is welcome to contribute. Everyone within the community is expected to abide by our code of conduct.

The project is hosted on https://github.com/matplotlib/matplotlib

32.1 Contributor Incubator

If you are interested in becoming a regular contributor to Matplotlib, but don't know where to start or feel insecure about it, you can join our non-public communication channel for new contributors. To do so, please go to gitter and ask to be added to '#incubator'. This is a private gitter room moderated by core Matplotlib developers where you can get guidance and support for your first few PRs. This is a place you can ask questions about anything: how to use git, github, how our PR review process works, technical questions about the code, what makes for good documentation or a blog post, how to get involved in community work, or get "pre-review" on your PR.

32.1.1 Issues for New Contributors

While any contributions are welcome, we have marked some issues as particularly suited for new contributors by the label good first issue. These are well documented issues, that do not require a deep understanding of the internals of Matplotlib. The issues may additionally be tagged with a difficulty. Difficulty: Easy is suited for people with little Python experience. Difficulty: Medium and Difficulty: Hard are not trivial to solve and require more thought and programming experience.

32.2 Submitting a bug report

If you find a bug in the code or documentation, do not hesitate to submit a ticket to the Issue Tracker. You are also welcome to post feature requests or pull requests.

If you are reporting a bug, please do your best to include the following:

1. A short, top-level summary of the bug. In most cases, this should be 1-2 sentences.
2. A short, self-contained code snippet to reproduce the bug, ideally allowing a simple copy and paste to reproduce. Please do your best to reduce the code snippet to the minimum required.
3. The actual outcome of the code snippet.

4. The expected outcome of the code snippet.

5. The Matplotlib version, Python version and platform that you are using. You can grab the version with the following commands:

```python
>>> import matplotlib
>>> matplotlib.__version__
'3.4.1'
>>> import platform
>>> platform.python_version()
'3.9.2'
```

We have preloaded the issue creation page with a Markdown template that you can use to organize this information.

Thank you for your help in keeping bug reports complete, targeted and descriptive.

### 32.3 Requesting a new feature

Please post feature requests to the Issue Tracker.

The Matplotlib developers will give feedback on the feature proposal. Since Matplotlib is an open source project with limited resources, we encourage users to then also participate in the implementation.

### 32.4 Contributing code

#### 32.4.1 How to contribute

The preferred way to contribute to Matplotlib is to fork the main repository on GitHub, then submit a "pull request" (PR).

A brief overview is:

1. Create an account on GitHub if you do not already have one.

2. Fork the project repository: click on the 'Fork' button near the top of the page. This creates a copy of the code under your account on the GitHub server.

3. Clone this copy to your local disk:

   ```bash
git clone https://github.com/<YOUR GITHUB USERNAME>/matplotlib.git
   ```

4. Enter the directory and install the local version of Matplotlib. See ref `<installing_for_devs>` for instructions

5. Create a branch to hold your changes:
and start making changes. Never work in the master branch!

6. Work on this copy, on your computer, using Git to do the version control. When you're done editing e.g., lib/matplotlib/collections.py, do:

```
git add lib/matplotlib/collections.py
git commit
```

to record your changes in Git, then push them to GitHub with:

```
git push -u origin my-feature
```

Finally, go to the web page of your fork of the Matplotlib repo, and click 'Pull request' to send your changes to the maintainers for review.

- Git-Contributing to a Project
- Introduction to GitHub
- Development workflow for best practices for Matplotlib
- Working with Matplotlib source code

### 32.4.2 Contributing pull requests

It is recommended to check that your contribution complies with the following rules before submitting a pull request:

- If your pull request addresses an issue, please use the title to describe the issue and mention the issue number in the pull request description to ensure that a link is created to the original issue.

- All public methods should have informative docstrings with sample usage when appropriate. Use the numpy docstring standard.

- Formatting should follow the recommendations of PEP8. You should consider installing/enabling automatic PEP8 checking in your editor. Part of the test suite is checking PEP8 compliance, things go smoother if the code is mostly PEP8 compliant to begin with.

- Each high-level plotting function should have a simple example in the Example section of the docstring. This should be as simple as possible to demonstrate the method. More complex examples should go in the examples tree.

- Changes (both new features and bugfixes) should be tested. See Testing for more details.

- Import the following modules using the standard scipy conventions:
import numpy as np
import numpy.ma as ma
import matplotlib as mpl
import matplotlib.pyplot as plt
import matplotlib.cbook as cbook
import matplotlib.patches as mpatches

In general, Matplotlib modules should not import rcParams using from matplotlib import rcParams, but rather access it as mpl.rcParams. This is because some modules are imported very early, before the rcParams singleton is constructed.

- If your change is a major new feature, add an entry to the What's new section by adding a new file in doc/users/next_whats_new (see doc/users/next_whats_new/README.rst for more information).
- If you change the API in a backward-incompatible way, please document it in doc/api/next_api_changes/behavior, by adding a new file with the naming convention 99999-ABC.rst where the pull request number is followed by the contributor's initials. (see doc/api/api_changes.rst for more information)
- See below for additional points about Keyword argument processing, if applicable for your pull request.

In addition, you can check for common programming errors with the following tools:

- Code with a good unittest coverage (at least 70%, better 100%), check with:

```
python -m pip install coverage
python -m pytest --cov=matplotlib --showlocals -v
```

- No pyflakes warnings, check with:

```
python -m pip install pyflakes
pyflakes path/to/module.py
```

Note: The current state of the Matplotlib code base is not compliant with all of those guidelines, but we expect that enforcing those constraints on all new contributions will move the overall code base quality in the right direction.

See also:

- Coding guidelines
- Testing
- Writing documentation
32.5 Contributing documentation

You as an end-user of Matplotlib can make a valuable contribution because you more clearly see the potential for improvement than a core developer. For example, you can:

- Fix a typo
- Clarify a docstring
- Write or update an example plot
- Write or update a comprehensive tutorial

The documentation source files live in the same GitHub repository as the code. Contributions are proposed and accepted through the pull request process. For details see How to contribute.

If you have trouble getting started, you may instead open an issue describing the intended improvement.

See also:
- Writing documentation

32.6 Other ways to contribute

It also helps us if you spread the word: reference the project from your blog and articles or link to it from your website! If Matplotlib contributes to a project that leads to a scientific publication, please follow the Citing Matplotlib guidelines.

32.7 Coding guidelines

32.7.1 API changes

Changes to the public API must follow a standard deprecation procedure to prevent unexpected breaking of code that uses Matplotlib.

- Deprecations must be announced via a new file in a new file in doc/api/next_api_changes/deprecations/ with naming convention 99999-ABC.rst where 99999 is the pull request number and ABC are the contributor's initials.
- Deprecations are targeted at the next point-release (i.e. 3.x.0).
- The deprecated API should, to the maximum extent possible, remain fully functional during the deprecation period. In cases where this is not possible, the deprecation must never make a given piece of code do something different than it was before; at least an exception should be raised.
- If possible, usage of an deprecated API should emit a MatplotlibDeprecationWarning. There are a number of helper tools for this:
  - Use cbook.warn_deprecated() for general deprecation warnings.
– Use the decorator `@cbook.deprecated` to deprecate classes, functions, methods, or properties.

– To warn on changes of the function signature, use the decorators `@cbook._delete_parameter`, `@cbook._rename_parameter`, and `@cbook._make_keyword_only`.

• Deprecated API may be removed two point-releases after they were deprecated.

### 32.7.2 Adding new API

Every new function, parameter and attribute that is not explicitly marked as private (i.e., starts with an underscore) becomes part of Matplotlib's public API. As discussed above, changing the existing API is cumbersome. Therefore, take particular care when adding new API:

• Mark helper functions and internal attributes as private by prefixing them with an underscore.

• Carefully think about good names for your functions and variables.

• Try to adopt patterns and naming conventions from existing parts of the Matplotlib API.

• Consider making as many arguments keyword-only as possible. See also [API Evolution the Right Way -- Add Parameters Compatibly](#).

### 32.7.3 New modules and files: installation

• If you have added new files or directories, or reorganized existing ones, make sure the new files are included in the match patterns in `MANIFEST.in`, and/or in `package_data` in `setup.py`.

### 32.7.4 C/C++ extensions

• Extensions may be written in C or C++.

• Code style should conform to PEP7 (understanding that PEP7 doesn't address C++, but most of its admonitions still apply).

• Python/C interface code should be kept separate from the core C/C++ code. The interface code should be named `FOO_wrap.cpp` or `FOO_wrapper.cpp`.

• Header file documentation (aka docstrings) should be in Numpydoc format. We don't plan on using automated tools for these docstrings, and the Numpydoc format is well understood in the scientific Python community.
32.7.5 Keyword argument processing

Matplotlib makes extensive use of **kwargs for pass-through customizations from one function to another. A typical example is in matplotlib.pyplot.text. The definition of the pylab text function is a simple pass-through to matplotlib.axes.Axes.text:

```
# in pylab.py
def text(*args, **kwargs):
    ret = gca().text(*args, **kwargs)
    draw_if_interactive()
    return ret
```

text in simplified form looks like this, i.e., it just passes all args and kwargs on to matplotlib.text.Text.__init__:

```
# in axes/_axes.py
def text(self, x, y, s, fontdict=None, withdash=False, **kwargs):
    t = Text(x=x, y=y, text=s, **kwargs)
```

and matplotlib.text.Text.__init__ (again with liberties for illustration) just passes them on to the matplotlib.artist.Artist.update method:

```
# in text.py
def __init__(self, x=0, y=0, text='', **kwargs):
    super().__init__()
    self.update(kwargs)
```

update does the work looking for methods named like set_property if property is a keyword argument. i.e., no one looks at the keywords, they just get passed through the API to the artist constructor which looks for suitably named methods and calls them with the value.

As a general rule, the use of **kwargs should be reserved for pass-through keyword arguments, as in the example above. If all the keyword args are to be used in the function, and not passed on, use the key/value keyword args in the function definition rather than the **kwargs idiom.

In some cases, you may want to consume some keys in the local function, and let others pass through. Instead of popping arguments to use off **kwargs, specify them as keyword-only arguments to the local function. This makes it obvious at a glance which arguments will be consumed in the function. For example, in plot(), scalex and scaley are local arguments and the rest are passed on as Line2D() keyword arguments:

```
# in axes/_axes.py
def plot(self, *args, scalex=True, scaley=True, **kwargs):
    lines = []
    for line in self._get_lines(*args, **kwargs):
        self.add_line(line)
        lines.append(line)
```

32.7. Coding guidelines
32.7.6 Using logging for debug messages

Matplotlib uses the standard Python `logging` library to write verbose warnings, information, and debug messages. Please use it! In all those places you write `print` calls to do your debugging, try using `logging.debug` instead!

To include `logging` in your module, at the top of the module, you need to `import` `logging`. Then calls in your code like:

```python
_log = logging.getLogger(__name__)  # right after the imports

# code
# more code
_log.info('Here is some information')
_log.debug('Here is some more detailed information')
```

will log to a logger named `matplotlib.yourmodulename`.

If an end-user of Matplotlib sets up `logging` to display at levels more verbose than `logging.WARNING` in their code with the Matplotlib-provided helper:

```python
plt.set_loglevel("debug")
```

or manually with

```python
import logging
logging.basicConfig(level=logging.DEBUG)
import matplotlib.pyplot as plt
```

Then they will receive messages like:

```
DEBUG:matplotlib.backends:backend MacOSX version unknown
DEBUG:matplotlib.yourmodulename:Here is some information
DEBUG:matplotlib.yourmodulename:Here is some more detailed information
```

### Which logging level to use?

There are five levels at which you can emit messages.

- `logging.critical` and `logging.error` are really only there for errors that will end the use of the library but not kill the interpreter.

- `logging.warning` and `_api.warn_external` are used to warn the user, see below.

- `logging.info` is for information that the user may want to know if the program behaves oddly. They are not displayed by default. For instance, if an object isn’t drawn because its position is NaN, that can usually be ignored, but a mystified user could call `logging.basicConfig(level=logging.INFO)` and get an error message that says why.

- `logging.debug` is the least likely to be displayed, and hence can be the most verbose. "Expected" code paths (e.g., reporting normal intermediate steps of layouting or rendering) should only log at this level.
By default, `logging` displays all log messages at levels higher than `logging.WARNING` to `sys.stderr`.

The logging tutorial suggests that the difference between `logging.warning` and `_api.warn_external` (which uses `warnings.warn`) is that `_api.warn_external` should be used for things the user must change to stop the warning (typically in the source), whereas `logging.warning` can be more persistent. Moreover, note that `_api.warn_external` will by default only emit a given warning once for each line of user code, whereas `logging.warning` will display the message every time it is called.

By default, `warnings.warn` displays the line of code that has the `warn` call. This usually isn’t more informative than the warning message itself. Therefore, Matplotlib uses `_api.warn_external` which uses `warnings.warn`, but goes up the stack and displays the first line of code outside of Matplotlib. For example, for the module:

```
# in my_matplotlib_module.py
import warnings

def set_range(bottom, top):
    if bottom == top:
        warnings.warn('Attempting to set identical bottom==top')
```

running the script:

```
from matplotlib import my_matplotlib_module
my_matplotlib_module.set_range(0, 0)  #set range
```

will display:

```
UserWarning: Attempting to set identical bottom==top
warnings.warn('Attempting to set identical bottom==top')
```

Modifying the module to use `_api.warn_external`:

```
from matplotlib import _api

def set_range(bottom, top):
    if bottom == top:
        _api.warn_external('Attempting to set identical bottom==top')
```

and running the same script will display:

```
UserWarning: Attempting to set identical bottom==top
my_matplotlib_module.set_range(0, 0)  #set range
```
32.7.7 Writing examples

We have hundreds of examples in subdirectories of `matplotlib/examples`, and these are automatically generated when the website is built to show up in the examples section of the website.

Any sample data that the example uses should be kept small and distributed with Matplotlib in the `lib/matplotlib/mpl-data/sample_data/` directory. Then in your example code you can load it into a file handle with:

```python
import matplotlib.cbook as cbook
fh = cbook.get_sample_data('mydata.dat')
```
BUG TRIAGING AND ISSUE CURATION

The issue tracker is important to communication in the project because it serves as the centralized location for making feature requests, reporting bugs, identifying major projects to work on, and discussing priorities. For this reason, it is important to curate the issue list, adding labels to issues and closing issues that are resolved or unresolvable.

Triaging issues does not require any particular expertise in the internals of Matplotlib, is extremely valuable to the project, and we welcome anyone to participate in issue triage! However, people who are not part of the Matplotlib organization do not have permissions to change milestones, add labels, or close issue. If you do not have enough GitHub permissions do something (e.g. add a label, close an issue), please leave a comment tagging @matplotlib/triageteam with your recommendations!

33.1 Working on issues to improve them

Improving issues increases their chances of being successfully resolved. Guidelines on submitting good issues can be found here. A third party can give useful feedback or even add comments on the issue. The following actions are typically useful:

- documenting issues that are missing elements to reproduce the problem such as code samples
- suggesting better use of code formatting (e.g. triple back ticks in the markdown).
- suggesting to reformulate the title and description to make them more explicit about the problem to be solved
- linking to related issues or discussions while briefly describing how they are related, for instance "See also #xyz for a similar attempt at this" or "See also #xyz where the same thing was reported" provides context and helps the discussion
- verifying that the issue is reproducible
- classify the issue as a feature request, a long standing bug or a regression

Fruitful discussions

Online discussions may be harder than it seems at first glance, in particular given that a person new to open-source may have a very different understanding of the process than a seasoned maintainer.
Overall, it is useful to stay positive and assume good will. The following article explores how to lead online discussions in the context of open source.

### 33.2 Triage Team

If you would like to join the triage team:

1. Correctly triage 2-3 issues.
2. Ask someone on the triage team (publicly or privately) to recommend you to the triage team. If you worked with someone on the issue triaged, they would be a good person to ask.
3. Responsibly exercise your new power!

Anyone with commit or triage rights may also nominate a user to be invited to join the triage team.

### 33.3 Triaging operations for members of the core and triage teams

In addition to the above, members of the core team and the triage team can do the following important tasks:

- Update labels for issues and PRs: see the list of available github labels.

- Triage issues:
  - reproduce the issue, if the posted code is a bug label the issue with "status: confirmed bug".
  - identify regressions, determine if the reported bug used to work as expected in a recent version of Matplotlib and if so determine the last working version. Regressions should be milestone for the next bug-fix release and may be labeled as "Release critical".
  - close usage questions and politely point the reporter to use discourse or Stack Overflow instead and label as "community support".
  - close duplicate issues, after checking that they are indeed duplicate. Ideally, the original submitter moves the discussion to the older, duplicate issue
  - close issues that cannot be replicated, after leaving time (at least a week) to add extra information

### Closing issues: a tough call

When uncertain on whether an issue should be closed or not, it is best to strive for consensus with the original poster, and possibly to seek relevant expertise. However, when the issue is a usage question or has been considered as unclear for many years, then it should be closed.
# 33.4 A typical workflow for triaging issues

The following workflow\(^1\) is a good way to approach issue triaging:

1. **Thank the reporter for opening an issue**
   
   The issue tracker is many people’s first interaction with the Matplotlib project itself, beyond just using the library. As such, we want it to be a welcoming, pleasant experience.

2. **Is this a usage question? If so close it with a polite message.**

3. **Is the necessary information provided?**
   
   Check that the poster has filled in the issue template. If crucial information (the version of Python, the version of Matplotlib used, the OS, and the backend), is missing politely ask the original poster to provide the information.

4. **Is the issue minimal and reproducible?**
   
   For bug reports, we ask that the reporter provide a minimal reproducible example. See [this useful post](https://www.example.com) by Matthew Rocklin for a good explanation. If the example is not reproducible, or if it's clearly not minimal, feel free to ask the reporter if they can provide an example or simplify the provided one. Do acknowledge that writing minimal reproducible examples is hard work. If the reporter is struggling, you can try to write one yourself.

   If a reproducible example is provided, but you see a simplification, add your simpler reproducible example.

   If you can not reproduce the issue, please report that along with your OS, Python, and Matplotlib versions.

   If we need more information from either this or the previous step please label the issue with "status: needs clarification".

5. **Is this a regression?**
   
   While we strive for a bug-free library, regressions are the highest priority. If we have broken user-code that used to work, we should fix that in the next patch release!

   Try to determine when the regression happened by running the reproduction code against older versions of Matplotlib. This can be done by released versions of Matplotlib (to get the version it last worked in) or by using [git bisect](https://www.example.com) to find the first commit where it was broken.

6. **Is this a duplicate issue?**
   
   We have many open issues. If a new issue seems to be a duplicate, point to the original issue. If it is a clear duplicate, or consensus is that it is redundant, close it. Make sure to still thank the reporter, and encourage them to chime in on the original issue, and perhaps try to fix it.

   If the new issue provides relevant information, such as a better or slightly different example, add it to the original issue as a comment or an edit to the original post.

   Label the closed issue with "status: duplicate"

---

\(^1\) Adapted from the pandas project [maintainers guide](https://www.example.com) and the scikit-learn project.
7. Make sure that the title accurately reflects the issue. If you have the necessary permissions edit it yourself if it's not clear.

8. Add the relevant labels, such as "Documentation" when the issue is about documentation, "Bug" if it is clearly a bug, "New feature" if it is a new feature request, ...

   If the issue is clearly defined and the fix seems relatively straightforward, label the issue as “Good first issue” (and possibly a description of the fix or a hint as to where in the code base to look to get started).

   An additional useful step can be to tag the corresponding module e.g. the "GUI/Qt" label when relevant.

### 33.5 Working on PRs to help review

Reviewing code is also encouraged. Contributors and users are welcome to participate to the review process following our [review guidelines](#).

### 33.6 Acknowledgments

This page is lightly adapted from the [scikit-learn project](#).
SETT \n\n34.1 Creating a dedicated environment

You should set up a dedicated environment to decouple your Matplotlib development from other Python and
Matplotlib installations on your system. Here we use python's virtual environment venv, but you may also
use others such as conda.

A new environment can be set up with

```
python -m venv <file folder location>
```

and activated with one of the following:

```
source <file folder location>/bin/activate  # Linux/macOS
<file folder location>/Scripts\activate.bat # Windows cmd.exe
<file folder location>/Scripts\Activate.ps1  # Windows PowerShell
```

Whenever you plan to work on Matplotlib, remember to activate the development environment in your shell.

34.2 Retrieving the latest version of the code

Matplotlib is hosted at https://github.com/matplotlib/matplotlib.git.

You can retrieve the latest sources with the command (see Set up your fork for more details):

```
git clone https://github.com/matplotlib/matplotlib.git
```

This will place the sources in a directory matplotlib below your current working directory.

If you have the proper privileges, you can use git@ instead of https://, which works through the ssh
protocol and might be easier to use if you are using 2-factor authentication.
34.3 Installing Matplotlib in editable mode

Install Matplotlib in editable mode from the matplotlib directory using the command

```
python -m pip install -ve .
```

The 'editable/develop mode', builds everything and places links in your Python environment so that Python will be able to import Matplotlib from your development source directory. This allows you to import your modified version of Matplotlib without re-installing after every change. Note that this is only true for *.py files. If you change the C-extension source (which might also happen if you change branches) you will have to re-run `python -m pip install -ve .`.

34.4 Additional dependencies for testing

This section lists the additional software required for running the tests.

Required:

- pytest (>=3.6)
- Ghostscript (>= 9.0, to render PDF files)
- Inkscape (to render SVG files)

Optional:

- pytest-cov (>=2.3.1) to collect coverage information
- pytest-flake8 to test coding standards using flake8
- pytest-timeout to limit runtime in case of stuck tests
- pytest-xdist to run tests in parallel

34.5 Additional dependencies for building documentation

34.5.1 Python packages

The additional Python packages required to build the documentation are listed in doc-requirements.txt and can be installed using

```
pip install -r requirements/doc/doc-requirements.txt
```

The content of doc-requirements.txt is also shown below:

```
# Requirements for building docs
#
# You will first need a matching Matplotlib installation
# e.g (from the Matplotlib root directory)
```

(continues on next page)
34.5.2 Additional external dependencies

Required:

- a minimal working LaTeX distribution

- Graphviz

- the LaTeX packages cm-super and dvipng. If your OS bundles TexLive, then often the "complete" version of the installer will automatically include these packages (e.g. "texlive-full" or "texlive-all").

Optional, but recommended:

- Inkscape

- optipng

- the font "Humor Sans" (aka the "XKCD" font), or the free alternative Comic Neue.

- the font "Times New Roman"

Note: The documentation will not build without LaTeX and Graphviz. These are not Python packages and must be installed separately. The documentation can be built without Inkscape and optipng, but the build process will raise various warnings. If the build process warns that you are missing fonts, make sure your LaTeX distribution bundles cm-super or install it separately.
Matplotlib uses the pytest framework.

The tests are in lib/matplotlib/tests, and customizations to the pytest testing infrastructure are in matplotlib.testing.

### 35.1 Requirements

To run the tests you will need to set up Matplotlib for development. Note in particular the additional dependencies for testing.

**Note:** We will assume that you want to run the tests in a development setup.

While you can run the tests against a regular installed version of Matplotlib, this is a far less common use case. You still need the additional dependencies for testing. You have to additionally get the reference images from the repository, because they are not distributed with pre-built Matplotlib packages.

### 35.2 Running the tests

In the root directory of your development repository run:

```bash
pytest
```

pytest can be configured via a lot of command-line parameters. Some particularly useful ones are:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-v</code> or <code>--verbose</code></td>
<td>Be more verbose</td>
</tr>
<tr>
<td><code>-n NUM</code></td>
<td>Run tests in parallel over NUM processes (requires pytest-xdist)</td>
</tr>
<tr>
<td><code>--capture=no</code> or <code>--</code></td>
<td>Do not capture stdout</td>
</tr>
</tbody>
</table>

To run a single test from the command line, you can provide a file path, optionally followed by the function separated by two colons, e.g., (tests do not need to be installed, but Matplotlib should be):
An alternative implementation that does not look at command line arguments and works from within Python is to run the tests from the Matplotlib library function `matplotlib.test()`:

```python
import matplotlib
matplotlib.test()
```

## 35.3 Writing a simple test

Many elements of Matplotlib can be tested using standard tests. For example, here is a test from `matplotlib/tests/test_basic.py`:

```python
def test_simple():
    """
    very simple example test
    """
    assert 1 + 1 == 2
```

Pytest determines which functions are tests by searching for files whose names begin with "test_" and then within those files for functions beginning with "test" or classes beginning with "Test".

Some tests have internal side effects that need to be cleaned up after their execution (such as created figures or modified `rcParams`). The pytest fixture `matplotlib.testing.conftest.mpl_test_settings` will automatically clean these up; there is no need to do anything further.

## 35.4 Random data in tests

Random data is a very convenient way to generate data for examples, however the randomness is problematic for testing (as the tests must be deterministic!). To work around this set the seed in each test. For numpy use:

```python
import numpy as np
np.random.seed(19680801)
```

The seed is John Hunter's birthday.

## 35.5 Writing an image comparison test

Writing an image-based test is only slightly more difficult than a simple test. The main consideration is that you must specify the "baseline", or expected, images in the `image_comparison` decorator. For example, this test generates a single image and automatically tests it:

```python
from matplotlib.testing.decorators import image_comparison
import matplotlib.pyplot as plt
```
def test_line_dashes():
    fig, ax = plt.subplots()
    ax.plot(range(10), linestyle=(0, (3, 3)), lw=5)

The first time this test is run, there will be no baseline image to compare against, so the test will fail. Copy
the output images (in this case result_images/test_lines/test_line_dashes.png) to the
correct subdirectory of baseline_images tree in the source directory (in this case lib/matplotlib/
tests/baseline_images/test_lines). Put this new file under source code revision control (with git add). When rerunning the tests, they should now pass.

Baseline images take a lot of space in the Matplotlib repository. An alternative approach for image compar-
ison tests is to use the check_figures_equal decorator, which should be used to decorate a function
taking two Figure parameters and draws the same images on the figures using two different methods (the
tested method and the baseline method). The decorator will arrange for setting up the figures and then collect
the drawn results and compare them.

See the documentation of image_comparison and check_figures_equal for additional informa-
tion about their use.

### 35.6 Creating a new module in matplotlib.tests

We try to keep the tests categorized by the primary module they are testing. For example, the tests related
to the mathtext.py module are in test_mathtext.py.

### 35.7 Using GitHub Actions for CI

GitHub Actions is a hosted CI system "in the cloud".

GitHub Actions is configured to receive notifications of new commits to GitHub repos and to run builds or
tests when it sees these new commits. It looks for a YAML files in .github/workflows to see how to
test the project.

GitHub Actions is already enabled for the main Matplotlib GitHub repository -- for example, see the Tests
workflows.

GitHub Actions should be automatically enabled for your personal Matplotlib fork once the YAML workflow
files are in it. It generally isn't necessary to look at these workflows, since any pull request submitted against
the main Matplotlib repository will be tested.

You can see the GitHub Actions results at https://github.com/your_GitHub_user_name/matplotlib/actions --
here's an example.
35.8 Using tox

Tox is a tool for running tests against multiple Python environments, including multiple versions of Python (e.g., 3.6, 3.7) and even different Python implementations altogether (e.g., CPython, PyPy, Jython, etc.), as long as all these versions are available on your system's $PATH (consider using your system package manager, e.g. apt-get, yum, or Homebrew, to install them).

Tox makes it easy to determine if your working copy introduced any regressions before submitting a pull request. Here's how to use it:

```
$ pip install tox
$ tox
```

You can also run tox on a subset of environments:

```
$ tox -e py37,py38
```

Tox processes everything serially so it can take a long time to test several environments. To speed it up, you might try using a new, parallelized version of tox called detox. Give this a try:

```
$ pip install -U -i http://pypi.testrun.org detox
$ detox
```

Tox is configured using a file called tox.ini. You may need to edit this file if you want to add new environments to test (e.g., py33) or if you want to tweak the dependencies or the way the tests are run. For more info on the tox.ini file, see the Tox Configuration Specification.

35.9 Building old versions of Matplotlib

When running a git bisect to see which commit introduced a certain bug, you may (rarely) need to build very old versions of Matplotlib. The following constraints need to be taken into account:

- Matplotlib 1.3 (or earlier) requires numpy 1.8 (or earlier).

35.10 Testing released versions of Matplotlib

Running the tests on an installation of a released version (e.g. PyPI package or conda package) also requires additional setup.

Note: For an end-user, there is usually no need to run the tests on released versions of Matplotlib. Official releases are tested before publishing.
35.10.1 Install additional dependencies

Install the *additional dependencies for testing.*

35.10.2 Obtain the reference images

Many tests compare the plot result against reference images. The reference images are not part of the regular packaged versions (pip wheels or conda packages). If you want to run tests with reference images, you need to obtain the reference images matching the version of Matplotlib you want to test.

To do so, either download the matching source distribution `matplotlib-X.Y.Z.tar.gz` from PyPI or alternatively, clone the git repository and `git checkout vX.Y.Z`. Copy the folder `lib/matplotlib/tests/baseline_images` to the folder `matplotlib/tests` of your the matplotlib installation to test. The correct target folder can be found using:

```
python -c "import matplotlib.tests; print(matplotlib.tests.__file__.rsplit('/', 1)[0])"
```

An analogous copying of `lib/mpl_toolkits/tests/baseline_images` is necessary for testing the *Toolkits.*

35.10.3 Run the tests

To run the all the tests on your installed version of Matplotlib:

```
pytest --pyargs matplotlib.tests
```

The test discovery scope can be narrowed to single test modules or even single functions:

```
pytest --pyargs matplotlib.tests.test_simplification.py::test_clipping
```
WRITING DOCUMENTATION

    * Wrapping parameter lists
36.1 Getting started

36.1.1 General file structure

All documentation is built from the doc/, tutorials/, and examples/ directories. The doc/ directory contains configuration files for Sphinx and reStructuredText (ReST; .rst) files that are rendered to documentation pages.

The main entry point is doc/index.rst, which pulls in the index.rst file for the users guide (doc/users), developers guide (doc/devel), api reference (doc/api), and FAQs (doc/faq). The documentation suite is built as a single document in order to make the most effective use of cross referencing.

Sphinx also creates .rst files that are staged in doc/api from the docstrings of the classes in the Matplotlib library. Except for doc/api/api_changes/, these .rst files are created when the documentation is built.

Similarly, the contents of doc/gallery and doc/tutorials are generated by the Sphinx Gallery from the sources in examples/ and tutorials/. These sources consist of python scripts that have ReST documentation built into their comments.

Note: Don't directly edit the .rst files in doc/gallery, doc/tutorials, and doc/api (excepting doc/api/api_changes/). Sphinx regenerates files in these directories when building documentation.
36.1.2 Setting up the doc build

The documentation for Matplotlib is generated from reStructuredText (ReST) using the Sphinx documentation generation tool.

To build the documentation you will need to set up Matplotlib for development. Note in particular the additional dependencies required to build the documentation.

36.1.3 Building the docs

The documentation sources are found in the doc/ directory in the trunk. The configuration file for Sphinx is doc/conf.py. It controls which directories Sphinx parses, how the docs are built, and how the extensions are used. To build the documentation in html format, cd into doc/ and run:

```make
make html
```

Other useful invocations include

```
# Delete built files. May help if you get errors about missing paths or
# broken links.
made clean

# Build pdf docs.
made latexpdf
```

The SPHINXOPTS variable is set to -W --keep-going by default to build the complete docs but exit with exit status 1 if there are warnings. To unset it, use

```make
make SPHINXOPTS= html
```

On Windows the arguments must be at the end of the statement:

```make
make html SPHINXOPTS=
```

You can use the O variable to set additional options:

- make O=-j4 html runs a parallel build with 4 processes.
- make O=-Dplot_formats=png:100 html saves figures in low resolution.
- make O=-Dplot_gallery=0 html skips the gallery build.

Multiple options can be combined using e.g. make O='-j4 -Dplot_gallery=0' html.

On Windows, either use the format shown above or set options as environment variables, e.g.:

```make
set O=-W --keep-going -j4
make html
```
36.2 Writing ReST pages

Most documentation is either in the docstring of individual classes and methods, in explicit .rst files, or in examples and tutorials. All of these use the ReST syntax. Users should look at the ReST documentation for a full description. But some specific hints and conventions Matplotlib uses are useful for creating documentation.

36.2.1 Formatting and style conventions

It is useful to strive for consistency in the Matplotlib documentation. Here are some formatting and style conventions that are used.

Section name formatting

For everything but top-level chapters, use Upper lower for section titles, e.g., Possible hangups rather than Possible Hangups

Function arguments

Function arguments and keywords within docstrings should be referred to using the *emphasis* role. This will keep Matplotlib's documentation consistent with Python's documentation:

Here is a description of *argument*

Do not use the `default role`:

Do not describe `argument` like this. As per the next section, this syntax will (unsuccessfully) attempt to resolve the argument as a link to a class or method in the library.

nor the `literal` role:

Do not describe `argument` like this.

36.2.2 Referring to other documents and sections

Sphinx allows internal references between documents.

Documents can be linked with the :doc: directive:

See the :doc:`/faq/installing_faq`

See the tutorial :doc:`/tutorials/introductory/sample_plots`

See the example :doc:`/gallery/lines_bars_and_markers/simple_plot`
will render as:

See the *Installation*

See the tutorial *Sample plots in Matplotlib*

See the example /gallery/lines_bars_and_markers/simple_plot

Sections can also be given reference names. For instance from the *Installation* link:

```bash
.. _clean-install:

How to completely remove Matplotlib
===================================
Occasionally, problems with Matplotlib can be solved with a clean...
```

and refer to it using the standard reference syntax:

```
See :ref:`clean-install`
```

will give the following link: *How to completely remove Matplotlib*

To maximize internal consistency in section labeling and references, use hyphen separated, descriptive labels for section references. Keep in mind that contents may be reorganized later, so avoid top level names in references like `user` or `devel` or `faq` unless necessary, because for example the FAQ "what is a backend?" could later become part of the users guide, so the label:

```bash
.. _what-is-a-backend:
```

is better than:

```bash
.. _faq-backend:
```

In addition, since underscores are widely used by Sphinx itself, use hyphens to separate words.

### 36.2.3 Referring to other code

To link to other methods, classes, or modules in Matplotlib you can use back ticks, for example:

```python
.matplotlib.collections.LineCollection`
```

generates a link like this: `matplotlib.collections.LineCollection`.

*Note:* We use the sphinx setting `default_role = 'obj'` so that you don't have to use qualifiers like `:class:`, `:func:`, `:meth:` and the likes.

Often, you don't want to show the full package and module name. As long as the target is unambiguous you can simply leave them out:

```python
.LineCollection`
```
and the link still works: `LineCollection`.

If there are multiple code elements with the same name (e.g. `plot()` is a method in multiple classes), you'll have to extend the definition:

```
`pyplot.plot` or `Axes.plot`
```

These will show up as `pyplot.plot` or `Axes.plot`. To still show only the last segment you can add a tilde as prefix:

```
`~pyplot.plot` or `~Axes.plot`
```

will render as `plot` or `plot`.

Other packages can also be linked via `intersphinx`:

```
`numpy.mean`
```

will return this link: `numpy.mean`. This works for Python, Numpy, Scipy, and Pandas (full list is in `doc/conf.py`). If external linking fails, you can check the full list of referenceable objects with the following commands:

```
python -m sphinx.ext.intersphinx 'https://docs.python.org/3/objects.inv'
python -m sphinx.ext.intersphinx 'https://docs.scipy.org/doc/numpy/objects.inv`
```

```
```

### 36.2.4 Including figures and files

Image files can directly included in pages with the `image::` directive. e.g., `thirdpartypackages/index.rst` displays the images for the third-party packages as static images:

```
.. image:: /_static/toolbar.png
```

as rendered on the page: `Third party packages`.

Files can be included verbatim. For instance the `matplotlibrc` file is important for customizing Matplotlib, and is included verbatim in the tutorial in `Customizing Matplotlib with style sheets and rcParams`:

```
.. literalinclude:: ../../_static/matplotlibrc
```

This is rendered at the bottom of `Customizing Matplotlib with style sheets and rcParams`. Note that this is in a tutorial; see `Writing examples and tutorials` below.

The examples directory is also copied to `doc/gallery` by `sphinx-gallery`, so plots from the examples directory can be included using
.. plot:: gallery/lines_bars_and_markers/simple_plot.py

Note that the python script that generates the plot is referred to, rather than any plot that is created. Sphinx-gallery will provide the correct reference when the documentation is built.

## 36.3 Writing docstrings

Most of the API documentation is written in docstrings. These are comment blocks in source code that explain how the code works.

**Note:** Some parts of the documentation do not yet conform to the current documentation style. If in doubt, follow the rules given here and not what you may see in the source code. Pull requests updating docstrings to the current style are very welcome.

All new or edited docstrings should conform to the numpydoc docstring guide. Much of the ReST syntax discussed above (Writing ReST pages) can be used for links and references. These docstrings eventually populate the doc/api directory and form the reference documentation for the library.

### 36.3.1 Example docstring

An example docstring looks like:

```python
def hlines(self, y, xmin, xmax, colors='k', linestyles='solid',
         label='', **kwargs):
    #"
    # Plot horizontal lines at each *y* from *xmin* to *xmax*.
    
    Parameters
    ----------
    y : float or array-like
        y-indexes where to plot the lines.
    xmin, xmax : float or array-like
        Respective beginning and end of each line. If scalars are provided, all lines will have the same length.
    colors : array-like of colors, default: 'k'
    linestyles : {'solid', 'dashed', 'dashdot', 'dotted'}, default: 'solid'
    label : str, default: ''

    Returns
    ------
    lines : `~matplotlib.collections.LineCollection`
```

(continues on next page)
Other Parameters

**kwargs : `~matplotlib.collections.LineCollection` properties

See also

vlines : vertical lines
axhline: horizontal line across the axes

See the `hlines` documentation for how this renders.

The `Sphinx` website also contains plenty of documentation concerning ReST markup and working with Sphinx in general.

### 36.3.2 Formatting conventions

The basic docstring conventions are covered in the `numpydoc` docstring guide and the `Sphinx` documentation. Some Matplotlib-specific formatting conventions to keep in mind:

#### Quote positions

The quotes for single line docstrings are on the same line (pydocstyle D200):

```python
def get_linewidth(self):
    """Return the line width in points."""
```

The quotes for multi-line docstrings are on separate lines (pydocstyle D213):

```python
def set_linestyle(self, ls):
    """Set the linestyle of the line.
    [
    [...]  
    """
```

#### Function arguments

Function arguments and keywords within docstrings should be referred to using the `*emphasis*` role. This will keep Matplotlib's documentation consistent with Python's documentation:

```python
If *linestyles* is *None*, the default is 'solid'.
```

Do not use the `default role` or the ```literal``` role:

```python
Neither `argument` nor `argument` should be used.
```
Quotes for strings

Matplotlib does not have a convention whether to use single-quotes or double-quotes. There is a mixture of both in the current code.

Use simple single or double quotes when giving string values, e.g.

```python
If 'tight', try to figure out the tight bbox of the figure.
No ```'extra'``` literal quotes.
```

The use of extra literal quotes around the text is discouraged. While they slightly improve the rendered docs, they are cumbersome to type and difficult to read in plain-text docs.

Parameter type descriptions

The main goal for parameter type descriptions is to be readable and understandable by humans. If the possible types are too complex use a simplification for the type description and explain the type more precisely in the text.

Generally, the numpydoc docstring guide conventions apply. The following rules expand on them where the numpydoc conventions are not specific.

Use `float` for a type that can be any number.

Use `(float, float)` to describe a 2D position. The parentheses should be included to make the tuple-ness more obvious.

Use `array-like` for homogeneous numeric sequences, which could typically be a numpy.array. Dimensionality may be specified using 2D, 3D, n-dimensional. If you need to have variables denoting the sizes of the dimensions, use capital letters in brackets ((M, N) array-like). When referring to them in the text they are easier read and no special formatting is needed. Use `array` instead of `array-like` for return types if the returned object is indeed a numpy array.

`float` is the implicit default dtype for array-likes. For other dtypes use `array-like of int`.

Some possible uses:

```python
2D array-like
(N,) array-like
(M, N) array-like
(M, N, 3) array-like
array-like of int
```

Non-numeric homogeneous sequences are described as lists, e.g.:

```python
list of str
list of `.Artist`
```
Referencing types

Generally, the rules from referring-to-other-code apply. More specifically:

Use full references `~matplotlib.colors.Normalize` with an abbreviation tilde in parameter types. While the full name helps the reader of plain text docstrings, the HTML does not need to show the full name as it links to it. Hence, the ~-shortening keeps it more readable.

Use abbreviated links `.Normalize` in the text.

```
norm : `~matplotlib.colors.Normalize`, optional
    A `.Normalize` instance is used to scale luminance data to 0, 1.
```

Default values

As opposed to the numpydoc guide, parameters need not be marked as optional if they have a simple default:

- use `{name} : {type}, default: {val}` when possible.
- use `{name} : {type}, optional` and describe the default in the text if it cannot be explained sufficiently in the recommended manner.

The default value should provide semantic information targeted at a human reader. In simple cases, it restates the value in the function signature. If applicable, units should be added.

```
Prefer:
    interval : int, default: 1000ms
over:
    interval : int, default: 1000
```

If `None` is only used as a sentinel value for "parameter not specified", do not document it as the default. Depending on the context, give the actual default, or mark the parameter as optional if not specifying has no particular effect.

```
Prefer:
    dpi : float, default: :rc:`figure.dpi`
over:
    dpi : float, default: None

Prefer:
    textprops : dict, optional
        Dictionary of keyword parameters to be passed to the 
        `~matplotlib.text.Text` instance contained inside TextArea.
over:
    textprops : dict, default: None
        Dictionary of keyword parameters to be passed to the 
        `~matplotlib.text.Text` instance contained inside TextArea.
```
See also sections

Sphinx automatically links code elements in the definition blocks of See also sections. No need to use backticks there:

```
See also
-------
vlines : vertical lines
axhline: horizontal line across the axes
```

Wrapping parameter lists

Long parameter lists should be wrapped using a \ for continuation and starting on the new line without any indent (no indent because pydoc will parse the docstring and strip the line continuation so that indent would result in a lot of whitespace within the line):

```python
def add_axes(self, *args, **kwargs):
    """
    ...
    Parameters
    ----------
    projection : {'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', \n    'rectilinear'}, optional
        The projection type of the axes.
    ...
    """
```

Alternatively, you can describe the valid parameter values in a dedicated section of the docstring.

rcParams

rcParams can be referenced with the custom :rc: role: :rc:`foo` yields `rcParams["foo"] = 'default', which is a link to the matplotlibrc file description.

36.3.3 Setters and getters

Artist properties are implemented using setter and getter methods (because Matplotlib predates the introductions of the property decorator in Python). By convention, these setters and getters are named set_PROPERTYNAME and getPROPERTYNAME; the list of properties thusly defined on an artist and their values can be listed by the setp and getp functions.

The Parameters block of property setter methods is parsed to document the accepted values, e.g. the docstring of `Line2D.set_linestyle` starts with
```
def set_linestyle(self, ls):
    """
    Set the linestyle of the line.
    
    Parameters
    ----------
    ls : {'-', '--', '-.', ':', '', (offset, on-off-seq), ...} etc.
    """
```

which results in the following line in the output of `plt.setp(line)` or `plt.setp(line, "linestyle")`:

```
linestyle or ls: {'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
```

In some rare cases (mostly, setters which accept both a single tuple and an unpacked tuple), the accepted values cannot be documented in such a fashion; in that case, they can be documented as an .. ACCEPTS: block, e.g. for `axes.Axes.set_xlim`:

```
def set_xlim(self, ...):
    """
    Set the x-axis view limits.
    
    Parameters
    ----------
    left : float, optional
        The left xlim in data coordinates. Passing *None* leaves the
        limit unchanged.
        
        The left and right xlims may also be passed as the tuple
        (*left*, *right*) as the first positional argument (or as
        the *left* keyword argument).
        
        .. ACCEPTS: (bottom: float, top: float)
        
    right : float, optional
        etc.
    """
```

Note that the leading .. makes the .. ACCEPTS: block a reST comment, hiding it from the rendered docs.

### 36.3.4 Keyword arguments

**Note:** The information in this section is being actively discussed by the development team, so use the docstring interpolation only if necessary. This section has been left in place for now because this interpolation is part of the existing documentation.

Since Matplotlib uses a lot of pass-through `kwargs`, e.g., in every function that creates a line (`plot`, `semilogx`, `semilogy`, etc...), it can be difficult for the new user to know which `kwargs` are supported.
Matplotlib uses a docstring interpolation scheme to support documentation of every function that takes a
**kwargs. The requirements are:

1. single point of configuration so changes to the properties don't require multiple docstring edits.
2. as automated as possible so that as properties change, the docs are updated automatically.

The function `matplotlib.artist.kwdoc` and the decorator `matplotlib.docstring.dedent_interpd` facilitate this. They combine Python string interpolation in the docstring with the Matplotlib artist introspection facility that underlies `setp` and `getp`. The `kwdoc` function gives the list of properties as a docstring. In order to use this in another docstring, first update the `matplotlib.docstring.interpd` object, as seen in this example from `matplotlib.lines`:

```python
# in lines.py
docstring.interpd.update(Line2D_kwdoc=artist.kwdoc(Line2D))
```

Then in any function accepting `Line2D` pass-through `kwargs`, e.g., `matplotlib.axes.Axes.plot`:

```python
# in axes.py
@docstring.dedent_interpd
def plot(self, *args, **kwargs):
    
    Some stuff omitted

    Other Parameters
    ----------------
    scalex, scaley : bool, default: True
    These parameters determine if the view limits are adapted to the data limits. The values are passed on to 'autoscale_view'.

    **kwargs : `.Line2D` properties, optional
    *kwargs* are used to specify properties like a line label (for auto legends), linewidth, antialiasing, marker face color.
    Example:

    >>> plot([1, 2, 3], [1, 2, 3], 'go-', label='line 1', linewidth=2)
    >>> plot([1, 2, 3], [1, 4, 9], 'rs', label='line 2')

    If you specify multiple lines with one plot call, the `kwargs` apply to all those lines. In case the label object is iterable, each element is used as labels for each set of data.

    Here is a list of available `.Line2D` properties:

    %(Line2D_kwdoc)s

    ````
```

Note there is a problem for `Artist __init__` methods, e.g., `matplotlib.patches.Patch.__init__`, which supports `Patch` `kwargs`, since the artist inspector cannot work until the class is fully defined and we can't modify the `Patch.__init__.__doc__` docstring outside the class definition. There are some some manual hacks in this case, violating the "single entry point" requirement above -- see the `docstring.interpd.update` calls in `matplotlib.patches`.

---

36.3. Writing docstrings 3235
36.3.5 Inheriting docstrings

If a subclass overrides a method but does not change the semantics, we can reuse the parent docstring for the method of the child class. Python does this automatically, if the subclass method does not have a docstring.

Use a plain comment `# docstring inherited` to denote the intention to reuse the parent docstring. That way we do not accidentally create a docstring in the future:

```python
class A:
    def foo():
        """The parent docstring."""
        pass

class B(A):
    def foo():
        # docstring inherited
        pass
```

36.3.6 Adding figures

As above (see Including figures and files), figures in the examples gallery can be referenced with a `:plot:` directive pointing to the python script that created the figure. For instance the `legend` docstring references the file `examples/text_labels_and_annotations/legend.py`:

```python
"""
...
Examples
--------
.. plot:: gallery/text_labels_and_annotations/legend.py
"""

Note that `examples/text_labels_and_annotations/legend.py` has been mapped to `gallery/text_labels_and_annotations/legend.py`, a redirection that may be fixed in future re-organization of the docs.

Plots can also be directly placed inside docstrings. Details are in `matplotlib.sphinxext.plot_directive`. A short example is:

```python
"""
...
Examples
--------
.. plot::
    import matplotlib.image as mpimg
    img = mpimg.imread('_static/stinkbug.png')
    imgplot = plt.imshow(img)
"""
```
An advantage of this style over referencing an example script is that the code will also appear in interactive docstrings.

36.4 Writing examples and tutorials

Examples and tutorials are python scripts that are run by Sphinx Gallery to create a gallery of images in the /doc/gallery and /doc/tutorials directories respectively. To exclude an example from having an plot generated insert "sgskip" somewhere in the filename.

The format of these files is relatively straightforward. Properly formatted comment blocks are treated as ReST text, the code is displayed, and figures are put into the built page.

For instance the example /gallery/lines_bars_and_markers/simple_plot example is generated from /examples/lines_bars_and_markers/simple_plot.py, which looks like:

```python
# Data for plotting
t = np.arange(0.0, 2.0, 0.01)
s = 1 + np.sin(2 * np.pi * t)

# Note that using plt.subplots below is equivalent to using
# fig = plt.figure and then ax = fig.add_subplot(111)
fig, ax = plt.subplots()
ax.plot(t, s)
ax.set(xlabel='time (s)', ylabel='voltage (mV)',
       title='About as simple as it gets, folks')
ax.grid()
plt.show()
```

The first comment block is treated as ReST text. The other comment blocks render as comments in /gallery/lines_bars_and_markers/simple_plot.

Tutorials are made with the exact same mechanism, except they are longer, and typically have more than one comment block (i.e. Usage Guide). The first comment block can be the same as the example above. Subsequent blocks of ReST text are delimited by a line of ### characters:
Create a simple plot.

```python
from matplotlib import pyplot as plt

fig, ax = plt.subplots()
ax.plot(np.sin(range(50)))
plt.show()
```

In this way text, code, and figures are output in a "notebook" style.

### 36.4.1 References for sphinx-gallery

The showcased Matplotlib functions should be listed in an admonition at the bottom as follows:

```bash
# References

.. admonition:: References
   :class: admonition

   The use of the following functions, methods, classes and modules is shown in this example:

   - `matplotlib.axes.Axes.fill` / `matplotlib.pyplot.fill`
   - `matplotlib.axes.Axes.axis` / `matplotlib.pyplot.axis`
```

This allows sphinx-gallery to place an entry to the example in the mini-gallery of the mentioned functions. Whether or not a function is mentioned here should be decided depending on if a mini-gallery link prominently helps to illustrate that function; e.g. mention `matplotlib.pyplot.subplots` only in examples that are about laying out subplots, not in every example that uses it.

Functions that exist in `pyplot` as well as in Axes or Figure should mention both references no matter which one is used in the example code. The `pyplot` reference should always be the second to mention; see the example above.
36.4.2 Order of examples in the gallery

The order of the sections of the Tutorials and the gallery, as well as the order of the examples within each section are determined in a two step process from within the /doc/sphinxext/gallery_order.py:

- **Explicit order**: This file contains a list of folders for the section order and a list of examples for the subsection order. The order of the items shown in the doc pages is the order those items appear in those lists.

- **Implicit order**: If a folder or example is not in those lists, it will be appended after the explicitly ordered items and all of those additional items will be ordered by pathname (for the sections) or by filename (for the subsections).

As a consequence, if you want to let your example appear in a certain position in the gallery, extend those lists with your example. In case no explicit order is desired or necessary, still make sure to name your example consistently, i.e. use the main function or subject of the example as first word in the filename; e.g. an image example should ideally be named similar to `imshow_mynewexample.py`.

36.5 Miscellaneous

36.5.1 Moving documentation

Sometimes it is desirable to move or consolidate documentation. With no action this will lead to links either going dead (404) or pointing to old versions of the documentation. Preferable is to replace the old page with an html refresh that immediately redirects the viewer to the new page. So, for example we move `/doc/topic/old_info.rst` to `/doc/topic/new_info.rst`. We remove `/doc/topic/old_info.rst` and in `/doc/topic/new_info.rst` we insert a `redirect-from` directive that tells sphinx to still make the old file with the html refresh/redirect in it (probably near the top of the file to make it noticeable)

```plaintext
.. redirect-from:: /topic/old_info
```

In the built docs this will yield an html file `/build/html/topic/old_info.html` that has a refresh to `new_info.html`. If the two files are in different subdirectories:

```plaintext
.. redirect-from:: /old_topic/old_info2
```

will yield an html file `/build/html/old_topic/old_info2.html` that has a (relative) refresh to `..topic/new_info.html`.

36.5.2 Adding animations

Animations are scraped automatically by Sphinx-gallery. If this is not desired, there is also a Matplotlib Google/Gmail account with username mplgithub which was used to setup the github account but can be used for other purposes, like hosting Google docs or Youtube videos. You can embed a Matplotlib animation in the docs by first saving the animation as a movie using `matplotlib.animation.Animation.save()`, and then uploading to Matplotlib's Youtube channel and inserting the embedding string youtube provides like:

```raw:: html
<iframe width="420" height="315"
    src="http://www.youtube.com/embed/32cjc6V0OZY"
    frameborder="0" allowfullscreen>
</iframe>
```

An example save command to generate a movie looks like this

```python
ani = animation.FuncAnimation(fig, animate, np.arange(1, len(y)),
    interval=25, blit=True, init_func=init)
ani.save('double_pendulum.mp4', fps=15)
```

Contact Michael Droettboom for the login password to upload youtube videos of google docs to the mplgithub account.

36.5.3 Generating inheritance diagrams

Class inheritance diagrams can be generated with the `inheritance-diagram` directive. To use it, provide the directive with a number of class or module names (separated by whitespace). If a module name is provided, all classes in that module will be used. All of the ancestors of these classes will be included in the inheritance diagram.

A single option is available: `parts` controls how many of parts in the path to the class are shown. For example, if `parts == 1`, the class `matplotlib.patches.Patch` is shown as `Patch`. If `parts == 2`, it is shown as `patches.Patch`. If `parts == 0`, the full path is shown.

Example:

```inheritance-diagram:: matplotlib.patches matplotlib.lines matplotlib.text
  :parts: 2
```
36.5.4 Emacs helpers

There is an emacs mode `rst.el` which automates many important ReST tasks like building and updating table-of-contents, and promoting or demoting section headings. Here is the basic `.emacs` configuration:

```lisp
(require 'rst)
(setq auto-mode-alist
      (append '((("\\.txt\$" . rst-mode)
                   ("\\.rst\$" . rst-mode)
                 ("\\.rest\$" . rst-mode)) auto-mode-alist))
```

Some helpful functions:

C-c TAB - rst-toc-insert

Insert table of contents at point

C-c C-u - rst-toc-update

Update the table of contents at point

C-c C-l rst-shift-region-left

Shift region to the left

C-c C-r rst-shift-region-right

(continues on next page)
| Shift region to the right |
Matplotlib supports the addition of custom procedures that transform the data before it is displayed.

There is an important distinction between two kinds of transformations. Separable transformations, working on a single dimension, are called "scales", and non-separable transformations, that handle data in two or more dimensions at a time, are called "projections".

From the user's perspective, the scale of a plot can be set with `Axes.set_xscale` and `Axes.set_yscale`. Projections can be chosen using the `projection` keyword argument of functions that create Axes, such as `pyplot.subplot` or `pyplot.axes`, e.g.

```python
plt.subplot(projection="custom")
```

This document is intended for developers and advanced users who need to create new scales and projections for Matplotlib. The necessary code for scales and projections can be included anywhere: directly within a plot script, in third-party code, or in the Matplotlib source tree itself.

### 37.1 Creating a new scale

Adding a new scale consists of defining a subclass of `matplotlib.scale.ScaleBase`, that includes the following elements:

- A transformation from data coordinates into display coordinates.
- An inverse of that transformation. This is used, for example, to convert mouse positions from screen space back into data space.
- A function to limit the range of the axis to acceptable values (`limit_range_for_scale()`). A log scale, for instance, would prevent the range from including values less than or equal to zero.
- Locators (major and minor) that determine where to place ticks in the plot, and optionally, how to adjust the limits of the plot to some "good" values. Unlike `limit_range_for_scale()`, which is always enforced, the range setting here is only used when automatically setting the range of the plot.
- Formatters (major and minor) that specify how the tick labels should be drawn.

Once the class is defined, it must be registered with Matplotlib so that the user can select it.
A full-fledged and heavily annotated example is in /gallery/scales/custom_scale. There are also some classes in `matplotlib.scale` that may be used as starting points.

### 37.2 Creating a new projection

Adding a new projection consists of defining a projection axes which subclasses `matplotlib.axes.Axes` and includes the following elements:

- A transformation from data coordinates into display coordinates.
- An inverse of that transformation. This is used, for example, to convert mouse positions from screen space back into data space.
- Transformations for the gridlines, ticks and ticklabels. Custom projections will often need to place these elements in special locations, and Matplotlib has a facility to help with doing so.
- Setting up default values (overriding `cla()`), since the defaults for a rectilinear axes may not be appropriate.
- Defining the shape of the axes, for example, an elliptical axes, that will be used to draw the background of the plot and for clipping any data elements.
- Defining custom locators and formatters for the projection. For example, in a geographic projection, it may be more convenient to display the grid in degrees, even if the data is in radians.
- Set up interactive panning and zooming. This is left as an "advanced" feature left to the reader, but there is an example of this for polar plots in `matplotlib.projections.polar`.
- Any additional methods for additional convenience or features.

Once the projection axes is defined, it can be used in one of two ways:

- By defining the class attribute `name`, the projection axes can be registered with `matplotlib.projections.register_projection()` and subsequently simply invoked by name:

  ```python
  plt.axes(projection='my_proj_name')
  ```

- For more complex, parameterisable projections, a generic "projection" object may be defined which includes the method `_as_mpl_axes`. `_as_mpl_axes` should take no arguments and return the projection's axes subclass and a dictionary of additional arguments to pass to the subclass' `__init__` method. Subsequently a parameterised projection can be initialised with:

  ```python
  plt.axes(projection=MyProjection(param1=param1_value))
  ```

  where `MyProjection` is an object which implements a `_as_mpl_axes` method.

A full-fledged and heavily annotated example is in /gallery/misc/custom_projection. The polar plot functionality in `matplotlib.projections.polar` may also be of interest.
37.3 API documentation

- `matplotlib.scale`
- `matplotlib.projections`
- `matplotlib.projections.polar`
WORKING WITH MATPLOTLIB SOURCE CODE

Contents:

38.1 Introduction

These pages describe a git and github workflow for the Matplotlib project.

There are several different workflows here, for different ways of working with Matplotlib.

This is not a comprehensive git reference, it's just a workflow for our own project. It's tailored to the github hosting service. You may well find better or quicker ways of getting stuff done with git, but these should get you started.

For general resources for learning git, see git resources.

38.2 Install git

38.2.1 Overview

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Installation Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debian / Ubuntu</td>
<td>sudo apt-get install git</td>
</tr>
<tr>
<td>Fedora</td>
<td>sudo yum install git</td>
</tr>
<tr>
<td>Windows</td>
<td>Download and install msysGit</td>
</tr>
<tr>
<td>OS X</td>
<td>Use the git-osx-installer</td>
</tr>
</tbody>
</table>

38.2.2 In detail

See the git page for the most recent information.

Have a look at the github install help pages available from github help

There are good instructions here: https://git-scm.com/book/en/v2/Getting-Started-Installing-Git
38.3 Following the latest source

These are the instructions if you just want to follow the latest Matplotlib source, but you don't need to do any development for now.

The steps are:

- Install git
- get local copy of the Matplotlib github git repository
- update local copy from time to time

38.3.1 Get the local copy of the code

From the command line:

```bash
git clone git://github.com/matplotlib/matplotlib.git
```

You now have a copy of the code tree in the new matplotlib directory.

38.3.2 Updating the code

From time to time you may want to pull down the latest code. Do this with:

```bash
cd matplotlib
git pull
```

The tree in matplotlib will now have the latest changes from the initial repository.

38.4 Making a patch

You've discovered a bug or something else you want to change in Matplotlib .. — excellent!
You've worked out a way to fix it — even better!
You want to tell us about it — best of all!

The easiest way is to make a patch or set of patches. Here we explain how. Making a patch is the simplest and quickest, but if you're going to be doing anything more than simple quick things, please consider following the Git for development model instead.
38.4.1 Making patches

Overview

```bash
# tell git who you are
git config --global user.email you@yourdomain.example.com
git config --global user.name "Your Name Comes Here"
# get the repository if you don't have it
git clone git://github.com/matplotlib/matplotlib.git
# make a branch for your patching
cd matplotlib
git branch the-fix-im-thinking-of
git checkout the-fix-im-thinking-of
# hack, hack, hack
# Tell git about any new files you've made
git add somewhere/tests/test_my_bug.py
# commit work in progress as you go
git commit -am 'BF - added tests for Funny bug'
# hack, hack
git commit -am 'BF - added fix for Funny bug'
# make the patch files
git format-patch -M -C master
```

Then, send the generated patch files to the Matplotlib mailing list — where we will thank you warmly.

In detail

1. Tell git who you are so it can label the commits you've made:

```bash
git config --global user.email you@yourdomain.example.com
git config --global user.name "Your Name Comes Here"
```

2. If you don't already have one, clone a copy of the Matplotlib repository:

```bash
git clone git://github.com/matplotlib/matplotlib.git
cd matplotlib
```

3. Make a 'feature branch'. This will be where you work on your bug fix. It's nice and safe and leaves you with access to an unmodified copy of the code in the main branch:

```bash
git branch the-fix-im-thinking-of
git checkout the-fix-im-thinking-of
```

4. Do some edits, and commit them as you go:

```bash
# hack, hack, hack
# Tell git about any new files you've made
git add somewhere/tests/test_my_bug.py
# commit work in progress as you go
git commit -am 'BF - added tests for Funny bug'
```

(continues on next page)
Note the `-am` options to `commit`. The `m` flag just signals that you’re going to type a message on the command line. The `a` flag — you can just take on faith — or see why the `-a` flag?

5. When you have finished, check you have committed all your changes:

```
git status
```

6. Finally, make your commits into patches. You want all the commits since you branched from the `master` branch:

```
git format-patch -M -C master
```

You will now have several files named for the commits:

```
0001-BF-added-tests-for-Funny-bug.patch
0002-BF-added-fix-for-Funny-bug.patch
```

Send these files to the Matplotlib mailing list.

When you are done, to switch back to the main copy of the code, just return to the `master` branch:

```
git checkout master
```

### 38.4.2 Moving from patching to development

If you find you have done some patches, and you have one or more feature branches, you will probably want to switch to development mode. You can do this with the repository you have.

Fork the Matplotlib repository on github — *Making your own copy (fork) of Matplotlib*. Then:

```
# checkout and refresh master branch from main repo
# rename pointer to main repository to 'upstream'
# point your repo to default read / write to your fork on github
# push up any branches you've made and want to keep
```

Then you can, if you want, follow the *Development workflow*. 
38.5 Git for development

Contents:

38.5.1 Making your own copy (fork) of Matplotlib

You need to do this only once. The instructions here are very similar to the instructions at https://help.github.com/forking/ — please see that page for more detail. We're repeating some of it here just to give the specifics for the Matplotlib project, and to suggest some default names.

Set up and configure a github account

If you don't have a github account, go to the github page, and make one.

You then need to configure your account to allow write access — see the Generating SSH keys help on github help.

Create your own forked copy of Matplotlib

1. Log into your github account.
2. Go to the Matplotlib github home at Matplotlib github.
3. Click on the fork button:

![Fork button](Unwatch) ![Fork button](Fork) ![Pull Request](Pull Request)

Now, after a short pause, you should find yourself at the home page for your own forked copy of Matplotlib.

38.5.2 Set up your fork

First you follow the instructions for Making your own copy (fork) of Matplotlib.
Overview

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>git clone https://github.com/your-user-name/matplotlib.git</code></td>
<td>Clone your fork to the local computer</td>
</tr>
<tr>
<td><code>cd matplotlib</code></td>
<td>Change directory to your new repo</td>
</tr>
<tr>
<td><code>git remote add upstream git://github.com/matplotlib/matplotlib.git</code></td>
<td>Add a new remote to your local repository</td>
</tr>
</tbody>
</table>

In detail

Clone your fork

1. Clone your fork to the local computer with `git clone https://github.com/your-user-name/matplotlib.git`

2. Investigate. Change directory to your new repo: `cd matplotlib`. Then `git branch -a` to show you all branches. You'll get something like:

   * master
   remotes/origin/master

   This tells you that you are currently on the master branch, and that you also have a remote connection to origin/master. What remote repository is remotes/origin? Try `git remote v` to see the URLs for the remote. They will point to your github fork.

   Now you want to connect to the upstream Matplotlib github repository, so you can merge in changes from trunk.

Linking your repository to the upstream repo

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cd matplotlib</code></td>
<td>Change directory to your new repo</td>
</tr>
<tr>
<td><code>git remote add upstream git://github.com/matplotlib/matplotlib.git</code></td>
<td>Add a new remote to your local repository</td>
</tr>
</tbody>
</table>

`upstream` here is just the arbitrary name we're using to refer to the main Matplotlib repository at Matplotlib github.

Note that we've used `git://` for the URL rather than `https://` or `git@`. The `git://` URL is read only. This means that we can't accidentally (or deliberately) write to the upstream repo, and we are only going to use it to merge into our own code.

Just for your own satisfaction, show yourself that you now have a new 'remote', with `git remote v` show, giving you something like:

<table>
<thead>
<tr>
<th>Remote Name</th>
<th>URL</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>upstream</td>
<td>git://github.com/matplotlib/matplotlib.git (fetch)</td>
<td></td>
</tr>
<tr>
<td>upstream</td>
<td>git://github.com/matplotlib/matplotlib.git (push)</td>
<td></td>
</tr>
<tr>
<td>origin</td>
<td><a href="https://github.com/your-user-name/matplotlib.git">https://github.com/your-user-name/matplotlib.git</a> (fetch)</td>
<td></td>
</tr>
<tr>
<td>origin</td>
<td><a href="https://github.com/your-user-name/matplotlib.git">https://github.com/your-user-name/matplotlib.git</a> (push)</td>
<td></td>
</tr>
</tbody>
</table>
38.5.3 Configure git

Overview

Your personal git configurations are saved in the .gitconfig file in your home directory.

Here is an example .gitconfig file:

```
[user]
    name = Your Name
    email = you@yourdomain.example.com

[alias]
    ci = commit -a
    co = checkout
    st = status
    stat = status
    br = branch
    wdiff = diff --color-words

[core]
    editor = vim

[merge]
    summary = true
```

You can check what is already in your config file using the `git config --list` command. You can edit the .gitconfig file directly or you can use the `git config --global` command:

```
git config --global user.name "Your Name"
git config --global user.email you@yourdomain.example.com
git config --global alias.ci "commit -a"
git config --global alias.co checkout
git config --global alias.st "status -a"
git config --global alias.stat "status -a"
git config --global alias.br branch
git config --global alias.wdiff "diff --color-words"
git config --global core.editor vim
git config --global merge.summary true
```

To set up on another computer, you can copy your ~/.gitconfig file, or run the commands above.

In detail

user.name and user.email

It is good practice to tell git who you are, for labeling any changes you make to the code. The simplest way to do this is from the command line:

```
git config --global user.name "Your Name"
git config --global user.email you@yourdomain.example.com
```
This will write the settings into your git configuration file, which should now contain a user section with your name and email:

```
[user]
    name = Your Name
    email = you@yourdomain.example.com
```

You'll need to replace Your Name and you@yourdomain.example.com with your actual name and email address.

**Aliases**

You might well benefit from some aliases to common commands.

For example, you might well want to be able to shorten `git checkout` to `git co`. Or you may want to alias `git diff --color-words (which gives a nicely formatted output of the diff)` to `git wdiff`

The following `git config --global` commands:

- `git config --global alias.ci "commit -a"
- `git config --global alias.co checkout`
- `git config --global alias.st "status -a"
- `git config --global alias.stat "status -a"
- `git config --global alias.br branch`
- `git config --global alias.wdiff "diff --color-words"

will create an alias section in your `.gitconfig` file with contents like this:

```
[alias]
    ci = commit -a
    co = checkout
    st = status -a
    stat = status -a
    br = branch
    wdiff = diff --color-words
```

**Editor**

You may also want to make sure that your editor of choice is used

```
git config --global core.editor vim
```
Merging

To enforce summaries when doing merges (~/.gitconfig file again):

```
[merge]
  log = true
```

Or from the command line:

```
git config --global merge.log true
```

Fancy log output

This is a very nice alias to get a fancy log output; it should go in the alias section of your .gitconfig file:

```
lg = log --graph --pretty=format:'%Cred%h%Creset -%C(yellow)%d%Creset %s
  %Cgreen(%cr) %C(bold blue)[%an]%Creset' --abbrev-commit --date=relative
```

You use the alias with:

```
git lg
```

and it gives graph / text output something like this (but with color!):

```
* 6d8e1ee - (HEAD, origin/my-fancy-feature, my-fancy-feature) NF - a fancy file (45 minutes ago) [Matthew Brett]
* d304a73 - (origin/placeholder, placeholder) Merge pull request #48 from hhuuggoo/master (2 weeks ago) [Jonathan Terhorst]
|\ 
| * 4aff2a8 - fixed bug 35, and added a test in test_bugfixes (2 weeks ago) [Hugo]
|/
* a7ff2e5 - Added notes on discussion/proposal made during Data Array Summit (2 weeks ago) [Corran Webster]
* 68f6752 - Initial implementation of AxisIndexer - uses 'index_by' which needs to be changed to a call on an Axes object - this is all very sketchy right now. (2 weeks ago) [Corr
* 376adbd - Merge pull request #46 from terhorst/master (2 weeks ago) [Jonathan Terhorst]
|\ 
| * b605216 - updated joshu example to current api (3 weeks ago) [Jonathan_ Terhorst]
| * 2e991e8 - add testing for outer ufunc (3 weeks ago) [Jonathan Terhorst]
| * 7beda5a - prevent axis from throwing an exception if testing equality with non-axis object (3 weeks ago) [Jonathan Terhorst]
| * 65af65e - convert unit testing code to assertions (3 weeks ago) [Jonathan Terhorst]
| * 956fbab - Merge remote-tracking branch 'upstream/master' (3 weeks ago) [Jonathan Terhorst]
```

(continues on next page)
Thanks to Yury V. Zaytsev for posting it.

### 38.5.4 Development workflow

You already have your own forked copy of the Matplotlib repository, by following *Making your own copy (fork) of Matplotlib*. You have *Set up your fork*. You have configured git by following *Configure git*. Now you are ready for some real work.

**Workflow summary**

In what follows we'll refer to the upstream Matplotlib `master` branch, as "trunk".

- Don't use your `master` branch for anything. Consider deleting it.
- When you are starting a new set of changes, fetch any changes from trunk, and start a new `feature branch` from that.
- Make a new branch for each separable set of changes — "one task, one branch" (*ipython git workflow*).
- Name your branch for the purpose of the changes - e.g. `bugfix-for-issue-14` or `refactor-database-code`.
- If you can possibly avoid it, avoid merging trunk or any other branches into your feature branch while you are working.
- If you do find yourself merging from trunk, consider *Rebasing on trunk*.
- Ask on the Matplotlib mailing list if you get stuck.
- Ask for code review!

This way of working helps to keep work well organized, with readable history. This in turn makes it easier for project maintainers (that might be you) to see what you've done, and why you did it.

See *linux git workflow* and *ipython git workflow* for some explanation.

**Consider deleting your master branch**

It may sound strange, but deleting your own `master` branch can help reduce confusion about which branch you are on. See *deleting master on github* for details.
**Update the mirror of trunk**

First make sure you have done *Linking your repository to the upstream repo.*

From time to time you should fetch the upstream (trunk) changes from github:

```bash
git fetch upstream
```

This will pull down any commits you don't have, and set the remote branches to point to the right commit. For example, 'trunk' is the branch referred to by (remote/branchname) `upstream/master` - and if there have been commits since you last checked, `upstream/master` will change after you do the fetch.

**Make a new feature branch**

When you are ready to make some changes to the code, you should start a new branch. Branches that are for a collection of related edits are often called 'feature branches'.

Making a new branch for each set of related changes will make it easier for someone reviewing your branch to see what you are doing.

Choose an informative name for the branch to remind yourself and the rest of us what the changes in the branch are for. For example `add-ability-to-fly`, or `buxfix-for-issue-42`.

```bash
# Update the mirror of trunk
git fetch upstream

# Make new feature branch starting at current trunk
git branch my-new-feature upstream/master
git checkout my-new-feature
```

Generally, you will want to keep your feature branches on your public github fork of Matplotlib. To do this, you `git push` this new branch up to your github repo. Generally (if you followed the instructions in these pages, and by default), git will have a link to your github repo, called `origin`. You push up to your own repo on github with:

```bash
git push origin my-new-feature
```

In git >= 1.7 you can ensure that the link is correctly set by using the `--set-upstream` option:

```bash
git push --set-upstream origin my-new-feature
```

From now on git will know that `my-new-feature` is related to the `my-new-feature` branch in the github repo.
The editing workflow

Overview

```bash
# hack hack
git add my_new_file
git commit -am 'NF - some message'
git push
```

In more detail

1. Make some changes
2. See which files have changed with `git status` (see `git status`). You’ll see a listing like this one:

```diff
# On branch ny-new-feature
# Changed but not updated:
#   (use "git add <file>..." to update what will be committed)
#   (use "git checkout -- <file>..." to discard changes in working_
#    directory)
#
# modified: README
#
# Untracked files:
#   (use "git add <file>..." to include in what will be committed)
#   
# INSTALL
no changes added to commit (use "git add" and/or "git commit -a")
```

3. Check what the actual changes are with `git diff` (see `git diff`).
4. Add any new files to version control `git add new_file_name` (see `git add`).
5. To commit all modified files into the local copy of your repo, do `git commit -am 'A commit message'`. Note the -am options to commit. The m flag just signals that you’re going to type a message on the command line. The a flag — you can just take on faith — or see why the -a flag? — and the helpful use-case description in the tangled working copy problem. The `git commit` manual page might also be useful.
6. To push the changes up to your forked repo on github, do a `git push` (see `git push`).
Ask for your changes to be reviewed or merged

When you are ready to ask for someone to review your code and consider a merge:

1. Go to the URL of your forked repo, say https://github.com/your-user-name/matplotlib.

2. Use the 'Switch Branches' dropdown menu near the top left of the page to select the branch with your changes:

3. Click on the 'Pull request' button:

Enter a title for the set of changes, and some explanation of what you've done. Say if there is anything you'd like particular attention for - like a complicated change or some code you are not happy with.

If you don't think your request is ready to be merged, just say so in your pull request message. This is still a good way of getting some preliminary code review.

Some other things you might want to do

Delete a branch on github

```
git checkout master
# delete branch locally
#git branch -D my-unwanted-branch
# delete branch on github
git push origin :my-unwanted-branch
```

Note the colon : before my-unwanted-branch. See also: https://help.github.com/articles/pushing-to-a-remote/#deleting-a-remote-branch-or-tag
Several people sharing a single repository

If you want to work on some stuff with other people, where you are all committing into the same repository, or even the same branch, then just share it via github.

First fork Matplotlib into your account, as from *Making your own copy (fork) of Matplotlib*.

Then, go to your forked repository github page, say https://github.com/your-user-name/matplotlib

Click on the ‘Admin’ button, and add anyone else to the repo as a collaborator:

Now all those people can do:

```
git clone https://github.com/your-user-name/matplotlib.git
```

Remember that links starting with https or git@ are read-write, and that git@ uses the ssh protocol; links starting with git:// are read-only.

Your collaborators can then commit directly into that repo with the usual:

```
git commit -am 'ENH - much better code'
git push origin master  # pushes directly into your repo
```

Explore your repository

To see a graphical representation of the repository branches and commits:

```
gitk --all
```

To see a linear list of commits for this branch:

```
git log
```

You can also look at the network graph visualizer for your github repo.

Finally the *Fancy log output* lg alias will give you a reasonable text-based graph of the repository.
Rebasing on trunk

Let’s say you thought of some work you’d like to do. You Update the mirror of trunk and Make a new feature branch called cool-feature. At this stage trunk is at some commit, let’s call it E. Now you make some new commits on your cool-feature branch, let’s call them A, B, C. Maybe your changes take a while, or you come back to them after a while. In the meantime, trunk has progressed from commit E to commit (say) G:

```
A---B---C cool-feature
/    
D---E---F---G trunk
```

At this stage you consider merging trunk into your feature branch, and you remember that this here page sternly advises you not to do that, because the history will get messy. Most of the time you can just ask for a review, and not worry that trunk has got a little ahead. But sometimes, the changes in trunk might affect your changes, and you need to harmonize them. In this situation you may prefer to do a rebase.

rebase takes your changes (A, B, C) and replays them as if they had been made to the current state of trunk. In other words, in this case, it takes the changes represented by A, B, C and replays them on top of G. After the rebase, your history will look like this:

```
A'--B'--C' cool-feature
/    
D---E---F---G trunk
```

See rebase without tears for more detail.

To do a rebase on trunk:

```
# Update the mirror of trunk
git fetch upstream
# go to the feature branch
git checkout cool-feature
# make a backup in case you mess up
git branch tmp cool-feature
# rebase cool-feature onto trunk
git rebase --onto upstream/master upstream/master cool-feature
```

In this situation, where you are already on branch cool-feature, the last command can be written more succinctly as:

```
git rebase upstream/master
```

When all looks good you can delete your backup branch:

```
git branch -D tmp
```

If it doesn't look good you may need to have a look at Recovering from mess-ups.

If you have made changes to files that have also changed in trunk, this may generate merge conflicts that you need to resolve - see the git rebase man page for some instructions at the end of the "Description" section. There is some related help on merging in the git user manual - see resolving a merge.
Recovering from mess-ups

Sometimes, you mess up merges or rebases. Luckily, in git it is relatively straightforward to recover from such mistakes.

If you mess up during a rebase:

```
git rebase --abort
```

If you notice you messed up after the rebase:

```
# reset branch back to the saved point
git reset --hard tmp
```

If you forgot to make a backup branch:

```
# look at the reflog of the branch
git reflog show cool-feature

8630830 cool-feature@{0}: commit: BUG: io: close file handles immediately
278dd2a cool-feature@{1}: rebase finished: refs/heads/my-feature-branch onto...
  ↪ 11ee694744f2552d
26aa21a cool-feature@{2}: commit: BUG: lib: make seek_gzip_factory not leak...
  ↪ gzip obj
...

# reset the branch to where it was before the botched rebase
```

Rewriting commit history

Note: Do this only for your own feature branches.

There’s an embarrassing typo in a commit you made? Or perhaps the you made several false starts you would like the posterity not to see.

This can be done via interactive rebasing.

Suppose that the commit history looks like this:

```
git log --oneline
eadc391 Fix some remaining bugs
a815645 Modify it so that it works
2de1c5a Fix a few bugs + disable
13d7934 First implementation
6ad92e5 * masked is now an instance of a new object, MaskedConstant
2901ed Add pre-nep for a copule of structured_array_extensions.
...
```
and 6ad92e5 is the last commit in the cool-feature branch. Suppose we want to make the following changes:

- Rewrite the commit message for 13d7934 to something more sensible.
- Combine the commits 2dec1ac, a815645, eadc391 into a single one.

We do as follows:

```
# make a backup of the current state
git branch tmp HEAD
# interactive rebase
git rebase -i 6ad92e5
```

This will open an editor with the following text in it:

```
pick 13d7934 First implementation
pick 2dec1ac Fix a few bugs + disable
pick a815645 Modify it so that it works
pick eadc391 Fix some remaining bugs

# Rebase 6ad92e5..eadc391 onto 6ad92e5
#
# Commands:
# p, pick = use commit
# r, reword = use commit, but edit the commit message
# e, edit = use commit, but stop for amending
# s, squash = use commit, but meld into previous commit
# f, fixup = like "squash", but discard this commit's log message
#
# If you remove a line here THAT COMMIT WILL BE LOST.
# However, if you remove everything, the rebase will be aborted.
```

To achieve what we want, we will make the following changes to it:

```
r 13d7934 First implementation
pick 2dec1ac Fix a few bugs + disable
f a815645 Modify it so that it works
f eadc391 Fix some remaining bugs
```

This means that (i) we want to edit the commit message for 13d7934, and (ii) collapse the last three commits into one. Now we save and quit the editor.

Git will then immediately bring up an editor for editing the commit message. After revising it, we get the output:

```
[detached HEAD 721fc64] FOO: First implementation
  2 files changed, 199 insertions(+), 66 deletions(-)
```

```
[detached HEAD 0f22701] Fix a few bugs + disable
  1 files changed, 79 insertions(+), 61 deletions(-)
Successfully rebased and updated refs/heads/my-feature-branch.
```

and the history looks now like this:
38.5.5 Maintainer workflow

This page is for maintainers — those of us who merge our own or other peoples' changes into the upstream repository.

Being as how you're a maintainer, you are completely on top of the basic stuff in Development workflow.

The instructions in Linking your repository to the upstream repo add a remote that has read-only access to the upstream repo. Being a maintainer, you've got read-write access.

It's good to have your upstream remote have a scary name, to remind you that it's a read-write remote:

```
$ git remote add upstream-rw git@github.com:matplotlib/matplotlib.git
$ git fetch upstream-rw
```

Integrating changes

Let's say you have some changes that need to go into trunk (upstream-rw/master).

The changes are in some branch that you are currently on. For example, you are looking at someone's changes like this:

```
$ git remote add someone git://github.com/someone/matplotlib.git
$ git fetch someone
$ git branch cool-feature --track someone/cool-feature
$ git checkout cool-feature
```

So now you are on the branch with the changes to be incorporated upstream. The rest of this section assumes you are on this branch.

A few commits

If there are only a few commits, consider rebasing to upstream:

```
# Fetch upstream changes
$ git fetch upstream-rw
# rebase
$ git rebase upstream-rw/master
```

Remember that, if you do a rebase, and push that, you'll have to close any github pull requests manually, because github will not be able to detect the changes have already been merged.
A long series of commits

If there are a longer series of related commits, consider a merge instead:

```
git fetch upstream-rw
git merge --no-ff upstream-rw/master
```

The merge will be detected by github, and should close any related pull requests automatically.

Note the `--no-ff` above. This forces git to make a merge commit, rather than doing a fast-forward, so that these set of commits branch off trunk then rejoin the main history with a merge, rather than appearing to have been made directly on top of trunk.

Check the history

Now, in either case, you should check that the history is sensible and you have the right commits:

```
git log --oneline --graph
git log -p upstream-rw/master..
```

The first line above just shows the history in a compact way, with a text representation of the history graph. The second line shows the log of commits excluding those that can be reached from trunk (`upstream-rw/master`), and including those that can be reached from current HEAD (implied with the `..` at the end). So, it shows the commits unique to this branch compared to trunk. The `-p` option shows the diff for these commits in patch form.

Push to trunk

```
git push upstream-rw my-new-feature:master
```

This pushes the `my-new-feature` branch in this repository to the `master` branch in the `upstream-rw` repository.

### 38.6 git resources

#### 38.6.1 Tutorials and summaries

- [github help](#) has an excellent series of how-to guides.
- [The pro git book](#) is a good in-depth book on git.
- A [git cheat sheet](#) is a page giving summaries of common commands.
- [The git user manual](#)
- [The git tutorial](#)
- [The git community book](#)
• **git ready** — a nice series of tutorials
• **git magic** — extended introduction with intermediate detail
• The **git parable** is an easy read explaining the concepts behind git.
• **git foundation** expands on the **git parable**.
• Fernando Perez' git page — **Fernando's git page** — many links and tips
• A good but technical page on **git concepts**
• **git svn crash course**: git for those of us used to **subversion**

### 38.6.2 Advanced git workflow

There are many ways of working with git; here are some posts on the rules of thumb that other projects have come up with:

• Linus Torvalds on **git management**
  • Linus Torvalds on **linux git workflow**. Summary; use the git tools to make the history of your edits as clean as possible; merge from upstream edits as little as possible in branches where you are doing active development.

### 38.6.3 Manual pages online

You can get these on your own machine with (e.g) `git help push` or (same thing) `git push --help`, but, for convenience, here are the online manual pages for some common commands:

• **git add**
• **git branch**
• **git checkout**
• **git clone**
• **git commit**
• **git config**
• **git diff**
• **git log**
• **git pull**
• **git push**
• **git remote**
• **git status**
38.7 Two and three dots in difference specs

Thanks to Yarik Halchenko for this explanation.

Imagine a series of commits A, B, C, D... Imagine that there are two branches, topic and master. You branched topic off master when master was at commit 'E'. The graph of the commits looks like this:

```
A---B---C topic
   /
D---E---F---G master
```

Then:

```
git diff master..topic
```

will output the difference from G to C (i.e. with effects of F and G), while:

```
git diff master...topic
```

would output just differences in the topic branch (i.e. only A, B, and C).
Pull requests (PRs) are the mechanism for contributing to Matplotlib's code and documentation.

### 39.1 Summary for PR authors

**Note:**

- We value contributions from people with all levels of experience. In particular if this is your first PR not everything has to be perfect. We'll guide you through the PR process.

- Nevertheless, try to follow the guidelines below as well as you can to help make the PR process quick and smooth.

- Be patient with reviewers. We try our best to respond quickly, but we have limited bandwidth. If there is no feedback within a couple of days, please ping us by posting a comment to your PR.

When making a PR, pay attention to:

- *Target the master branch.*

- Adhere to the *Coding guidelines.*

- Update the *documentation* if necessary.

- Aim at making the PR as "ready-to-go" as you can. This helps to speed up the review process.

- It is ok to open incomplete or work-in-progress PRs if you need help or feedback from the developers. You may mark these as *draft pull requests* on GitHub.

- When updating your PR, instead of adding new commits to fix something, please consider amending your initial commit(s) to keep the history clean. You can achieve this using:

  ```
git commit --amend --no-edit
git push [your-remote-repo] [your-branch] --force-with-lease
  ```

See also *Contributing* for how to make a PR.
39.2 Summary for PR reviewers

Note:

- If you have commit rights, then you are trusted to use them. Please help review and merge PRs!
- Be patient and kind with contributors.

Content topics:

- Is the feature / bugfix reasonable?
- Does the PR conform with the Coding guidelines?
- Is the documentation (docstrings, examples, what's new, API changes) updated?

Organizational topics:

- Make sure all automated tests pass.
- The PR should target the master branch.
- Tag with descriptive labels.
- Set the milestone.
- Keep an eye on the number of commits.
- Approve if all of the above topics handled.
- Merge if a sufficient number of approvals is reached.

39.3 Detailed Guidelines

39.3.1 Documentation

- Every new feature should be documented. If it's a new module, don't forget to add a new rst file to the API docs.
- Each high-level plotting function should have a small example in the Examples section of the docstring. This should be as simple as possible to demonstrate the method. More complex examples should go into a dedicated example file in the examples directory, which will be rendered to the examples gallery in the documentation.
- Build the docs and make sure all formatting warnings are addressed.
- See Writing documentation for our documentation style guide.
- If your change is a major new feature, add an entry to doc/users/whats_new.rst.
- If you change the API in a backward-incompatible way, please document it by adding a file in the relevant subdirectory of doc/api/next_api_changes/, probably in the behavior/ subdirectory.
39.3.2 Labels

- If you have the rights to set labels, tag the PR with descriptive labels. See the list of labels.

39.3.3 Milestones

- Set the milestone according to these rules:
  - *New features and API changes* are milestone for the next minor release \texttt{v3.X.0}.
  - *Bugfixes and docstring changes* are milestone for the next patch release \texttt{v3.X.Y}.
  - *Documentation changes* (all .rst files and examples) are milestone \texttt{v3.X-doc}.

If multiple rules apply, choose the first matching from the above list.

Setting a milestone does not imply or guarantee that a PR will be merged for that release, but if it were to be merged what release it would be in.

All of these PRs should target the master branch. The milestone tag triggers an *automatic backport* for milestones which have a corresponding branch.

39.3.4 Merging

- Documentation and examples may be merged by the first reviewer. Use the threshold "is this better than it was?" as the review criteria.

- For code changes (anything in src or lib) at least two core developers (those with commit rights) should review all pull requests. If you are the first to review a PR and approve of the changes use the GitHub 'approve review' tool to mark it as such. If you are a subsequent reviewer please approve the review and if you think no more review is needed, merge the PR.

Ensure that all API changes are documented in a file in one of the subdirectories of doc/api/next_api_changes, and significant new features have an entry in doc/user/whats_new.

  - If a PR already has a positive review, a core developer (e.g. the first reviewer, but not necessarily) may champion that PR for merging. In order to do so, they should ping all core devs both on GitHub and on the dev mailing list, and label the PR with the "Merge with single review?" label. Other core devs can then either review the PR and merge or reject it, or simply request that it gets a second review before being merged. If no one asks for such a second review within a week, the PR can then be merged on the basis of that single review.

    A core dev should only champion one PR at a time and we should try to keep the flow of championed PRs reasonable.

- Do not self merge, except for 'small' patches to un-break the CI or when another reviewer explicitly allows it (ex, "Approve modulo CI passing, may self merge when green").
39.3.5 Automated tests

Whenever a pull request is created or updated, various automated test tools will run on all supported platforms and versions of Python.

- Make sure the Linting, GitHub Actions, AppVeyor, CircleCI, and Azure pipelines are passing before merging (All checks are listed at the bottom of the GitHub page of your pull request). Here are some tips for finding the cause of the test failure:
  - If Linting fails, you have a code style issue, which will be listed as annotations on the pull request's diff.
  - If a GitHub Actions or AppVeyor run fails, search the log for FAILURES. The subsequent section will contain information on the failed tests.
  - If CircleCI fails, likely you have some reStructuredText style issue in the docs. Search the CircleCI log for WARNING.
  - If Azure pipelines fail with an image comparison error, you can find the images as artifacts of the Azure job:
    * Click Details on the check on the GitHub PR page.
    * Click View more details on Azure Pipelines to go to Azure.
    * On the overview page artifacts are listed in the section Related.

- Codecov and LGTM are currently for information only. Their failure is not necessarily a blocker.

- tox is not used in the automated testing. It is supported for testing locally.

39.3.6 Number of commits and squashing

- Squashing is case-by-case. The balance is between burden on the contributor, keeping a relatively clean history, and keeping a history usable for bisecting. The only time we are really strict about it is to eliminate binary files (ex multiple test image re-generations) and to remove upstream merges.

- Do not let perfect be the enemy of the good, particularly for documentation or example PRs. If you find yourself making many small suggestions, either open a PR against the original branch, push changes to the contributor branch, or merge the PR and then open a new PR against upstream.

- If you push to a contributor branch leave a comment explaining what you did, ex "I took the liberty of pushing a small clean-up PR to your branch, thanks for your work.". If you are going to make substantial changes to the code or intent of the PR please check with the contributor first.
39.4 Branches and Backports

39.4.1 Current branches

The current active branches are

**master**

The current development version. Future minor releases (v3.N.0) will be branched from this. Supports Python 3.7+.

**v3.N.x**

Maintenance branch for Matplotlib 3.N. Future patch releases will be branched from this. Supports Python 3.6+.

**v3.N.M-doc**

Documentation for the current release. On a patch release, this will be replaced by a properly named branch for the new release.

39.4.2 Branch selection for pull requests

Generally, all pull requests should target the master branch.

Other branches are fed through automatic or manual. Directly targeting other branches is only rarely necessary for special maintenance work.

39.4.3 Backport strategy

We will always backport to the patch release branch (v3.N.x):

- critical bug fixes (segfault, failure to import, things that the user can not work around)
- fixes for regressions against the last two releases.

Everything else (regressions against older releases, bugs/api inconsistencies the user can work around in their code) are on a case-by-case basis, should be low-risk, and need someone to advocate for and shepherd through the backport.

The only changes to be backported to the documentation branch (v3.N.M-doc) are changes to doc, examples, or tutorials. Any changes to lib or src including docstring-only changes should not be backported to this branch.
39.4.4 Automated backports

We use meeseeksdev bot to automatically backport merges to the correct maintenance branch base on the milestone. To work properly the milestone must be set before merging. If you have commit rights, the bot can also be manually triggered after a merge by leaving a message @meeseeksdev backport to BRANCH on the PR. If there are conflicts meeseekdevs will inform you that the backport needs to be done manually.

The target branch is configured by putting on-merge: backport to TARGETBRANCH in the milestone description on it’s own line.

If the bot is not working as expected, please report issues to Meeseeksdev.

39.4.5 Manual backports

When doing backports please copy the form used by meeseekdev, Backport PR #XXXX: TITLE OF PR. If you need to manually resolve conflicts make note of them and how you resolved them in the commit message.

We do a backport from master to v2.2.x assuming:

- matplotlib is a read-only remote branch of the matplotlib/matplotlib repo

The TARGET_SHA is the hash of the merge commit you would like to backport. This can be read off of the GitHub PR page (in the UI with the merge notification) or through the git CLI tools.

Assuming that you already have a local branch v2.2.x (if not, then git checkout -b v2.2.x), and that your remote pointing to https://github.com/matplotlib/matplotlib is called upstream:

```
git fetch upstream
git checkout v2.2.x  # or include -b if you don't already have this.
git reset --hard upstream/v2.2.x
git cherry-pick -m 1 TARGET_SHA
# resolve conflicts and commit if required
```

Files with conflicts can be listed by git status, and will have to be fixed by hand (search on >>>>>). Once the conflict is resolved, you will have to re-add the file(s) to the branch and then continue the cherry pick:

```
git add lib/matplotlib/conflicted_file.py
git add lib/matplotlib/conflicted_file2.py
```  
  
Use your discretion to push directly to upstream or to open a PR; be sure to push or PR against the v2.2.x upstream branch, not master!
This document is only relevant for Matplotlib release managers. A guide for developers who are doing a Matplotlib release.

Note: This assumes that a read-only remote for the canonical repository is remote and a read/write remote is DANGER

40.1 Testing

We use GitHub Actions for continuous integration. When preparing for a release, the final tagged commit should be tested locally before it is uploaded:

```bash
pytest -n 8 .
```

In addition the following test should be run and manually inspected:

```bash
python tools/memleak.py agg 1000 agg.pdf
```

In addition the following should be run and manually inspected, but is currently broken:

```bash
pushd examples/tests/
python backend_driver_sgskip.py
popd
```
40.2 GitHub Stats

We automatically extract GitHub issue, PRs, and authors from GitHub via the API. Copy the current `doc/users/github_stats.rst` to `doc/users/prev_whats_new/github_stats_X.Y.Z.rst`, changing the link target at the top of the file, and removing the "Previous GitHub Stats" section at the end.

For example, when updating from v3.2.0 to v3.2.1:

```
cp doc/users/github_stats.rst doc/users/prev_whats_new/github_stats_3.2.0.rst
$EDITOR doc/users/prev_whats_new/github_stats_3.2.0.rst
# Change contents as noted above.
git add doc/users/prev_whats_new/github_stats_3.2.0.rst
```

Then re-generate the updated stats:

```
python tools/github_stats.py --since-tag v3.2.0 --milestone=v3.2.1 --project ↪
'matplotlib/matplotlib' --links > doc/users/github_stats.rst
```

Review and commit changes. Some issue/PR titles may not be valid reST (the most common issue is * which is interpreted as unclosed markup).

**Note:** Make sure you authenticate against the GitHub API. If you do not you will get blocked by GitHub for going over the API rate limits. You can authenticate in one of two ways:

- using the keyring package; `pip install keyring` and then when running the stats script, you will be prompted for user name and password, that will be stored in your system keyring, or,

- using a personal access token; generate a new token on this GitHub page with the `repo:public_repo` scope and place the token in `~/.ghoauth`.

40.3 Update and Validate the Docs

40.3.1 Merge *-doc branch

Merge the most recent 'doc' branch (e.g., v3.2.0-doc) into the branch you are going to tag on and delete the doc branch on GitHub.

40.3.2 Update supported versions in Security Policy

When making major or minor releases, update the supported versions in the Security Policy in `SECURITY.md`. Commonly, this may be one or two previous minor releases, but is dependent on release managers.
40.3.3 Update "What's New" and "API changes"

Before tagging major and minor releases, the "what's new" and "API changes" listings should be updated. This is not needed for micro releases.

For the "what's new",

1. copy the current content to a file in `doc/users/prev_whats_new`
2. merge all of the files in `doc/users/next_whats_new/` into `doc/users/whats_new.rst` and delete the individual files
3. comment out the next what's new glob at the top

Similarly for the "API changes",

1. copy the current api changes to a file is `doc/api/prev_api_changes`
2. merge all of the files in the most recent `doc/api/next_api_changes` into `doc/api/api_changes.rst`
3. comment out the most recent API changes at the top.

In both cases step 3 will have to be un-done right after the release.

40.3.4 Verify that docs build

Finally, make sure that the docs build cleanly

```
make -Cdoc C=-j$(nproc) html latexpdf
```

After the docs are built, check that all of the links, internal and external, are still valid. We use `linkchecker` for this, which has not been ported to Python3 yet. You will need to create a Python2 environment with `requests==2.9.0` and `linkchecker`

```
conda create -p /tmp/lnkchk python=2 requests==2.9.0
source activate /tmp/lnkchk
pip install linkchecker
pushd doc/build/html
linkchecker index.html --check-extern
popd
```

Address any issues which may arise. The internal links are checked on Circle CI, this should only flag failed external links.
40.4 Create release commit and tag

To create the tag, first create an empty commit with a very terse set of the release notes in the commit message

```
git commit --allow-empty
```

and then create a signed, annotated tag with the same text in the body message

```
git tag -a -s v2.0.0
```

which will prompt you for your GPG key password and an annotation. For pre releases it is important to follow PEP 440 so that the build artifacts will sort correctly in PyPI.

To prevent issues with any down-stream builders which download the tarball from GitHub it is important to move all branches away from the commit with the tag\(^1\):

```
git commit --allow-empty
```

Finally, push the tag to GitHub:

```
git push DANGER master v2.0.0
```

Congratulations, the scariest part is done!

If this is a final release, also create a 'doc' branch (this is not done for pre-releases):

```
git branch v2.0.0-doc
```

```
git push DANGER v2.0.0-doc
```

and if this is a major or minor release, also create a bug-fix branch (a micro release will be cut from this branch):

```
git branch v2.0.x
```

On this branch un-comment the globs from *Update and Validate the Docs*. And then

```
git push DANGER v2.0.x
```

\(^1\) The tarball that is provided by GitHub is produced using `git archive`. We use versioneer which uses a format string in `lib/matplotlib/_version.py` to have `git` insert a list of references to exported commit (see `.gitattributes` for the configuration). This string is then used by versioneer to produce the correct version, based on the git tag, when users install from the tarball. However, if there is a branch pointed at the tagged commit, then the branch name will also be included in the tarball. When the branch eventually moves, anyone who checked the hash of the tarball before the branch moved will have an incorrect hash.

To generate the file that GitHub does use

```
git archive v2.0.0 -o matplotlib-2.0.0.tar.gz --prefix=matplotlib-2.0.0/
```
40.5 Release Management / DOI

Via the GitHub UI, turn the newly pushed tag into a release. If this is a pre-release remember to mark it as such.

For final releases, also get the DOI from zenodo (which will automatically produce one once the tag is pushed). Add the doi post-fix and version to the dictionary in tools/cache_zenodo_svg.py and run the script.

This will download the new svg to the _static directory in the docs and edit doc/citing.rst. Commit the new svg, the change to tools/cache_zenodo_svg.py, and the changes to doc/citing.rst to the VER-doc branch and push to GitHub.

```bash
git checkout v2.0.0-doc
$EDITOR tools/cache_zenodo_svg.py
python tools/cache_zenodo_svg.py
$EDITOR doc/citing.html
git commit -a
git push DANGER v2.0.0-doc:v2.0.0-doc
```

40.6 Building binaries

We distribute macOS, Windows, and many Linux wheels as well as a source tarball via PyPI. Most builders should trigger automatically once the tag is pushed to GitHub:

- Windows, macOS and manylinux wheels are built on GitHub Actions. Builds are triggered by the GitHub Action defined in .github/workflows/cibuildwheel.yml, and wheels will be available as artifacts of the build.
- Alternative Windows wheels are built by Christoph Gohlke automatically and will be available at his site once built.
- The auto-tick bot should open a pull request into the conda-forge feedstock. Review and merge (if you have the power to).

**Warning:** Because this is automated, it is extremely important to bump all branches away from the tag as discussed in Create release commit and tag.

If this is a final release the following downstream packagers should be contacted:

- Debian
- Fedora
- Arch
- Gentoo
- Macports
This can be done ahead of collecting all of the binaries and uploading to pypi.

40.7 Make distribution and upload to PyPI

Once you have collected all of the wheels (expect this to take about a day), generate the tarball

```bash
git checkout v2.0.0
git clean -xfd
python setup.py sdist
```

and copy all of the wheels into `dist` directory. First, check that the dist files are OK

```bash
twine check dist/*
```

and then use `twine` to upload all of the files to pypi

```bash
twine upload -s dist/matplotlib*tar.gz
twine upload dist/*whl
```

Congratulations, you have now done the second scariest part!

40.8 Build and Deploy Documentation

To build the documentation you must have the tagged version installed, but build the docs from the `ver-doc` branch. An easy way to arrange this is:

```bash
pip install matplotlib
pip install -r requirements/doc/doc-requirements.txt
git checkout v2.0.0-doc
git clean -xfd
make -C doc C="-A include_analytics=True -j$(nproc)" html latex pdf LATEMKOPTS="-s -silent -f"
```

which will build both the html and pdf version of the documentation.

The built documentation exists in the `matplotlib.github.com` repository. Pushing changes to master automatically updates the website.

The documentation is organized by version. At the root of the tree is always the documentation for the latest stable release. Under that, there are directories containing the documentation for older versions. The documentation for current master is built on Circle CI and pushed to the `devdocs` repository. These are available at `matplotlib.org/devdocs`.

Assuming you have this repository checked out in the same directory as matplotlib
which will copy the built docs over. If this is a final release, link the stable subdirectory to the newest version:

```bash
rsync -a 2.0.0/* ./
rm stable
ln -s 2.0.0/ stable
```

You will need to manually edit `versions.html` to show the last 3 tagged versions. You will also need to edit `sitemap.xml` to include the newly released version. Now commit and push everything to GitHub:

```bash
git add *
git commit -a -m 'Updating docs for v2.0.0'
git push DANGER master
```

Congratulations you have now done the third scariest part!

If you have access, clear the Cloudflare caches.

It typically takes about 5-10 minutes for GitHub to process the push and update the live web page (remember to clear your browser cache).

### 40.9 Announcing

The final step is to announce the release to the world. A short version of the release notes along with acknowledgments should be sent to

- matplotlib-users@python.org
- matplotlib-devel@python.org
- matplotlib-announce@python.org

For final releases announcements should also be sent to the numpy/scipy/scikit-image mailing lists.

In addition, announcements should be made on social networks (twitter via the @matplotlib account, any other via personal accounts). NumFOCUS should be contacted for inclusion in their newsletter.
40.10 Conda packages

The Matplotlib project itself does not release conda packages. In particular, the Matplotlib release manager is not responsible for conda packaging.

For information on the packaging of Matplotlib for conda-forge see https://github.com/conda-forge/matplotlib-feedstock.
41.1 Mandatory dependencies

When installing through a package manager like pip or conda, the mandatory dependencies are automatically installed. This list is mainly for reference.

- Python (>= 3.7)
- NumPy (>= 1.16)
- setuptools
- cycler (>= 0.10.0)
- dateutil (>= 2.7)
- kiwisolver (>= 1.0.1)
- Pillow (>= 6.2)
- pyparsing (>= 2.2.1)

41.2 Optional dependencies

The following packages and tools are not required but extend the capabilities of Matplotlib.

41.2.1 Backends

Matplotlib figures can be rendered to various user interfaces. See What is a backend? for more details on the optional Matplotlib backends and the capabilities they provide.

- Tk (>= 8.3, != 8.6.0 or 8.6.1): for the Tk-based backends.
- PyQt4 (>= 4.6) or PySide (>= 1.0.3): for the Qt4-based backends.
- PyQt5 or PySide2: for the Qt5-based backends.

1 Tk is part of most standard Python installations, but it's not part of Python itself and thus may not be present in rare cases.
2 PySide cannot be pip-installed on Linux (but can be conda-installed).
Matplotlib, Release 3.4.1

• **PyGObject**: for the GTK3-based backends³.
• **wxPython (>= 4)⁴**: for the wx-based backends.
• **pycairo (>= 1.11.0) or cairocffi (>= 0.8)**: for the GTK3 and/or cairo-based backends.
• **Tornado**: for the WebAgg backend.

### 41.2.2 Animations

• **ffmpeg**: for saving movies.
• **ImageMagick**: for saving animated gifs.

### 41.2.3 Font handling and rendering

• **LaTeX** (with cm-super) and **GhostScript (>=9.0)**: for rendering text with LaTeX.
• **fontconfig (>= 2.7)**: for detection of system fonts on Linux.

### 41.3 C libraries

Matplotlib brings its own copies of the following libraries:

• **Agg**: the Anti-Grain Geometry C++ rendering engine
• **ttconv**: a TrueType font utility

Additionally, Matplotlib depends on:

• **FreeType (>= 2.3)**: a font rendering library
• **QHull (>= 2020.2)**: a library for computing triangulations

By default, Matplotlib downloads and builds its own copies of FreeType (this is necessary to run the test suite, because different versions of FreeType rasterize characters differently) and of Qhull. As an exception, Matplotlib defaults to the system version of FreeType on AIX.

To force Matplotlib to use a copy of FreeType or Qhull already installed in your system, create a `setup.cfg` file with the following contents:

```
[libs]
system_freetype = true
system_qhull = true
```

³ If using pip (and not conda), PyGObject must be built from source; see https://pygobject.readthedocs.io/en/latest/devguide/dev_environ.html.

⁴ If using pip (and not conda) on Linux, wxPython wheels must be manually downloaded from https://wxpython.org/pages/downloads/.
before running `python -m pip install ..`

In this case, you need to install the FreeType and Qhull library and headers. This can be achieved using a package manager, e.g. for FreeType:

```
# Pick ONE of the following:
sudo apt install libfreetype6-dev   # Debian/Ubuntu
sudo dnf install freetype-devel     # Fedora
brew install freetype               # macOS with Homebrew
conda install freetype              # conda, any OS
```

(adapt accordingly for Qhull).

On Linux and macOS, it is also recommended to install `pkg-config`, a helper tool for locating FreeType:

```
# Pick ONE of the following:
sudo apt install pkg-config   # Debian/Ubuntu
sudo dnf install pkgconfig    # Fedora
brew install pkg-config       # macOS with Homebrew
conda install pkg-config      # conda
# Or point the PKG_CONFIG environment variable to the path to pkg-config:
export PKG_CONFIG=...
```

If not using `pkg-config` (in particular on Windows), you may need to set the include path (to the library headers) and link path (to the libraries) explicitly, if they are not in standard locations. This can be done using standard environment variables -- on Linux and OSX:

```
extport CFLAGS='"-I/directory/containing/ft2build.h"
extport LDFLAGS='"-L/directory/containing/libfreetype.so"
```

and on Windows:

```
set CL=IC:\directory\containing\ft2build.h
set LINK=LIBPATH:C:\directory\containing\freetype.lib
```

If you go this route but need to reset and rebuild to change your settings, remember to clear your artifacts before re-building:

```
git clean -xfd
```
MINIMUM VERSION OF DEPENDENCIES POLICY

For the purpose of this document, 'minor version' is in the sense of SemVer (major, minor, patch) and includes both major and minor releases. For projects that use date-based versioning, every release is a 'minor version'. Matplotlib follows NEP 29.

42.1 Python and NumPy

Matplotlib supports:

- All minor versions of Python released 42 months prior to the project, and at minimum the two latest minor versions.

- All minor versions of numpy released in the 24 months prior to the project, and at minimum the last three minor versions.

In setup.py, the python_requires variable should be set to the minimum supported version of Python. All supported minor versions of Python should be in the test matrix and have binary artifacts built for the release.

Minimum Python and NumPy version support should be adjusted upward on every major and minor release, but never on a patch release.

See also the List of dependency versions.

42.2 Python Dependencies

For Python dependencies we should support at least:

with compiled extensions

    minor versions initially released in the 24 months prior to our planned release date or the oldest that support our minimum Python + NumPy

without compiled extensions

    minor versions initially released in the 12 months prior to our planned release date or the oldest that supports our minimum Python.
We will only bump these dependencies as we need new features or the old versions no longer support our minimum NumPy or Python.

### 42.3 Test and Documentation Dependencies

As these packages are only needed for testing or building the docs and not needed by end-users, we can be more aggressive about dropping support for old versions. However, we need to be careful to not over-run what down-stream packagers support (as most of the run the tests and build the documentation as part of the packaging process).

We will support at least minor versions of the development dependencies released in the 12 months prior to our planned release.

We will only bump these as needed or versions no longer support our minimum Python and numpy.

### 42.4 System and C-dependencies

For system or C-dependencies (FreeType, GUI frameworks, LaTeX, Ghostscript, FFmpeg) support as old as practical. These can be difficult to install for end-users and we want to be usable on as many systems as possible. We will bump these on a case-by-case basis.

### 42.5 List of dependency versions

The following list shows the minimal versions of Python and NumPy dependencies for different versions of Matplotlib. Follow the links for the full specification of the dependencies.

<table>

Matplotlib Enhancement Proposals (MEP), inspired by cpython's PEP's but less formal, are design documents for large or controversial changes to Matplotlib. These documents should provide a discussion of both why and how the changes should be made.

To create a new MEP open a pull request (PR) adding a file based on the template to this the MEP directory. For the initial PR only a rough description is required and it should be merged quickly. Further detailed discussion can happen in follow on PRs.

### 43.1 MEP Template

- **Status**
- **Branches and Pull requests**
- **Abstract**
- **Detailed description**
- **Implementation**
- **Backward compatibility**
- **Alternatives**

This MEP template is a guideline of the sections that a MEP should contain. Extra sections may be added if appropriate, and unnecessary sections may be noted as such.
43.1.1 Status

MEPs go through a number of phases in their lifetime:

- **Discussion**: The MEP is being actively discussed on the mailing list and it is being improved by its author. The mailing list discussion of the MEP should include the MEP number (MEPxxx) in the subject line so they can be easily related to the MEP.
- **Progress**: Consensus was reached and implementation work has begun.
- **Completed**: The implementation has been merged into master.
- **Superseded**: This MEP has been abandoned in favor of another approach.
- **Rejected**: There are currently no plans to implement the proposal.

43.1.2 Branches and Pull requests

All development branches containing work on this MEP should be linked to from here.

All pull requests submitted relating to this MEP should be linked to from here. (A MEP does not need to be implemented in a single pull request if it makes sense to implement it in discrete phases).

43.1.3 Abstract

The abstract should be a short description of what the MEP will achieve.

43.1.4 Detailed description

This section describes the need for the MEP. It should describe the existing problem that it is trying to solve and why this MEP makes the situation better. It should include examples of how the new functionality would be used and perhaps some use cases.

43.1.5 Implementation

This section lists the major steps required to implement the MEP. Where possible, it should be noted where one step is dependent on another, and which steps may be optionally omitted. Where it makes sense, each step should include a link related pull requests as the implementation progresses.
43.1.6 Backward compatibility

This section describes the ways in which the MEP breaks backward incompatibility.

43.1.7 Alternatives

If there were any alternative solutions to solving the same problem, they should be discussed here, along with a justification for the chosen approach.

43.2 MEP8: PEP8

- Status
- Branches and Pull requests
- Abstract
- Detailed description
- Implementation
- Backward compatibility
- Alternatives

43.2.1 Status

Completed

We are currently enforcing a sub-set of pep8 on new code contributions.

43.2.2 Branches and Pull requests

None so far.

43.2.3 Abstract

The matplotlib codebase predates PEP8, and therefore is less than consistent style-wise in some areas. Bringing the codebase into compliance with PEP8 would go a long way to improving its legibility.
43.2.4 Detailed description

Some files use four space indentation, some use three. Some use different levels in the same file.
For the most part, class/function-variable naming follows PEP8, but it wouldn't hurt to fix where necessary.

43.2.5 Implementation

The implementation should be fairly mechanical: running the pep8 tool over the code and fixing where appropriate.
This should be merged in after the 2.0 release, since the changes will likely make merging any pending pull requests more difficult.
Additionally, and optionally, PEP8 compliance could be tracked by an automated build system.

43.2.6 Backward compatibility

Public names of classes and functions that require change (there shouldn't be many of these) should first be deprecated and then removed in the next release cycle.

43.2.7 Alternatives

PEP8 is a popular standard for Python code style, blessed by the Python core developers, making any alternatives less desirable.

43.3 MEP9: Global interaction manager

Add a global manager for all user interactivity with artists; make any artist resizeable, moveable, highlightable, and selectable as desired by the user.
43.3.1 Status

Discussion

43.3.2 Branches and Pull requests

https://github.com/dhyams/matplotlib/tree/MEP9

43.3.3 Abstract

The goal is to be able to interact with matplotlib artists in a very similar way as drawing programs do. When appropriate, the user should be able to move, resize, or select an artist that is already on the canvas. Of course, the script writer is ultimately in control of whether an artist is able to be interacted with, or whether it is static.

This code to do this has already been privately implemented and tested, and would need to be migrated from its current "mixin" implementation, to a bona-fide part of matplotlib.

The end result would be to have four new keywords available to matplotlib.artist.Artist: _moveable_, _resizeable_, _selectable_, and _highlightable_. Setting any one of these keywords to True would activate interactivity for that artist.

In effect, this MEP is a logical extension of event handling in matplotlib; matplotlib already supports "low level" interactions like left mouse presses, a key press, or similar. The MEP extends the support to the logical level, where callbacks are performed on the artists when certain interactive gestures from the user are detected.

43.3.4 Detailed description

This new functionality would be used to allow the end-user to better interact with the graph. Many times, a graph is almost what the user wants, but a small repositioning and/or resizing of components is necessary. Rather than force the user to go back to the script to trial-and-error the location, and simple drag and drop would be appropriate.

Also, this would better support applications that use matplotlib; here, the end-user has no reasonable access or desire to edit the underlying source in order to fine-tune a plot. Here, if matplotlib offered the capability, one could move or resize artists on the canvas to suit their needs. Also, the user should be able to highlight (with a mouse over) an artist, and select it with a double-click, if the application supports that sort of thing.

In this MEP, we also want to support the highlighting and selection natively; it is up to application to handle what happens when the artist is selected. A typical handling would be to display a dialog to edit the properties of the artist.

In the future, as well (this is not part of this MEP), matplotlib could offer backend-specific property dialogs for each artist, which are raised on artist selection. This MEP would be a necessary stepping stone for that sort of capability.
There are currently a few interactive capabilities in matplotlib (e.g. legend.draggable()), but they tend to be scattered and are not available for all artists. This MEP seeks to unify the interactive interface and make it work for all artists.

The current MEP also includes grab handles for resizing artists, and appropriate boxes drawn when artists are moved or resized.

### 43.3.5 Implementation

- Add appropriate methods to the "tree" of artists so that the interactivity manager has a consistent interface for the interactivity manager to deal with. The proposed methods to add to the artists, if they are to support interactivity, are:
  
  - `get_pixel_position_ll(self)`: get the pixel position of the lower left corner of the artist's bounding box
  - `get_pixel_size(self)`: get the size of the artist's bounding box, in pixels
  - `set_pixel_position_and_size(self, x, y, dx, dy)`: set the new size of the artist, such that it fits within the specified bounding box.

- Add capability to the backends to 1) provide cursors, since these are needed for visual indication of moving/resizing, and 2) provide a function that gets the current mouse position

- Implement the manager. This has already been done privately (by dhyams) as a mixin, and has been tested quite a bit. The goal would be to move the functionality of the manager into the artists so that it is in matplotlib properly, and not as a "monkey patch" as I currently have it coded.

### 43.3.6 Current summary of the mixin

(Note that this mixin is for now just private code, but can be added to a branch obviously)

`InteractiveArtistMixin`:

Mixin class to make any generic object that is drawn on a matplotlib canvas moveable and possibly resizeable. The Powerpoint model is followed as closely as possible; not because I’m enamoured with Powerpoint, but because that’s what most people understand. An artist can also be selectable, which means that the artist will receive the onActivated() callback when double clicked. Finally, an artist can be highlightable, which means that a highlight is drawn on the artist whenever the mouse passes over. Typically, highlightable artists will also be selectable, but that is left up to the user. So, basically there are four attributes that can be set by the user on a per-artist basis:

- highlightable
- selectable
- moveable
- resizeable

To be moveable (draggable) or resizeable, the object that is the target of the mixin must support the following protocols:
• get_pixel_position_ll(self)
• get_pixel_size(self)
• set_pixel_position_and_size(self,x,y,sx,sy)

Note that nonresizeable objects are free to ignore the sx and sy parameters. To be highlightable, the object
that is the target of the mixin must also support the following protocol:
• get_highlight(self)

Which returns a list of artists that will be used to draw the highlight.

If the object that is the target of the mixin is not an matplotlib artist, the following protocols must also be
implemented. Doing so is usually fairly trivial, as there has to be an artist somewhere that is being drawn.
Typically your object would just route these calls to that artist.
• get_figure(self)
• get_axes(self)
• contains(self,event)
• set_animated(self,flag)
• draw(self,renderer)
• get_visible(self)

The following notifications are called on the artist, and the artist can optionally implement these.
• on_select_begin(self)
• on_select_end(self)
• on_drag_begin(self)
• on_drag_end(self)
• on_activated(self)
• on_highlight(self)
• on_right_click(self,event)
• on_left_click(self,event)
• on_middle_click(self,event)
• on_context_click(self,event)
• on_key_up(self,event)
• on_key_down(self,event)

The following notifications are called on the canvas, if no interactive artist handles the event:
• on_press(self,event)
• on_left_click(self,event)
• on_middle_click(self,event)
• on_right_click(self, event)
• on_context_click(self, event)
• on_key_up(self, event)
• on_key_down(self, event)

The following functions, if present, can be used to modify the behavior of the interactive object:

• press_filter(self, event) # determines if the object wants to have the press event routed to it
• handle_unpicked_cursor() # can be used by the object to set a cursor as the cursor passes over the object when it is unpicked.

Supports multiple canvases, maintaining a drag lock, motion notifier, and a global "enabled" flag per canvas. Supports fixed aspect ratio resizings by holding the shift key during the resize.

Known problems:

• Zorder is not obeyed during the selection/drag operations. Because of the blit technique used, I do not believe this can be fixed. The only way I can think of is to search for all artists that have a zorder greater than me, set them all to animated, and then redraw them all on top during each drag refresh. This might be very slow; need to try.

• the mixin only works for wx backends because of two things: 1) the cursors are hardcoded, and 2) there is a call to wx.GetMousePosition() Both of these shortcomings are reasonably fixed by having each backend supply these things.

43.3.7 Backward compatibility

No problems with backward compatibility, although once this is in place, it would be appropriate to obsolete some of the existing interactive functions (like legend.draggable())

43.3.8 Alternatives

None that I know of.

43.4 MEP10: Docstring consistency
43.4.1 Status

Progress

This is still an on-going effort

43.4.2 Branches and Pull requests

43.4.3 Abstract

matplotlib has a great deal of inconsistency between docstrings. This not only makes the docs harder to read, but it is harder on contributors, because they don't know which specifications to follow. There should be a clear docstring convention that is followed consistently.

The organization of the API documentation is difficult to follow. Some pages, such as pyplot and axes, are enormous and hard to browse. There should instead be short summary tables that link to detailed documentation. In addition, some of the docstrings themselves are quite long and contain redundant information.

Building the documentation takes a long time and uses a `make.py` script rather than a Makefile.

43.4.4 Detailed description

There are number of new tools and conventions available since matplotlib started using Sphinx that make life easier. The following is a list of proposed changes to docstrings, most of which involve these new features.
Numpy docstring format

Numpy docstring format: This format divides the docstring into clear sections, each having different parsing rules that make the docstring easy to read both as raw text and as HTML. We could consider alternatives, or invent our own, but this is a strong choice, as it's well used and understood in the Numpy/Scipy community.

Cross references

Most of the docstrings in matplotlib use explicit "roles" when linking to other items, for example: :func:`myfunction`. As of Sphinx 0.4, there is a "default_role" that can be set to "obj", which will polymorphically link to a Python object of any type. This allows one to write `myfunction` instead. This makes docstrings much easier to read and edit as raw text. Additionally, Sphinx allows for setting a current module, so links like `~matplotlib.axes.Axes.set_xlim` could be written as `~axes.Axes.set_xlim`.

Overriding signatures

Many methods in matplotlib use the *args and **kwargs syntax to dynamically handle the keyword arguments that are accepted by the function, or to delegate on to another function. This, however, is often not useful as a signature in the documentation. For this reason, many matplotlib methods include something like:

```python
def annotate(self, *args, **kwargs):
    """
    Create an annotation: a piece of text referring to data point.
    
    Call signature:
    
    annotate(s, xy, xytext=None, xycoords='data', textcoords='data', arrowprops=None, **kwargs)
    """
```

This can't be parsed by Sphinx, and is rather verbose in raw text. As of Sphinx 1.1, if the autodoc_docstring_signature config value is set to True, Sphinx will extract a replacement signature from the first line of the docstring, allowing this:

```python
def annotate(self, *args, **kwargs):
    """
    annotate(s, xy, xytext=None, xycoords='data', textcoords='data', arrowprops=None, **kwargs)
    """
Create an annotation: a piece of text referring to a data point.
    """
```

The explicit signature will replace the actual Python one in the generated documentation.
Linking rather than duplicating

Many of the docstrings include long lists of accepted keywords by interpolating things into the docstring at load time. This makes the docstrings very long. Also, since these tables are the same across many docstrings, it inserts a lot of redundant information in the docs -- particularly a problem in the printed version.

These tables should be moved to docstrings on functions whose only purpose is for help. The docstrings that refer to these tables should link to them, rather than including them verbatim.

autosummary extension

The Sphinx autosummary extension should be used to generate summary tables, that link to separate pages of documentation. Some classes that have many methods (e.g. `Axes`) should be documented with one method per page, whereas smaller classes should have all of their methods together.

Examples linking to relevant documentation

The examples, while helpful at illustrating how to use a feature, do not link back to the relevant docstrings. This could be addressed by adding module-level docstrings to the examples, and then including that docstring in the parsed content on the example page. These docstrings could easily include references to any other part of the documentation.

Documentation using help() vs. a browser

Using Sphinx markup in the source allows for good-looking docs in your browser, but the markup also makes the raw text returned using help() look terrible. One of the aims of improving the docstrings should be to make both methods of accessing the docs look good.

43.4.5 Implementation

1. The numpydoc extensions should be turned on for matplotlib. There is an important question as to whether these should be included in the matplotlib source tree, or used as a dependency. Installing Numpy is not sufficient to get the numpydoc extensions -- it's a separate install procedure. In any case, to the extent that they require customization for our needs, we should endeavor to submit those changes upstream and not fork them.

2. Manually go through all of the docstrings and update them to the new format and conventions. Updating the cross references (from `:func:`myfunc` to `func`) may be able to be semi-automated. This is a lot of busy work, and perhaps this labor should be divided on a per-module basis so no single developer is over-burdened by it.

3. Reorganize the API docs using autosummary and `sphinx-autogen`. This should hopefully have minimal impact on the narrative documentation.

4. Modify the example page generator (`gen_rst.py`) so that it extracts the module docstring from the example and includes it in a non-literal part of the example page.
5. Use `sphinx-quickstart` to generate a new-style Sphinx Makefile. The following features in the current `make.py` will have to be addressed in some other way:
   - Copying of some static content
   - Specifying a "small" build (only low-resolution PNG files for examples)

Steps 1, 2, and 3 are interdependent. 4 and 5 may be done independently, though 5 has some dependency on 3.

### 43.4.6 Backward compatibility

As this mainly involves docstrings, there should be minimal impact on backward compatibility.

### 43.4.7 Alternatives

None yet discussed.

### 43.5 MEP11: Third-party dependencies

- **Status**
- **Branches and Pull requests**
- **Abstract**
- **Detailed description**
  - **Current behavior**
  - **Desired behavior**
- **Implementation**
- **Backward compatibility**
- **Alternatives**

This MEP attempts to improve the way in which third-party dependencies in matplotlib are handled.
43.5.1 Status

Completed -- needs to be merged

43.5.2 Branches and Pull requests

#1157: Use automatic dependency resolution
#1290: Debundle pyparsing
#1261: Update six to 1.2

43.5.3 Abstract

One of the goals of matplotlib has been to keep it as easy to install as possible. To that end, some third-party dependencies are included in the source tree and, under certain circumstances, installed alongside matplotlib. This MEP aims to resolve some problems with that approach, bring some consistency, while continuing to make installation convenient.

At the time that was initially done, setuptools, easy_install and PyPI were not mature enough to be relied on. However, at present, we should be able to safely leverage the "modern" versions of those tools, distribute and pip.

While matplotlib has dependencies on both Python libraries and C/C++ libraries, this MEP addresses only the Python libraries so as to not confuse the issue. C libraries represent a larger and mostly orthogonal set of problems.

43.5.4 Detailed description

matplotlib depends on the following third-party Python libraries:

- Numpy
- dateutil (pure Python)
- pytz (pure Python)
- six -- required by dateutil (pure Python)
- pyparsing (pure Python)
- PIL (optional)
- GUI frameworks: pygtk, gobject, tkinter, PySide, PyQt4, wx (all optional, but one is required for an interactive GUI)
Current behavior

When installing from source, a \texttt{git} checkout or \texttt{pip}:

- \texttt{setup.py} attempts to \texttt{import numpy}. If this fails, the installation fails.
- For each of \texttt{dateutil}, \texttt{pytz} and \texttt{six}, \texttt{setup.py} attempts to import them (from the top-level namespace). If that fails, matplotlib installs its local copy of the library into the top-level namespace.
- \texttt{pyparsing} is always installed inside of the matplotlib namespace.

This behavior is most surprising when used with \texttt{pip}, because no \texttt{pip} dependency resolution is performed, even though it is likely to work for all of these packages.

The fact that \texttt{pyparsing} is installed in the matplotlib namespace has reportedly (\#1290) confused some users into thinking it is a matplotlib-related module and import it from there rather than the top-level.

When installing using the Windows installer, \texttt{dateutil}, \texttt{pytz} and \texttt{six} are installed at the top-level \texttt{always}, potentially overwriting already installed copies of those libraries.

TODO: Describe behavior with the OS-X installer.

When installing using a package manager (Debian, RedHat, MacPorts etc.), this behavior actually does the right thing, and there are no special patches in the matplotlib packages to deal with the fact that we handle \texttt{dateutil}, \texttt{pytz} and \texttt{six} in this way. However, care should be taken that whatever approach we move to continues to work in that context.

Maintaining these packages in the matplotlib tree and making sure they are up-to-date is a maintenance burden. Advanced new features that may require a third-party pure Python library have a higher barrier to inclusion because of this burden.

Desired behavior

Third-party dependencies are downloaded and installed from their canonical locations by leveraging \texttt{pip}, \texttt{distribute} and \texttt{PyPI}.

\texttt{dateutil}, \texttt{pytz}, and \texttt{pyparsing} should be made into optional dependencies -- though obviously some features would fail if they aren't installed. This will allow the user to decide whether they want to bother installing a particular feature.

43.5.5 Implementation

For installing from source, and assuming the user has all of the C-level compilers and dependencies, this can be accomplished fairly easily using \texttt{distribute} and following the instructions \texttt{here}. The only anticipated change to the matplotlib library code will be to import \texttt{pyparsing} from the top-level namespace rather than from within matplotlib. Note that \texttt{distribute} will also allow us to remove the direct dependency on \texttt{six}, since it is, strictly speaking, only a direct dependency of \texttt{dateutil}.

For binary installations, there are a number of alternatives (here ordered from best/hardest to worst/easiest):
1. The distutils wininst installer allows a post-install script to run. It might be possible to get this script to run pip to install the other dependencies. (See this thread for someone who has trod that ground before).

2. Continue to ship dateutil, pytz, six and pyparsing in our installer, but use the post-install-script to install them only if they can not already be found.

3. Move all of these packages inside a (new) matplotlib.extern namespace so it is clear for outside users that these are external packages. Add some conditional imports in the core matplotlib codebase so dateutil (at the top-level) is tried first, and failing that matplotlib.extern.dateutil is used.

2 and 3 are undesirable as they still require maintaining copies of these packages in our tree -- and this is exacerbated by the fact that they are used less -- only in the binary installers. None of these 3 approaches address Numpy, which will still have to be manually installed using an installer.

TODO: How does this relate to the Mac OS-X installer?

### 43.5.6 Backward compatibility

At present, matplotlib can be installed from source on a machine without the third party dependencies and without an internet connection. After this change, an internet connection (and a working PyPI) will be required to install matplotlib for the first time. (Subsequent matplotlib updates or development work will run without accessing the network).

### 43.5.7 Alternatives

Distributing binary eggs doesn't feel like a usable solution. That requires getting easy_install installed first, and Windows users generally prefer the well known .exe or .msi installer that works out of the box.

### 43.6 MEP12: Improve Gallery and Examples

- **Status**
- **Branches and Pull requests**
- **Abstract**
- **Detailed description**
- **Implementation**
  - Gallery sections
  - Clean up guidelines
  * Additional suggestions
- **Backward compatibility**
43.6.1 Status

Progress

Initial changes added in 1.3. Conversion of the gallery is on-going. 29 September 2015 - The last `pylab_examples` where `pylab` is imported has been converted over to use `matplotlib.pyplot` and `numpy`.

43.6.2 Branches and Pull requests

#1623, #1924, #2181

PR #2474 demonstrates a single example being cleaned up and moved to the appropriate section.

43.6.3 Abstract

Reorganizing the matplotlib plot gallery would greatly simplify navigation of the gallery. In addition, examples should be cleaned-up and simplified for clarity.

43.6.4 Detailed description

The matplotlib gallery was recently set up to split examples up into sections. As discussed in that PR\(^1\), the current example sections (`api`, `pylab_examples`) aren't terribly useful to users: New sections in the gallery would help users find relevant examples.

These sections would also guide a cleanup of the examples: Initially, all the current examples would remain and be listed under their current directories. Over time, these examples could be cleaned up and moved into one of the new sections.

This process allows users to easily identify examples that need to be cleaned up; i.e. anything in the `api` and `pylab_examples` directories.

\(^1\) https://github.com/matplotlib/matplotlib/pull/714
43.6.5 Implementation

1. Create new gallery sections. [Done]

2. Clean up examples and move them to the new gallery sections (over the course of many PRs and with the help of many users/developers). [In progress]

Gallery sections

The naming of sections is critical and will guide the clean-up effort. The current sections are:

- Lines, bars, and markers (more-or-less 1D data)
- Shapes and collections
- Statistical plots
- Images, contours, and fields
- Pie and polar charts: Round things
- Color
- Text, labels, and annotations
- Ticks and spines
- Subplots, axes, and figures
- Specialty plots (e.g., sankey, radar, tornado)
- Showcase (plots with tweaks to make them publication-quality)
- separate sections for toolboxes (already exists: 'mplot3d', 'axes_grid', 'units', 'widgets')

These names are certainly up for debate. As these sections grow, we should reevaluate them and split them up as necessary.

Clean up guidelines

The current examples in the api and pylab_examples sections of the gallery would remain in those directories until they are cleaned up. After clean-up, they would be moved to one of the new gallery sections described above. "Clean-up" should involve:

- sphinx-gallery docstrings: a title and a description of the example formatted as follows, at the top of the example:

```python
""
===============================
Colormaps alter your perception
===============================
Here I plot the function
```

(continues on next page)
.. math:: f(x, y) = \sin(x) + \cos(y)

with different colormaps. Look at how colormaps alter your perception!

• PEP8 clean-ups (running flake8, or a similar checker, is highly recommended)
• Commented-out code should be removed.
• Replace uses of pylab interface with pyplot (+ numpy, etc.). See c25ef1e
• Remove shebang line, e.g.:

    #!/usr/bin/env python

• Use consistent imports. In particular:

    import numpy as np
    import matplotlib.pyplot as plt

    Avoid importing specific functions from these modules (e.g. from numpy import sin)
• Each example should focus on a specific feature (excluding showcase examples, which will show more "polished" plots). Tweaking unrelated to that feature should be removed. See f7b2217, e57b5fc, and 1458aa8

Use of pylab should be demonstrated/discussed on a dedicated help page instead of the gallery examples.

Note: When moving an existing example, you should search for references to that example. For example, the API documentation for axes.py and pyplot.py may use these examples to generate plots. Use your favorite search tool (e.g., grep, ack, grin, pss) to search the matplotlib package. See 2dc9a46 and aa6b410

Additional suggestions

• Provide links (both ways) between examples and API docs for the methods/objects used. (issue #2222)
• Use plt.subplots (note trailing "s") in preference over plt.subplot.
• Rename the example to clarify its purpose. For example, the most basic demo of imshow might be imshow_demo.py, and one demonstrating different interpolation settings would be imshow_demo_interpolation.py (not imshow_demo2.py).
• Split up examples that try to do too much. See 5099675 and fc2ab07
• Delete examples that don’t show anything new.
• Some examples exercise esoteric features for unit testing. These tweaks should be moved out of the gallery to an example in the unit directory located in the root directory of the package.
• Add plot titles to clarify intent of the example. See bd2b13c
43.6.6 Backward compatibility

The website for each Matplotlib version is readily accessible, so users who want to refer to old examples can still do so.

43.6.7 Alternatives

Tags

Tagging examples will also help users search the example gallery. Although tags would be a big win for users with specific goals, the plot gallery will remain the entry point to these examples, and sections could really help users navigate the gallery. Thus, tags are complementary to this reorganization.

43.7 MEP13: Use properties for Artists

- Status
- Branches and Pull requests
- Abstract
- Detailed description
- Implementation
- Backward compatibility
- Examples
  - axes.Axes.set_axis_off/set_axis_on
  - axes.Axes.get_xlim/set_xlim and get_autoscalex_on/set_autoscalex_on
  - axes.Axes.get_title/set_title
  - axes.Axes.get_xticklabels/set_xticklabels
- Alternatives

43.7.1 Status

- Discussion
43.7.2 Branches and Pull requests

None

43.7.3 Abstract

Wrap all of the matplotlib getter and setter methods with python properties, allowing them to be read and written like class attributes.

43.7.4 Detailed description

Currently matplotlib uses getter and setter functions (usually prefixed with get_ and set_, respectively) for reading and writing data related to classes. However, since 2.6 python supports properties, which allow such setter and getter functions to be accessed as though they were attributes. This proposal would implement all existing setter and getter methods as properties.

43.7.5 Implementation

1. All existing getter and setter methods will need to have two aliases, one with the get_ or set_ prefix and one without. Getter methods that currently lack prefixes should be recording in a text file.

2. Classes should be reorganized so setter and getter methods are sequential in the code, with getter methods first.

3. Getter and setter methods the provide additional optional arguments should have those arguments accessible in another manner, either as additional getter or setter methods or attributes of other classes. If those classes are not accessible, getters for them should be added.

4. Property decorators will be added to the setter and getter methods without the prefix. Those with the prefix will be marked as deprecated.

5. Docstrings will need to be rewritten so the getter with the prefix has the current docstring and the getter without the prefix has a generic docstring appropriate for an attribute.

6. Automatic alias generation will need to be modified so it will also create aliases for the properties.

7. All instances of getter and setter method calls will need to be changed to attribute access.

8. All setter and getter alias with prefixes will be removed

The following steps can be done simultaneously: 1, 2, and 3; 4 and 5; 6 and 7.

Only the following steps must be done in the same release: 4, 5, and 6. All other changes can be done in separate releases. 8 should be done several major releases after everything else.
43.7.6 Backward compatibility

All existing getter methods that do not have a prefix (such as get_) will need to be changed from function calls to attribute access. In most cases this will only require removing the parenthesis.

setter and getter methods that have additional optional arguments will need to have those arguments implemented in another way, either as a separate property in the same class or as attributes or properties of another class.

Cases where the setter returns a value will need to be changed to using the setter followed by the getter.

Cases where there are set_ATTR_on() and set_ATTR_off() methods will be changed to ATTR_on properties.

43.7.7 Examples

axes.Axes.set_axis_off/set_axis_on

Current implementation:

```python
axes.Axes.set_axis_off()
axes.Axes.set_axis_on()
```

New implementation:

```python
True = axes.Axes.axis_on
False = axes.Axes.axis_on
axes.Axes.axis_on = True
axes.Axes.axis_on = False
```

axes.Axes.get_xlim/set_xlim and get_autoscalex_on/set_autoscalex_on

Current implementation:

```python
[left, right] = axes.Axes.get_xlim()
auto = axes.Axes.get_autoscalex_on()

[left, right] = axes.Axes.set_xlim(left=left, right=right, emit=emit, _
  auto=auto)
[left, right] = axes.Axes.set_xlim(left=left, right=None, emit=emit, _
  auto=auto)
[left, right] = axes.Axes.set_xlim(left=None, right=right, emit=emit, _
  auto=auto)
[left, right] = axes.Axes.set_xlim(left=left, emit=emit, auto=auto)
[left, right] = axes.Axes.set_xlim(right=right, emit=emit, auto=auto)
```

New implementation:

```python
axes.Axes.set_autoscalex_on(auto)
```
axes.Axes.set_title

Current implementation:

```python
string = axes.Axes.get_title()
axes.Axes.set_title(string, fontdict=fontdict, **kwargs)
```

New implementation:

```python
string = axes.Axes.title
string = axes.Axes.title_text.text

text.Text = axes.Axes.title_text
text.Text.<attribute> = attribute
text.Text.fontdict = fontdict

axes.Axes.title = string
axes.Axes.title = text.Text
axes.Axes.title_text = string
axes.Axes.title_text = text.Text
```

axes.Axes.get_xticklabels/set_xticklabels

Current implementation:

```python
[text.Text] = axes.Axes.get_xticklabels()
[text.Text] = axes.Axes.get_xticklabels(minor=False)
[text.Text] = axes.Axes.get_xticklabels(minor=True)
[text.Text] = axes.Axes.get_xticklabels([string], fontdict=fontdict, **kwargs)
[text.Text] = axes.Axes.get_xticklabels([string], fontdict=fontdict=None, minor=False, **kwargs)
[text.Text] = axes.Axes.get_xticklabels([string], fontdict=fontdict=None, minor=True, **kwargs)
```

New implementation:

```python
[text.Text] = axes.Axes.get_xticklabels()
[text.Text] = axes.Axes.get_xticklabels(minor=False)
[text.Text] = axes.Axes.get_xticklabels(minor=True)
[text.Text] = axes.Axes.get_xticklabels([string], fontdict=fontdict=None, minor=False, **kwargs)
[text.Text] = axes.Axes.get_xticklabels([string], fontdict=fontdict=None, minor=True, **kwargs)
```

(continues on next page)
43.7.8 Alternatives

Instead of using decorators, it is also possible to use the property function. This would change the procedure so that all getter methods that lack a prefix will need to be renamed or removed. This makes handling docstrings more difficult and harder to read.

It is not necessary to deprecate the setter and getter methods, but leaving them in will complicate the code. This could also serve as an opportunity to rewrite or even remove automatic alias generation.

Another alternate proposal:

Convert `set_xlim`, `set_xlabel`, `set_title`, etc. to `xlim`, `xlabel`, `title`,... to make the transition from `plt` functions to `axes` methods significantly simpler. These would still be methods, not properties, but it's still a great usability enhancement while retaining the interface.

43.8 MEP14: Text handling

- Status
- Branches and Pull requests
- Abstract
- Detailed description
- Implementation
- Backward compatibility
- Alternatives

43.8.1 Status

- Discussion
43.8.2 Branches and Pull requests

Issue #253 demonstrates a bug where using the bounding box rather than the advance width of text results in misaligned text. This is a minor point in the grand scheme of things, but it should be addressed as part of this MEP.

43.8.3 Abstract

By reorganizing how text is handled, this MEP aims to:

- improve support for Unicode and non-ltr languages
- improve text layout (especially multi-line text)
- allow support for more fonts, especially non-Apple-format TrueType fonts and OpenType fonts.
- make the font configuration easier and more transparent

43.8.4 Detailed description

Text layout

At present, matplotlib has two different ways to render text: "built-in" (based on FreeType and our own Python code), and "usetex" (based on calling out to a TeX installation). Adjunct to the "built-in" renderer there is also the Python-based "mathtext" system for rendering mathematical equations using a subset of the TeX language without having a TeX installation available. Support for these two engines in strewn about many source files, including every backend, where one finds clauses like

```
if rcParams['text.usetex']:
   # do one thing
else:
   # do another
```

Adding a third text rendering approach (more on that later) would require editing all of these places as well, and therefore doesn't scale.

Instead, this MEP proposes adding a concept of "text engines", where the user could select one of many different approaches for rendering text. The implementations of each of these would be localized to their own set of modules, and not have little pieces around the whole source tree.

Why add more text rendering engines? The "built-in" text rendering has a number of shortcomings.

- It only handles right-to-left languages, and doesn't handle many special features of Unicode, such as combining diacriticals.
- The multiline support is imperfect and only supports manual line-breaking -- it can not break up a paragraph into lines of a certain length.
- It also does not handle inline formatting changes in order to support something like Markdown, reStructuredText or HTML. (Though rich-text formatting is contemplated in this MEP, since we want to make sure this design allows it, the specifics of a rich-text formatting implementation is outside of the scope of this MEP.)

Supporting these things is difficult, and is the "full-time job" of a number of other projects:
Of the above options, it should be noted that harfbuzz is designed from the start as a cross platform option with minimal dependencies, so therefore is a good candidate for a single option to support.

Additionally, for supporting rich text, we could consider using WebKit, and possibly whether than represents a good single cross-platform option. Again, however, rich text formatting is outside of the scope of this project.

Rather than trying to reinvent the wheel and add these features to matplotlib's "built-in" text renderer, we should provide a way to leverage these projects to get more powerful text layout. The "built-in" renderer will still need to exist for reasons of ease of installation, but its feature set will be more limited compared to the others. [TODO: This MEP should clearly decide what those limited features are, and fix any bugs to bring the implementation into a state of working correctly in all cases that we want it to work. I know @leejjoon has some thoughts on this.]

Font selection

Going from an abstract description of a font to a file on disk is the task of the font selection algorithm -- it turns out to be much more complicated than it seems at first.

The "built-in" and "usetex" renderers have very different ways of handling font selection, given their different technologies. TeX requires the installation of TeX-specific font packages, for example, and can not use TrueType fonts directly. Unfortunately, despite the different semantics for font selection, the same set of font properties are used for each. This is true of both the FontProperties class and the font-related rcParams (which basically share the same code underneath). Instead, we should define a core set of font selection parameters that will work across all text engines, and have engine-specific configuration to allow the user to do engine-specific things when required. For example, it is possible to directly select a font by name in the "built-in" using rcParams("font.family") (default: ['sans-serif']), but the same is not possible with "usetex". It may be possible to make it easier to use TrueType fonts by using XeTeX, but users will still want to use the traditional metafonts through TeX font packages. So the issue still stands that different text engines will need engine-specific configuration, and it should be more obvious to the user which configuration will work across text engines and which are engine-specific.

Note that even excluding "usetex", there are different ways to find fonts. The default is to use the font list cache in font_manager which matches fonts using our own algorithm based on the CSS font matching algorithm. It doesn't always do the same thing as the native font selection algorithms on Linux (fontconfig), Mac and Windows, and it doesn't always find all of the fonts on the system that the OS would normally pick up. However, it is cross-platform, and always finds the fonts that ship with matplotlib. The Cairo and MacOSX backends (and presumably a future HTML5-based backend) currently bypass this mechanism and use the OS-native ones. The same is true when not embedding fonts in SVG, PS or PDF files and opening them in a third-party viewer. A downside there is that (at least with Cairo, need to confirm with MacOSX) they don't always find the fonts we ship with matplotlib. (It may be possible to add the fonts to their search path, though, or we may need to find a way to install our fonts to a location the OS expects to find them).

There are also special modes in the PS and PDF to only use the core fonts that are always available to those formats. There, the font lookup mechanism must only match against those fonts. It is unclear whether the
OS-native font lookup systems can handle this case.

There is also experimental support for using fontconfig for font selection in matplotlib, turned off by default. fontconfig is the native font selection algorithm on Linux, but is also cross platform and works well on the other platforms (though obviously is an additional dependency there).

Many of the text layout libraries proposed above (pango, QtTextLayout, DirectWrite and CoreText etc.) insist on using the font selection library from their own ecosystem.

All of the above seems to suggest that we should move away from our self-written font selection algorithm and use the native APIs where possible. That's what Cairo and MacOSX backends already want to use, and it will be a requirement of any complex text layout library. On Linux, we already have the bones of a fontconfig implementation (which could also be accessed through pango). On Windows and Mac we may need to write custom wrappers. The nice thing is that the API for font lookup is relatively small, and essentially consist of "given a dictionary of font properties, give me a matching font file".

Font subsetting

Font subsetting is currently handled using tconv. tconv was a standalone command line utility for converting TrueType fonts to subsetted Type 3 fonts (among other features) written in 1995, which matplotlib (well, I) forked in order to make it work as a library. It only handles Apple-style TrueType fonts, not ones with the Microsoft (or other vendor) encodings. It doesn't handle OpenType fonts at all. This means that even though the STIX fonts come as .otf files, we have to convert them to .ttf files to ship them with matplotlib. The Linux packagers hate this -- they'd rather just depend on the upstream STIX fonts. tconv has also been shown to have a few bugs that have been difficult to fix over time.

Instead, we should be able to use FreeType to get the font outlines and write our own code (probably in Python) to output subsetted fonts (Type 3 on PS and PDF and paths on SVG). Freetype, as a popular and well-maintained project, handles a wide variety of fonts in the wild. This would remove a lot of custom C code, and remove some code duplication between backends.

Note that subsetting fonts this way, while the easiest route, does lose the hinting in the font, so we will need to continue, as we do now, provide a way to embed the entire font in the file where possible.

Alternative font subsetting options include using the subsetting built-in to Cairo (not clear if it can be used without the rest of Cairo), or using fontforge (which is a heavy and not terribly cross-platform dependency).

Freetype wrappers

Our FreeType wrapper could really use a reworking. It defines its own image buffer class (when a Numpy array would be easier). While FreeType can handle a huge diversity of font files, there are limitations to our wrapper that make it much harder to support non-Apple-vendor TrueType files, and certain features of OpenType files. (See #2088 for a terrible result of this, just to support the fonts that ship with Windows 7 and 8). I think a fresh rewrite of this wrapper would go a long way.

Text anchoring and alignment and rotation

The handling of baselines was changed in 1.3.0 such that the backends are now given the location of the baseline of the text, not the bottom of the text. This is probably the correct behavior, and the MEP refactoring should also follow this convention.

In order to support alignment on multi-line text, it should be the responsibility of the (proposed) text engine to handle text alignment. For a given chunk of text, each engine calculates a bounding box for that text and
the offset of the anchor point within that box. Therefore, if the va of a block was "top", the anchor point would be at the top of the box.

Rotating of text should always be around the anchor point. I'm not sure that lines up with current behavior in matplotlib, but it seems like the sanest/least surprising choice. [This could be revisited once we have something working]. Rotation of text should not be handled by the text engine -- that should be handled by a layer between the text engine and the rendering backend so it can be handled in a uniform way. [I don't see any advantage to rotation being handled by the text engines individually...]

There are other problems with text alignment and anchoring that should be resolved as part of this work. [TODO: enumerate these].

Other minor problems to fix
The mathtext code has backend-specific code -- it should instead provide its output as just another text engine. However, it's still desirable to have mathtext layout inserted as part of a larger layout performed by another text engine, so it should be possible to do this. It's an open question whether embedding the text layout of an arbitrary text engine in another should be possible.

The text mode is currently set by a global rcParam ("text.usetex") so it's either all on or all off. We should continue to have a global rcParam to choose the text engine ("text.layout_engine"), but it should under the hood be an overridable property on the Text object, so the same figure can combine the results of multiple text layout engines if necessary.

43.8.5 Implementation

A concept of a "text engine" will be introduced. Each text engine will implement a number of abstract classes. The TextFont interface will represent text for a given set of font properties. It isn't necessarily limited to a single font file -- if the layout engine supports rich text, it may handle a number of font files in a family. Given a TextFont instance, the user can get a TextLayout instance, which represents the layout for a given string of text in a given font. From a TextLayout, an iterator over TextSpans is returned so the engine can output raw editable text using as few spans as possible. If the engine would rather get individual characters, they can be obtained from the TextSpan instance:

```python
class TextFont(TextFontBase):
    def __init__(self, font_properties):
        """
        Create a new object for rendering text using the given font properties.
        """
        pass

    def get_layout(self, s, ha, va):
        """
        Get the TextLayout for the given string in the given font and
        the horizontal (left, center, right) and vertical alignment (top, center, baseline, bottom)
        """
        pass

class TextLayout(TextLayoutBase):
```

(continues on next page)
def get_metrics(self):
    
    Return the bounding box of the layout, anchored at (0, 0).
    
    pass

def get_spans(self):
    
    Returns an iterator over the spans of different in the layout. This is useful for backends that want to editable raw text as individual lines. For rich text where the font may change, each span of different font type will have its own span.
    
    pass

def get_image(self):
    
    Returns a rasterized image of the text. Useful for raster backends, like Agg.

    In all likelihood, this will be overridden in the backend, as it can be created from get_layout(), but certain backends may want to override it if their library provides it (as freetype does).
    
    pass

def get_rectangles(self):
    
    Returns an iterator over the filled black rectangles in the layout. Used by TeX and mathtext for drawing, for example, fraction lines.
    
    pass

def get_path(self):
    
    Returns a single Path object of the entire laid out text.

    [Not strictly necessary, but might be useful for textpath functionality]
    
    pass

class TextSpan(TextSpanBase):
    x, y  # Position of the span -- relative to the text layout as a whole
          # where (0, 0) is the anchor. y is the baseline of the span.
    fontfile  # The font file to use for the span
    text  # The text content of the span

    def get_path(self):
        pass  # See TextLayout.get_path

    def get_chars(self):
class TextChar(TextCharBase):
    x, y  # Position of the character -- relative to the text layout as a whole, where (0, 0) is the anchor. y is in the baseline of the character.
    codepoint # The unicode code point of the character -- only for informational purposes, since the mapping of codepoint to glyph_id may have been handled in a complex way by the layout engine. This is an int to avoid problems on narrow Unicode builds.
    glyph_id # The index of the glyph within the font
    fontfile # The font file to use for the char

    def get_path(self):
        """Get the path for the character."""
        pass

Graphic backends that want to output subset of fonts would likely build up a file-global dictionary of characters where the keys are (fontname, glyph_id) and the values are the paths so that only one copy of the path for each character will be stored in the file.

Special casing: The "usetex" functionality currently is able to get Postscript directly from TeX to insert directly in a Postscript file, but for other backends, parses a DVI file and generates something more abstract. For a case like this, TextLayout would implement get_spans for most backends, but add get_ps for the Postscript backend, which would look for the presence of this method and use it if available, or fall back to get_spans. This kind of special casing may also be necessary, for example, when the graphics backend and text engine belong to the same ecosystem, e.g. Cairo and Pango, or MacOSX and CoreText.

There are three main pieces to the implementation:

1) Rewriting the freetype wrapper, and removing ttconv.
   a) Once (1) is done, as a proof of concept, we can move to the upstream STIX .otf fonts
   b) Add support for web fonts loaded from a remote URL. (Enabled by using freetype for font subsetting).

2) Refactoring the existing "builtin" and "usetex" code into separate text engines and to follow the API outlined above.

3) Implementing support for advanced text layout libraries.

(1) and (2) are fairly independent, though having (1) done first will allow (2) to be simpler. (3) is dependent on (1) and (2), but even if it doesn’t get done (or is postponed), completing (1) and (2) will make it easier to move forward with improving the "builtin" text engine.
43.8.6 Backward compatibility

The layout of text with respect to its anchor and rotation will change in hopefully small, but improved, ways. The layout of multiline text will be much better, as it will respect horizontal alignment. The layout of bidirectional text or other advanced Unicode features will now work inherently, which may break some things if users are currently using their own workarounds.

Fonts will be selected differently. Hacks that used to sort of work between the "builtin" and "usetex" text rendering engines may no longer work. Fonts found by the OS that weren't previously found by matplotlib may be selected.

43.8.7 Alternatives

TBD

43.9 MEP15 - Fix axis autoscaling when limits are specified for one axis only

- Status
- Branches and Pull requests
- Abstract
- Detailed description
- Implementation
- Backward compatibility
- Alternatives

43.9.1 Status

Discussion

43.9.2 Branches and Pull requests

None so far.
43.9.3 Abstract

When one Axis of a 2-dimensional plot is overridden via \texttt{set_xlim} or \texttt{set_ylim}, automatic scaling of the remaining Axis should be based on the data that falls within the specified limits of the first Axis.

43.9.4 Detailed description

When axis limits for a 2-D plot are specified for one axis only (via \texttt{set_xlim} or \texttt{set_ylim}), matplotlib currently does not currently rescale the other axis. The result is that the displayed curves or symbols may be compressed into a tiny portion of the available area, so that the final plot conveys much less information than it would with appropriate axis scaling.

The proposed change of behavior would make matplotlib choose the scale for the remaining axis using only the data that falls within the limits for the axis where limits were specified.

43.9.5 Implementation

I don't know enough about the internals of matplotlib to be able to suggest an implementation.

43.9.6 Backward compatibility

From the standpoint of software interfaces, there would be no break in backward compatibility. Some outputs would be different, but if the user truly desires the previous behavior, he/she can achieve this by overriding the axis scaling for both axes.

43.9.7 Alternatives

The only alternative that I can see is to maintain the status quo.

43.10 MEP19: Continuous Integration

43.10.1 Status

Completed
43.10.2 Branches and Pull requests

43.10.3 Abstract

matplotlib could benefit from better and more reliable continuous integration, both for testing and building installers and documentation.

43.10.4 Detailed description

Current state-of-the-art

Testing

matplotlib currently uses Travis-CI for automated tests. While Travis-CI should be praised for how much it does as a free service, it has a number of shortcomings:

- It often fails due to network timeouts when installing dependencies.
- It often fails for inexplicable reasons.
- build or test products can only be saved from build off of branches on the main repo, not pull requests, so it is often difficult to "post mortem" analyse what went wrong. This is particularly frustrating when the failure can not be subsequently reproduced locally.
- It is not extremely fast. matplotlib's cpu and memory requirements for testing are much higher than the average Python project.
- It only tests on Ubuntu Linux, and we have only minimal control over the specifics of the platform. It can be upgraded at any time outside of our control, causing unexpected delays at times that may not be convenient in our release schedule.

On the plus side, Travis-CI's integration with github -- automatically testing all pending pull requests -- is exceptional.

Builds

There is no centralized effort for automated binary builds for matplotlib. However, the following disparate things are being done [If the authors mentioned here could fill in detail, that would be great!]:

- @sandrotosi: builds Debian packages
- @takluyver: Has automated Ubuntu builds on Launchpad
- @cgoihke: Makes Windows builds (don't know how automated that is)
- @r-owen: Makes OS-X builds (don't know how automated that is)

Documentation

Documentation of master is now built by travis and uploaded to http://matplotlib.org/devdocs/index.html
@NelleV, I believe, generates the docs automatically and posts them on the web to chart MEP10 progress.
Peculiarities of matplotlib

matplotlib has complex requirements that make testing and building more taxing than many other Python projects.

- The CPU time to run the tests is quite high. It puts us beyond the free accounts of many CI services (e.g. ShiningPanda)
- It has a large number of dependencies, and testing the full matrix of all combinations is impractical. We need to be clever about what space we test and guarantee to support.

Requirements

This section outlines the requirements that we would like to have.

1. Testing all pull requests by hooking into the GitHub API, as Travis-CI does
2. Testing on all major platforms: Linux, Mac OS-X, MS Windows (in that order of priority, based on user survey)
3. Retain the last n days worth of build and test products, to aid in post-mortem debugging.
4. Automated nightly binary builds, so that users can test the bleeding edge without installing a complete compilation environment.
5. Automated benchmarking. It would be nice to have a standard benchmark suite (separate from the tests) whose performance could be tracked over time, in different backends and platforms. While this is separate from building and testing, ideally it would run on the same infrastructure.
6. Automated nightly building and publishing of documentation (or as part of testing, to ensure PRs don't introduce documentation bugs). (This would not replace the static documentation for stable releases as a default).
7. The test systems should be manageable by multiple developers, so that no single person becomes a bottleneck. (Travis-CI's design does this well -- storing build configuration in the git repository, rather than elsewhere, is a very good design.)
8. Make it easy to test a large but sparse matrix of different versions of matplotlib's dependencies. The matplotlib user survey provides some good data as to where to focus our efforts: https://docs.google.com/spreadsheet/ccc?key=0AjrPjITMRTwTdhpQS25pcTZIRWdqX0pNckNSU01sMHc
9. Nice to have: A decentralized design so that those with more obscure platforms can publish build results to a central dashboard.
43.10.5 Implementation

This part is yet-to-be-written.

However, ideally, the implementation would be a third-party service, to avoid adding system administration to our already stretched time. As we have some donated funds, this service may be a paid one if it offers significant time-saving advantages over free offerings.

43.10.6 Backward compatibility

Backward compatibility is not a major concern for this MEP. We will replace current tools and procedures with something better and throw out the old.

43.10.7 Alternatives

43.10.8 Hangout Notes

CI Infrastructure

- We like Travis and it will probably remain part of our arsenal in any event. The reliability issues are being looked into.

- Enable Amazon S3 uploads of testing products on Travis. This will help with post-mortem of failures (@mdboom is looking into this now).

- We want Mac coverage. The best bet is probably to push Travis to enable it for our project by paying them for a Pro account (since they don't otherwise allow testing on both Linux and Mac).

- We want Windows coverage. Shining Panda is an option there.

- Investigate finding or building a tool that would collect and synthesize test results from a number of sources and post it to GitHub using the GitHub API. This may be of general use to the Scipy community.

- For both Windows and Mac, we should document (or better yet, script) the process of setting up the machine for a build, and how to build binaries and installers. This may require getting information from Russel Owen and Christoph Gohlke. This is a necessary step for doing automated builds, but would also be valuable for a number of other reasons.

The test framework itself

- We should investigate ways to make it take less time
  - Eliminating redundant tests, if possible
  - General performance improvements to matplotlib will help

- We should be covering more things, particularly more backends

- We should have more unit tests, fewer integration tests, if possible
43.11 MEP21: color and cm refactor

- **Status**
- **Branches and Pull requests**
- **Abstract**
- **Detailed description**
- **Implementation**
- **Backward compatibility**
- **Alternatives**

43.11.1 Status

- **Discussion:** This MEP has not commenced yet, but here are some ongoing ideas which may become a part of this MEP:

43.11.2 Branches and Pull requests

43.11.3 Abstract

- color
  - tidy up the namespace
  - Define a "Color" class
  - make it easy to convert from one color type to another \`hex -> RGB\`, \`RGB -> hex\`, \`HSV -> RGB\` etc.
  - improve the construction of a colormap - the dictionary approach is archaic and overly complex (though incredibly powerful)
  - make it possible to interpolate between two or more color types in different modes, especially useful for construction of colormaps in HSV space for instance
- cm
  - rename the module to something more descriptive - mappables?

Overall, there are a lot of improvements that can be made with matplotlib color handling - managing backwards compatibility will be difficult as there are some badly named variables/modules which really shouldn't exist - but a clear path and message for migration should be available, with a large amount of focus on this in the API changes documentation.

Progress

43.12.2 Branches and Pull requests

Previous work
- https://github.com/matplotlib/matplotlib/pull/1849
- https://github.com/matplotlib/matplotlib/pull/2557
- https://github.com/matplotlib/matplotlib/pull/2465

Pull Requests:
- Removing the NavigationToolbar classes https://github.com/matplotlib/matplotlib/pull/2740 CLOSED
43.12.3 Abstract

The main goal of this MEP is to make it easier to modify (add, change, remove) the way the user interacts with the figures.

The user interaction with the figure is deeply integrated within the Canvas and Toolbar. Making extremely difficult to do any modification.

This MEP proposes the separation of this interaction into Toolbar, Navigation and Tools to provide independent access and reconfiguration.

This approach will make easier to create and share tools among users. In the far future, we can even foresee a kind of Marketplace for Tools where the most popular can be added into the main distribution.

43.12.4 Detailed description

The reconfiguration of the Toolbar is complex, most of the time it requires a custom backend.

The creation of custom Tools sometimes interferes with the Toolbar, as example see https://github.com/matplotlib/matplotlib/issues/2694 also the shortcuts are hardcoded and again not easily modifiable https://github.com/matplotlib/matplotlib/issues/2699

The proposed solution is to take the actions out of the Toolbar and the shortcuts out of the Canvas. The actions and shortcuts will be in the form of Tools.

A new class Navigation will be the bridge between the events from the Canvas and Toolbar and redirect them to the appropriate Tool.

At the end the user interaction will be divided into three classes:

- NavigationBase: This class is instantiated for each FigureManager and connect the all user interactions with the Tools
- ToolbarBase: This existing class is relegated only as a GUI access to Tools.
- ToolBase: Is the basic definition of Tools.

43.12.5 Implementation

ToolBase(object)

Tools can have a graphical representation as the SubplotTool or not even be present in the Toolbar as Quit.

The ToolBase has the following class attributes for configuration at definition time

- keymap = None: Key(s) to be used to trigger the tool
• description = ": Small description of the tool
• image = None: Image that is used in the toolbar

The following instance attributes are set at instantiation:

• name
• navigation

Methods

• trigger(self, event): This is the main method of the Tool, it is called when the Tool is triggered by: * Toolbar button click * keypress associated with the Tool Keymap * Call to navigation.trigger_tool(name)
• set_figure(self, figure): Set the figure and navigation attributes
• destroy(self, *args): Destroy the Tool graphical interface (if exists)

Available Tools

• ToolQuit
• ToolEnableAllNavigation
• ToolEnableNavigation
• ToolToggleGrid
• ToolToggleFullScreen
• ToolToggleYScale
• ToolToggleXScale
• ToolHome
• ToolBack
• ToolForward
• SaveFigureBase
• ConfigureSubplotsBase

ToolToggleBase(ToolBase)

The ToolToggleBase has the following class attributes for configuration at definition time

• radio_group = None: Attribute to group 'radio' like tools (mutually exclusive)
• cursor = None: Cursor to use when the tool is active

The Toggleable Tools, can capture keypress, mouse moves, and mouse button press

It defines the following methods

• enable(self, event): Called by ToolToggleBase.trigger method
- disable(self, event): Called when the tool is untoggled
- toggled : **Property** True or False

**Available Tools**
- ToolZoom
- ToolPan

**NavigationBase**

**Defines the following attributes**
- canvas:
  - keypresslock: Lock to know if the canvas key_press_event is available and process it
- messagelock: Lock to know if the message is available to write

**Public methods for User use:**
- nav_connect(self, s, func): Connect to to navigation for events
- nav_disconnect(self, cid): Disconnect from navigation event
- message_event(self, message, sender=None): Emit a tool_message_event event
- active_toggle(self): **Property** The currently toggled tools or None
- get_tool_keymap(self, name): Return a list of keys that are associated with the tool
- set_tool_keymap(self, name, *keys): Set the keys for the given tool
- remove_tool(self, name): Removes tool from the navigation control.
- add_tools(self, tools): Add multiple tools to Navigation
- add_tool(self, name, tool, group=None, position=None): Add a tool to the Navigation
- tool_trigger_event(self, name, sender=None, canvasevent=None, data=None): Trigger a tool and fire the event
- tools(self) **Property**: Return a dict with available tools with corresponding keymaps, descriptions and objects
- get_tool(self, name): Return the tool object
ToolbarBase

Methods for Backend implementation

- `add_toolitem(self, name, group, position, image, description, toggle)`: Add a toolitem to the toolbar. This method is a callback from `tool_added_event` (emitted by navigation)
- `set_message(self, s)`: Display a message on toolbar or in status bar
- `toggle_toolitem(self, name)`: Toggle the toolitem without firing event.
- `remove_toolitem(self, name)`: Remove a toolitem from the Toolbar

43.12.6 Backward compatibility

For backward compatibility added 'navigation' to the list of values supported by `rcParams["toolbar"]` (default: 'toolbar2'), that is used for Navigation classes instantiation instead of the NavigationToolbar classes

With this parameter, it makes it transparent to anyone using the existing backends.

[@pelson comment: This also gives us an opportunity to avoid needing to implement all of this in the same PR - some backends can potentially exist without the new functionality for a short while (but it must be done at some point).]

43.13.1 Status

Discussion

43.13.2 Branches and Pull requests

Previous work - https://github.com/matplotlib/matplotlib/pull/2465 To-delete

43.13.3 Abstract

Add the possibility to have multiple figures grouped under the same `FigureManager`

43.13.4 Detailed description

Under the current structure, every canvas has its own window.

This is and may continue to be the desired method of operation for most use cases.

Sometimes when there are too many figures open at the same time, it is desirable to be able to group these under the same window [see](https://github.com/matplotlib/matplotlib/issues/2194).

The proposed solution modifies `FigureManagerBase` to contain and manage more than one `Canvas`. The settings parameter `rcParams["backend.multifigure"]` control when the `MultiFigure` behaviour is desired.

Note

It is important to note, that the proposed solution, assumes that the [MEP22](https://github.com/matplotlib/matplotlib/wiki/Mep22) is already in place. This is simply because the actual implementation of the Toolbar makes it pretty hard to switch between canvases.

43.13.5 Implementation

The first implementation will be done in GTK3 using a Notebook as canvas container.

`FigureManagerBase`

will add the following new methods

- `add_canvas`: To add a canvas to an existing `FigureManager` object
- `remove_canvas`: To remove a canvas from a `FigureManager` object, if it is the last one, it will be destroyed
- `move_canvas`: To move a canvas from one `FigureManager` to another.
- `set_canvas_title`: To change the title associated with a specific canvas container
- `get_canvas_title`: To get the title associated with a specific canvas container
• **get_active_canvas**: To get the canvas that is in the foreground and is subject to the gui events. There is no **set_active_canvas** because the active canvas, is defined when **show** is called on a **Canvas** object.

**new_figure_manager**

To control which **FigureManager** will contain the new figures, an extra optional parameter **figuremanager** will be added, this parameter value will be passed to **new_figure_manager_given_figure**.

**new_figure_manager_given_figure**

- If **figuremanager** parameter is given, this **FigureManager** object will be used instead of creating a new one.
- If **rcParams['backend.multifigure']** is True: The last **FigureManager** object will be used instead of creating a new one.

**NavigationBase**

Modifies the **NavigationBase** to keep a list of canvases, directing the actions to the active one.

**43.13.6 Backward compatibility**

For the **MultiFigure** properties to be visible, the user has to activate them directly setting **rcParams['backend.multifigure'] = True**

It should be backwards compatible for backends that adhere to the current **FigureManagerBase** structure even if they have not implemented the **MultiFigure** magic yet.

**43.13.7 Alternatives**

Instead of modifying the **FigureManagerBase** it could be possible to add a parallel class, that handles the cases where **rcParams['backend.multifigure'] = True**. This will warranty that there won't be any problems with custom made backends, but also makes bigger the code, and more things to maintain.

**43.14 MEP24: negative radius in polar plots**

- **Status**
- **Branches and Pull requests**
- **Abstract**
43.14.1 Status

Discussion

43.14.2 Branches and Pull requests

None

43.14.3 Abstract

It is clear that polar plots need to be able to gracefully handle negative r values (not by clipping or reflection).

43.14.4 Detailed description

One obvious application that we should support is bB plots (see https://github.com/matplotlib/matplotlib/issues/1730#issuecomment-40815837), but this seems more generally useful (for example growth rate as a function of angle). The assumption in the current code (as I understand it) is that the center of the graph is \( r = 0 \), however it would be good to be able to set the center to be at any \( r \) (with any value less than the offset clipped).

43.15.1 Status

Rejected

This work is important, but this particular effort has stalled.

43.15.2 Branches and Pull requests

- development branches:
  - related pull requests:

43.15.3 Abstract

This MEP aims at adding a serializable Controller objects to act as an Artist managers. Users would then communicate changes to an Artist via a Controller. In this way, functionality of the Controller objects may be added incrementally since each Artist is still responsible for drawing everything. The goal is to create an API that is usable both by graphing libraries requiring high-level descriptions of figures and libraries requiring low-level interpretations.
43.15.4 Detailed description

Matplotlib is a core plotting engine with an API that many users already understand. It's difficult/impossible for other graphing libraries to (1) get a complete figure description, (2) output raw data from the figure object as the user has provided it, (3) understand the semantics of the figure objects without heuristics, and (4) give matplotlib a complete figure description to visualize. In addition, because an Artist has no conception of its own semantics within the figure, it's difficult to interact with them in a natural way.

In this sense, matplotlib will adopt a standard Model-View-Controller (MVC) framework. The Model will be the user defined data, style, and semantics. The Views are the ensemble of each individual Artist, which are responsible for producing the final image based on the model. The Controller will be the Controller object managing its set of Artist objects.

The Controller must be able to export the information that it's carrying about the figure on command, perhaps via a to_json method or similar. Because it would be extremely extraneous to duplicate all of the information in the model with the controller, only user-specified information (data + style) are explicitly kept. If a user wants more information (defaults) from the view/model, it should be able to query for it.

- This might be annoying to do, non-specified kwargs are pulled from the rcParams object which is in turn created from reading a user specified file and can be dynamically changed at run time. I suppose we could keep a dict of default defaults and compare against that. Not clear how this will interact with the style sheet [[MEP26]] - @tacaswell

Additional Notes:

- The "raw data" does not necessarily need to be a list, ndarray, etc. Rather, it can more abstractly just have a method to yield data when needed.

- Because the Controller will contain extra information that users may not want to keep around, it should not be created by default. You should be able to both (a) instantiate a Controller with a figure and (b) build a figure with a Controller.

Use Cases:

- Export all necessary informat
- Serializing a matplotlib figure, saving it, and being able to rerun later.
- Any other source sending an appropriately formatted representation to matplotlib to open

43.15.5 Examples

Here are some examples of what the controllers should be able to do.

1. Instantiate a matplotlib figure from a serialized representation (e.g., JSON):

   ```python
   import json
   from matplotlib.controllers import Controller
   with open('my_figure') as f:
       o = json.load(f)
   c = Controller(o)
   fig = c.figure
   ```
2. Manage artists from the controller (e.g., Line2D):

```python
# not really sure how this should look
c.axes[0].lines[0].color = 'b'
# ?
```

3. Export serializable figure representation:

```python
o = c.to_json()
# or... we should be able to throw a figure object in there too
o = Controller.to_json(mpl_fig)
```

### 43.15.6 Implementation

1. Create base Controller objects that are able to manage Artist objects (e.g., Hist)

   Comments:
   - initialization should happen via unpacking **, so we need a copy of call signature parameter for the Artist we're ultimately trying to control. Unfortunate hard-coded repetition...
   - should the additional **kwargs accepted by each Artist be tracked at the Controller
   - how does a Controller know which artist belongs where? E.g., do we need to pass axes references?

   Progress:
   - A simple NB demonstrating some functionality for Line2DController objects: https://nbviewer.jupyter.org/gist/theenginear/f0aa8d79f64325e767c0

2. Write in protocols for the Controller to update the model.

   Comments:
   - how should containers be dealt with? E.g., what happens to old patches when we re-bin a histogram?
   - in the link from (1), the old line is completely destroyed and redrawn, what if something is referencing it?

3. Create method by which a json object can be assembled from the Controllers

4. Deal with serializing the unserializable aspects of a figure (e.g., non-affine transforms?)

5. Be able to instantiate from a serialized representation

6. Reimplement the existing pyplot and Axes method, e.g. `pyplot.hist` and `Axes.hist` in terms of the new controller class.

> @theengineer: in #2 above, what do you mean by get updates from each Artist?

^ Yup. The Controller shouldn't need to get updated. This just happens in #3. Delete comments when you see this.
43.15.7 Backward compatibility

- pickling will change
- non-affine transformations will require a defined pickling method

43.15.8 Alternatives

PR #3150 suggested adding semantics by parasitically attaching extra containers to axes objects. This is a more complete solution with what should be a more developed/flexible/powerful framework.

43.16.2 Branches and Pull requests

43.16.3 Abstract

This MEP proposes a new stylesheet implementation to allow more comprehensive and dynamic styling of artists.

The current version of matplotlib (1.4.0) allows stylesheets based on the rcParams syntax to be applied before creation of a plot. The methodology below proposes a new syntax, based on CSS, which would allow styling of individual artists and properties, which can be applied dynamically to existing objects.

This is related to (and makes steps toward) the overall goal of moving to a DOM/tree-like architecture.

43.16.4 Detailed description

Currently, the look and appearance of existing artist objects (figure, axes, Line2D etc...) can only be updated via `set_` and `get_` methods on the artist object, which is quite laborious, especially if no reference to the artist(s) has been stored. The new style sheets introduced in 1.4 allow styling before a plot is created, but do not offer any means to dynamically update plots or distinguish between artists of the same type (i.e. to specify the line color and line style separately for differing `Line2D` objects).

The initial development should concentrate on allowing styling of artist primitives (those `Artist` objects that do not contain other `Artist`), and further development could expand the CSS syntax rules and parser to allow more complex styling. See the appendix for a list of primitives.

The new methodology would require development of a number of steps:

- A new stylesheet syntax (likely based on CSS) to allow selection of artists by type, class, id etc...
- A mechanism by which to parse a stylesheet into a tree
- A mechanism by which to translate the parse-tree into something which can be used to update the properties of relevant artists. Ideally this would implement a method by which to traverse the artists in a tree-like structure.
- A mechanism by which to generate a stylesheet from existing artist properties. This would be useful to allow a user to export a stylesheet from an existing figure (where the appearance may have been set using the matplotlib API)...

43.16.5 Implementation

It will be easiest to allow a '3rd party' to modify/set the style of an artist if the 'style' is created as a separate class and store against the artist as a property. The *GraphicsContextBase* class already provides a the basis of a Style class and an artist's *draw* method can be refactored to use the Style class rather than setting up its own *GraphicsContextBase* and transferring its style-related properties to it. A minimal example of how this could be implemented is shown here: [https://github.com/JamesRamm/mpl_experiment](https://github.com/JamesRamm/mpl_experiment)

IMO, this will also make the API and code base much neater as individual get/set methods for artist style properties are now redundant... Indirectly related would be a general drive to replace get/set methods with properties. Implementing the style class with properties would be a big stride toward this...

For initial development, I suggest developing a syntax based on a much (much much) simplified version of CSS. I am in favour of dubbing this Artist Style Sheets :+1: :

BNF Grammar

I propose a very simple syntax to implement initially (like a proof of concept), which can be expanded upon in the future. The BNF form of the syntax is given below and then explained

```plaintext
RuleSet ::= SelectorSequence "{Declaration}"  
SelectorSequence ::= = Selector {"," Selector}  
Declaration ::= propName":" propValue";"  
Selector ::= ArtistIdent"#"Ident  
propName ::= Ident  
propValue ::= Ident | Number | Colour | "None"
```

ArtistIdent, Ident, Number and Colour are tokens (the basic building blocks of the expression) which are defined by regular expressions.

Syntax

A CSS stylesheet consists of a series of *rule sets* in hierarchical order (rules are applied from top to bottom). Each rule follows the syntax

```
selector {attribute: value;}
```

Each rule can have any number of *attribute: value* pairs, and a stylesheet can have any number of rules.

The initial syntax is designed only for Artist primitives. It does not address the question of how to set properties on Container types (whose properties may themselves be Artists with settable properties), however, a future solution to this could simply be nested RuleSets
Selectors

Selectors define the object to which the attribute updates should be applied. As a starting point, I propose just 2 selectors to use in initial development:

**Artist Type Selector**

Select an *Artist* by its type. E.g Line2D or Text:

```
Line2D {attribute: value}
```

The regex for matching the artist type selector (ArtistIdent in the BNF grammar) would be:

```
ArtistIdent = r'(?:P<ArtistIdent>|bLine2D|bText|bAxesImage|b|\n ~bFigureImage|b|bPatch|b)'`

**GID selector**

Select an *Artist* by its gid:

```
Line2D#myGID {attribute: value}
```

A gid can be any string, so the regex could be as follows:

```
Ident = r'(?:P<Ident>[a-zA-Z_][a-zA-Z_0-9]+)'`
```

The above selectors roughly correspond to their CSS counterparts (http://www.w3.org/TR/CSS21/selector.html)

**Attributes and values**

- Attributes are any valid (settable) property for the *Artist* in question.
- Values are any valid value for the property (Usually a string, or number).

**Parsing**

Parsing would consist of breaking the stylesheet into tokens (the python cookbook gives a nice tokenizing recipe on page 66), applying the syntax rules and constructing a Tree. This requires defining the grammar of the stylesheet (again, we can borrow from CSS) and writing a parser. Happily, there is a recipe for this in the python cookbook as well.
Visitor pattern for matplotlib figure

In order to apply the stylesheet rules to the relevant artists, we need to 'visit' each artist in a figure and apply the relevant rule. Here is a visitor class (again, thanks to python cookbook), where each node would be an artist in the figure. A visit_ method would need to be implemented for each mpl artist, to handle the different properties for each

```python
class Visitor:
    def visit(self, node):
        name = 'visit_' + type(node).__name__
        meth = getattr(self, name, None)
        if meth is None:
            raise NotImplementedError
        return meth(node)
```

An evaluator class would then take the stylesheet rules and implement the visitor on each one of them.

43.16.6 Backward compatibility

Implementing a separate Style class would break backward compatibility as many get/set methods on an artist would become redundant. While it would be possible to alter these methods to hook into the Style class (stored as a property against the artist), I would be in favor of simply removing them to both neaten/simplify the codebase and to provide a simple, uncluttered API...

43.16.7 Alternatives

No alternatives, but some of the ground covered here overlaps with MEP25, which may assist in this development

43.16.8 Appendix

Matplotlib primitives

This will form the initial selectors which stylesheets can use.

43.17 MEP27: decouple pyplot from backends

43.17.1 Status

Progress

43.17.2 Branches and Pull requests

Main PR (including GTK3): + https://github.com/matplotlib/matplotlib/pull/4143

Backend specific branch diffs: + https://github.com/OceanWolf/matplotlib/compare/backend-refactor..
..OceanWolf:backend-refactor-tkagg + https://github.com/OceanWolf/matplotlib/compare/backend-refactor...

43.17.3 Abstract

This MEP refactors the backends to give a more structured and consistent API, removing generic code and consolidate existing code. To do this we propose splitting:

1. **FigureManagerBase** and its derived classes into the core functionality class **FigureManager**
and a backend specific class **WindowBase** and

2. **ShowBase** and its derived classes into **Gcf.show_all** and **MainLoopBase**.
43.17.4 Detailed description

This MEP aims to consolidate the backends API into one single uniform API, removing generic code out of the backend (which includes _pylab_helpers and Gcf), and push code to a more appropriate level in matplotlib. With this we automatically remove inconsistencies that appear in the backends, such as FigureManagerBase.resize(w, h) which sometimes sets the canvas, and other times set the entire window to the dimensions given, depending on the backend.

Two main places for generic code appear in the classes derived from FigureManagerBase and ShowBase.

1. FigureManagerBase has three jobs at the moment:
   1. The documentation describes it as a "Helper class for pyplot mode, wraps everything up into a neat bundle"
   2. But it doesn't just wrap the canvas and toolbar, it also does all of the windowing tasks itself. The conflation of these two tasks gets seen the best in the following line: `python self.set_window_title("Figure %d" % num) ` This combines backend specific code self.set_window_title(title) with matplotlib generic code title = "Figure %d" % num.
   3. Currently the backend specific subclass of FigureManager decides when to end the mainloop. This also seems very wrong as the figure should have no control over the other figures.

2. ShowBase has two jobs:
   1. It has the job of going through all figure managers registered in _pylab_helpers.Gcf and telling them to show themselves.
   2. And secondly it has the job of performing the backend specific mainloop to block the main programme and thus keep the figures from dying.

43.17.5 Implementation

The description of this MEP gives us most of the solution:

1. To remove the windowing aspect out of FigureManagerBase letting it simply wrap this new class along with the other backend classes. Create a new WindowBase class that can handle this functionality, with pass-through methods (arrow_right:) to WindowBase. Classes that subclass WindowBase should also subclass the GUI specific window class to ensure backward compatibility (manager.window == manager.window).

2. Refactor the mainloop of ShowBase into MainLoopBase, which encapsulates the end of the loop as well. We give an instance of MainLoop to FigureManager as a key unlock the exit method (requiring all keys returned before the loop can die). Note this opens the possibility for multiple backends to run concurrently.

3. Now that FigureManagerBase has no backend specifics in it, to rename it to FigureManager, and move to a new file backend_managers.py noting that:
   1. This allows us to break up the conversion of backends into separate PRs as we can keep the existing FigureManagerBase class and its dependencies intact.
and this also anticipates MEP22 where the new `NavigationBase` has morphed into a backend independent `ToolManager`.

### 43.17.6 Future compatibility

As eluded to above when discussing MEP 22, this refactor makes it easy to add in new generic features. At the moment, MEP 22 has to make ugly hacks to each class extending from `FigureManagerBase`. With this code, this only needs to get made in the single `FigureManager` class. This also makes the later deprecation of `NavigationToolbar2` very straightforward, only needing to touch the single `FigureManager` class.

MEP 23 makes for another use case where this refactored code will come in very handy.

### 43.17.7 Backward compatibility

As we leave all backend code intact, only adding missing methods to existing classes, this should work seamlessly for all use cases. The only difference will lie for backends that used `FigureManager.resize` to resize the canvas and not the window, due to the standardisation of the API.

I would envision that the classes made obsolete by this refator get deprecated and removed on the same timetable as `NavigationToolbar2`, also note that the change in call signature to the `FigureCanvasWx` constructor, while backward compatible, I think the old (imho ugly style) signature should get deprecated and removed in the same manner as everything else.
43.17.8 Alternatives

If there were any alternative solutions to solving the same problem, they should be discussed here, along with a justification for the chosen approach.

43.17.9 Questions

Mdehoon: Can you elaborate on how to run multiple backends concurrently?

OceanWolf: @mdehoon, as I say, not for this MEP, but I see this MEP opens it up as a future possibility. Basically the `MainLoopBase` class acts a per backend Gcf, in this MEP it tracks the number of figures open per backend, and manages the mainloops for those backends. It closes the backend specific mainloop when it detects that no figures remain open for that backend. Because of this I imagine that with only a small amount of tweaking that we can do full-multi-backend matplotlib. No idea yet why one would want to, but I leave the possibility there in `MainLoopBase`. With all the backend-code specifics refactored out of `FigureManager` also aids in this, one manager to rule them (the backends) all.

Mdehoon: @OceanWolf, OK, thanks for the explanation. Having a uniform API for the backends is very important for the maintainability of matplotlib. I think this MEP is a step in the right direction.

43.18 MEP28: Remove Complexity from Axes.boxplot

### 43.18.1 Status

**Discussion**

### 43.18.2 Branches and Pull requests

The following lists any open PRs or branches related to this MEP:

3. Deprecate passings 2D NumPy arrays as input: None
5. Exposing `cbook.boxplot_stats` through `Axes.boxplot` kwargs: None
6. Remove redundant statistical kwargs in `Axes.boxplot`: None
7. Remove redundant style options in `Axes.boxplot`: None
8. Remaining items that arise through discussion: None

### 43.18.3 Abstract

Over the past few releases, the `Axes.boxplot` method has grown in complexity to support fully customizable artist styling and statistical computation. This lead to `Axes.boxplot` being split off into multiple parts. The statistics needed to draw a boxplot are computed in `cbook.boxplot_stats`, while the actual artists are drawn by `Axes.bxp`. The original method, `Axes.boxplot` remains as the most public API that handles passing the user-supplied data to `cbook.boxplot_stats`, feeding the results to `Axes.bxp`, and pre-processing style information for each facet of the boxplot plots.
This MEP will outline a path forward to rollback the added complexity and simplify the API while maintaining reasonable backwards compatibility.

### 43.18.4 Detailed description

Currently, the `Axes.boxplot` method accepts parameters that allow the users to specify medians and confidence intervals for each box that will be drawn in the plot. These were provided so that advanced users could provide statistics computed in a different fashion that the simple method provided by matplotlib. However, handling this input requires complex logic to make sure that the forms of the data structure match what needs to be drawn. At the moment, that logic contains 9 separate if/else statements nested up to 5 levels deep with a for loop, and may raise up to 2 errors. These parameters were added prior to the creation of the `Axes.bxp` method, which draws boxplots from a list of dictionaries containing the relevant statistics. Matplotlib also provides a function that computes these statistics via `cbook.boxplot_stats`. Note that advanced users can now either a) write their own function to compute the stats required by `Axes.bxp`, or b) modify the output returned by `cbook.boxplots_stats` to fully customize the position of the artists of the plots. With this flexibility, the parameters to manually specify only the medians and their confidence intervals remain for backwards compatibility.

Around the same time that the two roles of `Axes.boxplot` were split into `cbook.boxplot_stats` for computation and `Axes.bxp` for drawing, both `Axes.boxplot` and `Axes.bxp` were written to accept parameters that individually toggle the drawing of all components of the boxplots, and parameters that individually configure the style of those artists. However, to maintain backwards compatibility, the `sym` parameter (previously used to specify the symbol of the fliers) was retained. This parameter itself requires fairly complex logic to reconcile the `sym` parameters with the newer `flierprops` parameter at the default style specified by `matplotlibrc`.

This MEP seeks to dramatically simplify the creation of boxplots for novice and advanced users alike. Importantly, the changes proposed here will also be available to downstream packages like seaborn, as seaborn smartly allows users to pass arbitrary dictionaries of parameters through the seaborn API to the underlying matplotlib functions.

This will be achieved in the following way:

1. `cbook.boxplot_stats` will be modified to allow pre- and post-computation transformation functions to be passed in (e.g., `np.log` and `np.exp` for lognormally distributed data)
2. `Axes.boxplot` will be modified to also accept and naïvely pass them to `cbook.boxplots_stats` (Alt: pass the stat function and a dict of its optional parameters).
3. Outdated parameters from `Axes.boxplot` will be deprecated and later removed.
Importance

Since the limits of the whiskers are computed arithmetically, there is an implicit assumption of normality in box and whisker plots. This primarily affects which data points are classified as outliers.

Allowing transformations to the data and the results used to draw boxplots will allow users to opt-out of that assumption if the data are known to not fit a normal distribution.

Below is an example of how Axes.boxplot classifies outliers of lognormal data differently depending on these types of transforms.

```python
import numpy as np
import matplotlib.pyplot as plt
from matplotlib import cbook

np.random.seed(0)

fig, ax = plt.subplots(figsize=(4, 6))
ax.set_yscale('log')
data = np.random.lognormal(-1.75, 2.75, size=37)

stats = cbook.boxplot_stats(data, labels=['arithmetic'])
logstats = cbook.boxplot_stats(np.log(data), labels=['log-transformed'])

for lsdict in logstats:
    for key, value in lsdict.items():
        if key != 'label':
            lsdict[key] = np.exp(value)

stats.extend(logstats)
ax.bxp(stats)
fig.show()
```

43.18.5 Implementation

Passing transform functions to cbook.boxplots_stats

This MEP proposes that two parameters (e.g., transform_in and transform_out) be added to the cookbook function that computes the statistics for the boxplot function. These will be optional keyword-only arguments and can easily be set to `lambda x: x` as a no-op when omitted by the user. The transform_in function will be applied to the data as the boxplot_stats function loops through each subset of the data passed to it. After the list of statistics dictionaries are computed the transform_out function is applied to each value in the dictionaries.

These transformations can then be added to the call signature of Axes.boxplot with little impact to that method's complexity. This is because they can be directly passed to cbook.boxplot_stats. Alternatively, Axes.boxplot could be modified to accept an optional statistical function kwarg and a dictionary of parameters to be directly passed to it.

At this point in the implementation users and external libraries like seaborn would have complete control via the Axes.boxplot method. More importantly, at the very least, seaborn would require no changes to its API to allow users to take advantage of these new options.
Simplifications to the `Axes.boxplot` API and other functions

Simplifying the boxplot method consists primarily of deprecating and then removing the redundant parameters. Optionally, a next step would include rectifying minor terminological inconsistencies between `Axes.boxplot` and `Axes.bxp`.

The parameters to be deprecated and removed include:

1. usermedians - processed by 10 SLOC, 3 if blocks, a for loop
2. conf_intervals - handled by 15 SLOC, 6 if blocks, a for loop
3. sym - processed by 12 SLOC, 4 if blocks

Removing the sym option allows all code in handling the remaining styling parameters to be moved to `Axes.bxp`. This doesn't remove any complexity, but does reinforce the single responsibility principle among `Axes.bxp`, `cbook.boxplot_stats`, and `Axes.boxplot`.

Additionally, the notch parameter could be renamed shownotches to be consistent with `Axes.bxp`. This kind of cleanup could be taken a step further and the whis, bootstrap, autorange could be rolled into the kwargs passed to the new statfxn parameter.

### 43.18.6 Backward compatibility

Implementation of this MEP would eventually result in the backwards incompatible deprecation and then removal of the keyword parameters usermedians, conf_intervals, and sym. Cursory searches on GitHub indicated that usermedians, conf_intervals are used by few users, who all seem to have a very strong knowledge of matplotlib. A robust deprecation cycle should provide sufficient time for these users to migrate to a new API.

Deprecation of sym however, may have a much broader reach into the matplotlib userbase.

### Schedule

An accelerated timeline could look like the following:

1. v2.0.1 add transforms to `cbook.boxplot_stats`, expose in `Axes.boxplot`
2. v2.1.0 Initial Deprecations, and using 2D NumPy arrays as input
   a. Using 2D NumPy arrays as input. The semantics around 2D arrays are generally confusing.
   b. usermedians, conf_intervals, sym parameters
3. v2.2.0
   a. remove usermedians, conf_intervals, sym parameters
   b. deprecate notch in favor of shownotches to be consistent with other parameters and `Axes.bxp`
4. v2.3.0
   a. remove notch parameter
b. move all style and artist toggling logic to Axes.bxp such Axes.boxplot is little more than a broker between Axes.bxp and cbook.boxplots_stats

Anticipated Impacts to Users

As described above deprecating usermedians and conf_intervals will likely impact few users. Those who will be impacted are almost certainly advanced users who will be able to adapt to the change.

Deprecating the sym option may import more users and effort should be taken to collect community feedback on this.

Anticipated Impacts to Downstream Libraries

The source code (GitHub master as of 2016-10-17) was inspected for seaborn and python-ggplot to see if these changes would impact their use. None of the parameters nominated for removal in this MEP are used by seaborn. The seaborn APIs that use matplotlib's boxplot function allow user's to pass arbitrary **kwargs through to matplotlib's API. Thus seaborn users with modern matplotlib installations will be able to take full advantage of any new features added as a result of this MEP.

Python-ggplot has implemented its own function to draw boxplots. Therefore, no impact can come to it as a result of implementing this MEP.

43.18.7 Alternatives

Variations on the theme

This MEP can be divided into a few loosely coupled components:

1. Allowing pre- and post-computation transformation function in cbook.boxplot_stats
2. Exposing that transformation in the Axes.boxplot API
3. Removing redundant statistical options in Axes.boxplot
4. Shifting all styling parameter processing from Axes.boxplot to Axes.bxp.

With this approach, #2 depends on #1, and #4 depends on #3.

There are two possible approaches to #2. The first and most direct would be to mirror the new transform_in and transform_out parameters of cbook.boxplot_stats in Axes.boxplot and pass them directly.

The second approach would be to add statfxn and statfxn_args parameters to Axes.boxplot. Under this implementation, the default value of statfxn would be cbook.boxplot_stats, but users could pass their own function. Then transform_in and transform_out would then be passed as elements of the statfxn_args parameter.
def boxplot_stats(data, ..., transform_in=None, transform_out=None):
    if transform_in is None:
        transform_in = lambda x: x
    if transform_out is None:
        transform_out = lambda x: x
    output = []
    for _d in data:
        d = transform_in(_d)
        stat_dict = do_stats(d)
        for key, value in stat_dict.items():
            if key != 'label':
                stat_dict[key] = transform_out(value)
        output.append(d)
    return output

class Axes(...):
    def boxplot_option1(data, ..., transform_in=None, transform_out=None):
        stats = cbook.boxplot_stats(data, ..., transform_in=transform_in, transform_out=transform_out)
        return self.bxp(stats, ...)
    
    def boxplot_option2(data, ..., statfxn=None, **statopts):
        if statfxn is None:
            statfxn = boxplot_stats
        stats = statfxn(data, **statopts)
        return self.bxp(stats, ...)

Both cases would allow users to do the following:

```
fig, ax1 = plt.subplots()
artists1 = ax1.boxplot_optionX(data, transform_in=np.log,
                               transform_out=np.exp)
```

But Option Two lets a user write a completely custom stat function (e.g., my_box_stats) with fancy BCA confidence intervals and the whiskers set differently depending on some attribute of the data.

This is available under the current API:

```
fig, ax1 = plt.subplots()
my_stats = my_box_stats(data, bootstrap_method='BCA',
                        whisker_method='dynamic')
ax1.bxp(my_stats)
```

And would be more concise with Option Two

```
fig, ax = plt.subplots()
statopts = dict(transform_in=np.log, transform_out=np.exp)
ax.boxplot(data, ..., **statopts)
```
Users could also pass their own function to compute the stats:

```python
fig, ax1 = plt.subplots()
ax1.boxplot(data, statfn=my_box_stats, bootstrap_method='BCA',
             whisker_method='dynamic')
```

From the examples above, Option Two seems to have only marginal benefit, but in the context of downstream libraries like seaborn, its advantage is more apparent as the following would be possible without any patches to seaborn:

```python
import seaborn
tips = seaborn.load_data('tips')
g = seaborn.factorplot(x="day", y="total_bill", hue="sex", data=tips,
                       kind='box', palette="PRGn", shownotches=True,
                       statfn=my_box_stats, bootstrap_method='BCA',
                       whisker_method='dynamic')
```

This type of flexibility was the intention behind splitting the overall boxplot API in the current three functions. In practice however, downstream libraries like seaborn support versions of matplotlib dating back well before the split. Thus, adding just a bit more flexibility to the `Axes.boxplot` could expose all the functionality to users of the downstream libraries with modern matplotlib installation without intervention from the downstream library maintainers.

**Doing less**

Another obvious alternative would be to omit the added pre- and post- computation transform functionality in `cbook.boxplot_stats` and `Axes.boxplot`, and simply remove the redundant statistical and style parameters as described above.

**Doing nothing**

As with many things in life, doing nothing is an option here. This means we simply advocate for users and downstream libraries to take advantage of the split between `cbook.boxplot_stats` and `Axes.bxp` and let them decide how to provide an interface to that.

**43.19 MEP29: Text light markup**

- **Status**
- **Branches and Pull requests**
- **Abstract**
- **Detailed description**
- **Implementation**
43.19 Improvements

- Problems

- Backward compatibility

- Alternatives

43.19.1 Status

Discussion

43.19.2 Branches and Pull requests

None at the moment, proof of concept only.

43.19.3 Abstract

This MEP proposes to add lightweight markup to the text artist.

43.19.4 Detailed description

Using different size/color/family in a text annotation is difficult because the `text` method accepts argument for size/color/family/weight/etc. that are used for the whole text. But, if one wants, for example, to have different colors, one has to look at the gallery where one such example is provided: /gallery/text_labels_and_annotations/rainbow_text

This example takes a list of strings as well as a list of colors which makes it cumbersome to use. An alternative would be to use a restricted set of pango-like markup and to interpret this markup.

Some markup examples:

```
Hello <b>world!</b>`
Hello <span color="blue">world!</span>
```

43.19.5 Implementation

A proof of concept is provided in `markup_example.py` but it currently only handles the horizontal direction.
**Improvements**

- This proof of concept uses regex to parse the text but it may be better to use the html.parser from the standard library.
- Computation of text fragment positions could benefit from the OffsetFrom class. See for example item 5 in *Using Complex Coordinates with Annotations*.

**Problems**

- One serious problem is how to deal with text having both LaTeX and HTML-like tags. For example, consider the following:

  $<b>Bold</b>$

  Recommendation would be to have mutual exclusion.

### 43.19.6 Backward compatibility

None at the moment since it is only a proof of concept.

### 43.19.7 Alternatives

As proposed by @anntzer, this could be also implemented as improvements to mathtext. For example:

```
$r"$text(Hello \textbf{world})$"$
$r"$text(Hello \textcolor{blue}{world})$"$
$r"$text(Hello \textsf{\small world})$"
```
Matplotlib only uses BSD compatible code. If you bring in code from another project make sure it has a PSF, BSD, MIT or compatible license (see the Open Source Initiative licenses page for details on individual licenses). If it doesn't, you may consider contacting the author and asking them to relicense it. GPL and LGPL code are not acceptable in the main code base, though we are considering an alternative way of distributing LGPL code through an separate channel, possibly a toolkit. If you include code, make sure you include a copy of that code's license in the license directory if the code's license requires you to distribute the license with it. Non-BSD compatible licenses are acceptable in Matplotlib toolkits (e.g., basemap), but make sure you clearly state the licenses you are using.

### 44.1 Why BSD compatible?

The two dominant license variants in the wild are GPL-style and BSD-style. There are countless other licenses that place specific restrictions on code reuse, but there is an important difference to be considered in the GPL and BSD variants. The best known and perhaps most widely used license is the GPL, which in addition to granting you full rights to the source code including redistribution, carries with it an extra obligation. If you use GPL code in your own code, or link with it, your product must be released under a GPL compatible license. i.e., you are required to give the source code to other people and give them the right to redistribute it as well. Many of the most famous and widely used open source projects are released under the GPL, including linux, gcc, emacs and sage.

The second major class are the BSD-style licenses (which includes MIT and the python PSF license). These basically allow you to do whatever you want with the code: ignore it, include it in your own open source project, include it in your proprietary product, sell it, whatever. python itself is released under a BSD compatible license, in the sense that, quoting from the PSF license page:

There is no GPL-like "copyleft" restriction. Distributing binary-only versions of Python, modified or not, is allowed. There is no requirement to release any of your source code. You can also write extension modules for Python and provide them only in binary form.

Famous projects released under a BSD-style license in the permissive sense of the last paragraph are the BSD operating system, python and TeX.

There are several reasons why early Matplotlib developers selected a BSD compatible license. Matplotlib is a python extension, and we choose a license that was based on the python license (BSD compatible). Also, we
wanted to attract as many users and developers as possible, and many software companies will not use GPL
code in software they plan to distribute, even those that are highly committed to open source development,
such as enthought, out of legitimate concern that use of the GPL will "infect" their code base by its viral
nature. In effect, they want to retain the right to release some proprietary code. Companies and institutions
who use Matplotlib often make significant contributions, because they have the resources to get a job done,
even a boring one. Two of the Matplotlib backends (FLTK and WX) were contributed by private companies.
The final reason behind the licensing choice is compatibility with the other python extensions for scientific
computing: ipython, numpy, scipy, the enthought tool suite and python itself are all distributed under BSD
compatible licenses.
As discussed at length elsewhere [insert links], \texttt{jet} is an empirically bad colormap and should not be the default colormap. Due to the position that changing the appearance of the plot breaks backward compatibility, this change has been put off for far longer than it should have been. In addition to changing the default colormap we plan to take the chance to change the default color-cycle on plots and to adopt a different colormap for filled plots (\texttt{imshow}, \texttt{pcolor}, \texttt{contourf}, etc) and for scatter like plots.

### 45.1 Default Heat Map Colormap

The choice of a new colormap is fertile ground to bike-shedding ("No, it should be \_this\_ color") so we have a proposed set criteria (via Nathaniel Smith) to evaluate proposed colormaps.

- it should be a sequential colormap, because diverging colormaps are really misleading unless you know where the "center" of the data is, and for a default colormap we generally won't.
- it should be perceptually uniform, i.e., human subjective judgments of how far apart nearby colors are should correspond as linearly as possible to the difference between the numerical values they represent, at least locally.
- it should have a perceptually uniform luminance ramp, i.e. if you convert to greyscale it should still be uniform. This is useful both in practical terms (greyscale printers are still a thing!) and because luminance is a very strong and natural cue to magnitude.
- it should also have some kind of variation in hue, because hue variation is a really helpful additional cue to perception, having two cues is better than one, and there's no reason not to do it.
- the hue variation should be chosen to produce reasonable results even for viewers with the more common types of colorblindness. (Which rules out things like red-to-green.)
- For bonus points, it would be nice to choose a hue ramp that still works if you throw away the luminance variation, because then we could use the version with varying luminance for 2d plots, and the version with just hue variation for 3d plots. (In 3d plots you really want to reserve the luminance channel for lighting/shading, because your brain is \textit{really} good at extracting 3d shape from luminance variation. If the 3d surface itself has massively varying luminance then this screws up the ability to see shape.)
- Not infringe any existing IP
45.1.1 Example script

45.1.2 Proposed Colormaps

45.2 Default Scatter Colormap

For heat-map like applications it can be desirable to cover as much of the luminance scale as possible, however when colormapping markers, having markers too close to white can be a problem. For that reason we propose using a different (but maybe related) colormap to the heat map for marker-based. The design parameters are the same as above, only with a more limited luminance variation.

45.2.1 Example script

```python
import numpy as np
import matplotlib.pyplot as plt

np.random.seed(1234)

fig, (ax1, ax2) = plt.subplots(1, 2)

N = 50
x = np.random.rand(N)
y = np.random.rand(N)
colors = np.random.rand(N)
area = np.pi * (15 * np.random.rand(N))**2  # 0 to 15 point radiuses

ax1.scatter(x, y, s=area, c=colors, alpha=0.5)

X, Y = np.meshgrid(np.arange(0, 2*np.pi, .2),
                   np.arange(0, 2*np.pi, .2))
U = np.cos(X)
V = np.sin(Y)
Q = ax2.quiver(X, Y, U, V, units='width')
qd = np.random.rand(np.prod(X.shape))
Q.set_array(qd)
```

45.2.2 Proposed Colormaps

45.3 Color Cycle / Qualitative colormap

When plotting lines it is frequently desirable to plot multiple lines or artists which need to be distinguishable, but there is no inherent ordering.
45.3.1 Example script

```python
import numpy as np
import matplotlib.pyplot as plt

fig, (ax1, ax2) = plt.subplots(1, 2)
x = np.linspace(0, 1, 10)

for j in range(10):
    ax1.plot(x, x * j)

th = np.linspace(0, 2*np.pi, 1024)
for j in np.linspace(0, np.pi, 10):
    ax2.plot(th, np.sin(th + j))

ax2.set_xlim(0, 2*np.pi)
```

45.3.2 Proposed Color cycle
